CYCLOPÆDIA:

OR, AN

UNIVERSAL DICTIONARY

OF

ARTS and SCIENCES.

D.

D, The fourth letter in the alphabet, and the third conſonant.

The letter *D* is the fourth in the Hebrew, Chaldee, Samaritan, Syriac, Greek, and Latin alphabets; in the five firſt of which languages it has the ſame name, though ſomewhat differently ſpoken, e. gr. in Hebrew, Samaritan, and Chaldee, *Daleth*; in Syriac *Dolath*; and in Greek *Delta*.

The Arabians have three *D's* in their language, the firſt called *Dal*, which is the eighth of the twenty-eight letters; the ſecond, called *Dhſol*, is only diſtinguiſhed from the former by having a point added over it; though its ſound is much the ſame with that of the *Z*: the third, which is their ſeventeenth letter, is called *Da*, and pronounced like our *D*, though in form it reſembles the Arabic *Ta*, the difference being a point added at the top.

The form of our *D* is the ſame with that of the Latins; as appears from all the ancient medals and inſcriptions. And the Latin *D* is no other than the Greek Δ, rounded a little, by making it quicker, and at two ſtrokes. The Δ of the Greeks, again, is borrowed from the ancient character of the Hebrew *Daleth*; which form it ſtill retains on the Samaritan coins, as is ſhewn by the Jeſuit Souciet, in his Diſſertation on the Samaritan Medals. All the alteration the Greeks have made in it, is the making it ſtoop a little, and taking away a little line. Nor would it be difficult to ſhew, that the Syriac *Dolath*, and the Arabic *Dal*, are both borrowed from the ancient Hebrew, as well as the ד *Daleth* of the modern, or Chaldee Hebrew.

Some indeed will have it, that the Greek Δ, *Delta*, is borrowed from the Egyptians, who made their *D* of three ſtars diſpoſed in a triangle; which was a hieroglyphic that among them denoted God, the ſovereign Being, as if they had had ſome notion of a Trinity: but this ſurmiſe is weakly ſupported.

Grammarians generally rank *D* among the lingual letters, as ſuppoſing the tongue to have the principal ſhare in the pronunciation thereof; though the abbot de Dangeau ſeems to have reaſon in making it a palatal letter. It has one uniform ſound, nearly approaching to that of T, but formed by a ſtronger appulſe of the tongue to the upper part of the mouth.

D is alſo a numeral letter ſignifying *five hundred*, which ariſes hence, that in the Gothic characters the *D* is half the M, or Clↄ, which ſignifies a thouſand. Hence the verſe:

Litera D *valet* A *Quingentos ſignificabit.*

A daſh added at the top of the D, denotes it to ſtand for *five thouſand*.

D uſed in abbreviation has various ſignifications: thus *D* ſtands for doctor, and M. D. doctor of medicine,

D. T. doctor of theology, D. D. doctor of divinity, *or dono dedit*; D. D. D. is uſed for *dat, dicat, dedicat*; and D. D. D. D. for *dignum deo donum dedit*.

Among Roman writers, *D* ſtands for *dabam, dicimus, devotus, diebus*, and *diutius*.

D M in the Roman epitaphs ſignifies *dis manibus*, but on other occaſions *deo magno*, or *diis magnis*; *D N* denoted *dominus noſter*, a title given by the Romans to their emperors.

D on the French coins is the mark of the city of Lyons.

D, in the chemical alphabet, ſignifies vitriol.

D, in the *Italian Muſic*, intimates, that in thorough baſſes, the treble or deſcant ought to play alone; as T does the tenor, and B the baſs.

DC, in the *Italian Muſic*, an abbreviation of *da capo*, i. e. from the head or beginning: theſe words or letters are commonly met with at the end of rondeaus, or ſuch airs and tunes as end with the firſt ſtrain, and intimate that the ſong is to be begun again, and ended with the firſt part.

DAALDER. See Dollar and Coin.

DAB, in *Ichthyology*, a name given by the Engliſh to a ſmall fiſh of the PLEURONECTES kind, called by authors the *paſſer aſper* and *limanda*.

It is a flat fiſh, ſuperior in goodneſs to the common plaiſe, but inferior in ſize, covered with ſmall ſcales, rough at their extremities, and edged as it were with teeth: the eyes are on the right ſide, and are placed very cloſe together. It is generally of an uniform brown colour on the upper ſide, though ſometimes ſhaded with a darker; the lower part of the body is white. The lateral line is incurvated at the beginning, and then proceeds ſtraight to the tail. It is in beſt ſeaſon in February, March, and April; ſpawns in May and June, and becomes flabby during the reſt of ſummer. The *ſpotted-dab* reſembles the former; its back is covered with ſmall ſmooth ſcales, of a light brown colour, and ſpotted with yellow; the belly is white, and marked with five large duſky ſpots. It is equally good with the common *dab*. Pennant.

It is caught in the Mediterranean and Engliſh ſeas.

DABUH, a name given by the Arabs to the HYÆNA.

DACE, in *Ichthyology*, the Engliſh name for the fiſh, called by authors the *leuciſcus*. According to the new ſyſtem of Artedi, this is a ſpecies of the cyprinus; and it is called by ſome *albicula*.

It is diſtinguiſhed from other fiſhes by its reſembling the chub in ſize, but that it is ſmaller and whiter, and has a ſmaller head in proportion to its body. Its length is ſeldom more than ten inches. It has no teeth in its jaws, but, like the reſt of the leather-mouthed fiſhes, has them in the throat. It is very common in our rivers, and is a remarkably lively fiſh. They ſpawn in February, and the males at that time are ſpotted and ſcabby, as in the

rukid, &c. and are in highest season for table in April and May; but they are never a very well-tasted fish, or much esteemed.

This fish gives the expert angler great diversion. The *dace* will bite at any fly; but he is more than ordinarily fond of the stone-caddis, or May-fly, which is plentiful in the latter end of April, and the whole month of May. In warm weather this fish very seldom refuses a fly at the top of the water; but at other times he must have the bait sunk to within about three inches of the bottom. The winter fishing for *dace* requires a very different bait: this is a white maggot with a reddish head, which is the produce of the eggs of the beetle, and is turned up with the plough in great abundance. A parcel of these pot in any vessel, with the earth they were taken in, will keep many months, and are an excellent bait.

Small *dace* may be put into a glass jar with fresh water, and there preserved alive for a long time, if the water is properly changed. They have been observed to eat nothing but the animalcula in the water. They will grow very tame by degrees. Phil. Trans. N° 487. p. 23 seq.

DACOLITHUS, in *Ichthyology*, a name given by many to a small fish, a species of the loach, and distinguished by the name of *rubris barbatulus aculeatus* by Ray and others. It is a very small fish, seldom exceeding two, or at the utmost three inches in length. Its head is broader and flatter than the rest of the body; its back is of a dusky brown, spotted with black, and its belly yellow. It has two beards on each side of the upper jaw; and on the coverings of the gills has, on each side, two prickles, or a double-pointed sharp hook, by means of which it moves itself about among the stones. This fish loves shallow waters with a stony bottom, and spawns in May and June. Willughby.

There is another species of this fish, which has ten beards about its mouth, and otherwise resembles this. There is an opinion that they swallow little stones, and they have hence the German name signifying stone-swallowers, or stone-biters.

DACRYODES, in *Medicine*, a term applied to ulcers, which are continually yielding a putrid matter.

The word is formed from δακρυω, *tear*, and ειδος, *form*; denoting the ulcers to weep, or shed somewhat like tears.

DACRYON. See TEARS.

DACTYL, DACTYLUS, a foot in the Latin and Greek poetry, consisting of a long syllable, followed by two short ones; as *carmine*.

Some say it is derived from δακτυλος, a *finger*, because it is divided into three joints, the first of which is longer than the other two.

The *dactyl* is said to have been the invention of Dionysius or Bacchus, who delivered oracles in this measure at Delphos, before Apollo. The Greeks call it ιαμβικος. The *dactyl* and spondee are the most considerable of the poetical feet; as being the measures used in heroic verse by Homer, Virgil, &c. These two are of equal time, but not equal motion. The spondee has an even, strong, and heavy pace, like a trot; the *dactyl* resembles the nimbler strokes of a gallop.

DACTYLUS was also a sort of dance among the ancient Greeks, chiefly performed, as Hesychius observes, by the athletæ.

DACTYLS also denote the fruit of the palm-tree, more usually called *dates*.

DACTYLETHRA, or DACTYLITHRA, *Digitale*, among the *Ancient Physicians*, a medicine used to provoke vomiting. It was a sort of topical application, and is described at large by Oribasius.

DACTYLI, in *Antiquity*, a name attributed to the first priests of the goddess Cybele; who were particularly called *Dactyli Idæi*, on account of the goddess herself, who was styled *Cybele Idæa*, because principally honoured on mount Ida in Phrygia. The name *Dactyli* is supposed to have been given them on this occasion: that to prevent Saturn from hearing the cries of Jupiter, whom Cybele had committed to their custody, they used to sing verses of their own invention, which by their unequal measures seemed to resemble the foot called *dactylus*.—This is the account of the grammarian Diomedes.

One Sophocles, quoted by Strabo, lib. x. speaks differently. According to him they were called *Dactyli*, from the Greek word δακτυλος, *finger*, because their number was at first equal to that of the fingers of the hand, viz. ten; five of them boys, and as many girls. He adds, that it is to them we owe the invention of iron, and the manner of working it, with divers other useful things. Others make their numbers more, and others less, than ten. Some, again, make them natives of Phrygia, near the foot of mount Ida: and others bring them from other places.

However, all the authors Strabo had seen, he says, agreed that they were the first who wrought in iron; that they had been ministers of the mother of the gods, or Cybele; and that they dwelt at the foot of mount Ida: and they probably derived their knowledge of forging metals from the fusion of minerals at the burning of mount Ida.

It is also conjectured by some authors, not that the Curetes and Corybantes were the same with the *Dactyli Idæi*, but that the Curetes and Corybantes were their posterity; that a hundred men, born in Crete, were first called *Dactyli Idæi*; that each of these had nine children who were the Curetes; and that each of the Curetes had ten children, who were also called *Dactyli Idæi*. They were CYCLOPIANS.

Strabo only gives us the names of four of the *Dactyli Idæi*, which are Salaminus, Damnameus, Hercules, and Acmon.

DACTYLIC, something that has a relation to *dactyl*.

Anciently, there were *dactylic*, as well as spondaic flutes, *tibiæ dactylicæ*. The *dactylic* flutes consisted of unequal intervals; as the *dactylic* foot does of unequal measures.

DACTYLIC *verses* are hexameter verses, ending in a *dactyl* instead of a spondee; as spondaic verses are those which have a spondee in the fifth foot instead of a *dactyl*.

An instance of a *dactylic* verse we have in Virg. Æn. lib. vi. 33.

Bis patriæ cecidere manus: quin protinus omnia
Perlegerem oculis——

DACTYLIOMANCY, DACTYLIOMANTIA, a sort of divination performed by means of a ring.

The word is composed of the Greek δακτυλος, *ring*, of δακτυλος, *finger*; and μαντεια, *divination*.

Dactyliomancy consisted principally in holding a ring, suspended by a fine thread, over a round table, on the edge whereof were made divers marks with the twenty-four letters of the alphabet. The ring in shaking, or vibrating over the table, stopped over certain of the letters, which, being joined together, composed the answer required.

But the operation was preceded and accompanied by several superstitious ceremonies; for first the ring was to be consecrated with a great deal of mystery: the person who held it was to be clad in linen garments, to the very shoes; his head was to be shaved all round; and in his hand he was to hold vervain. And before he proceeded on any thing, the gods were first to be appeased by a formulary of prayers, &c. Ammianus Marcellinus gives the process at large in his twenty-ninth book.

DACTYLIS, in *Botany*. See *Cock's-foot* GRASS.

DACTYLONOMY, DACTYLONOMIA, from δακτυλος, *finger*, and νομος, *law*, the art of accounting, or numbering, by the fingers.

The rule is this: the left thumb is reckoned 1, the index 2, and so on to the *right* thumb, which is the tenth, and of consequence is denoted by the cypher 0.

DACTYLUS, in *Ichthyology*, a name used by many authors for the solen or razor-fish, supposed to be the *dactylus* of Pliny, to which he attributes a quality of being luminous in the dark; but Mr. Reaumur has observed, that the common solea or razor-fish has no such quality; but that the *pholas*, or, as the French call it, the *dail*, has: and therefore it follows either that the *pholas* is the *dactylus* of Pliny, or else that this author has attributed to one species of fish what is the peculiar property of another. The shell of this creature is not at all luminous, but only its body and juices; and in this it is no way allied to some kinds of fish, which are known to have the quality of shining in the dark, since those never shine till they are in a state of decay, and in part rotten; whereas these have their luminous quality at all times, even when just taken out of the sea. The glow-worm has only part of its body luminous, but the *pholas* is luminous all over, and is equally so in every part: and when the fish is taken whole out of the shell, and laid in a dark place, every part of its surface shines with a very bright light. Neither is the light peculiar to the external surface of the fish, but common to the whole body: for if it be wounded tranversely, or longitudinally, the cut parts are equally luminous with the other surfaces.

The *pholas* is therefore a true natural phosphorus, and, like the artificial phosphorus of urine, it renders every thing luminous that it is rubbed against.

Mr. Reaumur observed of this fish, that when fresh caught it abounds with water, and that this water naturally drops away in the handling it; and, according to Pliny's just observation, these very drops of water are luminous.

The light which this fish gives to bodies that touch it, is not of any long continuance, but remains only while they are wet. Mr. Reaumur observed, that the light upon his fingers grew fainter and fainter by degrees as they dried; and that on dipping them in water to wash them

them, it brightened up again. This author was thus encouraged to attempt some way of keeping the fish, so as to make it a phosphorus ready for use at pleasure; but this did not succeed to his wishes.

In the summer months, the fish may be kept several days fresh, and with their luminous property; but as they begin to decay, they gradually lose it. It seems also, that there being some dead ones among the living, would make them lose their luminous quality even in that which is their best state. It is well known, that the PHOLAS lives in holes within stones, from whence it cannot get out; and Mr. Beaumur casting some of these stones to be taken up, in which, on breaking, there appeared to be some dead ones, and some alive, found that the living fish from these stones had not their luminous property, which seemed as it were extinguished by the dead and stinking ones. Mem. Acad. des Scienc. ann. 1723.

DACTYLUS *Idæus*, in *Natural History*, a name given by many authors to the BELEMNITES; supposed erroneously by many, to be the *pistorites* of the ancients. For other meanings of the word, see DACTYLI.

DADO, in *Architecture*, is, by some writers, used for that part in the middle of a pedestal of a column between its base and cornice. It is of a cubic form, whence it is also denominated *dye*.

DADUCHI, in *Antiquity*, priests of Ceres.

That goddess, having lost her daughter Proserpine, say mythologists, began to make search for her at the beginning of the night. In order to do this in the dark, she lighted a torch, and thus set forth on her travels throughout the world: for which reason it is, that she is always seen represented with a lighted torch in her hand.

On this account, and in commemoration of this pretended exploit, it became a custom for the priests, at the feasts and sacrifices of this goddess, to run about in the temple, with torches, after this manner; one of them took a lighted torch from off the altar, and holding it with his hand, ran with it to a certain part of the temple, where he gave it to another, saying to him, *Tibi trado:* this second ran after the like manner, to another part of the temple, and gave it to the third, and so of the rest.

From this ceremony the priests became denominated *daduchi*, *δαδουχοι*, q. d. *torch-bearers*; from *δαις*, an unctuous and resinous wood, as pine, fir, &c. whereof the ancients made torches; and *εχω*, *I have*, *I hold*.

The Athenians also gave the name *daduchus* to the high-priest of Hercules.

DÆDALA, in *Antiquity*, two festivals in Bœotia, one of which was observed by the Platæans at Alalcomenus, where was the largest grove in all Bœotia. Here they assembled, and expiating to the open air pieces of sodden flesh, carefully observed whether the crows that came to feed upon them took their flight, and then hewed down all those trees on which any of them alighted, and formed them into statues, which by the ancient Greeks were called *dedalæ*, *δαιδαλα*.

The other solemnity was by far the greatest and most remarkable of the two, being celebrated only once in sixty years. For the ceremonies observed in it, see Pott. Archæol. Græc. lib. ii. cap. 20.

DÆDIS, among the Greeks, a solemn festival that lasted three days, during all which time *dades*, or *torches*, were kept burning, which gave occasion to the name. Pott. Archæol. Græc. lib. ii. cap. 10.

DÆMON, *δαιμων*, a name the ancients gave to certain spirits, or genii, which they say appeared to men, either to do them service, or to hurt them.

The Greek word, *δαιμων*, is derived (according to Plato, in his Cratylus, p. 398. ed. Serrani, vol. i.) from *δαημων*, *knowing*, or *intelligent*; but according to others from *δαιομαι*, *to distribute*. See the Scholiast on Homer, Il. i. ver. 222. Either of these derivations agrees with the office ascribed to *dæmons* by the ancient heathens, as the spirits intrusted with the *inspection* and *government* of mankind. For, according to the philosophers, *dæmons* held a middle rank between the celestial gods and men on earth, and carried on all intercourse between them; conveying the addresses of men to the gods, and the divine benefits to men. Plutarch. de Defect Orac. p. 415, et seq. Plato. Sympos. p. 202. tom. iii. ed. Serrani. Apuleius de Deo Socrat. p. 674. 677. ed. Delph. Iamblichus de Myster. Augusl. de Civ. Dei.

It was the opinion of many, that the celestial divinities did not themselves interpose in human affairs, but committed the entire administration of the government of this lower world to these subaltern deities. *Neque enim pro majestate deum cœlestium fuerit, hæc curare.* Apuleius de Deo Socratis, p. 677. *Cuncta cælestium voluntate, numine & authoritate, sed dæmonum obsequio, & operâ, & ministerio fieri arbitrandum est.* Id. p. 675. Hence they became the objects of divine worship. *If idols are no thing*, says Celsus, (apud Origen. cont. Celf. lib. viii. p. 393.) *what harm can there be to join in the public festivals? If they are dæmons, then it is certain that they are gods, in whom we are unwilling, and to whom we should offer sacrifices and prayers, to render them propitious.*

Several of the heathen philosophers held, that there were several kinds of *dæmons*; that some of them were spiritual substances of a more noble origin than the human race, and that others had once been men. Apuleius de Deo Socratis, p. 684, 690. Ammonius apud Plutarch. de Defect. Orac. p. 431. tom. ii. ed. 1624. Plato in Timæo, p. 41. 42. 69. 71. 75.

But those *dæmons* that were the more immediate objects of the established worship amongst the ancient nations were *human spirits*, such as were believed to become *dæmons* or deities after their departure from their bodies. Plutarch teaches (Vit. Romul. p. 36. ed. Paris) *that entering to a divine nature and justice, the souls of virtuous men are advanced to the rank of dæmons; and that from dæmons, if they are properly purified, they are exalted into gods, not by any political institution, but according to right reason.* The same author says in another place (De Is. & Osir. p. 361.) *that Isis and Osiris were, for their virtues, changed from good dæmons into gods, as were Hercules and Bacchus afterwards, receiving the united honours both of gods and dæmons.* Hesiod, and other poets, who have recorded the ancient history, or traditions, on which the public faith and worship were founded, assert, that the men of the golden age, who were supposed to be very good, became *dæmons* after death, and dispensers of good things to mankind.

Though *dæmon* is often used in a general sense, as equivalent to a *deity*; and is accordingly applied to *fate* or *fortune*, or whatever else was regarded as a god, yet those *dæmons* who were the more immediate objects of divine worship amongst the heathens, were human spirits; as is shewn in Farmer on Miracles, chap. iii. sect. 2.

The word *dæmon* is used indifferently, in a good and in a bad sense. In the former sense it was very commonly used amongst the ancient heathens. *We must not*, says Menander, *think any* dæmon *to be evil, hurtful to a good life, but every god is to good.* Nevertheless, those are certainly mistaken who affirm, that *dæmon* never signifies an evil being till after the times of Christ. Pythagoras held *dæmons* who sent diseases to men and cattle, Diogen. Laert. Vit. Pythagor. p. 514. ed. Amstel. Zaleucus, in his preface to his Laws (apud Stobæum, Serm. 42.) supposes that an evil *dæmon* might be present with a man, *to influence him to injustice.* The *dæmons* of Empedocles were evil spirits, and exiles from heaven. Plutarch Περι το δει δαιμονα. And in his life of Dion (p. 958.) he says, *It was the opinion of the ancients, that evil and mischievous* dæmons, *out of envy and hatred to good men, oppose whatever they do.* Scarce did any opinion more generally prevail in ancient times than this, viz. that as the departed souls of good men became good *dæmons*, so the departed souls of bad men became evil *dæmons*. See Chalcid. in Platon. Tim. cap. 135. p. 330.

It has been generally thought, that by *dæmons* we are to understand *devils*, in the Septuagint version of the Old Testament; but it has been shewn, that the word is in that version certainly applied to the ghosts of such dead men as the heathens deified, in Deut. xxxii. 17. Pf. cvi. 37. What is offered on this head by Mr. Farmer, in his Essay on the Dæmoniacs of the New Testament, is much confirmed by what occurs in Sir Isaac Newton's Chronology, p. 180, 181. That *dæmon* often bears the same meaning in the New Testament, and particularly in Acts xvii. 8. 1 Cor. x. 21. 1 Tim. iv. 1. Rev. ix. 13. is shewn at large by Mr. Joseph Mede (Works, p. 623, et seq.) that the word is applied always to human spirits in the New Testament, Mr. Farmer has attempted to shew in the forementioned Essay, p. 208, et seq. As to the meaning of the word *dæmon* in the fathers of the Christian church, it is used by them in the same sense as it was by the heathen philosophers, especially the latter Platonists; that is, sometimes for departed human spirits, and at other times for such spirits as had never inhabited human bodies. In the fathers indeed the word is more commonly taken in an evil sense, than in the ancient philosophers. Besides the two forementioned kinds of *dæmons*, the fathers, as well as the ancient philosophers, held a third, viz. such as sprang from the congress of superior beings with the daughters of men. In the theology of the fathers, these were the worst kind of *dæmons*. Tertullian's Apology, cap. 22. Lactantius, Div. Institut. lib. ii. cap. 15.

Different orders of *dæmons* had different stations and employments assigned them by the ancients. Good *dæmons* were considered as the authors of good to mankind; evil *dæmons* brought innumerable evils both upon men and beasts. Amongst evil *dæmons* there was a great distinc-

tion with respect to the offices assigned them; some compelled men to wickedness, others stimulated them to madness. See DÆMONIAC.

DÆMONIAC, *Δαιμονιζομενος*, one possessed by a dæmon. *Dæmoniac*, or (if we may be allowed the expression) *dæmonized person*, were such as were thought to have a dæmon or dæmons *inspiring* and *actuating* them, suspending the faculties of their minds, and governing the members of their bodies. The dæmons were supposed to inform the bodies of the possessed, in the same manner that their own souls did at all other times. Hence it came to pass, that every thing said or done by the *dæmoniacs*, was often ascribed to the indwelling dæmons. Plato (apud Clem. Alex. Strom. 5. p. 405. Oxon.) affirms that *dæmoniacs do not use their own discourse, but that of the dæmons who have entered into them.* And Lucian, when stating the common opinion concerning persons thought to be possessed, says, *The patient is silent, the dæmon returns the answer to the questions that are asked.* Accordingly we find in the New Testament, that what was said, and done by the *dæmoniacs* themselves, is (in conformity to the vulgar language) very often referred to the dæmons by whom they were supposed to be inspired and actuated. And *dæmoniacs* having been educated in the common opinion concerning the nature and reality of possessions, did (as it is natural to suppose they would) frequently fancy themselves to be possessed by dæmons, or that they were dæmons themselves, and spoke and acted in conformity to the apprehended sentiments and inclinations of those spirits. Hence their dread of Christ's power, and their tortures and expostulations with him. See Farmer's Letters in answer to Dr. Worthington, p. 98, and p. 139.

The peculiar symptoms of the *dæmoniacs* were certain kinds of infanity, such as the ancients could not account for by natural causes, and seemed to argue the seizure of the understanding by a malevolent dæmon, who instigated the unhappy patient to every thing that was extravagant and injurious to himself and others. Among the Greeks, the Latins, the Jews, and other eastern people, none were thought to be possessed whose understandings were not disturbed. Amongst the primitive Christians also, reputed *dæmoniacs* were all mad, melancholy, or epileptic persons; and such likewise were all the *dæmoniacs* of the New Testament; as is shewn by Dr. Sykes in his Inquiry, and Farther Inquiry concerning this subject, and by Mr. Farmer in his Essay upon it, chap. i. sect. 5, 6. Both these writers have also taken much pains to shew, that the dæmons to whom possessions were referred by the ancients, were considered as human spirits. Josephus says in express terms, that dæmons are *the spirits of wicked men, who enter the living, and kill those who receive no help.* De Bello Jud. lib. vii. cap. 6. sect. 3. And Justin Martyr affirms (Apol. 1. ad. ii. p. 65. Paris. 1615) *that those persons who are seized and thrown down by the fits of the disease, are such as all men agree in calling dæmoniacs and mad.*

In the translation of the New Testament in vulgar use, we frequently read of persons *having* or *being possessed by a devil* or *devils*, and of Christ's *casting out devils*. But the Scripture never describes more than one evil spirit by the word devil; and never represents any persons as possessed by the *devil*, or by *devils*, not even in a single instance, notwithstanding the great frequency with which the evangelists speak on the subject of possessions. In all the instances in which the term devils occurs in the English translation of the New Testament, the original word is *dæmon* (*δαιμων, δαιμονιον, δαιμονιζομενος*) and not that from whence comes the English word *devil* (*διαβολος*). As possessing dæmons were in the age of the Gospel universally regarded as human spirits, it is very reasonable to suppose that the sacred writers employ the term dæmon in reference to possessions, in the same sense in which all other persons did; especially as they have given us no notice of their using the word in a new or peculiar sense, and have even themselves certainly used it on other occasions to describe such men as the superstition of the heathens deified, and corrupt Christians have proposed as objects of worship. 1 Cor. x. 20, 21. 1 Tim. iv. 1. Rev. ix. 20.

Whether there were ever any real *dæmoniacs*, is a question that will be considered under the article DÆMONIACAL *possession*.

In the Romish Church there is a particular office for the exorcism of *dæmoniacs*.

DÆMONIACS are also a part or branch of the Anabaptists, whose distinguishing tenet it is, that the devils shall be saved at the end of the world.

DÆMONIACAL *possession*. In the ages of ignorance and superstition, the credulous part of mankind were easily persuaded to believe, that maniacs and epileptics were really possessed by dæmons: but those who consulted their reason, and gained an insight into nature, pronounced what commonly passed for *dæmoniacal possessions*, to be mere natural disorders. The divine Hippocrates wrote his book Περι Ιερης νουσου, to shew that the epilepsy has nothing in it supernatural, more than any other distemper; and to expose the ignorance and impiety of those who ascribed it to the immediate agency of the gods, and accordingly undertook to cure it by expiations and charms. Amongst many other considerations which he has urged to prove that epileptical distempers owe their rise to natural causes, he observes, (De Morbo Sacro. p. 307. ed. Foesii) *that goats are remarkably subject to the epilepsy; and on affecting the head, the brain is found to be overcharged with a rheum of a very bad smell; a plain proof*, he adds, *that the animal is diseased, not possessed by a deity.*

Indeed the doctrine of *dæmoniacal possessions* is so manifestly repugnant to the perfections of God, and to that fixed order and causes of effects which we discover in every part of nature, and particularly in the human system, that few perhaps in this enlightened age would appear in its defence, were it not for an apprehension that it is supported by the authority of revelation. Various expressions used by Christ and his apostles are thought by some to assert or imply the reality of possessions. We are told, that the people brought to Jesus were such as were *possessed and vexed with unclean spirits*; and that he *cast out spirits with his word*. But perhaps these learned writers do not sufficiently consider, that the reality of possessions and dispossessions was never taught by Christ and his apostles as a doctrine; and that they could not, with propriety, interpose their authority in establishing the reality of possessions, considered as the secret cause of those disorders imputed to them: for the miraculous cure of these disorders being a part of that evidence which was designed for the conviction of unbelievers, we are to judge of the nature of the miracle in question by reason alone, not by an authority which cannot be admitted previous to its performance. Besides, as possession by dæmons was anciently thought to produce some maniacal disorder; and the expulsion or departure of dæmons was thought to effect a removal of the disorder, or a recovery of the understanding; it hence came to pass that possessions and dispossessions were in common life used to express those outward and sensible symptoms they were thought to produce, or the *disorder* and *cure* of reputed *dæmoniacs*. It is very common to give to an effect the name of the cause to which it is attributed. And whenever the supposed cause or author of any thing is put for the thing itself, the cause or author is not included. When Ceres, for example, stands for corn, and Bacchus for wine; corn and wine alone are intended. In like manner *dæmoniacal* possession was used merely to express madness, without taking the cause into the account. Josephus (Bell. Jud. lib. ii. cap. 13. sect. 4.) says, concerning certain demagogues, that *they persuaded the multitude to be possessed by dæmons*, when his whole meaning was, "That the people were worked up into a "*phrensy* by the artifices and eloquence of their leaders." Thus, amongst the moderns, *lunacy*, which at first denoted that peculiar kind of phrensy over which the moon was supposed to have an influence, is now used for phrensy in general. Nor are the evangelists to be blamed for describing the disorder and cure of *dæmoniacs* in the popular language, that is, by possessions and dispossessions; inasmuch as they might adopt the popular language on this subject (as they certainly have done on other subjects, and all other persons daily do) without designing to establish the doctrine on which it was originally founded.

Did we not consider how far prejudice is capable of perverting the understanding, it must seem incredible, that Christians should form their judgment of the sentiments of the sacred writers concerning possessions by their descriptions of *dæmoniacs*, rather than by their professed doctrine concerning dæmons. If what all the prophets of God, under both testaments, have taught us concerning the utter inability of dæmons or heathen deities to do either good or harm to mankind; if this doctrine be true, there never was, nor can be, a real *dæmoniac*.

DÆSIUS, in *Chronology*, the Macedonian name for the Athenian month ANTHESTERION, which was the sixth of the year, and answered to the latter part of our November and beginning of December. See MONTH.

DAFFODIL, in *Botany*. See NARCISSUS.

DAFFODIL *Lily*. See AMARYLLIS.

DAFFODILS, *Sea*, *Pancratium*, in *Botany*, a genus of the *hexandria monogynia* class. Its characters are these: the flowers are enclosed in an oblong spatha, or sheath, and have a funnel-shaped cylindrical nectarium of one leaf, spreading open at the top, with six spear-shaped petals, which are inserted on the outside of the nectarium, and six

six long stamina inserted in the brim of the nectarium, terminated by oblong prostrate summits. They have a three-cornered obtuse germen, situated under the flower, supporting a long slender style, crowned by an obtuse stigma. The germen afterwards becomes a roundish three-cornered capsule with three cells, filled with globular seeds. Linnæus enumerates seven; and Miller nine species.

DAGON, in *Mythology*, an idol of the Philistines represented under the figure of a man without thighs, with his body ending in the tail of a fish bending up backward; and covered with scales from the reins to the lower part of the belly. *Dagon* signifies *fish* in Hebrew. Encycl.

DAGYSA, a marine animal with which the sea abounds, not twenty leagues from the coast of Spain, first discovered by Mr. Banks and Dr. Solander, who to this new *genus* of marine animals gave the name of *dagysa*, from the likeness of one species of them to a gem. It is of an angular figure, about three inches long, and one thick, with a hollow passing quite through it, and a brown spot at one end, which they conjectured to be its stomach; four of these adhered together by their sides, when they were taken, and were thought at first to be one animal; but on being put in a glass of water they soon separated, and swam about briskly. Several specimens of them were taken, adhering together, sometimes to the length of a yard or more, and shining in the water with very beautiful colours. But the colours of the CARCINUM *spatanum* were still more beautiful and vivid.

DAILE, in a *ship*, the trough wherein the water runs over the decks.

DAILY, in *Astronomy*. See DIURNAL.

DAIRI, or DAIRO, in the *History of Japan*, is the sovereign pontiff of the Japanese; or, according to Kæmpfer, the hereditary ecclesiastical monarch of Japan. In effect, the empire of Japan is at present under two sovereigns, viz. an ecclesiastical one, called the *dairo*, and a secular one, who bears the title of *cubo*. The last is the emperor, and the former the oracle of the religion of the country.

DAIRY, or DAIRY-*house*, in *Rural Architecture*, a building where milk, butter, cheese, whey, &c. are made or kept. See MILK, BUTTER, &c.

DAIS. See DAIS.

DAISY, in *Botany*, a genus of the *decandria monogynia* class: the characters of which are, that it has a four-leaved involucrum, the corolla is divided into five parts, and the fruit is a single seeded berry. There are two species.

DAISY, in *Botany, Berlin*, a genus of the *frugenesia polygamia superflua* class. Its characters are these: it hath a radiated oifcous flower, composed of many hermaphrodite flowers in the disk, and female flowers, which form the border or rays, included in a common empalement. The hermaphrodite flowers have an oval germen, attended by five short stamina; the germen afterward becomes a single naked seed, placed vertically. There are three species; the first of which is the common *daisy*, which grows naturally in pastures; the second is a native of the Alps; the third is the garden *daisy*, of which there are several varieties. The garden *daisy* flowers in April and May, when they make a pretty variety, being intermixed with plants of the same growth: they should be planted in a shady border, and a loamy soil without dung, in which they may be preserved without varying, provided the roots are transplanted and parted every autumn; which, with keeping them from weeds, is all the culture they require.

The common little *daisy* has the reputation of being a very eminent medicine of the tribe of vulneraries. The roots and leaves are prescribed, fresh gathered, both externally and internally, in bruises and in wounds. They make a sort of cataplasm of the whole plant, bruised, in some parts of the kingdom, which they apply to the part, and give the juice internally at the same time. The ladies have an opinion also, that the roots of this plant have a power of stopping the growth of animals, and with this intent give a decoction of them in milk to the puppies of their favourite breed, to keep them small. The two species of *bellis* used in medicine are, the *bellis major*, called also *leucanthemum vulgare*, in English *ox-eye daisy*; and the *bellis minor*, called also *consolida minima*, or *pumpernut wort*, of most repute for physical virtues, being esteemed a good attenuant, resolvent, healer, cooler, and astringent, efficacious against intomescences of the blood, hæmorrhages, &c.

Foreign *dispensatory* writers describe a water, syrup, conserve, essence, tincture, extract, and fixed salt, prepared from this plant.

DAISY, *blue*, or *Globe* DAISY, *Globularia*, in *Botany*, a genus of the *tetrandria monogynia* class. Its characters are these: it has a flower composed of many florets, which are included in one common scaly empalement; and each floret is tubulous, and cut into four parts at the top. They have four stamina, terminated by distinct summits; and in the bottom of the tube is situated an oval germen, which becomes an oval seed, sitting in the common empalement. There are seven species.

This plant is to be found in the gardens of the curious; and is a vulnerary.

DAISY, *great*, in *Botany*. See CHAMOMILE.

DAISY, *meadow*. See LEOPARD'S *Bane*.

DAISY, *ox-eye*. See *Corn* MARYGOLD.

DAKER *hen*, in *Ornithology*, the English name for the *ortygometra*, a bird of the gallinaceous kind, somewhat resembling the quail, and called by the Italians the king of the quails, *re delle quaglie*. It is larger than the quail, and is common in Ireland, and in some of the northern counties of England. Ray. See *Land*-RAIL.

DAKIR, in our statutes, is used for the twentieth part of a hill of hides.

According to the statute of 51 Hen. III. *De compositione pondcrum & mensurarum*, a *last* of hides consists of twenty *dakirs*, and every *dakir* of ten hides. But by 1 Jac. cap. 33. one *last* of hides or skins is twelve dozen. See DICKER.

DALEA, in *Botany*. See PSORALEA.

DALECHAMPIA, so called in honour of Jacobus Dalechamp, a curious botanist, a genus of the *monœcia monadelphia* class. Its characters are these: it hath male and female flowers on the same plant; the male flowers have no petals, but many stamina. The female flowers have a roundish three-cornered germen, which afterward becomes a round three-cornered capsule, having three cells, each containing one roundish seed. We have but one species of this plant in England, which is a native of Jamaica. Miller.

DALMATICA, a garment with large open sleeves, worn at first only by bishops, though since made a distinction of degrees: it is so called, because it came originally from Dalmatia.

DALUS, in *Antiquity*, a certain measure of land; whence comes *dole*. The *doli prati* have been esteemed such narrow slips of pasture, as are left between the ploughed furrows in arable land; which, in some parts of England, are called *dales*. The word is applied in Welsh to low meadows by a river side.

DAM, a boundary or confinement, as to *dam* up, or *dam* out: *infra damnum suum*, within the bounds or limits of his own property or jurisdiction. Bract. lib. ii. c. 37.

DAMAGE, is generally taken for any hurt, or hindrance, that a man receives in his estate; but more particularly for a part of what the jurors are to enquire of, in passing verdict for the plaintiff, or defendant, in a civil action, be it personal or real. After verdict given of the principal cause, they are asked their consciences touching costs and *damages*, which contain the hindrances that the plaintiff or demandant hath sustained by means of the wrong done him by the defendant or tenant.

DAMAGE has two significations; the one proper and general, the other strict and relative. *Proper*, as it is in cases where damages are founded on the statute of 2 Hen. IV. cap. 1. and 8 Hen. VI. cap. 9. where costs are included within the word *damages*. *Damage* then, in its proper signification, is said *a damnando*, when, by diminution, a thing becomes worse; and in this sense costs of suit are *damages* to the plaintiff, as by them his substance is diminished.

Relative is when the plaintiff declares the wrong done him to the *damage* of such a sum. This is to be taken relatively, for the wrong which passed before the writ brought; and is assessed by reason of the trespass aforesaid; and cannot extend to the costs of suit, which are future, and of another nature.

DAMAGE-*cleer*, *Damna Clericorum*, was a fee assessed out of all *damages* exceeding five marks, and recovered in the courts of common pleas, king's bench, and exchequer, which the plaintiff was obliged to pay as a gratuity to the prothonotaries and his clerks, for drawing special writs and pleadings; but is abolished by stat. 17 Car. II. cap. 6.

DAMAGE *feasant*, or *faisant*, is when a stranger's beasts are doing hurt, or spoiling the grass, corn, woods, &c. of another man, without his leave or licence.

In this case, the party whom they damage may distrain, and impound them both by night, and by day; though in other cases, as for rent, services, &c. none may distrain in the night.

DAMASCUS *steel*, a very fine kind of steel, made in some parts of the Levant, and particularly at Damascus, remarkable for its excellent temper; and used chiefly in the making of sword-blades.

Some authors assure us it comes from the kingdom of Golconda in the East Indies; where the method of tempering with alum, which the Europeans have never been able to imitate, was first invented.

DAMASK, a sort of silken stuff, having some parts raised above the ground, representing flowers or other figures.

Damasks should be of dressed silks, both in warp and woof. It has its name from its being originally brought from Damascus, in Syria.

There is also a stuff in France called the cuffart *damask*, made in imitation of the true *damask*, having the woof of hair, coarse silk, thread, wool, or cotton. Some have the warp of silk, and the woof of thread; others are all thread, or all wool.

DAMASK is also a kind of wrought linen, made in Flanders, so called, because its large flowers resemble those of *damasks*. It is chiefly used for tables: a table-cloth, and a dozen of napkins, are called a *damask-a-vue*.

DAMASKEENING, the art, or act, of adorning iron, steel, &c. by making incisions therein, and filling them up with gold or silver wire; chiefly used in enriching sword-blades, guards and gripes, locks of pistols, &c.

Its name shews the place of its origin; or, at least, the place where it has been practised in the greatest perfection, *viz.* the city of Damascus in Syria: though M. Felibien attributes the perfection of the art to his countryman Curfinet, who wrought under the reign of king Henry IV.

Damaskeening is partly mosaic work, partly engraving, and partly carving; as mosaic work, it consists of pieces inlayed; as engraving, the metal is indented, or cut in *crenx*; and as carving, gold and silver are wrought therein in *relievo*.

There are two ways of *damaskeening*: in the first, which is the most beautiful, the artists cut into the metal with a graver, and other tools proper for engraving on steel; and afterwards fill up the incisions, or notches, with a pretty thick silver or gold wire. In the other, which is only superficial, they content themselves to make hatches, or strokes, across the iron, &c. with a cutting-knife, such as is used in making of small files. As to the first, it is necessary the gravings or incisions be made in the dove-tail form; that the gold or silver wire, which is thrust forcibly into them, may adhere the more strongly. As to the second, which is the more usual, the method is thus: having heated the steel till it changes to a violet, or blue colour, they hatch it over and across with the knife, then draw the design, or ornament, intended, on this hatching, with a fine brass point, or bodkin. This done, they take fine gold wire, and conducting or chasing it according to the figures already designed, they sink it carefully into the hatches of the metal with a copper tool.

DAMASSIN, a kind of damask, with gold and silver flowers, made in warp and woof, of wrought, and not raw silk.

DAMASSONIUM, in *Botany*. See *Star-headed water* PLANTAIN.

DAMASQUITTE, a kind of stuff made at Venice, of which there are two sorts; one with gold, the other with silk: the pieces are eighteen ells long. See Lewis's Com. Phil. Techn. p. 226.

DAMATER, in *Mythology*, the surname of Ceres.

DAMATRIUS, in *Ancient Chronology*, the Boeotian name of the Athenian month *Pyanepsion*, which was the fifth of their year, and corresponded to the latter part of our October, and beginning of November. See PYANEPSION and MONTH.

DAME was formerly a title of honour, and is still used in the English law to denote a lady; but in common acceptation it signifies the mistress of a family of the lower rank in the country.

DAME's *Violet*. See VIOLET.

DAMELOPE, a kind of SLIANDER used in Holland, for conveying merchandize from one canal to another, and contrived for commodious passages under the bridges.

DAMIANISTS, a branch of the ancient Acephalous Severians; who agreed with the Catholics in admitting the fourth council; but disowned any distinction of persons in the Godhead, and professed one single nature incapable of any difference; and yet they called God, the Father, Son, and Holy Ghost. On which account the Severians Petrites, another branch of Acephali, used to call them Sabellianites, and sometimes Tetraditæ. Thus much we learn from Nicephorus Callistus, lib. xviii. cap. 49. They took their name from *Damianus*, a bishop of Alexandria, who was originally their leader, in the sixth century.

DAMIER, in *Conchology*, the name given by French naturalists to that elegant species of voluta, the spots of which stand in a chequered order, and resemble the marks of a draught or chess board, that being the common signification of the word *damier*. See VOLUTA.

DAMNATA *terra* in *Chemistry*, the same with CAPUT *mortuum*.

DAMPS, in *Natural History*, are noxious steams, or exhalations, frequently found in close, subterranean places, particularly mines, pits, and wells.

In the German and Saxon languages the word *damp* signifies vapour and exhalation.

Damps, with respect to their nature and effects, may be distinguished into two kinds: the *first* is heavier than common air, and therefore chiefly lies at the bottom of pits and mines. It extinguishes flame, precipitates the lime of lime-water, and is noxious, and often fatal to animals, and on this account called the *choke-damp*. It is a species of *fixed* AIR, and has been described by modern writers under that name. It resembles those uninflammable vapours, that are produced by the combustion of inflammable bodies, as charcoal, and by fermenting and effervescing substances. This *damp* is sometimes visible, and appears in form of a fog, as in a cavern near Pyrmont; and it hangs so near the surface, that a person may stand upright, without any other inconvenience than an uncommon heat of his lower extremities, but he cannot without danger bend down his head. Many instances occur of the fatal effects of this kind of *damp*. Some persons, digging in a cellar at Paris, were found dead, like so many statues, with open eyes, and in the posture of digging. Several others were successively destroyed at Chartres, by going down into a cellar where a baker had been accustomed to throw hot embers from his oven; and one, who was instantly killed upon being let down into it, was opened; his lungs were found spotted with black marks; his intestines swoln, red, and inflamed; and the muscles of his legs, thighs, and arms, seemed to be separated from each other, and from the adjacent parts. This case was so singular, that it drew the attention of the magistrate and physician, who found that the embers had not been properly extinguished, and that they had raised a malignant vapour from the salt-petre, with which the cellars in that neighbourhood abound. A quantity of water was thrown in to extinguish the fire, and by the vapour, and thus the danger was removed. Hist. de l'Academie des Scienc. 1701, 1710. and Connor's Differt. Med. Phys.

Miners try the salubrity of the air in pits where they work, by carrying down with them a lighted candle; they soon discover the effects of the noxious vapour in its diminishing, and gradually extinguishing the flame; however they remain safely for several hours in pits where a candle cannot burn; but when the *damp* is so strong, that not only the flame of the candle, but also the redness of the burning wick is extinguished, they never venture to remain a minute, knowing that such a degree of *damp* will be soon fatal to animal life.

The *second* kind of noxious vapour, though less dangerous than the former, is called the *fulminating*, or *fire-damp*; because, when touched by the flame of a candle, it takes fire, and explodes like gunpowder. This is chiefly found in coal-mines, and sometimes in lead-mines, as in those of Mendip-hills. It is lighter than common air, and therefore floats near the roofs of subterraneous places; and miners, when it is accidentally inflamed, or when they designedly set fire to it, in order to destroy it, lie flat on the ground, and thus escape injury. This inflammable vapour may probably be produced by the decomposition of pyritous matters, with which most miners, and especially coal-miners, abound.

In some of the tool-pits in the neighbourhood of Mendip hills, *fire-damps* almost continually happen, so that great numbers have been killed, maimed, and burnt by them. The colliers however continue their work notwithstanding, only using the caution of renewing their air very quick, and using no candles in their work but those of a single wick, and of forty or seventy to the pound; which notwithstanding will give as good a light there, as others of ten or twelve to the pound in other places. They always have the caution to place even these behind them, and never present them to the breast of the work. When any person is burnt by these *damps*, they presently betake themselves to a good fire, and sending for a large quantity of cows milk, they bathe the burnt places with this while warm; and afterwards the places will heal by the common cooling ointments, and healing plasters.

The German miners think themselves not qualified for their business, if they are not able to make their weather, as they express it; that is, to cure their *damps*. These are of various kinds in their mines; some so strong that they suffocate the workmen, others less violent, and only making them faint, without doing them any further hurt, unless they are so imprudent as to continue a long time in the place. The common way of curing the *damp* is by letting the air in and out, and causing a circulation in it. *Phil. Trans.* abr. vol. ii. p. 373, 382.

The pernicious *damps* in mines shew abundantly that nature affords us inflammable air in some cases; and we have found by experiments that art can do the same, and that very probably on the same principles with the natural. Sir James Lowther having collected the air of some

of

of these *damps* in bladders, preserved it so well, that, when brought up to London, it would take fire at the flame of a candle, on being let out by the orifice of a piece of tobacco-pipe.

It is well known to all that are versed in chemical experiments, that most metals emit a great quantity of sulphureous vapours during the effervescence they undergo in the time of their solutions in their respective menstruums. On this principle many have produced an inflammable air by art, like the natural one. It is observed that iron, while under solution with oil of vitriol, emits a very great quantity of these vapours, which are very subtile, and not easily condensed. This vapour being received into bladders, in the same manner with the natural air of Sir James Lowther, took fire in the same manner, on being let out in a small stream, and answered all the phenomena of the natural kind. See AIR *fixed*, and AIR *inflammable*.

There is a vapour called the *peat-blasm damp*, on account of its smell. It always comes in the summer-time, and hath never been known to be mortal. The miners in the Peak of Derby fancy that it arises there from the multitude of red trefoil flowers, called by them honeysuckles, with which the lime-stone meadows of the Peak much abound; the smell of this gives timely notice to get out of the way.

DAMSEL, DAMOISEL, or DAMOISEAU, an appellation anciently given to all young people of genteel or noble extraction of either sex, e. gr. to the sons and daughters of knights, barons, and even of kings.

Thus, in history, we read of the *damsel* Pepin, *damsel* Louis le Gros, *damsel* Richard, prince of Wales.

Pasquier will have the word a diminutive of *dame*, an ancient name for lord; as in some authors we read *Dam* Dieu for Lord God; *dam* chevalier, &c. Though in its feminine sense he takes it to come from *dame*. Others derive the word from *dominellus*, or *domicellus*, a diminutive of *dominus*, *quasi parvus dominus*: accordingly, Du-Cange observes, that it has been sometimes written *domnus*.

They who hold the signory of Commercy, M. de la Roque tells us, anciently held it in the title of *damoiseau*: and M. de Marca assures us, that the nobleste of Bero is still divided into three bodies, or classes: the barons, the esvers, and the *damsels*, *domicelli*, called in that country *domengers*.

The kings of Denmark and Sweden have the same title, as appears from Puntanus's Hist. of Denmark, lib. vii. and viii. and Henry of Upsal's Hist. of Suec. lib. iii. From the sons of kings, the appellation passed to those of great lords and barons; and, at length, to those of gentlemen who were not yet knights.

DAMSEL, at present, is applied to all maids, or girls, not yet married; provided they be not of the lowest class of people.

DAMSEL is sometimes also applied to a kind of utensil put in beds, to warm old men's feet.

It consists of a hot iron inclosed in a hollow cylinder, which is wrapped round with linen cloth, and keeps its warmth a long time. Some call it a BUN.

DAMSON *tree*, in *Botany*. See CHRYSOPHYLLUM and PRUNUS.

DAMSONS. See PRUNES.

DANAE, or DANACE, ΔΑΝΑΗ, or ΔΑΝΑΗ, in *Antiquity*, a coin current among the barbarians, being somewhat more than the OBOLUS. This they put into the mouths of dead people, to pay for their passage over the river Acheron.

DANAIDES, in the *Ancient Mythology*, the daughters of Danais, or Danaus, eleventh king of Argos, and brother of Aegyptus.

They were fifty in number, and were espoused to the fifty sons of their uncle Aegyptus.

Danaus, fearing the accomplishment of an oracle, which had foretold, that he should be expelled his kingdom by a son-in-law, persuaded his daughters to murder, each of them, her husband, the first night; which they performed, all but Hypermnestra, who spared her husband Lynceus.

In vengeance for this crime of the forty-nine *Danaides*, the poets have condemned them to hell, to be continually employed in filling a cask perforated at bottom.

The *Danaides* are sometimes also called *Belides*, from their father, who was the son of the Egyptian Belus. Hyginus has preserved the names of forty-seven of them.

DANCE, an agreeable motion of the body, adjusted by art, to the measures of a piece of music, either sung or played.

The word is French, *dance*, formed of the German *danzen*, or *tanzen*, which signifies the same thing. Bochart derives it from the Arabic *tanza*, and Guichart from the Hebrew דָּלַג, *dalag*, which have all the same significa-

tion. Salmasius derives the French *danse*, to *dance*, from the Latin *dansare*, *to thicken*; as holding it a practice among the ancient fullers to leap and *dance* as they fulled their cloths.

Some distinguish the *high dance*, consisting of capers, gambades, &c. from the *low dance*, which is the *terra à terra*, or close to the ground.

In the carousal of king Louis XIII. there were *dances* of horses. The invention of such *dances* is attributed to the Sybarites.

Dancing has always been in use among all nations, both civilized and barbarous; though held in esteem among some, and in contempt among others. Of itself, no doubt, *dancing* is harmless. There is a time, says the preacher, to *dance*; and sometimes it is even made an act of religion. Thus David *danced* before the ark, to honour God, and expects his excess of joy for its return into the city of Sion. The daughters of Shiloh are likewise said to have *danced* in a yearly feast of the Lord. Judges, ch. xxi. And we find many references to this practice in the religious solemnities of the Jews. From them it passed to the Egyptians, and afterwards to the Greeks and Romans, with whom it was a principal part of the worship of their false gods. It afterwards was adopted in many pagan nations; and Christians in popish countries celebrated certain festivals, particularly those of the sacrament, and passion of our Lord, with *dancing*. Socrates learnt to dance of Aspasia. And the people of Crete and Sparta went to the attack *dancing*. On the other hand, Cicero reproaches Gallinius, a consular man, with having *danced*. Tiberius expelled the *dancers* out of Rome; and Domitian excluded several members from the senate, for having *danced*. Castor and Pollux are said to be the first who taught the art of *dancing*; and that to the Lacedæmonians: though others attribute the invention to Minerva, who, they say, *danced* for joy after the defeat of the giants.

The ancients had three kinds of *dances*, called *hordice*; the first grave, called *emmelia*, answering to our *low dances* and pavanes. The second gay, called *cordax*, answering to our courants, galliards, gavots, and vaults. The third, called *sicinis*, was a mixture of gravity and gaiety. Neoptolemus, son of Achilles, taught the Cretans a new sort of *dance*, called *Pyrrhica*, or the *armed dance*, to be used in going to war: though, according to mythologists, the Curetes first invented this *dance*, to amuse and divert the infant Jupiter, and to drown his cries with the noise and clash of their swords, beating against their bucklers.

Diodorus Siculus, in the fourth of his Bibliotheca, assures us, that Cybele, daughter of Menoes, king of Phrygia, and Dindymenis his wife, invented divers things, and, among others, the flageolet of several pipes, *dancings*, the tabor, and the cymbal. Numa, it is certain, instituted a sort of *dance* for the Salii, priests of Mars, who made use of weapons therein. From these *dances* were composed another sort, called *saltatio mimicorum*, or the *buffoons dance*; wherein the *dancers* were dressed in little coiffets, with gilt morions, and had bells on their legs, and swords and bucklers in their hands. Lucian has an expres treatise, and Julius Pollux a chapter, on this head; Athenæus, Cælius Rhodiginus, and Scaliger, also make mention of this *dance*.

It is not many years ago, since Thoinet Arbeau, a *dancing*-master of Paris, gave an orchesography, wherein all the steps and motions of a *dance* are written, or noted down; as the sounds of a song are scored in music: though the famous Beauchamp had some pretensions to be the inventor of this secret, and accordingly procured an arret in his favour.

Dancing is usually an effect and indication of joy among most nations: though M. Pallegrat assures us, that there are people in South America, who *dance* to shew their sorrow; and it likewise made a part of the funeral solemnities of the ancients.

DANCE *of St. Vitus*. See VITUS.

DANCE, *Country*. See COUNTRY-*Dance*.

DANCER, *Rope*, *Schœnobates*. Groddeck, professor of philology at Dantzic, has published a dissertation on *rope-dancers*, De Funambulis; full of learning, and an uncommon knowlege of antiquity. He defines a *rope-dancer*, a person who walks on a thick rope fastened to two opposite posts; which is precisely what is expressed by the Latin word *funambulus*. But our *rope-dancers* do more; for they not only walk, but *dance* and leap upon the rope.

The ancients, it is certain, had their *rope-dancers* as well as we: witness the Greek words, *neurobates*, and *schœnobates*, as well as the Latin *funambulus*, which every where occur. They had likewise the cremnobates and oribates, that is, people who walked on the brinks of precipices. Nay more, Suetonius in Galba, cap. 6. Se-

neca in his eighty-fifth epiſtle, and Pliny, lib. viii. cap 2. make mention of elephants that were taught to walk on the rope.

Mr. Grodsleck, coming from the hiſtorical to the moral conſideration, maintains, that the profeſſion of a *rope-dancer* is not lawful: that the profeſſors are infamous, and their art of no uſe to ſociety; that they expoſe their bodies to very great dangers; and that they ought not to be tolerated in a well-regulated ſtate. But, coming afterwards to temper the ſeverity of his morals, he allows that there are ſometimes reaſons for admitting them; that the people muſt have ſhews; that one of the ſecrets of government is to furniſh them therewith, &c.

The ancient *rope-dancers* had four ſeveral ways of exerciſing their art; the firſt vaulted, or turned round the rope, like a wheel round its axis, and there hung by the heels, or the neck. The ſecond flew, or flid, from above, downwards, reſting on their ſtomachs with the arms and legs extended. The third ran along a rope ſtretched in a right line, or up and down. Laſtly, the fourth not only walked on a rope, but made ſurpriſing leaps and turns thereon.

DANCING, in *Eccleſiaſtical Hiſtory*, a fact that ſprung up in Aſia Minor, in 1373, and ſpread through Flanders. Perſons of both ſexes were ſuddenly ſeized with *dancing fits*, and continued them, with extreme violence, till they were quite exhauſted; and at theſe times they pretended to receive wonderful viſions. The French prophets, or convulſionnaires, in later times, and ſome wild methodiſts in our own country, reſembled theſe more ancient religious *dancers*.

DANCETTE, in *Heraldry*, is when the outline of any bordure, or ordinary, is indented very largely; the largeneſs of the indentures being the only thing that diſtinguiſhes it from indented.

There is alſo a bearing of a bend, called *double dancette*; that, he beareth azure, a bend double *dancette* argent.

DANCHE, or *Dorche*, in *Heraldry*, the ſame with indented; or, as others will have it, with *dancette*.

DANCRETA, in *Botany*, a name given by the people of Guinea to a plant which they uſe in diſorders of the head, boiling it in water, and uſing the decoͤction in the way of a fomentation. It is a ſpecies of bindweed, and is called by Pluknet *convolvulus guineæ folio Guineenſis foliis non pinnatis*, or the five-leaved Guinea bindweed, with leaves not ſerrated. Caſpar Bauhine, in his Prodromus, deſcribes a ſpecies of bindweed growing in Egypt, which exactly agrees with this in all particulars, except that it is finely ſerrated all round the edges of the leaves. Phil. Tranſ. N° 90.

DANDELION, *Dens Leonis, or Leontodon*, in *Botany*, the name of a genus of plants of the *ſyngeneſia polygamia æqualis* claſs, the characters of which are theſe: the flower is of the ſemi-floſculous kind, and the petals it is compoſed of are placed on the embryo ſeeds, and ſurrounded by the cup; the embryos finally become ſeeds winged with down, which are ſeated on the thalamus, but expand their downy ends into a globular head, and the ſtalks are uſually hollow, and not branched.

Miller gives no characters of this genus; and only obſerves, that they grow naturally in the fields, that they are a troubleſome weed, which ſhould be deſtroyed before the ſeeds ripen, as by reaſon of their down they are wafted by the wind to a great diſtance; and that the roots are gathered by ſome people, and blanched in their gardens for a ſalad herb.

The common ſpecies of this plant has much the ſame virtues with the common endive, but in a greater degree: the roots eaten in ſpring are eſteemed of great ſervice by obſtructions in the liver and ſpleen. Its more immediate ſenſible operation is to looſen the belly, promote the urinary diſcharge, and render the water high-coloured, without exciting any particular heat.

DANEBURY, or *Danesfolde*. See EDDER and EDELDUS.

DANEGELT, or *Danegild*, from *Dane* and *geld*, ſignifying in Dutch, *ſtore*, an annual tax laid on our anceſtors, firſt of 1s. afterwards 2s. for every hide of land through the realm, for maintaining ſuch a number of forces as were thought ſufficient to clear the Britiſh ſeas of Danith pirates, which themſelves greatly annoyed our coaſts.

It was firſt impoſed as a ſtanding yearly tax on the whole nation, under king Ethelred, A. D. 991. That prince, ſays Camden, Britan. 142, much diſtreſſed by the continual invaſions of the Danes, to procure his peace, was compelled to charge his people with heavy taxes, called *danegelt*. At firſt they paid 10,000l. then 16,000l. then 24,000l. after that 36,000l. and laſtly, 48,000l. *per annum*.

Ethelred, in 1002, made a vigorous effort to free his people from this inſupportable tribute, by a general tax on all the lands of the kingdom, for fitting out a fleet, which might effectually guard againſt the Danes. Lord Lyttelton's Hiſtory, &c. vol. iii. p. 65.

Edward the Confeſſor remitted this tax: William I. and II. aſſumed it occaſionally. In the reign of Henry I. it was accounted among the king's ſtanding revenues; it was levied by king Stephen, and paid in the 1ſt, 2d, 20th, and 21ſt years of Henry II. Soon after the name was loſt. No church or church land paid a penny to the *danegelt*; becauſe, as is ſet forth in an ancient Saxon law, the people of England placed more confidence in the prayers of the church, than in any military defence they could make. Camd. ap. Magn. Brit. p. 68.

DANELAGE. See LAW.

DANGGANGHAC, in *Natural Hiſtory*, the name given by the people of the Philippine iſlands to the heron. The Spaniards call it *garza*. It is the ſame ſpecies with that ſo common in Europe. See HERON.

DANGERIA, in *Antiquity*, a payment in money made by foreſt tenants, that they might have liberty to plough and ſow in time of DANNAGE.

DANIEL, or *Book of* DANIEL, a canonical Book of the Old Teſtament, ſo denominated from its author Daniel, who was a very extraordinary perſon, and was favoured of God, and honoured of men, beyond any who lived in his time. His prophecies concerning the coming of the Meſſiah, and the other great events of after-times, are ſo clear and explicit, that, as St. Jerom tells us, Porphyry objected to them, that thoſe which related to the kings of Syria and Egypt, chap. xi. muſt have been written after the times of Antiochus Epiphanes; whereas this prophecy was tranſlated into Greek a hundred years before his time, and the tranſlation was in the hands of the Egyptians, who had no great kindneſs for the Jews, and their religion. And thoſe prophecies foretelling the ſucceſſes of Alexander, chap. viii. ver. 5. were ſhewn to Alexander by the Jews, in conſequence of which they obtained ſeveral privileges from him. Ant. lib. xi. c. 8. The ſtyle of Daniel is not ſo lofty and figurative as that of the other prophets; it is clear and conciſe, and his narrations and deſcriptions ſimple and natural: in ſhort, he writes more like a hiſtorian than a prophet.

The Jews do not reckon Daniel among the prophets; part of his book, that is, from the fourth verſe of the ſecond chapter, to the end of the ſeventh chapter, was originally written in the Chaldee language; the reaſon of which was, that in that part he treats of the Chaldean or Babylonith affairs: all the reſt of the book is in Hebrew. The ſix firſt chapters of the book of Daniel are a hiſtory of the kings of Babylon, and what befel the Jews under their government. In the ſix laſt he is almoſt gether prophetical, foretelling not only what ſhould happen to his own church and nation, but events in which foreign princes and kingdoms were concerned.

DANK, in *Commerce*, a piece of ſilver current in Perſia, and in ſome parts of Arabia, weighing the ſixteenth part of a drachm. It is alſo a weight uſed by the Arabians to weigh jewels and drugs.

DANTELLE, in *Heraldry*, the ſame with *dancette*, or rather with *nebulée*, viz. a large open indenture. See DANCETTE.

DANTZIGERS, or PRUSSIANS, in *Eccleſiaſtical Hiſtory*, a ſect of the reformed ANABAPTISTS (ſee ELUMINIANS), ſo called, on account of their adopting the manners and diſcipline of the Pruſſians.

DAPHNE, Δάφνη, in *Antiquity*, a kind of divination, taken from the crackling of laurel leaves thrown into the fire.

DAPHNE, in *Botany*. See SPURGE-*laurel*.

DAPHNELÆON, in *Medicine*, Δαφνηλαιον (from δάφνη, *the bay-tree*, and ελαιον, *oil*), *laurinum*, or *oil of bay*. This is prepared of the berries, when full ripe and ready to fall off, by boiling them in water; by which they tranſmit through their huſks a fat ſubſtance, which, after compreſſing the berries with the hand, is taken off with ſhells. Some, after they have infuſioned oil of turpentine olives with capers, juniper berries, and cubebs, ſtuff therein the tender leaves of the bay, and bind them together; and others add the berries, until it ſmells ſufficiently ſtrong; and ſometimes myrrh and myrtle are mixed with them. The mountainous and broad-leaved bay is the beſt for the preparation of this oil, which is beſt in its kind when recent, of a green colour, very bitter, and acrimonious.

Laurinum has heating and mollifying virtues, opens the mouths of the veſſels (*aperiendo*), and removes laſſitudes. It is beneficial in all nervous diſorders, pains and diſtillations of the ears, and is inferior to no other remedy in diſtempers of the kidneys, contracted from cold, the parts being anointed with it: but taken inwardly, it excites a naufea.

DAPHNEPHORIA, Δαφνηφορια, in *Antiquity*, a ſolemnal feſtival, celebrated by the Boeotians in honour of Apollo. For the ceremonies uſed at this ſolemnity, ſee PORT. Archæol.

DAPHNIUS *lapis*, in *Natural Hiſtory*, the name of a ſtone, the veins of which repreſent the grain of the wood of the

the bay-tree; and which was probably formed of the wood of that tree, impregnated with stony matter, in the manner of the other fossil woods.

DAPHNOMANCY, from δαφνη, *laurel*, and μαντια, *divination*; a kind of divination practised by throwing branches of laurel into the fire: the crackling of them was deemed a favourable omen; the contrary, otherwise. The leaves of laurel were also chewed, in order to communicate the gift of prophecy.

DAPIFER, the dignity or office of grand master, or grand sewer, of a king or prince's household.

The word is pure Latin, compounded of *dapis*, *dapis*, *a dish of meat served on the table*, and *fero*, *I bear*: so that *dapifer* literally signifies *a dish-carrier*, or an officer who serves the meats upon the table.

The title of *dapifer* was given by the emperor of Constantinople to the czar of Russia, as a testimony of favour. In France, the like office was instituted by Charlemagne, under the title of *dapiferat*, and *seneschaussie*, to which was affixed the superintendance over all the officers of the household.

In England the office of *dapifer* was less eminent; being found in several of our ancient charters named one of the last of the officers of the household.

The dignity of *dapifer* is still subsisting in Germany. Till the year 1623, the elector Palatine was *dapifer* or grand sewer of the empire: since that time, the elector of Bavaria has assumed the title of *archidapifer* of the empire. His office is, at the coronation of an emperor, to carry the first dish of meat to table on horse-back.

The several functions of a *dapifer* accustomed the ancients to give him divers names: as, *bucarpus*, and *bucco*, *dispensator*, *cenvector*, *trapezopoa*, *architriclinus*, *frequis*, *prægustator*, *domesticus*, *magadonestius*, *accumsus*, *majordomus*, *seneschalcus*, *scholus*, *gastaldus*, *assisor*, *praefectus* or *præpositus mensæ*, *princeps cupedinum*, & *magister*.

DAPIFERAT, DAPIFERATUS, the office of DAPIFER.

DAPPLE *bay*, in the *Manege*, is used for a horse which has marks of a dark bay colour. Such are also called *bays a mirror*.

DAPPLE *black*, in the *Manege*, a black horse, having spots or marks blacker and more shining than the rest of his skin.

DAPSILES *coronæ*, among the Romans, a kind of crowns or garlands worn by the women, which covered their face, and served as a veil.

DARANI, in the *Materia Medica*, a word used by some of the old writers to express the *sol ammoniac* of those times, which was the same with our *sal gemmæ*.

DARAPTI, in *Logic*, a mode of syllogism in the third figure, wherein the major and minor are universal affirmative propositions, and the conclusion a particular affirmative. E. gr.

DA *Every truly religious man is virtuous.*
RA *Every truly religious man is hated by the world.*
PTI *Therefore, some virtuous men are hated by the world.*

DARDANARIUS, *Usurer*, *Monopolist*, a name anciently attributed to such as caused a scarcity, and dearness of provisions, particularly corn, by buying and hoarding it up, to raise its value, and sell it again at an extravagant rate.

The name *Dardanarius* was given from one Dardanus, who is said to have made a practice of spoiling and destroying the fruits of the earth by a sort of sorcery. Hof. Lex. in voc.

The same people are also called *arrhabatores*, *circellarii*, *forestarii*, *annonæ stipulatores*, and *sophistæ*.

DARE. See DACE, and PISHING.

DARIC, in *Antiquity*, a famous piece of gold, first coined by Darius the Mede about 538 years before Christ; probably during his stay at Babylon, out of the vast quantity of gold which had been accumulated in the treasury. From thence it was dispersed over the East, and also into Greece; so that the Persian *daric*, which was also called *Aster*, was the gold coin best known in Athens in ancient times. According to Dr. Bernard, it weighed two grains more than one of our guineas; but as it was very fine, and contained little alloy, it may be reckoned worth about twenty-five shillings of our money. Plutarch informs us, that the *daric* were stamped on one side with an archer clothed in a long robe, and crowned with a spiked crown, holding a bow in his left hand, and an arrow in his right; and on the other side with the effigies of Darius. All the other pieces of gold of the same weight and value, that were coined by the succeeding kings both of the Persian and Macedonian race, were called *darics*, from Darius, in whose reign this coin commenced. Of these there were whole *darics* and half *darics*: and they are called in these parts of Scripture written after the Babylonish captivity, *adarkemin*; and by the Talmudists, *darkemath*. Greaves says that the *daric* is still found in Persia; but it is certainly very scarce, and perhaps of doubtful antiquity. Suidas in Δαρεικος. Bernard de Ponder. &c. p. 171. Prideaux's Conn. vol. i. p. 182, &c.

DARII, in *Logic*, a mode of syllogisms in the first figure, wherein the major proposition is an universal affirmative, and the minor and conclusion particular affirmatives. E. gr.

DA *They who speak well of every body have many friends.*
RI *Some speak well of every one.*
I *Therefore some have many friends.*

DARK *chamber*. See CAMERA *obscura*.

DARK *tent*, a portable *camera obscura*, made not unlike a desk, and fitted with optic glasses, to take prospects of landscapes, buildings, fortifications, &c. See CAMERA *obscura*.

DARNEL. See GRASS.

DARREIN, in *Law*, a corruption of the French *dernier*, *last*, and used in the like sense: as, *darrein* continuance (see CONTINUANCE); *darrein* presentment (see ASSISA *darrein presentment*.)

DARSINI, in the *Materia Medica of the Ancients*, a name given by some to cinnamon. It is generally used by Avicenna, Serapion, and the rest of the Arabian physicians.

DARSIS, in *Medical Writers*, is used for an excoriation of the skin. Blancard.

DART, in *Astronomy* and *Geometry*. See SAGITTA.

DARTOS, or DARTUS, in *Anatomy*, the muscular coat of the scrotum, composed of a great number of muscular, or fleshy fibres; whence some consider it as a cutaneous muscle. Dr. Hunter says no such muscle can be found, and Albinus takes no notice of it in his tables.

The word is pure Greek δαρτος, *excoriated*, *flea'd off*, or δερω, *excorio*; probably because it lies close under the skin, or from its excoriated appearance.

It is by means hereof that the scrotum is contracted, or corrugated, which is esteemed a sign of health.

The *dartos* was anciently taken to be a continuation of the *panniculus carnosus*, but mistakenly. It has several veins and arteries. It invests the testicles, and extending itself between them, separates them from each other. It is placed between two cellular membranes, which communicate with each other. See SCROTUM.

DARU, in *History*, a name given by Avicenna and Serapion to a species of turpentine-tree, which the latter author calls the lentisk. This grew up to a very large tree, and bore a much larger and more beautiful fruit than the common turpentine-tree.

DASYOMMA, a superficial inequality of the inner part of the eye-lids, accompanied with a redness. Blancard derives it from δασυς, *hirsutus*.

DASYPUS, in *Zoology*, belongs to the order of brutes and class of *mammalia* in the Linnæan system. This genus has many grinding teeth, but no cutting nor canine teeth. The several varieties are distinguished by the number of bands which encompass it, and reach from the back to the edges of the belly. Accordingly, Linnæus enumerates the single-banded, the three-banded, the four, six, seven, and nine-banded *dasypus*. See further under ARMADILLO and TATU.

DASYS, δασυς, dense, thick, close, rough, in Prorrhetic and Coac. is an epithet for a tongue condensed, contracted, and exasperated with heat and dryness, as it happens in phrenetics. James's Med. Dic.

DATA, in *Mathematics*, certain things, or quantities, supposed to be given, or known, in order, from them, to find out other things or quantities, which are unknown, or sought for. A problem, or question, generally consists of two parts: *data* and *quæsita*.

Euclid has an express treatise of *data*; wherein he uses the word for such spaces, lines, and angles, as are given in magnitude; or to which we can assign others equal.

From the primary use of the word *data* in mathematics, it has been transplanted into other arts; as philosophy, medicine, &c. where it expresses any quantity, which, for the sake of a present calculation, is taken for granted to be such, without requiring an immediate proof of its certainty; called also the *given* quantity, number, or power. And hence also such things as are known, from whence either in natural philosophy, the animal mechanism, or the operation of medicines, we come to the knowledge of others unknown, are now frequently in physical writers called *data*.

DATE, an addition, or appendage, in writings, acts, instruments, letters, &c. expressing the day, and month of the year, when the act, or letter, was passed or signed; together with the place where the same was done.

The word is formed from the Latin *datum*, *given*, the participle

participle of *do*, *I give*. The Latins usually say *dabam*, *I gave*.

In writings of importance the *date* should be written in words at length; *dated* or given at London this twenty-fifth day of March, in the year of our Lord one thousand seven hundred and fifty. In letters, the *date* is usually in figures; London, March the 26th, 1750.

An *ante-date* is a false *date*, prior to the real time when the inſtrument was paſſed, or ſigned.

A *poſt-date*, is that poſterior to the real time, &c.

Our ancient deeds had no *date*, but only the month and year, to ſignify that they were not made in haſte, or in the ſpace of a day, but upon longer and more mature deliberation. The king's grants began with theſe words, *Præſentibus & futuris*, &c. but the grants of private perſons with *Omnibus præſentes literas inſpecturis*, &c.

A deed is good, though it mentions no *date*, or hath a falſe *date*; or even if it hath an impoſſible *date*, as the 30th of February; provided the real day of its being *dated* or given, that is, delivered, can be proved. Blackſt. Com. vol. ii. p. 304.

DATE, *Dactylus*, the fruit of the palm-tree. See PALM-*tree*.

The word is formed of *dactil*, and that of *dactylus*, *finger*; as being round and oblong, reſembling a finger's end.

This fruit is gathered in autumn, before it is ripe; and bears a near reſemblance to our bullace; being of a green colour, and very ſharp and aſtringent. When ripe, it becomes ruddy, having a hard, longiſh ſtone, cloven at bottom, and encompaſſed with a thin white pellicle, or ſkin.

The huſk, or covering of the *date*, called by the ancients *elater*, or *ſpathe*, when the fruit is in its growth, is variable, having as many changes of colour as the fig has.

Some *dates* are black, ſome white, ſome brown; ſome again are round like apples, and very big. Ordinarily they are oblong, fleſhy, yellow, ſomewhat bigger than the thumb's end, and ſome are very agreeable to the taſte. Some are no bigger than a chich-pea, and others as big as a pomgranate. The beſt are thoſe called *royal dates*. There is alſo another ſort called *caryota*, which are very good. Some of them have ſtones, and others none.

Dates are principally uſed in medicine: their qualities are, to ſoften the aſperities of the gullet, to ſtrengthen the *fortes* in the womb, to aſſuage all immoderate fluxes of the belly, and to eaſe diſorders of the reins and bladder. Their bad property is, that they digeſt difficultly, cauſe pains in the head, and produce a thick melancholic blood. Theſe effects ariſe from the principles they contain, which are, a moderate ſhare of oil, and a deal of phlegm, and eſſential ſalt. The oil and phlegm render them moiſtening and nutritious, good againſt acrimonies of the breaſt, to aſſuage coughs, &c. and the phlegm and ſalt render them deterſive and aſtringent, and good againſt diſeaſes of the throat. As for the reſt, they are a heavy food, full of earthy juices, and occaſion obſtructions in the *viſcera*; for which reaſon, people who eat great quantities of *dates* become ſcorbutic, and loſe their teeth betimes.

Our *dates* are brought us from Egypt, Syria, Africa, and the Indies. Among the Egyptians and Africans, they make a principal article of food. They never come to full maturity in Italy, or the moſt ſouthern parts of Spain; and yet there are tolerable *dates* in Provence; which do not keep, but breed worms. The beſt come from Tunis and Perſia.

DATE *plum*. See *Indian Date* PLUM.

DATISCA, in *Botany*. See *Baſtard* HEMP.

DATISI, in *Logic*, a mode of ſyllogiſms in the third figure, wherein the major is an univerſal affirmative, and the minor and concluſion are particular affirmative propoſitions. E. gr.

DA *All God's friends are kings.*
TI *Some of God's friends are poor.*
SI *Therefore, ſome poor are kings.*

DATIVE, in *Grammar*, the third caſe in the declenſion of nouns; expreſſing the ſtate, or relation, of a thing, to whoſe preſs or uſe ſome other thing is referred.

It is called *dative*, becauſe uſually governed by a verb implying ſomething to be given to ſome perſon. As, *commodare Socrati, to lend to Socrates*; *utile reipublicæ, uſeful to the commonwealth*; *periculoſus eccleſiæ, pernicious to the church*; *ignum eſt Platoni, it ſeemed to Plato*, &c.

In Engliſh, where we have properly no CASES, this relation is expreſſed by the ſigns *to*, or *for*.

DATURA, in *Botany*, a name given by many authors to the plant more uſually called *ſtramonium*, or the *thorn-apple*. See THORN-*apple*.

DAVACA *terræ*, a portion of land in Scotland ſo called; *& apud priſcos Gothos*, DAVACH of land, *quod continet quatuor aratra terræ, quorum unum quodque trahitur octo bobus*.

DAUCI *ſemen*, in the *Materia Medica*, the name of a ſeed uſed in many of the officinal preparations. The plant which produces it is a ſort of *myrrhis*, or chervil, called *daucus Creticus*, or candy carrot, by the old authors; but by the moderns, *myrrhis annua ſemine ſtriato, villoſo, ovato*.

This ſeed being hairy, has very frequently little animalcules and duſt hanging to it; and this fault grows worſe, the longer it is kept, as the animals continue to eat the ſeed, and their excrements become mixed with it in large quantities. It ought therefore to be choſen new, plump and fall, and very clean. See SPIGNEL.

It expels wind, and is good againſt colics, pains of the womb, and in hyſterical complaints.

DAUCUS. See CARROT.

DAUGHTERS, among the *Ancients*, were more frequently expoſed than ſons, as requiring greater charge to educate and fettle them in the world. See EXPOSING *of Children*.

Thoſe who had no legitimate ſons were obliged, by the Athenian laws, to leave their eſtates to their daughters, who were confined to marry their neareſt relations, otherwiſe to forfeit their inheritances; as we find to have been practiſed likewiſe among the Jews, many of whoſe laws ſeem to have been tranſcribed by Solon.

If an heireſs happened to be married before her father's death, this did not hinder the neareſt relation to claim the inheritance, and even to take the woman from her huſband; which is ſaid to have been a common caſe. Potter, Archæol. Græc. lib. iv. c. 15. tom. ii. p. 441. See SON.

The *ſons* and *daughters* of the king of England are called the *ſons* and *daughters* of England; becauſe all the ſubjects of England have a ſpecial intereſt in them. See PRINCE.

DAVIDISTS, DAVIDICI, or DAVID GEORGIANS, a ſect of heretics, the adherents of David George, a native of Delft, who, in 1525, began to preach a new doctrine; publiſhing himſelf to be the true Meſſiah; and that he was ſent thither to fill heaven, which was quite empty for want of people to deſerve it. He is likewiſe ſaid to have denied the exiſtence of angels, good and evil, of heaven and hell, and to have rejected the doctrine of a future judgment. He rejected marriage, with the Adamites; held, with Manes, that the ſoul was not defiled by ſin; and laughed at the ſelf-denial ſo much recommended by Jeſus Chriſt. Such were his principal errors. He made his eſcape from Delft, and retired firſt into Friſeland, and then to Baſil, where he changed his name, aſſuming that of John Bruck, and died in 1556.

He left ſome diſciples behind him, to whom he promiſed, that he would riſe again at the end of three years. Nor was he altogether a falſe prophet herein; for the magiſtrates of that city, being informed, at the three years end, of what he had taught, ordered him to be dug up, and burnt, together with his writings, by the common hangman.

There are ſtill ſome remains of this ridiculous ſect in Holſtein, Frieſland, and other countries; whoſe temper and conduct ſeem to diſcredit the exaggerated account which ſome writers have given to their founder. He was probably a deluded fanatic and myſtic.

DAVIS's *Quadrant*. See BACK-*ſtaff*.

DAVIT, a piece of timber in a ſhip, having a notch at one end; in which, by a ſtrap, hangs a block, called the fish-block: the uſe of this is to hale up the fluke of the anchor, and to faſten it at the ſhip's bow or loof. This *davit* may be ſhifted from one ſide of the ſhip to the other, as occaſion ſerves.

There is a ſmall *davit* in the ſhip's boat, which is ſet over her head with a ſheaver, into which is brought the buoy-rope to weigh the anchor: it ſtands in the carlings in the boat's bow.

DAUPHIN, DOLPHIN, in *Aſtronomy*. See DELPHINUS.

DAUPHIN is a title given to the eldeſt ſon of France, and preſumptive heir of the crown; on account of the province of Dauphiné, which in 1343 was given to Philip de Valois, on this condition, by Humbert, *dauphin* of the Viennois.

The *dauphin*, in his letters patent, ſtyles himſelf, "By "the grace of God, eldeſt ſon of France, and *dauphin* "of Viennois."

DAUPHIN was anciently the title, or appellation, of the prince of Viennois in France.

Moſt authors, who have fought the origin of the name *dauphin*, and *Dauphiné*, ſeem to have given too much looſe to conjecture. Du Cheſne is of opinion, that it was the grandſon of Guy the Fat who firſt bore the name of *dauphin*. Chorier obſerves, that William, canon of Notre Dame at Grenoble, who has wrote the life of Margaret, daughter of Stephen, earl of Burgundy, married

tied with Guy, ſon of Guy the Fat, calls the latter ſimply Guy the Old, and the former always count *Dauphin*; and adds, that no record nor monument, ever attributes the title of *dauphin* to Guy the Fat, or any of his predeceſſors: ſo that it muſt neceſſarily have taken its riſe in his ſon, all whoſe ſucceſſors ſo conſtantly aſſumed it, that it became the proper name of the family. He died in 1142, in the flower of his youth; ſo that it muſt be about the year 1120, that the title commenced; and without doubt, adds he, on ſome illuſtrious occaſion. He obſerves farther, that this prince was of a military diſpoſition, and delighted in nothing but war; and again, that it was the cuſtom of the cavaliers to deck their caſks, coats of arms, and the houſing of their horſes, with ſome figure, or device, peculiar to themſelves, whereby they were diſtinguiſhed from all others engaged in the ſame combat or tournament. From all theſe circumſtances he conjectures, that this Guy choſe the *dauphin* for his ſignature; that this was the creſt of his helmet; and that he bore it on his coat in ſome notable tournament, or battle, wherein he diſtinguiſhed himſelf. And this, Chorier makes no doubt, is the real origin of the appellation. Nothing was more common, in thoſe times, than to make proper names become the names of families, or dignities. Witneſs the Ademars, Arthauds, Aynards, Ademans, Bercngers, and infinite others; who all owe their names to ſome one of their anceſtors, from whom it has been tranſmitted throughout the family.

The ſeigneurs, or lords, of Auvergne, have likewiſe borne the appellation of *dauphin*; but the *dauphins* of Auvergne had it not till a good while after thoſe of the Viennois, and even received it from them. The manner was this: Guy VIII. *dauphin* of Viennois, had by his wife Margaret, daughter of Stephen, earl of Burgundy, a ſon and two daughters. The ſon was Guy IX. his ſucceſſor. Beatrix, one of the daughters, was married to the count d'Auvergne, who, according to Biondel, was William V. or rather, as Chorier and others hold, Robert VI. father of William V. This prince loſt the greateſt part of the county Auvergne, which was taken from him by his uncle William, aſſiſted by Louis the Young; and was only left maſter of the little canton whereof Vodable is the capital. He had a ſon whom he called *Dauphin*, on account of Guy, or Guigues, his uncle by the mother's ſide. From his time his ſucceſſors, holding the ſame petty canton of Auvergne, ſtyled themſelves *dauphins* of Auvergne, and bore a *dolphin* for their arms.

DAUPHIN, in *Conchyliology*, the name of a ſpecies of ſhell-fiſh. It is one of the round-mouthed ſnails, or *cochleæ lunores*; and is ornamented with rows of indented eminences, on all the turns of the ſhell.

DAUPHINS, or DELPHINS, in *Literary Hiſtory*, a name given to the commentators on the ancient Latin authors, who were employed by order of Louis XIV. of France, for the benefit of the prince, under the care and direction of M. de Montauſier his governor, Boſſuet and Huet his preceptors. They were thirty-nine in number.

DAWEL-*coraale*, in the language of the Ceyloneſe, drum-cinnamon. This is called in Low Dutch, *trommel caneel*. The reaſon of the name is, that the wood of the tree which affords this ſpecies, when dried, is light and tough, and is uſed to make drums of. The bark is taken off while the tree is growing, and is of a pale colour. It is a very bad kind of cinnamon, and is very rarely ſold as ſuch; but the natives uſe it in medicine.

DAY, a diviſion of time, deduced from the appearance and diſappearance of the ſun.

The *day* is of two kinds; *artificial*, and *natural*.

DAY, *artificial*, which ſeems to be that primarily meant by the word *day*, is the time of light; determined by the ſun's riſing and ſetting.

This is properly defined, the ſtay of the ſun above the horizon: in oppoſition to which, the time of darkneſs, or the ſun's ſtay below the horizon, from ſetting to riſing again, is called *night*.

DAY, *natural*, is the ſpace of time wherein the ſun performs one revolution round the earth; or, more juſtly, the time wherein the earth makes a rotation on its axis; which the Greeks more properly expreſs by νυχθημερον, νυκθαιμερον, q. d. *night-day*. This is either *aſtronomical* or *civil*. The *aſtronomical day* begins at noon, when the ſun's centre is on the meridian, and is reckoned twenty-four hours to the following noon.

The epocha, or beginning of the *civil day*, is the term from which one *day* begins, and in which the preceding *day* concludes. The fixing of this term is of ſome importance. It is certain, that, for the more commodious diſtinguiſhing of *days*, it ought to be fixed in ſome moment of time wherein the ſun is in ſome diſtinguiſhable part of the heavens. The moſt eligible, therefore, ſhould be the moments wherein the ſun paſſes either the horizon, or the meridian. In effect, as there is no moment can be more accurately determined by obſervation, than that in which the ſun paſſes through the upper meridian; if regard be had to the exactneſs of the meaſure, the noon-tide has the beſt pretenſions; the riſing and ſetting of the ſun being diſturbed by the refractions; beſide that, the horizon is ſeldom clear of clouds. But yet, as the *artificial day* does begin with the ſun's riſe, and ends with the ſetting; and, beſides, the ſun's paſſing the horizon is a thing eaſily obſerved; the riſing or ſetting of the ſun ſhould appear the moſt commodious, though not moſt accurate, epoch or beginning of the *civil day*.

As, then, there are not wanting reaſons for beginning the *natural day*, both from the ſun's paſſing the meridian, and the eaſtern and weſtern ſide of the horizon; it is no wonder, that different nations ſhould begin their *day* differently.

Accordingly, 1ſt, The ancient Babylonians, Perſians, Syrians, and moſt other eaſtern nations, with the preſent inhabitants of the Baleariс iſlands, the Greeks, &c. being their *day* with the ſun's riſing. 2dly, The ancient Athenians and Jews, with the Auſtrians, Bohemians, Matcomanni, Siloſians, modern Italians, and Chineſe, reckon it from the ſun's ſetting. 3dly, The ancient Umbri and Arabians, with the modern aſtronomers, at noon. And, 4thly, The Egyptians and Romans, with the modern Engliſh, French, Dutch, Germans, Spaniards, and Portugueſe, at midnight.

The *day* is divided into hours; and the week, months, &c. into *days*. For the origin of the Engliſh names of the *days* of the week, ſee WEEK.

As to the different length of the *day* in different climates, it has been a matter of ſome controverſy among aſtronomers, whether or no the *natural days* be all equally long throughout the year; and, if not, what is their difference? A profeſſor of mathematics at Seville, in a memoir in the Philoſophical Tranſactions, affects, from a continued ſeries of obſervations for three years, that they are all equal. Mr. Flamſteed, in the ſame Tranſactions, refutes the opinion; and ſhews, that one *day*, when the ſun is in the equinoctial, is ſhorter than when he is in the tropics by forty ſeconds; and that fourteen tropical *days* are longer than ſo many equinoctial ones, by one ſixth of an hour, or ten minutes. This inequality of the *days* flows from two ſeveral principles: the one, the eccentricity of the earth's orbit; the other, the obliquity of the ecliptic with regard to the equator, which is the meaſure of time. As theſe two cauſes happen to be combined, the length of the *day* is varied. See EQUATION *of time*.

DAY, in *Law*, is frequently uſed for the *day* of appearance in court, either originally, or upon aſſignation.

We ſay, He had a *day* by the rolls; i. e. he had a *day* of appearance aſſigned him.

If a fact be done in the night, you muſt ſay in *law* proceedings, *in nocte ejuſdem diei*.

There are ſeveral return *days* in the terms; and if either of them happen upon a Sunday, the *day* following is taken inſtead of it; for Sunday is *dies non juridicus*: and ſo is Aſcenſion *day* in Eaſter term, St. John the Baptiſt in Trinity term, All Saints and All Souls in Michaelmas term, and the Purification of the Virgin Mary in Hilary term. 2 Inſt. 264.

DAY-*coal*, in *Natural Hiſtory*, a name given by the miners of England, and the common people who live in coal countries, to that ſeam or ſtratum of the coal which lies uppermoſt in the earth. The ſame vein or ſtratum of coal uſually runs a great way through the country, and dips and riſes in the earth in different places; ſo that this upper ſtratum, or *day-coal*, is in the various parts of the ſame ſtratum, ſometimes near the ſurface, and ſometimes at many fathoms deep. The ſubterraneau fires found in ſome of our coal countries principally feed on this coal, and are nearer, or farther from the ſurface, as it riſes or ſinks. Phil. Tranſ. N° 130.

DAY-*light*, in *Law*. In reſpect to *day-light*, before ſun-riſing, and after ſun-ſetting, is accounted part of the *day* by common law; as to robberies committed in the *day*-time, when the *hundred* is liable. 7 Rep. 6.

The law regularly rejects all fractions and diviſions of a *day*, for the uncertainty. 5 Rep. 1. 1 Inſt. 135.

DAY-*lily*, in *Botany*. See LILY.

DAY'S *work*, in *Sea Language*, denotes the reckoning or account of the ſhip's courſe, during twenty-four hours, or between noon and noon, according to the rules of trigonometry. See DEAD-*reckoning*.

DAYS *in bank*, are *days* ſet down by ſtatute, or order of the court, when writs ſhall be returned, or when the party ſhall appear on the writ ſerved.

To be diſmiſſed *without day*, *ſine die*, is to be finally diſcharged the court.

DAYS *of precision*, in the *Exchequer*. See REMEMBRANCER.

DAYS *of grace*, in *Commerce*, are a number of days allowed by cuſtom for the payment of a bill of exchange, after the ſame becomes due; i. e. after the time it was accepted for is expired.

In England, three *days of grace* are allowed: ſo that a bill accepted, in order to be paid, c. gr. ten *days* after ſight, is not to be paid till thirteen *days*. Throughout France, they allow ten *days of grace*; as many at Dantzic; eight at Naples; ſix at Venice, Amſterdam, Rotterdam, and Antwerp; four at Francfort; five at Leipſic; twelve at Hamburgh; ſix in Portugal; fourteen in Spain; thirty in Genoa, &c. Note, Sundays and holidays are included in the number of *days of grace*.

DAYS-*man* is uſed in ſome parts of England for an arbitrator or judge: and it has been obſerved that the word *day* ſignifies judgment.

DAYS, *Fyſh*. See ABSTINENCE.

DAYS, *Dog*, *Dies canicolares*. See CANICULAR.

DAYS, *Critical*, *Dies critici*. See CRITICAL *days*.

DAYS, *Intercalary*, or *additional*. See INTERCALARY *days*.

D'AYENA, in *Botany*, *mouſer*. Its characters are theſe: the flowers ariſe from the wings of the ſtalk; they have a five-leaved empalement, and five heart-ſhaped petals; it hath five ſtamina inſerted in a ſhort nectarium; and a five-cornered germen, ſituated at the bottom of the nectarium, which afterward becomes a roundiſh five-cornered capſule having five cells, each having one kidney-ſhaped ſeed. There is but one ſpecies known, a native of Peru; which is named from M. Le Due D'Ayena, a great lover of botany, and who has a noble garden at St. Germains.

DAZE, in *Natural Hiſtory*, a name given by our miners to a ſort of glittering ſtone, which often occurs in their works; and, as it is an unprofitable ſubſtance, is one of thoſe things which they call weeds. The word *daze* takes in, with them, every ſtone that is hard and glittering; and therefore it comprehends the whole genus of the *lelongio*, or ſtony nodules, which have flakes of talc in their ſubſtance: theſe, according to the colour of the ſtony matter they are bedded in, and their own colour, give the names of *black daze*, *white*, *red*, and *yellow daze* to theſe ſtones.

Theſe *dazes* are generally of the poorer part of the vein. The ſhoad-ſtones are many of them of this nature, and the ends of the veins degenerate again into them. Phil. Tranſ. N° 69.

DEACON, *Diaconus*, a perſon in the loweſt degree of holy orders, whoſe buſineſs is to baptize, read in the church, and aſſiſt at the celebration of the euchariſt.

The word is formed from the Latin *diaconus*; of the Greek διακονος, *miniſter*, *ſervant*.

Deacons were firſt inſtituted, ſeven in number, by the apoſtles, Acts, chap. vi. which number was retained a long time in ſeveral churches. Grotius apprehends that the order of *deacons* in the Chriſtian church correſponded to that of *eleemoſynaries* in the Jewiſh ſynagogue. Their office was, to ſerve in the agapæ, and to diſtribute the bread and wine to the communicants, and diſpenſe the alms. Tertullian informs us, that the deacons preached, and, in the abſence of the biſhop and preſbyters, conferred the ſacrament of baptiſm. De Bapt. p. 602.

By the ancient canons, marriage was not incompatible with the ſtate and miniſtry of a *deacon*; but it is now a long time that the Romiſh church has prohibited their marrying; and the pope only grants them diſpenſations for very important cauſes; and, after this diſpenſation, they loſe the rank and functions of their order, and return to a lay ſtate.

At Rome, under pope Sylveſter, they had only one *deacon*; then ſeven were appointed; then fourteen; and, at laſt, eighteen; who were called *cardinal deacons*, to diſtinguiſh them from thoſe of other churches.

Their office was, to take care of the temporalities of the church, to look to the rents and charities, and provide for the neceſſities of the eccleſiaſtics, and even of the pope. The collecting of the rents, alms, &c. belonged to the *ſubdeacons*: the *deacons* were the depoſitaries and diſtributers. Having thus the management of the revenues of the church in their hands, their authority grew apace, as the riches of the church increaſed. Thoſe of Rome, as being miniſters of the firſt church, preceded all others, and even at length took place of the prieſts themſelves. Doubtleſs, it was the avarice of the prieſts that made them give place to the *deacons*, who had the diſpoſal of the money.

The *deacons* rehearſed certain prayers at the holy office, which were thence denominated *diaconical*.

They took care that the people at church behaved themſelves with due modeſty and reſpect. They were not allowed to teach publicly; at leaſt not in the preſence of a biſhop or prieſt. They only inſtructed the catechumens, and prepared them for baptiſm. The doors of the church were likewiſe in their cuſtody; though, in after-times, that charge was committed to the *ſubdeacons*.

The office of a *deacon*, in the church of England, according to the form of ordination, is to baptize, preach, and aſſiſt in the adminiſtration of the Lord's ſupper; and, in ſhort, to perform all the other offices in the liturgy, which a prieſt can do, except that of conſecrating the elements of the Lord's ſupper, and pronouncing the abſolution. No perſon can be ordained a *deacon* under the age of twenty-three years, unleſs by a faculty or diſpenſation obtained from the archbiſhop of Canterbury: and in order to this, he muſt be provided with a title to a cure, or be a fellow or chaplain in ſome college in Cambridge or Oxford, or a maſter of arts of five years ſtanding, living at his own charge in either of the univerſities, or be admitted by the biſhop who ordains him to ſome benefice or curacy then void. Otherwiſe the ordaining biſhop ſhall maintain him, till he is preferred to ſome eccleſiaſtical living. And by ſtat. 13 and 14 Car. II. c. 4. no perſon is capable of being admitted to any benefice or eccleſiaſtical promotion, till he be ordained a prieſt; nor is a *deacon* capable of a DONATIVE, but is only allowed to uſe his orders as a chaplain to ſome family, a curate to ſome prieſt, or a lecturer without a title.

DEACONESS, *Diaconiſſa*, an office in uſe in the primitive church, though now laid aſide. St. Paul makes mention thereof in his Epiſtle to the Romans: and the younger Pliny, in a letter to Trajan, tells that prince, that he had ordered two *deaconeſſes*, whom he calls *miniſtræ*, to be tortured.

Deaconeſs was a title given to certain devout women, who conſecrated themſelves to the ſervice of the church, and rendered thoſe offices to the women, which men could not decently do: as in baptiſm, for inſtance, which was conferred, by immerſion, on women as well as men.

They were likewiſe to look to the doors on the ſide the women were on, who were ſeparated from the men, according to the cuſtom of thoſe times. They had the care and inſpection of the poor, ſick, &c. And in times of perſecution, when a *deacon* could not be ſent to the women, to exhort and fortify them, a *deaconeſs* was ſent. See Balſamon on the eleventh canon of the council of Laodicea; and the Apoſtolical Conſtitutions, lib. ii. cap. 57. To ſay nothing of the epiſtle of Ignatius to the people of Antioch; where, what is ſaid of *deaconeſſes*, is ſuppoſed to be an interpolation.

The council of Nice ranks *deaconeſſes* among the clergy: though ſome hold, that their ordination was not ſacramental, but a mere eccleſiaſtical ceremony. However, it gave them a pre-eminence above the reſt of their ſex; for which reaſon the council of Laodicea forbad the ordaining of any more for the future. The office of *deaconeſſes* expired in the Weſtern church about the twelfth century, and in the Eaſtern about the thirteenth.

Atto of Verceil, in his eighth letter, gives the reaſon of their being aboliſhed: he obſerves, that in the firſt ages the miniſtry of women was neceſſary, in order to the more eaſy inſtructing of other women, and recovering them from paganiſm; and that they likewiſe ſerved for the more decent adminiſtration of baptiſm to the ſame: but that it was not then neceſſary, becauſe none but children were baptized; and if it might now be added, becauſe baptiſm is only conferred by ſprinkling.

The number of *deaconeſſes* does not ſeem to have been fixed: the emperor Heraclius, in his letter to Sergius, patriarch of Conſtantinople, orders that in the great church of Conſtantinople there be forty *deaconeſſes*; whereas there were only ſix in that of the Mother of God, in the quarter of the Blachernæ.

DEACONRY, *Diaconatus*, the order or miniſtry of a *deacon*, or *deaconeſs*. See DEACON, and DEACONESS.

DEACONRY, *Diaconia*, is alſo a name ſtill reſerved to the chapels and oratories in Rome, under the direction of the ſeveral deacons, in their reſpective regions or quarters.

To the *deaconries* were annexed a ſort of hoſpitals, or boards, for the diſtribution of alms, governed by the regionary deacons, called cardinal deacons, of whom there were ſeven, anſwering to the ſeven regions, their chief being called the arch-deacon.

The hoſpital adjoining to the church of the *deaconry*, had an adminiſtrator for the temporal concerns, called the *father of the deaconry*, who was ſometimes a prieſt, and ſometimes a layman.

At preſent there are fourteen of theſe *deaconries* or hoſpitals at Rome, which are reſerved to the cardinals. Du-Cange gives us their names: as the *deaconry* of St. Maria in the Broad-way, the *deaconry* of St. Euſtachio near the Pantheon, &c.

DEAD-*boat*, in *Horology*, is a general term for a particular conſtruction of pallets; firſt applied by Mr. Graham to clocks, to prevent the retrograde motion of the wheels, and to remedy the imperfections ariſing from the recoil of the common pallets. The principle of this eſcapement is the ſame as the horizontal wheel in watches. and what the French call *echapement à repos*. See PALLET.

DEAD-*lights*, are wooden ports made to faſten in the cabin windows, to prevent the waves from breaking into the ſhip in a high ſea.

DEAD-*men's eyes*, in a ſhip, are a kind of blocks, having many holes in them, but no ſheevers; and through them the lanniers or laniards go, which make faſt the ſhrouds to the chains. Sometimes the main-ſtays of a ſhip are ſet taught in *dead-man's eyes*; but moſt great ſhips uſe double blocks. The crowfeet reeve through the *dead-man's eyes*.

DEAD-*nettle*, ſtinking or yellow. See NETTLE.

DEAD-*nettles*, in *Botany*. See ARCHANGEL.

DEAD-*pledge*. See MORTGAGE.

DEAD-*reckoning*, at ſea, is that eſtimation, judgment, or conjecture, which the ſeamen make of the place where a ſhip is, by keeping an account of her way by the log, by knowing the courſe they have ſteered by the compaſs, and by rectifying all, with allowance for drift, lee-way, &c. according to the ſhip's trim: ſo that this reckoning is without any obſervation of the ſun, moon, or ſtars, and is to be rectified as often as any good obſervation can be had. See LOG.

DEAD-*riſing*, a term in a ſhip for that part of her bottom, through her whole length, where the floor timber is terminated upon the lower ſuttock.

DEAD-*ropes*, in a ſhip, are ſuch as are not running, i. e. which do not run in any block.

DEAD-*ſtops*, a diſeaſe incident to young trees: and cured by cutting off the dead parts, cloſe to the next good twig or ſhoot, and claying them over as in grafting.

DEAD-*water*, is the eddy water juſt behind the ſtern of a ſhip. It is ſo called, becauſe it does not paſs away ſo ſwiftly, as the water running by her ſides doth.

If a ſhip have a great eddy following her ſtern, they ſay, ſhe makes much *dead-water*.

DEAD-*wood*, in *Naval Architecture*, a name given by ſhipwrights to certain blocks of timber laid upon the keel, particularly at the extremities afore and abaft, where theſe pieces are placed upon one another to a conſiderable height, becauſe the ſhip is there ſo narrow, as not to admit of the two half-timbers, which are therefore ſcored into the *dead-wood*, where the angle of the floor timbers greatly diminiſhes, as approaching the ſtern and ſtern-poſt. The *dead-wood* afore and abaft is equal in depth to two thirds of the depth of the keel, and as broad as it can be, without exceeding the breadth of the keel.

DEAD-*work*, denotes all that part of a ſhip, which is above water when ſhe is laden.

DEADLY *carrot*. See THAPSIA.

DEADLY *feud*, in our *Law Books*, a profeſſion of irreconcilable enmity till a perſon is revenged by the death of his enemy.

The word *feud* is derived from the German *fehd*, which, as Hottoman obſerves, ſignifies, *modo bellum, modo capitales inimicitias*. See FEUD.

Such enmity and revenge was allowed by our ancient laws in the time of the Saxons; viz. If any man was killed, and a pecuniary ſatisfaction were not made to the kindred, it was lawful for them to take up arms, and revenge themſelves on the murderer; which was called *deadly feud*. And this, probably, was the original of an appeal.

DEADLY *nightſhade*, in *Botany*. See NIGHTSHADE.

DEADS, in *Mining*, is uſed to expreſs that part of the ſhelf or faſt ground which contains no ore; but which encloſes the vein or bed of the ore, like a wall on every ſide. The drifts which they ſink for the tin ore in Cornwall, are generally about three feet over, and about ſeven feet high; ſo that a man may conveniently ſtand upright at work, and manage his tools. In caſe the vein itſelf is not broad enough to allow this, as in many places it is not half a foot over, then they pick down the ſtrata that encloſe it, ſo as to make an opening of the ſame breadth. This work they call *breaking up the deads*. Phil. Tranſ. N° 69.

This word is alſo uſed for ſuch parcels of common looſe mould or earth, lying above the ſhelf, as uſually contain the *ſhoad*, which they find when they are training a load.

In the Mendip lead-mines, when a vein of ore breaks off abruptly in an earth, they call it a *deading-bed*; and earth without ore, they call *dead earth*.

DEAFFORESTED, in our *Law Books*, the being diſcharged from being foreſt; or freed and exempted from foreſt-laws. See FOREST.

Johannes Dei gratia, &c. archiepiſcopis, epiſcopis, &c. ſciatis nos omnino deafforeſtaſſe foreſtam de Brewood de omnibus, quæ ad foreſtam et foreſtarios pertinent. Quare volumus et firmiter præcipimus, quod prædicta foreſta, et homines in illa manentes, et hæredes eorum ſint deafforeſtati in perpetuum.

DEAFNESS, the ſtate of a perſon who wants the ſenſe of hearing: or a diſeaſe of the ear, which prevents its due reception of ſounds.

Deafneſs generally ariſes either from an obſtruction, or a compreſſion, of the auditory nerve; or from ſome collection of matter in the cavities of the inner ear; or elſe from the auditory paſſage being ſtopped up by ſome hardened excrement; or, laſtly, from ſome exceſcence, as a ſwelling in the glands, or ſome foreign body introduced within it.

As to the prognoſtics, thoſe who are born *deaf* are rarely cured; a real *deafneſs* is hard to remedy; a *deafneſs* in acute diſeaſes, with crude urine, foretels a delirium: but when the ſigns of coction are good, it portends a critical hæmorrhage. With regard to the cure, if the obſtruction be in the external cavity of the ear, it is diſcernible by the ſight. If there is occaſion to ſyringe the ear, a decoction of ſage and roſemary flowers will be proper, with equal parts of water and white wine: but great caution is to be uſed. Some pump the head with warm Bath waters; ſome ſay the eggs of ants bruiſed, and put into the ear, with the juice of an onion, cure the moſt inveterate *deafneſs*: others affirm that a ſalivation will ſometimes perform a cure. A critical *deafneſs* will ceaſe of itſelf. Etmuller recommends amber and muſk; and hardneſs of hearing has been often cured by putting a grain or two of muſk into the ear with cotton. Hoffman ſays *deafneſs* ſometimes ariſes from a ſtackneſs of the auditory nerves, which often happens from too great humidity, which if neglected will terminate in perpetual and incurable *deafneſs*; but may be diſperſed if taken in time, by proper cephalics and ſudorifics. Some for this purpoſe recommend equal parts of ſpirit of lavender and Hungary water, which ſhould be dropped warm into the ear. Lindanus adviſes the gall of an eel, mixed with ſpirit of wine; and others the fumes of ſulphur, conveyed into the ear with a pipe or funnel: but regard muſt always be had to the cauſe, if diſcoverable. Heiſter informs us, that medicinal waters drank in the ſummer-time freely, are the beſt means as preſervatives, and for curing diſorders in the ears; and that they often perform more than any other remedy whatever.

Deafneſs ariſing from cold of the head may be cured by keeping the head warm, eſpecially at night; by taking gentle purges, keeping the feet warm, and bathing them frequently in luke-warm water at bed-time.

Thoſe born *deaf* are alſo dumb, as not being able to learn any language, at leaſt in the common way. However, as the eyes, in ſome meaſure, ſerve them for ears, they may underſtand what is ſaid by obſerving the motion of the lips, tongue, &c. of the ſpeaker; and even acquiſtom themſelves to move their own, as they ſee other people do; and by this means learn to ſpeak.

Thus it was that Dr. Wallis taught two young gentlemen, born *deaf*, to know what was ſaid to them, and to return pertinent anſwers. Digby gives us another inſtance of the ſame, within his own knowledge. And there was a Swiſs phyſician formerly living at Amſterdam, one Joh. Conrad Amman, who effected the ſame in ſeveral children born *deaf*, with ſurpriſing ſucceſs. He has reduced his ſcheme to a fixed art, or method, which he has publiſhed in his Surdens Loquens, Amſtelod. 1692. and De Loquela, ibid. 1700.

In the Philoſoph. Tranſact. N° 312. we have an account by Mr. Waller, R. S. Sec. of a man and his ſiſter, each about fifty years old, born in the ſame town with Mr. Waller, who had neither of them the leaſt ſenſe of hearing; yet both of them knew, by the motion of the lips only, whatever was ſaid to them, and would anſwer pertinently to the queſtion propoſed. It ſeems they could both hear and ſpeak when children, but loſt their ſenſe afterwards; whence they retained their ſpeech, which, though uncouth, was yet intelligible.

Such another inſtance is that of Mr. Goddy's daughter, miniſter of St. Gervais in Geneva, related by biſhop Burnet. At two years old they perceived ſhe had in great part loſt her hearing; and ever after, though ſhe heard great noiſes, yet ſhe could hear nothing of what was ſaid to her. But by obſerving the motions of the mouths and lips of others, ſhe had acquired ſo many words, that out of theſe ſhe had formed a ſort of jargon, in which ſhe could hold converſation whole days with thoſe that could ſpeak her language. She knew nothing that was ſaid to her, unleſs ſhe ſaw the motion of their mouths that ſpoke to her; ſo that, in the night, they were obliged to light candles to ſpeak to her. One thing will appear the ſtrangeſt part of the whole narra-

tion: she had a sister, with whom she had practised her language more than with any body else; and in the night, by laying her hand on her sister's mouth, she could perceive by that what she said, and so could discourse with her in the dark. Burn. Let. iv. p. 248.

It is observable that *deaf* persons, and several others thick of hearing, hear better and more easily, if a loud noise be raised at the time when you speak to them; which is owing, no doubt, to the greater tension of the ear-drum, on that occasion. Dr. Willis mentions a *deaf* woman, who, if a drum were beat in the room, could hear any thing very clearly: so that her husband hired a drummer for a servant, that by his means he might hold conversation with his wife. The same author mentions another, who, living near a steeple, could always hear very well, if there was a ringing of three or four bells; but never else.

Dr. Buchner relates an extraordinary method of making *deaf* persons to hear, by applying thin slips of wood, about six feet long, an inch broad, and as thick as the back of a knife, at one end to the upper teeth of the speaker, and at the other to the upper teeth of the *deaf* person. Many trials were made to ascertain the fact, and the voice was found perceptible and distinct. This method, he observes, may be adapted to all persons afflicted with *deafness*, provided the auditory nerves are not injured or destroyed at their origin. See Buchner's Easy and practicable Method to enable deaf Persons to hear, translated from the German, 1770.

DEAL, a well-known kind of wood, of great use.

A very good method of seasoning planks of *deal* and fir, is to throw them into salt-water as soon as they are sawed, and keep them there three or four days, frequently turning them. In this case they will be rendered much harder, by drying afterwards in the air and sun; but neither this nor any other means yet known, will preserve them from shrinking.

Deals called Bulgensory *deals*, the hundred containing six score, pay on importation 3*l.* 8*s.* 8½*d.* and drawback 3*l.* 3*s.* the rate 12*l.* Meabro *deals*, six score, pay 1*l.* 2*s.* 10½*d.* and drawback 1*l.* 1*s.* the rate 4*l.* Norway *deals*, six score, pay 1*l.* 8*s.* 7½*d.* and drawback 1*l.* 6*s.* 9*d.* the rate 5*l.* Spruce deals, six score, pay 4*l.* 5*s.* 10½*d.* and drawback 3*l.* 18*s.* 9*d.* the rate 15*l.* *Deals* from Russia, and all other countries not particularly rated, exceeding twenty feet in length, pay 4*l.* 5*s.* 10½*d.* and drawback 3*l.* 18*s.* 9*d.* the rate 15*l.* *Deals* from Sweden or any other country, of twenty feet in length or under, not otherwise rated, the hundred and twenty, pay 1*l.* 8*s.* 7½*d.* and drawback 1*l.* 6*s.* 3*d.* the rate 5*l.*

Rods of *deal* expand laterally, or cross the grain, in moist weather, and contract again in dry; and thence have been found to make an useful hygrometer. Phil. Trans. N° 480. p. 134. See HYGROMETER.

DEAN, a prime dignitary in most cathedral and collegiate churches; being usually the president of the chapter.

He is called *dean*, *decanus*, of the Greek δεκα, *ten*, as being supposed to preside over ten canons or prebendaries, at least.

Canonists distinguish between *deans* of cathedral, and those of collegiate churches. The first, with their chapter, are regularly subject to the jurisdiction of the bishop. As to *deans* of collegiate churches, they have usually the contentious jurisdiction in themselves, that is, they exercise jurisdiction over their canons in all civil or criminal matters; though sometimes this belongs to them in common with the chapter.

In England, as there are two foundations of cathedral and collegiate churches, the old and the new (the latter being those founded by Henry the Eighth on the suppression of the abbots and priors, when their convents were turned into *deans* and chapter;) so there are two ways of creating the *dean*. Those of the old foundation, as the *deans* of St. Paul's, York, &c. are raised to their dignity much like a bishop; the prince first sending out his congé d'elire to the chapter; the chapter then choosing, the king yielding his royal assent, and the bishop confirming him, and giving his mandate to install him. Those of the new foundation, as the *deans* of Canterbury, Durham, Ely, Norwich, Winchester, &c. are donative, and are installed by a shorter course; only by the king's letters patent, without either election or confirmation. There are some cathedral churches, which never had a *dean*, as that of St. David and Landaff, where the bishop is the head of the chapter, and in his absence the archdeacon.

Constantine, we are told, erected an office of nine hundred and fifty persons at Constantinople, taken out of divers trades and professions, whom he exempted from all impositions, and bestowed them on the cathedral church, to render the offices of burial *gratis* to the defunct, particularly to the poor. These he called *decani*, and *decimi*, probably because they were divided by tens; each whereof had a bier, or litter, to carry the bodies in. It is supposed to be these, who, under Constantius, began to be called *copiatæ*; i. e. clerks destined for labour; for they are usually ranked among the clerks, and even before the chantors. By a law of the year 357, it appears, that there were some of these *copiatæ* at Rome.

DEAN is also a title applied among us to divers persons that are the chief of some peculiar churches, or chapels: as, the *dean* of the King's chapel, who has no jurisdiction; of the ARCHES; of Battel, founded by William I. who had jurisdiction within the liberty of Battel, is presentable by the duke of Montagu, and instituted and inducted by the bishop of Chichester, but not subject to his visitation; of Bocking, who hath a court and jurisdiction to hold plea of all ecclesiastical matters arising in several parishes within his peculiar, and is constituted by commission from the archbishop of Canterbury, like the *dean* of Arches. There are also *deputy deans*, and *commendatory deans*, who cannot confirm any grants, &c.

DEAN, *Rural*, or *Urban* DEAN, was formerly an ecclesiastical person, who had a district of ten churches, or parishes, either in the country or city, within which he exercised jurisdiction. These *rural deans* were sometimes called *archipresbyteri*; and at first they were, both in order and authority, above the archdeacons. They were at first elected by the clergy, and by their votes deposed; but afterwards they were appointed, and removed, at the discretion of the bishop; and hence they were called *decani temporales*, to distinguish them from the cathedral *deans*, who were called *decani perpetui*. They seem to have been deputies of the bishop, dispersed round his diocese, the better to inspect the conduct of the parochial clergy, and therefore armed with an inferior degree of judicial and coercive authority.

We meet with *rural deans* as early as the ninth century. Hincmar, in a capitular to his archdeacons, reserves the right of electing them to himself; and only allows it to the archdeacons, in case he be absent, and by provision only. Some take the *rural deans* to hold the rank and place of the *chorepiscopi*. Be this as it will, it is certain, they are very ancient in France, Germany, and England; though, till the end of the fifteenth century, they were unknown in Italy; because the bishoprics being there exceeding small, they were not needed. St. Charles Borromeo is said to have first introduced them there. Their office is now wholly extinguished in England, the authority which they had being executed by the archdeacons and chancellors of bishops.

DEAN, in the ancient monasteries, was a superior established under the abbot, to ease him in taking care of ten monks; whence he was called *decanus*, in imitation of those officers called by the same name among the Romans, who had ten soldiers under them.

The monasteries being now less populous than they were in ancient times, the abbot, or prior, does not stand in so much need of being eased: so that these *deans* are, in general, fet aside.

DEAN *and Chapter*. Anciently, bishops did not ordinarily transact matters of moment *sine consilio presbyterorum pariopalium*, who were then called *fratres et consiliarii*, and colleagues of the bishops; represented, in some measure, by our chapters of cathedrals, wherein the *dean* and some of the prebends are, upon the bishop's summons, to assist him in ordinations, deprivations, condemnations, excommunications, and other weighty concerns of the church. See CHAPTER.

DEARTICULATION, in *Anatomy*. See DIARTHROSIS.

DEATH, *Mors*, is generally considered as the separation of the *soul* from the body; in which sense it stands opposed to life, which consists in the union thereof.

Physicians have usually defined *death* by a total stoppage of the circulation of the blood; and a cessation of the animal and vital functions consequent thereon; as respiration, sensation, &c.

An animal body, by the actions inseparable from life, undergoes a continual change: in time, its smallest fibres become rigid; its minute vessels grow into solid fibres no longer pervious to the fluids: its greater vessels grow hard and narrow; and every thing becomes contracted, closed, and bound up; whence the dryness, inflexibility, and extenuation, observed in old age. By such means, the offices of the minuter vessels are destroyed, and the humours stagnate, harden, and at length coalesce with the solids: thus are the subtiler fluids in the body intercepted and lost, the concoction weakened, and the separation prevented; only the coarser juices continue to run slowly through the greater vessels, to the preservation of life, after many of the animal functions are destroyed. At length, in the process of these changes,

death itself becomes inevitable, as the neceſſary conſequence of life.

But it is rare, that life is thus long protracted, or that *death* ſucceeds merely from the decays and impairments of old age: diſeaſes, in a long and horrid train, uſually precipitate diſſolution.

It is generally taught, that the life of thoſe animals, which we call perfect, conſiſts in a continued flux and reflux of blood, nervous juice, and air, to and from the principal organs; and that a man may be reckoned *dead* when he no longer breathes, and his heart and arteries have left off all circulation and pulſation. Even Lanciſi, the beſt author on this ſubject, ſays, that without a ſmall degree of reſpiration, and ſome little motion and trembling of the heart, there is no life. In conſequence of this ſyſtem, the general practice is, that as ſoon as theſe ſymptoms of life are gone, all hopes and endeavours to maintain the ſmall remains of life are laid aſide. But Dr. Stevenſon does not admit this doctrine, being of opinion, that after the motion of the heart, arteries, and lungs ceaſes, *there* often remains a ſmall degree of vital principle, deſerving attention. After a full ſtop of all thoſe organic motions on which life is ſaid to depend, the juices frequently retain ſo much of the animal proceſs, as frequently ſerves to keep up warmth for a long time; which, with proper cheriſhing, might perhaps reſtore life earlierly. Every age and country affords inſtances of ſurpriſing recoveries after lying long for *dead*. From the number of thoſe preſerved by lucky accidents, we may conclude a far greater number might have been preſerved by *timely* pains and ſkill. Med. Eſſ. Edinb. vol. v. art. 37.

This ingenious author hopes, from his theory, that one, who from all the above mentioned motions ceaſing, may with propriety be called *dead*, may recover, and be properly ſaid to come to life again.

His theory is, that the cauſe of animal heat, or of the ſame motion which had been going on proſperouſly, while the progreſſive motion of the fluids in the veſſels continued, is now checked; yet ſtill proceeds in a lower manner, perhaps like the beginning of fermentation or putrefaction. By this degree of the animal proceſs, the maſs of fluids, particularly in the great reſervoir of venous blood, the heart, rarefying, preſſing every way, and being reſiſted by the valves, ſwells ſo as to fill the flaccid right auricle of the heart, which had been ſome time empty; and thus ſtimulating its fibres, which were at reſt, puts them into motion again; as we ſee the heart, after being taken out of the body, by being pricked, or having warm water thrown on it, beat afreſh, though it has been for ſome time motionleſs. The right auricle being thus filled, and ſtimulated into a contraction, fills the ventricle; which, being irritated, likewiſe contracts and empties itſelf into the pulmonary artery; whereby the circulation begins where it left off, and life is reſtored, if the organs and juices are in a fit diſpoſition for it, as they perhaps are much oftener than is imagined.

From hence it ſeems, that *death* does not inevitably attend an entire organic reſt of what we call the fluids of the body; nay, that one cannot be called *dead* till the energy of the blood is ſo far gone, that, though aſſiſted by all poſſible means, it can never be again able to fill, and ſtimulate into contraction, the right *ſinus venoſus* and auricle of the heart.

See a remarkable caſe, in ſupport of this opinion, in Med. Eſſ. Edinb. vol. v. art. 55. *See* DROWNING.

The learned Wiſdom has given us a treatiſe upon the uncertainty of the ſigns of *death*.

The law diſtinguiſhes between natural and civil *death*: the former is the actual termination of life; the latter, when a perſon is not actually *dead*, but adjudged ſo by law. Thus, if a perſon for whoſe life an eſtate is granted remains beyond ſea, or is otherwiſe abſent ſeven years, and no proof be made of his being alive, or becomes a profeſſed monk, he ſhall be accounted naturally *dead*. However, the latter diſability, ſince the Reformation, is held to be aboliſhed.

DEATH, *appeal of*. *See* APPEAL.

DEATH-*watch*, in *Zoology*, the Engliſh name of the *pediculus* of old wood, a ſpecies of the *termes*, belonging to the order of *aptera* and claſs of inſects in the Linnæan ſyſtem. It is nearly of the ſize of the common louſe; and the noiſe, reſembling the beating of a watch, is made by the male or female, when wooing each other. This ticking noiſe the populace have long taken for a preſage of *death*, in the family where it is heard: whence it is alſo called *pediculus fatidicus*, *mortifaga*, *pulſatorius*, &c.

There are two kinds of *death-watches*: of the firſt we have a good account in the Philoſophical Tranſactions, by Mr. Allen. It is a ſmall beetle, five ſixteenths of an inch long, of a dark brown colour, ſpotted; having pellucid wings under the vagina, a large cap, or helmet, on the head, and two antennæ proceeding from beneath the eyes. The part with which it beats, he obſerved, was the extreme edge of the face, which he chooſes to call the upper lip; the mouth being protracted by this bony part, and lying underneath, out of view. Its figure, as it appears in a microſcope, ſee repreſented in *Tab. Nat. Hiſt. fig.* 2.

This account is confirmed by Dr. Derham, with this difference, that, inſtead of ticking with the upper lip, he obſerved the inſect to draw back its mouth, and beat with its forehead. The author had two *death-watches*, a male and female, which he kept alive in a box, ſeveral months; and could bring one of them to beat whenever he pleaſed, by imitating its beating: and by this ticking noiſe he could frequently invite the male to get up upon the other, in the way of coition. When the male found he got up in vain, he would get off again, beat very eagerly, and then up again: whence the ingenious author concludes thoſe pulſations to be the way whereby thoſe inſects woo one another, and find out, and invite each other to copulation.

The ſecond kind of *death-watch* is an inſect in appearance quite different from the firſt. The former only beats ſeven or eight ſtrokes at a time, and quicker; the latter will beat ſome hours together, without intermiſſion; and his ſtrokes are more leiſurely, and like the beat of a watch. This latter is a ſmall greyiſh inſect, much like a louſe when viewed with the naked eye. Its figure, as magnified, is ſeen in *Tab. Nat. Hiſt. fig.* 1. The ticking, as in the other, is a wooing act.

This inſect is at firſt a minute white egg, much ſmaller than the nits of lice; though the inſect is near as big as a louſe. In March it is hatched, and creeps about with its ſhell on. When it firſt leaves its ſhell, it is even ſmaller than its egg; though that is ſcarce diſcernible without a microſcope. In this ſtate it is ſomewhat like the mites in cheeſe: from this ſmall ſtate they grow gradually to their mature or perfect ſize: when they become like the old one, they at firſt run about much more ſwiftly than before. Phil. Tranſ. abr. vol. v. p. 26, &c.

DE BENE ESSE, a Latin phraſe uſed in our law-books. To take, or do, a thing *de bene eſſe*, is to accept, or allow it as well done for the preſent; but when it comes to be more fully examined, or tried, to ſtand or fall, to be allowed or diſallowed, according to the merit, or well-being, of the thing in its own nature; or, as we ſay, *Voltat quantum valere poteſt*.

Thus, in chancery, upon motion to have one of the leſs principal defendants in a cauſe examined as a witneſs, the court (not then thoroughly examining the juſtneſs of it, or not hearing what may be objected on the other ſide) often orders ſuch a defendant to be examined *de bene eſſe*, i.e. that his depoſitions ſhall be allowed, or ſuppreſſed, at the hearing of the cauſe upon a full debate of the matter, as the court ſhall think fit; but for the preſent they have a well-being, or conditional allowance. Thus alſo in common law, the judges often take bail *de bene eſſe*, to be allowed or rejected upon the approbation or exception of the plaintiff's attorney.

DEBENTURE, a kind of writing in the nature of a bond, firſt given in 1649, to charge the commonwealth to ſecure the ſoldier-creditor, or his aſſigns, the ſum due, upon auditing the accounts of his arrears.

The word is now alſo uſed in the exchequer, and in the king's houſhold, where *debentures* are uſually given to the ſervants for the payment of their wages, board-wages, and the like.

Debenture is mentioned in the act of oblivion, 12 Car. II. cap. 2. and ſince the late Revolution, has been uſed in many acts of parliament, eſpecially in that which relates to the forfeited eſtates in Ireland, out of which the ſoldiers *debentures* are appointed to be ſatisfied. 11 W. III.

DEBENTURE, in *Commerce*, a term uſed at the cuſtom-houſe, where the exporter of any merchandiſe is entitled to any bounty or drawback, by act of parliament, on the exportation; in which caſe this *debenture* is a peculiar certificate ſigned by the officers of the cuſtoms, which entitles the trader to the receipt of ſuch bounty or drawback.

All merchandiſe that are deſigned to be taken on board for that voyage, being entered and ſhipped, and the ſhip being regularly cleared out, and ſailed out of port on her intended voyage, *debentures* may be made out from the exporter's entries, in order to obtain the drawbacks, allowances, bounties, or premiums; which *debentures* for foreign goods are to be paid within one month after demand: and in making out theſe *debentures*, it muſt be obſerved, that every piece of vellum, parchment, or paper, containing any *debenture* for drawing back cuſtoms

or duties, muſt, before writing, be ſtamped, and pay a duty of eight pence.

The form of *debentures* vary, according to the merchandiſe exported. In the execution of *debentures* for tobacco, it muſt be particularly obſerved, 1. that *debentures* for the ſame quantity may be made in one or more parchments; 2. that the exporter's oath muſt be printed, ſpecifying whether he acts for himſelf, or by commiſſion; 3. if exported to any other foreign ports than thoſe of Ireland, the word Ireland muſt be added to the oath after Great Britain; 4. that as no tobacco may be conſumed in ſhips of war in Europe, but what has paid full duties, and been manufactured in Great Britain, no drawback is to be allowed for any tobacco exported in men of war; 5. that eight pounds of tobacco *per* hogſhead of 350 pounds or more, allowed for ſtraight at importation, muſt not be deducted on exportation; 6. that *debentures* for tobacco exported to Ireland, muſt not be paid till a certificate be produced, teſtifying the landing thereof; 7. that no perſons may ſwear to the exportation, but ſuch as are permitted to ſwear to *debentures* for other goods. In *debentures* for all other foreign goods, no perſon may be admitted to ſwear to the exportation, but the true exporter, either as a proprietor, or who being employed by commiſſion, is concerned in the direction of the voyage. All kinds of *debentures*, before delivered or paid to the exporters, are entered into a ſeparate book kept for that purpoſe by the collector or comptroller of the cuſtoms. See BOUNTY.

DEBET, among *Merchants*, ſignifies the ſums due to them for goods ſold on credit, for which they have charged their journal or ledger. It is more particularly underſtood of the remainder of debts, part of which has been paid on account.

DEBET, among *Book-keepers*, is uſed to expreſs the left-hand page of the ledger, to which are carried all articles ſupplied or paid, on the ſubject of an account.

DEBET & DETINET, in *Law*, are Latin words uſed in the bringing writs and actions: and an action thall always be in the *debet & detinet*, when he who makes a bargain or contract, or lends money to another, or he to whom a bond is made, bringeth the action againſt him who is bounden, or party to the contract and bargain, or unto the lending the money, &c. But if a man ſells to another a horſe, &c. if he brings debt for the horſe, the writ muſt be in the *detinet* oly. New. Nat. Br. 265.

DEBET & SOLET, are alſo formal words made uſe of in writs; and ſome writs have theſe words in them, which ought not to be omitted. Likewiſe, according to the diverſity of the caſe, both *debet & ſolet* are uſed, or *debet* alone: as a *quod permittat* may be in the *debet & ſolet*, or in the *debet* only, as the demandant claims. And if a perſon ſues to recover any right, whereof his anceſtor was diſſeiſed, by the tenant or his anceſtor, then he uſeth the word *debet* alone in his writ, becauſe his anceſtor only was diſſeiſed, and the eſtate diſcontinued: but if he ſue for any thing that is now firſt of all denied him, then he uſeth *debet & ſolet*, becauſe his anceſtor before him and he himſelf uſually enjoyed the thing ſued for, until the preſent refuſal of the tenant. Reg. Orig. 140. The writ of *ſecta molendina* is a writ of right in the *debet & ſolet*, &c. F. N. B. 98.

DEBILITY, in a *Medicinal Senſe*, is a relaxation of the ſolids, which often induces weakneſs and fainting.

DEBRUISED, or DEBRUISED, in *Heraldry*, is when we would intimate the grievous reſtraint of any animal, which is debarred its natural freedom by any of the ordinaries being laid over it.

Thus when a pale, &c. is borne upon a beaſt in an eſcutcheon, the beaſt is ſaid to be *debruiſed* by the pale.

DEBT, a thing due to another, whether it conſiſt of money, goods, or ſervices.

The legal acceptation of *debt* is a ſum of money due by certain and expreſs agreement: as, by a bond for a determinate ſum; a bill or note; a ſpecial bargain; or a rent reſerved on a leaſe, that is fixed and unalterable. The non-payment of theſe is an injury, for which the proper remedy is by action of debt, to compel the performance of the contract, and recover the ſpecific ſum that is due. Actions of *debt* are now ſeldom brought but upon ſpecial contracts under ſeal, in which the ſum due is clearly and preciſely expreſſed. The form of the writ of *debt* is ſometimes in the *debet & detinet*, and ſometimes in the *detinet* only.

By our law, *debts* due to the king are to be ſatisfied in the firſt place in all caſes of executorſhip, and adminiſtratorſhip; and till the king's *debt* be ſatisfied, he may protect the debtor from the arreſt of any other creditor. At the common law, *debt* lies not for rent upon a leaſe for life, though it does on a leaſe for years; but the remedy is aſſize, if the plaintiff have ſeiſin, or by diſtreſs, 3 Rep. 65. But by ſtat. 8 Anne, cap. 17. any perſon having rent in arrear, upon any leaſe for life or lives, may bring action of *debt* for ſuch rent, as where rent is due on a leaſe for years. Action of *debt* will lie againſt a leſſee, for rent due after the aſſignment of the leaſe; for the perſonal privity of contract remains, notwithſtanding the privity of eſtate is gone. 3 Rep. 22. But after the death of the leſſee, it is then a real contract, and runs with the land. Cro. Eliz. 555.

We meet with divers kinds of *debts*: *active debts*, are thoſe whereof a perſon is creditor; *paſſive debts*, thoſe whereof he is debtor. There are alſo *real debts*, *perſonal debts*, and *mixed debts*. See RECORD, SIMPLE, and SPECIALTY.

It behoves an executor or adminiſtrator to pay regard to the priority of *debts* in diſcharging them; otherwiſe, on deficiency of aſſets, he muſt anſwer thoſe of a higher nature out of his own eſtate: ſuch are funeral charges, and expence of proving the will; *debts* to the king on record or ſpecialty; *debts*, which by particular ſtatutes are to be preferred to all others, as forfeiture for not burying in woollen, money due on poor's rates, letters to the poſt-office, and ſome others; *debts* of record, as judgments, ſtatutes, and recognizances; *debts* due on ſpecial contracts, as for rent, on bonds, covenants, &c. under ſeal; and laſtly, *debts* on ſimple contracts, as notes and verbal promiſes, and ſervants wages.

DEBT, *Chirographary*, in the *French Law*, is that due by virtue of a note, or writing under one's hand, and not proved in judicature.

DEBT, *Hypothecary*, is that due in virtue of ſome contract, or judgment.

DEBT, *Præditory*, is that ariſing from an alienation of lands, &c. the whole purchaſe whereof has not been paid.

DEBT, *Privileged*, is that which muſt be ſatisfied before all others; as, the king's tax, &c.

DEBT, *Nominal*. See FUND.

DEBTEE *Executor*. If a perſon debtor to another makes his creditor or *debtee* his executor, or if ſuch creditor obtain letters of adminiſtration to his debtor, he may retain ſufficient to pay himſelf before any other creditors whoſe debts are of equal degree. Blackſt. Com. vol. iii. p. 18.

DEBTOR, a perſon who owes ſomething to another: in oppoſition to creditor, which is he to whom it is owing.

DECACHORDON, in *Antiquity*, a muſical inſtrument of ten ſtrings, called by the Hebrews *haſor*, reſembling our harp, of a triangular figure, with a hollow belly, and ſounding from the lower part.

DECACTIS, in *Natural Hiſtory*, a name given by ſome to a kind of ſtar-fiſh of the branched, or aſtrophyte kind, whoſe rays are ten in number, where they firſt part from the body, and each ſoon branches out into a number more.

DECADARCHUS, Δεκάδαρχος, among the Greeks, a commander of a party of ten men.

DECADE, a word uſed by ſome old writers for the number ten; and *decades*, for an enumeration by tens: the word is formed from the Latin *decas*, which is derived from a Greek word of the ſame import. The word has been more peculiarly appropriated to the number of books, q. d. *decades*, into which the Roman Hiſtory of Titus Livius is divided. Hence alſo came *decadal* arithmetic, the Decameron of Boccacio, &c.

DECAGON, a plain figure in geometry, having ten ſides and angles.

If all the ſides and angles be equal, it is called a regular *decagon*, and may be inſcribed in a circle.

The ſides of a regular *decagon* are, in power and length, equal to the greateſt ſegment of an hexagon inſcribed in the ſame circle, and cut according to extreme and mean proportion. See EXTREME *and mean proportion*.

A fortification conſiſting of ten baſtions, is ſometimes called a *decagon*.

DECALITRON, among the *Ancients*, a piece of money uſed by the people of Ægina, Corinth, and Syracuſe, in value equal to 163 oboli of Athens.

DECALOGUE, the Ten Commandments of God, engraven on two tables of ſtone, and given to Moſes.

The word is Greek, compoſed of Δεκα, *ten*, and λογος, *word*, q. d. *ten words*. Accordingly, the Jews call them עשרה דברים, *the ten words*, which appellation is very ancient.

The Samaritans, both in their text and verſion, add after the ſeventeenth verſe of the twentieth chapter of Exodus, and after the twenty-firſt verſe of the fifth chapter of Deuteronomy, an eleventh commandment, to build an altar on mount Gerizzim, &c. But it is apparently an interpolation, to authoriſe their having a temple and an altar on that mountain; and to diſcredit, if poſſible, the temple at Jeruſalem, and the worſhip there performed. It muſt be added, however, that, though all, both Jews and Chriſtians, agree in the number of Ten Command-

ments, there is some difference as to the manner of dividing them.

The Talmudists, and Postellus after them, in his treatise De Phœnicum Literis, say, that the *Decalogue*, or Ten Commandments, were engraven quite through the tables which God gave to Moses; but that nevertheless the middle of the ם *Mem* final, and of the ס *Samech*, remained miraculously suspended without adhering to any thing. See the Dissertation on the Samaritan Medals, printed at Paris in 1715. They add, that the *Decalogue* was written in letters of light, i. e. in luminous shining letters.

The *Decalogue* was originally delivered in two tables; one of which contains our duty to God, expressed in the four first commandments; and the second, our duty to our neighbour, enforced in the six last. The church of Rome, for a very obvious reason, hath omitted the second commandment in many of her books; and in order to preserve the number complete, divided the last into two.

DECAMERIS, a term signifying a tenth part; used by Mr. Sauveur, and some other authors, to mark and measure the intervals of sounds.

The word is formed of δεκα, *ten*, and μερος, *part*.

In Mr. Sauveur's system, the *decameris* is the tenth part of the heptameris, which he makes the seventh part of the meris; and this is the forty-third part of the octave: so that the *decameris* is $\frac{1}{7000}$ of an octave. See Mem. Acad. Scienc. 1701, and 1707.

DECAMERON, from δεκα, *ten*, and ημερα, *day*; a work containing the actions or conversations of ten days. Boccacio's Decameron consists of one hundred novels related in ten days.

DECAMP. When an army raises its camp, or breaks up from the place where it lay before, they say it is *decamped*.

DECAMYRON, in the *Medicinal Writings of the Ancients*, the name of a malagma or cataplasm, consisting of ten different kinds of aromatics: these were the Indian leaf, nasitic, euphorbium, spikenard, adarce, storax, pepper, ointment of nard, opobalsamum, and wax.

DECANDRIA, in *Botany*, the tenth class of plants, with hermaphrodite flowers, and ten stamina, or male parts in each. See *Tab. of Botany, Linnæan System*.

The word is formed of the Greek δεκα, *ten*, and ανηρ, *male*.

Of this class of plants there are five orders; viz. the *monogynia*, containing fifty-three genera; the *digynia*, comprehending twelve genera; the *trigynia*, eleven; the *tetragynia*, fourteen; and the *decagynia*, two genera.

DECANTATION, in *Chemistry*, the act of pouring off a liquor from the feces, &c. by gently inclining the lip, or *canthus* of the vessel; whence the word is derived. See CANTHUS.

DECANUS, among the Romans, an officer who had ten other officers, or persons, under his charge; whence our English dean.

DECANUS, in *Astrology*, a title given to the god who presided at any birth, ὡροσκοπος. See ASTROLOGY.

DECAPITE, in *Heraldry*. See DEFFAIT.

DECAPROTI, DECEMPRIMI, among the *Ancients*, were officers who gathered the tributes, or taxes.

The word comes from δεκα, *ten*, and προτος, *first*; probably because the ten first, or principal persons of each community, were chosen to make the levies.

The *decaproti* were obliged to pay for the dead; or, to answer to the emperor for the quota of such as died, out of their own estates. Cicero, in his oration for Roscius, calls them *decemprimi*.

DECASMUS, Δεκασμος, in *Antiquity*, the name of an action or process among the Athenians, which was brought against any person who offered a bribe. They thought it not enough to punish the person receiving a bribe, but that the person who offered it ought to be punished likewise. Pott. Archæol. Græc. lib. i. c. 23.

DECASTYLE, in the *Ancient Architecture*, a building with an ordonnance of ten columns in front. The temple of Jupiter Olympius was *decastyle*.

The word is formed of δεκα, and στυλος, *column*.

DECEIT, *Deceptio*, or *Dolus*, in *Law*, is used for any subtile, wily shift, or trick; to which may be referred all manner of craft, subtilty, guile, fraud, sleight, cunning, covin, collusion, and practice used to deceive another by any means.

Deceit is an offence both by common law and by statute. All practices of defrauding, or endeavouring to defraud, another of his right, are punishable by fine and imprisonment, sometimes pillory, &c. and there is a writ called *deceptione*, that lies for one who receives injury, or damage, &c.

A writ of *deceit* lies against attornies, for losses sustained by their default; also against bakers, brewers, and other artificers, for not selling good commodities, or refusing to perform a bargain: in all which cases they are by statute liable to penalties in proportion to their offence.

DECEIVED, in the *Manege*, is used when a horse upon a demi-volt of one or two treads, working, for instance, to the right, and not having yet finished above half the demi-volt, is pressed one time or motion forwards with the inner leg, and then is put to a reprise upon the left, in the same cadence with which he began. He thus regains the place where the demi-volt had been begun to the right, and works to the left. A horse may in this manner be *deceived* on any hand. Guillet, Gen. Dict. par. 1. in voc.

DECEMBER, the last month of the year; wherein the sun enters the tropic of Capricorn, and makes the winter solstice.

In Romulus's year, *December* was the tenth month; whence the name, viz. from *decem*, *ten*: for the Romans began their year in March.

The month of *December* was under the protection of Vesta: Romulus assigned it thirty days; Numa reduced it to twenty-nine; which Julius Cæsar increased to thirty-one.

Under the reign of Commodus, this month was called, by way of flattery, *Amonianus*, in honour of a courtezan, whom that prince passionately loved, and had got painted like an *Amazon*; but it only kept the name during that emperor's life.

At the latter end of this month they had the *Juvenales ludi*, and the country people kept the feast of the goddess Vacuna in the fields, having then gathered in their fruits, and sown their corn; whence seems to be derived our popular festival called *harvest-home*.

DECEMPEDA, Δεκαπους, *ten-feet rod*; an instrument used by the antients in measuring.

The *decempeda* was a rule, or rod, divided into ten feet; whence its name, from *decem*, *ten*, and *pes*, *pedis*, *foot*.

The foot was subdivided into twelve inches; and each inch into ten digits.

The *decempeda* was used both in measuring of land, like the chain among us; and by architects, to give the proper dimentions and proportions to the parts of their buildings, which use it still retains. Horace, lib. ii. od. 15. blaming the magnificence and delicacy of the buildings of his time, observes, that it was otherwise in the times of Romulus and Cato; that in the houses of private persons there were not then known any porticoes measured out with the *decempeda*, nor turned to the north to take the cool air.

DECEM-TALES, in *Law*, a writ that issues directed to the sheriff, whereby he is commanded to make a supply of jurymen, when a sufficient number does not appear on a trial at bar.

DECEMVIRI, an order of annual magistrates among the Romans, created with a sovereign power to draw up and make laws for the people; thus called, because their number was ten.

To the *decemviri* was given all the legislative authority ever enjoyed by the kings, and after them by the consuls. One among them had all the ensigns and honours of the function; and the rest had the like in their turn, during the year of their *decemvirate*.

The *decemviri* were those who drew up the laws of the Twelve Tables, called thence *leges decemvirales*, which for a considerable time were the whole of the Roman law.

In the year 302, the consuls Appius Claudius Crassinius, and T. Genucius Augurinus, being obliged to abdicate, the first *decemviri* were created; in the year following, ten new ones were appointed to succeed them; and in the year 304, another set were to have been chosen, but that the people rose, made them lay down, and resumed the consuls. The excessive debauchery of Appius Claudius Crassinius, one of the consuls, who was first obliged to abdicate, and who had been chosen first *decemvir* three times, was the principal cause of all this. Cicero De Finib. lib. i. Livy, lib. iii. Halicarnassæus, lib. x. and Florus, lib. i. c. 24. relate the history.

The *decemviral* administration, however, it is to be observed, had not its first rise at the time when the authority of the consuls was devolved into the hands of the *decemviri*: for, during the interregnum that ensued after the death of Romulus, the management of affairs, which the senate then took upon them, is called by Halicarnassæus, lib. ii. *decemviral*, because the senators, divided into tens, commanded each in their turn: that is, one of each ten, for five days successively, having the fasces, lictors, &c. like the kings.

There were also military *decemviri*; and on divers emergencies, *decemviri* were created to manage and regulate certain affairs, after the same manner as boards of commissioners

missioners are appointed among us. Thus we find *decemviri* for conducting colonies; *decemviri* to prepare and preside at feasts in honour of the gods; *decemviri* to take care of the sacrifices; and *decemviri* to keep the Sibyls books.

Sometimes, in lieu of *decemviri*, they only created *septemviri*, or *triumviri*, or *duumviri*, &c.

DECENNALIA, in *Antiquity*, feasts which the Roman emperors held every tenth year of their reign, with sacrifices, games, largesses to the people, &c.

Augustus was the author of this custom, which was afterwards imitated by his successors.

At the same time they likewise offered vows for the emperor, and the perpetuity of his empire, called *vota decennalia*.

From the time of Antoninus Pius, we find these ceremonies marked on medals. PRIMI DECENNALES. SECUNDI DECENNALES. VOTA SOL. DECEN. II. VOTA SUSCEP. DECENN. III.

These vows must have been made at the beginning of every tenth year; for on a medal of Pertinax, who scarce reigned four months, we find VOTA DECENN. & VOTIS DECENNALIBUS.

Stevins is of opinion, that these vows took place of those which the censor used to make in the times of the republic, for the prosperity and preservation thereof. In effect, they were not only made in behalf of the prince, but also of the state, as may be observed from Dion. lib. viii. and Pliny the younger, lib. x. ep. 101.

Augustus's aim in establishing the *decennalia*, was to preserve the empire, and the sovereign power, without offence or restraint to the people. For, during the celebration of this feast, that prince used to surrender up all his authority into the hands of the people, who, filled with joy, and charmed with the goodness of Augustus, immediately delivered it to him back again

DECENNARY, *Decennaria*, the limits or compass of ten *frithsoken*. See DECIMERS, and TITHING.

DECEPTIONE, in *Law*, a writ which properly lies for one that receives harm or damage, by him that does any thing deceitfully in the name of another.

This writ is either *criminal* or *judicial*. Old. Nat. Br. fol. 50. Fitz. Nat. Br. fol. 95. See Reg. of Writs, fol. 122. and Reg. Judicial.

DECIDUOUS, in the general, expresses a thing apt and ready to fall.

In some plants, the perianthium or calyx is *deciduous* with the flower, that is, falls off from the plant with it; in others not.

In some the leaves are *deciduous*, or fall off in autumn; in others, they remain all the winter.

DECIES *tantum*, a writ that lies against a juror, who hath taken money for giving his verdict.

It is so called from its effect, which is to recover ten times as much as he took.

It also lies against embracers that procure such an inquest. See EMBRACER.

DECIL, *Decilis*, in *Astronomy*, an aspect or position of two planets, when they are distant from each other a tenth part of the zodiac, i. e. thirty-six degrees. This is one of the new aspects invented by Kepler.

DECIMAL *arithmetic*, the art of computing by *decimal* fractions, first invented by Johannes Regiomontanus, about the year 1464, and used by him in the construction of his tables of sines; who thus introduced *decimal* parts in the room of SEXAGESIMALS. They were also used by Ramus, in his Arithmetic, written in 1550; and before his time by our countryman Buckluus; and about the same time by Record. But the first person who wrote an express treatise on *decimals*, was Stevinus, about the year 1582.

DECIMAL *fractions*, are those whose denominator is 1, with one or more cyphers; as, 10, 100, 1000, 10000, &c. Thus, $\frac{78}{100}$, $\frac{1000}{10000}$, &c. are *decimal fractions*.

In the writing of *decimal fractions* we usually omit the denominator, as only consisting of unity with cyphers annexed; and in lieu thereof a point, or comma, called the *separatrix*, is prefixed to the numerator. Thus, $\frac{78}{100}$ is written ,78; $\frac{1000}{10000}$, ,1000. So ,125 expresses a hundred and twenty-five parts of any thing supposed to be divided into a thousand parts.

As cyphers on the right hand of integers do increase their value *decimally*; as, 2, 20, 200, &c. so, when set on the left hand of *decimal fractions*, they decrease the value *decimally*; as, ,5. ,05, ,005, &c. when set on the left hand of integers, or on the right hand of *decimals*, they signify nothing, but only to fill up places; thus, ,5000 denotes only five tenths, and ,005 is only five units.

To reduce any vulgar fraction, as suppose $\frac{1}{8}$, to a *decimal fraction* of the same value; add cyphers at pleasure to the numerator, and divide by the denominator; as thus,

$$8\overline{)5000}$$
$$,625$$

And therefore $\frac{1}{8} = ,625$, or ,625, is a *decimal* of the same value with the former fraction $\frac{1}{8}$.

Some vulgar fractions can never be reduced into *decimals*, without defect; as $\frac{1}{3}$, &c. in those cases, the greater number of places the *decimals* are continued to, the more is the defect diminished, in a tenfold proportion. Thus, $\frac{1}{3}$ expressed in *decimals* is ,333333 *ad infinitum*.

Such *decimals* are very properly called circulating *decimals*, because of the continual return of the same figures; and they may be called indeterminate or infinite *decimals*, by way of distinction from those where the reduction leaves no remainder, and which are therefore called finite or determinate *decimals*. See REPETENDS.

By the rule above given, the parts of any integer may be easily reduced into *decimals*. Thus, 5*s.* is $\frac{5}{20}$, or $\frac{25}{100}$ of a pound sterling; 6*d.* is $\frac{6}{240}$, or $\frac{1}{40}$, i. e. ,025 of a pound; and 5*s.* 6*d.* is ,25+,025=,275. Or the *decimal* of a mixed number may be readily obtained by reducing the number of the lowest species to the *decimal* of the next above; add to this the number of that species, if there be any, and reduce the sum to the next higher species, adding to the number found the number of that species given in the question; and thus proceed till you arrive at the proposed integer: 4 *l.* 7 *d.* 3 $\frac{1}{2}$ are equal to ,232916 *l.* for 3 $\frac{1}{2}$ is $\frac{7}{24}$, or ,175 *d.* to which add 7 *d.* and 7,175 is equal to $\frac{7175}{1000}$, or ,645833 &c. *s.* to which add 4 *s.* and 4,645833 &c. is equal to $\frac{4645833}{1000000}$, or ,232916 &c. *l.* The same process may be easily applied to the *decimal* parts of any other integer, as weights, measures, and times.

The common operations in *decimals* are performed as in the vulgar rules, regard being had only to the particular notation, to distinguish the integral from the fractional part of a sum.

In Addition and Subtraction of DECIMALS; the points being all placed under each other, the figures are to be added, and subtracted, as in common arithmetic; and when the operation is done, so many figures of the sum, or the remainder, are to be noted for *decimals*, as there are places of *decimals* in the greatest given numbers. An example will make this clear.

Addition of *Decimals*.

From	25 ,1462
Take	13 ,07
Rem.	12 ,0762

For Multiplication of DECIMALS, observe to cut off just so many *decimal* parts from the product as there are *decimals* in both factors. The work is the same as in integers. Thus,

Multiplication of *Decimals*.

,1472	,365	3,650
,175	,122	621
7360	730	3 650
10304	730	73 00
1472	365	2190 0
,0257600	,044530	2266,650

Note. In the first and second examples, the products only amount to six and five places; for which reason cyphers are prefixed, to make up the number of *decimal* places in the two factors respectively.

Hence, to multiply a *decimal* by unit with any number of cyphers, is only to remove the separatrix so many places to the right as there are cyphers annexed.

In Division of DECIMALS, proceed in all respects as in dividing of integers; and, when the operation is done, mark as many places in the quotient for *decimals*, as, with the number of *decimals* in the divisor, are equal to the *decimal* places of the dividend.

Hence, to divide a *decimal* by unit with any number of cyphers, is only to remove the ſeparatrix ſo many places to the left as there are cyphers annexed.

But there are certain caſes in diviſion of *decimals*, which require ſome farther management: as, firſt, where the diviſor is a *decimal fraction*, and the dividend is an integer; add, or annex, as many or rather more cyphers to the dividend, than there are places in the diviſor; thus, ,365)22,0000(60,2. For there being three places of *decimals* in the diviſor, and four in the dividend, there will be but one in the quotient. Secondly, Where the diviſor is a mixed number, and the dividend a whole number, add at leaſt as many cyphers to the dividend, as there are places in the diviſor; thus, 3,65)22,0000(6,02. Thirdly, Wherever the diviſor is bigger than the dividend, annex cyphers to the latter; thus,

30,5)22,0000(,602.

For the valuation of DECIMALS; multiply the given *decimal* by the number of parts contained in the propoſed integer, proceeding from the higher to the lower if there be a remainder, and you will have the value required at the left of the ſeparatrix. Thus, ,785 *l.* is equal to 15 *s.* 8 *d.* 1,6 *f.*

DECIMAL *ſcales*, in the general, denote any ſcales divided *decimally*; but particularly certain ſcales of money, weights, and meaſures, made from tables ſo called, to expedite *decimal* arithmetic, by ſhewing by *inſpection* the *decimal fraction* of any part of money, weigh, or meaſure. See SCALE.

DECIMATION, a puniſhment which the Romans uſed to inflict on the ſoldiers who had quitted their poſt, raiſed a mutiny in the camp, behaved themſelves cowardly in the fight, or otherwiſe failed in their duty: for which every tenth man was put to death as an example to the reſt.

The manner of *decimating* was thus: the general aſſembled the whole camp; then the tribune brought to him thoſe that were guilty, and impeached, and reprouched them with their cowardly actions, and baſeneſs, in the preſence of the whole army; then putting their names into an urn, or a helmet, as many were drawn out as made the tenth part of the whole number, and theſe were put to the ſword, and the others ſaved.

This was called *decimare*, a word of the ancient Roman militia, who, to puniſh whole legions, when they had failed in their duty, ſometimes alſo made every tenth ſoldier draw lots, and put him to death for an example to the others.

As the Romans had their *decimatio*, they had alſo the *vicenſimatio*, and even *centeſimatio*, when only the twentieth or hundreth man ſuffered by lot.

This practice has been occaſionally recurred to in modern times: as, particularly, in France, for the puniſhment of the garriſon of Treves in 1675, who capitulated and ſurrendered that place in oppoſition to the remonſtrance of the Marſhal de Crequi, who commanded there.

DECIMÆ. See TITHES.

DECIMIS *ſolvendis pro poſſeſſionibus alienigenarum*, a writ, yet extant in the regiſter, which lay againſt thoſe that had farmed the priors aliens lands of the king, for the rector of the pariſh, to recover his tithe of them. Reg. of Writs, fol. 179.

DECINERS, DECENNIERS, or DOZINERS, derived from the French *dizaine*, i. e. *decas*, *ten*; in the ancient monuments of our law, are ſuch as are wont to have the overſight and check of the friburghs, for maintenance of the king's peace; the limits of whoſe juriſdiction were called *decennæ*, and *dozein*.

They ſeem to have had very large authority in the Saxon times; taking cognizance of cauſes within their circuit, and redreſſing wrongs by way of judgment. Thus Briton, "We will that all thoſe who are fourteen years old "ſhall make oath, that they will be ſufficient and loyal "to us; and neither be felons, nor aſſenting to felons; "and we will, that all profeſs themſelves of this or that "*dozein*, and make cauſe ſurety of their behaviour by "thoſe or thoſe *dozeiners*, except religious perſons, clerks, "knights eldeſt ſons, and women."

A *dozein* now ſeems to be no more than a leet: for in leets only this oath is adminiſtered by the ſteward, and taken by ſuch as are twelve years old and upwards.

DECIPHERING, or DECYPHERING, the art, or act, of finding the alphabet of a *cipher*, or of explaining a letter written in CIPHER.

Every language has peculiar rules of *deciphering*; which depend not only on the form of its characters, but likewiſe on the place, order, combination, frequency, and number of the letters. The general theory of this art may be comprized in the following propoſitions: one word is to be compared with another, in order to obſerve both their reſemblance and their difference: no word can be without a vowel: a word of one letter is always a vowel, or a conſonant with an apoſtrophe: the vowels recur much more frequently than the conſonants: double vowels may be produced at the beginning of a word, but not double conſonants; and double characters in this place are always vowels: ſhort words of two or three letters have two or three vowels, or one or two conſonants; and in words of this kind the vowels are moſt eaſily diſcovered: when double conſonants are preceded by a ſingle letter, that letter is a vowel: one vowel is often joined with another in words abounding with diphthongs: the conſonant, that always precedes or follows double conſonants, is one of the liquids *l*, *m*, *n*, *r*: the conſonant *q* is always followed by the vowel *u*, though *u* may be joined with other letters. When two different characters occur, the latter of which is often joined with various letters, and the former never found either by itſelf, or followed by any other letter, thoſe two are *q* and *u*; which letters are almoſt always followed by a vowel: one vowel and one conſonant recur more frequently than others. The particular theory of *deciphering* depends on the peculiar ſtructure of different languages to which it is applied. The curious, who deſire farther information on this ſubject, may conſult the Art of *Deciphering* deduced from principles, and explained by examples in the German, Dutch, Latin, Engliſh, French, Italian, and Greek languages, by David Arnold Conradus, in the twelfth volume of the Gentleman's Mag. for 1742. See alſo M. s'Graveſande Introd. ad Philoſophiam, cap. XXIV. Leyden, 1737.

B. Porta publiſhed a treatiſe on this ſubject; and a collection of letters written in cipher, and *deciphered* by Dr. Wallis, are now in the Library of Oxford.

DECK *of a ſhip*, from *decker*, Dan. *to cover*; a kind of planked floor, connecting the ſides, and ſerving as different platforms to ſupport the artillery, to lodge the men, and to preſerve the cargo in merchant-veſſels.

A ſhip is ſaid to have two or three *decks*, when it contains two or three ſtories. Ships of the firſt and ſecond rates are furniſhed with three whole *decks*, reaching from the ſtem to the ſtern, beſides a fore-caſtle and a quarter-*deck*, which extends from the ſtern to the main-maſt. There is alſo another *deck* above the hinder part of the quarter-*deck*, called the poop, and ſerving as a roof for the captain's cabin or conch. Inferior ſhips of the line of battle have two *decks* and a half; and frigates, ſloops, &c. have one gun-*deck* and a half, with a ſpare *deck* below to lodge the crew. The frame of the lower *deck* is ſtronger than that of the others, becauſe ſhips are broader at the lower *deck* than at the next above it, and it alſo bears the heavieſt cannon.

The *decks* are formed and ſuſtained by the BEAMS, the CLAMPS, the WATER-WAYS, the CARLINGS, the LEDGES, the KNEES, and two rows of ſmall pillars, called STANCHIONS.

DECK, *Fluſh*, is one that lies even in a right line, fore and aft, from ſtem to ſtern.

The ſeamen ſay, *a deck lies cambering*, when it doth not lie level, but higher at the middle than at either end. A

cumbered *deck* is by no means proper for a man of war. Alſo, if the ſhip's keel be bent in the middle upwards (which may happen from her lying a-ground on a place, where neither her aft nor fore-part touch it, and from many other reaſons taken from her make), they ſay, *ſhe is camber-keeled.*

DECK, *Half*, is a ſpace under the quarter-*deck* of a ſhip of war, between the foremoſt bulk head of the ſteerage, and the fore-part of the quarter-*deck*. In the Northumberland colliers, the ſteerage is called the *half-deck*, and is uſually the habitation of the ſhip's crew.

DECK, a *Rope*, is that made of cordages interwoven, and ſtretched over a veſſel that has no *deck*, through which it is eaſy to annoy the enemy who comes to board her, and has leaped thereon. Theſe are little uſed but in merchant-veſſels, to defend them from the corſairs.

DECLAMATION, a diſcourſe or ſpeech made in public, in the tone and manner of an oration.

Among the Greeks, *declamation* was the art of ſpeaking indifferently on all ſubjects, and on all ſides of a queſtion; of making a thing appear juſt that was unjuſt; and of triumphing over the beſt and ſoundeſt reaſons.

Such ſort of *declamations*, M. de St. Evremond obſerves, were fit only to corrupt the mind, by accuſtoming men to cultivate their imagination rather than to form their judgment, and to ſeek for veriſimilitudes to impoſe upon, rather than ſolid reaſons to convince, the underſtanding.

It is ſaid that a certain orator, named Plotius Gallus, firſt introduced the uſe of *declamations* at Rome. In this way Cicero formed himſelf for eloquence. The term frequently occurs both in Horace and Juvenal.

Among us, *declamation* is reſtrained to certain exerciſes, which ſcholars perform, to teach them to ſpeak in public.

We ſay, a *declamation* againſt Hannibal, againſt Pyrrhus, the *declamation* of Quintilian, &c.

In the colleges of the Jeſuits, *declamations* are little theatrical or dramatic performances, conſiſting of a few ſcenes, not divided into acts, rehearſed by the ſtudents by way of exerciſe, and to form them for ſpeaking in public. Such *declamations* are the moſt uſeful exerciſes performed in the colleges.

DECLARATION, in the *Cuſtom-Houſe and Commerce of France*, contains a particular account or invoice of what is contained in the bales or caſes, brought to the officer for entrance inward or outward.

DECLARATION, in *Law*, the act of ſhewing in writing the cauſe of complaint of the demandant, or plaintiff, againſt the defendant, where he is ſuppoſed to have received ſome wrong.

This ought to be plain and certain, both becauſe it impeacheth the defendant, and alſo compels him to anſwer thereto. It muſt alſo ſet forth the plaintiff's and defendant's names, the nature and cauſe of the action, &c. and the damage received. See COUNT.

DECLARATION *of fidelity*, is uſed for a confeſſion, which the Quakers, who ſcruple taking the oaths of ſupremacy, &c. are obliged to make and ſubſcribe in lieu thereof.

Its tenor is a ſolemn promiſe to be true and faithful to king George; with a deteſtation and horror of that damnable poſition, that princes excommunicated by the pope, or any other power, may be depoſed or murdered; and a *declaration*, that no foreign prince, or power, has any right, juriſdiction, or authority, in this kingdom.

There is alſo a *declaration* againſt tranſubſtantiation made and ſubſcribed by thoſe who qualify for offices; 25 Car. II. c. 2. and a *declaration* againſt popery to be made and ſubſcribed by the members of both houſes of parliament, by diſſenters qualified according to the toleration act, &c. &c. in which they renounce tranſubſtantiation, the invocation of ſaints and of the Virgin Mary, and the ſacrifice of the maſs, and every kind of evaſion, and mental reſervation, as well as diſpenſation or abſolution. 30 Car. II. ſtat. 2. c. 1.

DECLARATIONS, *Clerk of the*. See CLERK.

DECLARATORY *part of a Law*, is that by which the rights to be obſerved, and the wrongs to be avoided, are clearly defined and laid down. This depends not ſo much on the law of revelation or of nature, as on the wiſdom and will of the legiſlator.

DECLARATORY *part of a Statute*, is that which relates to obſolete or diſputable cuſtoms; in which caſe the parliament has thought proper, *in perpetuum rei teſtimonium*, and for avoiding all doubts and difficulties, to *declare* what the common law is and ever hath been.

DECLENSION, in *Grammar*, the inflexion of a noun, according to its diverſe caſes. See CASE, NOMINATIVE, &c.

Mr. Harris obſerves, that the Peripatetics likened the noun in its primary and original form, to a perpendicular line; and the variations from the nominative were conſidered as if that line *fell* from its perpendicular to an oblique poſition: and hence theſe variations were called πτωσεις, *caſus*, *caſes*, or *fallings*. Grammarians were thus led to call the method of enumerating the various caſes of a noun, κλισις, *declinatio*, *a declenſion*; becauſe it was a ſort of progreſſive deſcent from the noun's upright form, through its various declining forms. Hermes, p. 277, 278.

The *declenſion* of nouns is a different thing in the modern languages, which have not properly any caſes, from what it is in the ancient Greek and Latin, which have.

Declenſion, in languages wherein the nouns admit of changes, whether in the middle, beginning, or end, is properly the expreſſing or reciting all thoſe changes in a certain order, and by certain degrees, called *caſes*.

In languages wherein the nouns do not admit of changes in the ſame number, *declenſion* is the expreſſing of the different ſtates or habitudes a noun is in, and the different relations it has: which difference of relations is marked by particles called *articles*; as, *a*, *the*, *of*, *to*, *from*, &c.

DECLENSION *of a diſeaſe*, is when it is paſt its height, and the ſymptoms abate.

DECLINATION, in *Aſtronomy*, the diſtance of the ſun, a ſtar, planet, or other point of the ſphere of the world, from the equator, either northward or ſouthward. It is the ſame with LATITUDE in geography.

Declination is either *real* or *apparent*, according as the real or apparent place of the point is conſidered.

The *declination* is an arch of a great circle, as GS (*Tab. Aſtronomy, fig. 4.*), intercepted between a given point, as S, and the equator AQ, and perpendicular to the ſame. Conſequently, the circle, by whoſe arch the *declination* GS is meaſured, paſſes through the poles of the world.

The *declination* of a ſtar, &c. is found by firſt obſerving the altitude of the pole, as PR (*fig. 5.*) This ſubtracted from 90° gives the height of the equator AH. Then, the meridian altitude of the ſtar HD being obſerved, if it be greater than the altitude of the equator AH, the latter ſubtracted from the former leaves the *declination* northward AD; or, if the altitude of the ſtar HT be leſs than that of the equator HA, the former ſubtracted from the latter leaves the *declination* ſouthward TA.

E. gr. Tycho at Uraniſbourg obſerved the meridian altitude of the Cauda Leonis:

	HD	50°	59′	0″
Altitude of equat.	HA	34	5	20
Declinat. therefore,	AD	16	53	40

If the ſtar be in the quadrant ZR, then the leaſt altitude MR ſubtracted from the altitude of the pole PR leaves the diſtance from the pole PM; which ſubtracted again from the quadrant PQ, leaves the *declination* MQ. E. gr. M. Couplet obſerved PM 2° 18′ 50″, which ſubtracted from 90° leaves MQ 87° 41′ 10″. And by this method are conſtructed the tables of *declination* of the fixed ſtars given us by Ricciolus and Dechales.

In the conſtruction of tables of *declination* of the ſun, planets, and ſtars, regard ſhould be had to REFRACTION, ABERRATION, NUTATION, and PARALLAX.

By comparing the ancient obſervations with the modern, it appears, that the *declination* of the fixed ſtars is variable; and that differently, in different ſtars. For in ſome it increaſes, and in others decreaſes, and that in different quantities.

It has been greatly diſputed among the latter mathematicians, whether or no the *declination* and the obliquity of the ecliptic be variable. See ECLIPTIC, and OBLIQUITY.

A TABLE SHEWING THE SUN's PLACE AND DECLINATION.

January.

This table was calculated by Mr. Ferguſon for the noon of every day of the ſecond year after leap-year, on the meridian of Greenwich; which is a mean between thoſe of leap-year itſelf and the firſt and third years after. See a table of *declination*, &c. annually publiſhed in the *Nautical* ALMANACK.

DECLINATION, *Circle of*, is a great circle of the ſphere paſſing through the poles of the world; and on which the *declination* of a ſtar is meaſured; ſuch is P D G K, paſſing through the poles P and K, *Tab. Aſtronomy, fig.* 4.

DECLINATION, *Parallax of*, is an arch of the circle of *declination*, whereby the parallax of the altitude increaſes or diminiſhes the *declination* of a ſtar.

DECLINATION, *Refraction of the*, an arch of the circle of *declination*, whereby the *declination* of a ſtar is increaſed or diminiſhed by means of the refraction.

DECLINATION *of the needle*, or *compaſs*, is its VARIATION from the true meridian.

DECLINATION *of a vertical plane, or wall*, in *Dialling*, is an arch of the horizon, comprehended either between the plane, and the prime vertical circle, if you account it from eaſt to weſt; or between the meridian and the plane, if you account it from north to ſouth.

There are many ways given by authors for finding the *declination* of planes; the moſt practicable way is by a *declinator*.

DECLINATOR, or DECLINATORY, an inſtrument in dialling, whereby the declination, inclination, and reclination of planes is determined.

Its ſtructure is as follows: on a ſquare wooden board A B C D (*Tab. Dialling, fig.* 1.) deſcribe a ſemicircle A E D, and divide the two quadrants thereof A E and E D into 90 degrees each, beginning from E, as in the figure. Then, having fixed a pin in the centre F, fit a wooden ruler H I upon the ſame, moveable thereon, with a box and needle K, as ſhewn under COMPASS.

Now, to apply this, in taking the *declination* of a plane: apply the ſide A D of the inſtrument to the plane propoſed, as M N (*fig.* 2.); and move the ruler F G, with the compaſs G, this way and that, about the centre F, till the needle reſt upon the line of the magnetical meridian of the place. Now, if the ruler in this ſituation cut the quadrant in E, the plane is either northern or ſouthern: but if it cut between D and E, the plane declines to the weſt; or, if between A and E, to the eaſt by the quantity of the angle G F E.

The ſame inſtrument will alſo ſerve to take the inclinations and reclinations of planes. To this end inſtead of the ruler and needle, a thread with a plumbet is fitted on a pin in the centre F: then the ſide B C of the *declinator* A B C D, being applied to the propoſed plane, as I L (*fig.* 3.), if the plumb-line F G cut the ſemicircle A E D in the point E, the plane is horizontal: or if it cut the quadrant E D in any point at G, then will E F G be the angle of inclination: laſtly, if applying the ſide A B to the plane, the plumbet cut E, the plane is vertical. Hence, if the quantity of the angle of inclination be compared with the elevation of the pole, and equator, it is eaſily known whether the plane be inclined, or reclined. See INCLINATION and RECLINATION.

DECLINATORY *Plea*, in *Law*. See *Benefit of* CLERGY.

DECLINERS, or DECLINING *dials*, are thoſe which cut either the plane of the prime vertical circle, or the plane of the horizon, obliquely.

If we conceive the plane of the prime vertical circle to revolve a little upon a right line drawn from zenith to nadir, the plane will become declining; nor will it be any longer cut at right angles by the meridian, but by ſome vertical circle paſſing through the intermediate points. After the like manner an horizontal plane will be brought to decline, if revolving on the meridian line, one part of it be raiſed a little towards the zenith, and the other depreſſed towards the nadir.

The uſe of declining vertical dials is very frequent, becauſe the walls of houſes whereon dials are commonly drawn, do generally decline from the cardinal points. Incliners and recliners, and eſpecially declinciners, are very rare. See DIAL.

DECLIVIS, in *Anatomy*, a muſcle of the abdomen, called alſo OBLIQUUS *deſcendens*.

DECLIVITY. See ACCLIVITY.

DECOCTION, the act of boiling any ſubſtance in water, to extract the virtues out of the ſame for ſome medicinal purpoſe; or the water itſelf, in which the ſubſtance has been boiled.

Decoction is moſtly employed about balſamics, detergents, and cathartics; for it is not ſo proper for cephalics, &c. as it exhales the more volatile parts, in which the virtues of all thoſe ingredients conſiſt. The harder bodies, as woods, dried roots, &c. require moſt boiling; but herbs and ſeeds need only be ſcalded. All thoſe *decoctions* which are reſtringent, and moſt of the cathartics, may for the greater elegance be cleariſied: but all ſuch as are emollient, and intended to conſiſt of the ſoft and mucilaginous parts of ſimples, are by no means to be ſo managed.

M. Boulduc aſſures us from his own experience, that the infuſions of vegetable purgatives act better, and produce better effects, than their *decoctions*; which he attributes to this, that the pureſt and moſt active principles of thoſe bodies are diſſipated and evaporated by a boiling heat. Memoires de l' Academie Royale des Sciences, an. 1710. And M. Baumé, in his Elements of Pharmacy, obſerves, that the infuſion of Peruvian bark made without heat contains more of its principles than the *decoction*: becauſe heat ſeparates and precipitates a conſiderable quantity of reſinous ſubſtance, of which the bark conſiſts: and it is obſerved in general, that *decoction* ought not to be employed but when abſolutely neceſſary, or when the ſame principles and the ſame quantity of thoſe principles cannot be obtained by an infuſion without heat.

DECOLLATION, *beheading*, a term frequently uſed in the phraſe, *decollation* of St. John Baptiſt, which denotes a painting, wherein is repreſented the Baptiſt's head, ſtruck off from his trunk; or, the ſcull held in honour of the martyr.

DECOMPOSITE *Leaf*, in *Botany*. See LEAF.

DECOMPOSITION, in *Chemiſtry* and *Pharmacy*, the ſame with analyſis or reſolution; viz. the reduction of a body into its principles, or component parts.

DECOMPOSITION is ſometimes taken for any ſort of reſolution, or ſeparation of parts; but, in propriety, *decompoſition* is a chemical proceſs, in order to a ſeparation of the heterogeneities, or impurities, from any matter.

Tradition, founded on repeated experiments, is a much ſurer way of arriving at the knowledge of the properties of a plant, than any chemical analyſis, or *decompoſition* of its principles. See MEDICINE.

DECOMPOSITION is uſed by Boyle, Newton, and other Engliſh authors, to ſignify the compoſition or junction of two or more bodies, which were previouſly compounded of other parts.

DECORATION, in *Architecture*, any thing that adorns and enriches a building, church, triumphal arch, or the like, either without-ſide, or within.

The orders of architecture contribute greatly to the *decoration*; but then the ſeveral parts of thoſe orders muſt have their juſt proportions, characters, and ornaments; otherwiſe the fineſt order will bring confuſion rather than richneſs.

Decorations in churches are paintings, vaſes, feſtoons, &c. occaſionally applied to the walls; but that with ſo much ſkill, as not to take off any thing from the form of the architecture; as is much practiſed in Italy, at the ſolemn feaſts.

DECORATION is more properly applied to the ſcenes of theatres, which muſt be frequently changed, conformably to the ſubject.

The ancients had two kinds of *decorations* for their theatres; the firſt, called *verſatiles*, having three ſides, or faces, which were turned ſucceſſively to the ſpectators; the other, called *ductiles*, ſhewing a new *decoration* by drawing, or ſliding another before it.

This latter ſort is ſtill uſed, and apparently with much greater ſucceſs than among the ancients, who were obliged to draw a curtain whenever they made a change in the *decoration*; whereas on our ſtage the change is made in a moment, and almoſt without being perceived.

DECORTICATION, the act of peeling, or unbuſking roots, ſeeds, fruits, branches, &c. or of freeing them from their barks, rinds, huſks, or ſhells.

DECORUM, *Decor*, in *Architecture*, denotes the ſuitableneſs of a building, and of the ſeveral parts and ornaments thereof, to the place and occaſion.

Vitruvius is very ſevere in this point, and gives expreſs rules for appropriating, or ſuiting the ſeveral orders to their natural characters: ſo, e. gr. as that a Corinthian column may not be ſet at the entrance of a priſon, or gatehouſe; nor a Tuſcan, in the portico of a temple; as ſome have done among us, in breach of *decorum*. Even in the diſpoſition of the offices of our ordinary houſes, we find grievous offences againſt *decorum*; the kitchen being often where the parlour ſhould be, and that in the firſt and beſt flory, which ſhould have been condemned to the loweſt, and worſt.

DECOUPLE, in *Heraldry*, the ſame as uncouple, i. e. parted, or ſevered.

Thus, a chevron *decouplé* is a chevron wanting ſo much towards the point, that the two ends ſtand at a diſtance from each other.

DECOURS, } in *Heraldry*. See DECREMENT.
DECRESSANT, }

DECOY, a place made fit for catching of wild fowl.

Hence alſo a *decoy-duck* is one that flies abroad, and lights

light into company of wild ones, and, being become acquainted with them, by her allurement draws them into the *decoy* place, where they become a prey. See FOWL.

The *decoy* is usually made where there is a large pond, surrounded with wood, and behind it a marshy and uncultivated country, where the wild-fowl may securely sleep during the day-time. The *decoy* consists of several pipes, as they are called, which lead up a narrow ditch, that closes at last with a funnel-net. Over these pipes, which become narrower from the full entrance, is fixed a continued arch of netting suspended on hoops. There is usually a pipe or arch for almost every wind that can blow, as the wild fowl are determined by this circumstance which pipe to choose; and the *decoy*-man always keeps on the leeward side of the ducks to prevent his effluvia from reaching their fagacious nostrils. Screens made of reeds are placed at certain distances along each pipe, in such a manner, that it is impossible for the wild-fowl to see the *decoy*-man, before they have pushed forwards the end of the pipe where the net is placed. In the evenings, when the wild-fowl begin to feed, the *decoy* rises, and the noise of their wings, in their flight, may be heard at a great distance. The rising of the *decoy* is in Somersetshire called *reddup*. The *decoy*-ducks are fed with hempen-seed, which is thrown in small quantities over the flat-net, to bring them forwards into the pipes, and to allure the wild-fowl to follow. They are so trained as to lead the way, after hearing the whistle of the *decoy*-man, and enticed by the hempen-seed, and to dive under water, whilst the wild-fowl fly on, and are taken in the net. When they are in such a sleepy state as not to follow the *decoy*-ducks, a small dog is made to pass between the screens, approaching gradually nearer and nearer to the purse-net; which draws the attention of the wild-fowl, and makes them to advance forward: at length the *decoy*-man appears behind a screen, and drives them into the net.

The general season for catching wild-fowl in *decoys* is from the latter end of October till February. The act of 10 Geo. II. cap. 32. forbids taking them from June 1 to Oct. 1. under a penalty of five shillings for every bird destroyed within that time. The Lincolnshire *decoys*, which principally supply the London markets, are rented from 50 to 250*l.* a year. Pennant's Zoology, vol. ii. p. 594. 8vo. 1776.

DECOY, in *Sea Language*, denotes a stratagem employed by a small ship of war to decoy a vessel of inferior force into a station, till the enemy within gun-shot. The men and sides are painted so as to disguise the ship, and the emblems and ornaments of the nation to which the stranger belongs, are assumed. When the adversary is allured to chace, the *decoy* is continued by spreading a great sail, as if the endeavoured to escape, but her course is retained by an artful alteration of her trim. The *decoy* is also performed for enticing the chase of a ship of superior force in a dark night, by having out a lighted cask of pitch, which will burn for a considerable time, and extinguish the moment when the cask is thrown out, the course of the pursuing ship is changed.

DECREE, DECRETUM, in order, or resolve, made by a superior power, for the regulations of an inferior.

The commerce between soul and body, F. Malebranche observes, has no other simultaneous connection, but the efficacy of the divine *decrees*. Second causes only execute the *decrees* of Providence.

The doctrine of the Calvinists has been charged with implying that God concurs to sin by a positive *decree*: in that, it comes were not ordained by an antecedent *decree*, God could not foresee the events.

DECREES of councils are the laws made by them to regulate the doctrine and policy of the church.

DECREE was originally used by the lawyers for any thing ordained by the prince, upon cognizance of a cause.

But the canonists now restrain the word *decree* to the ordinances of popes, which form the first part of the canon-law; as the name canon is to what is ordained by councils.

DECREES in chancery are the determinations or sentences of the lord chancellor, upon full hearing, and weighing the merits of the cause. See CHANCERY.

DECREMENT, or DECRESCENT, in *Heraldry*, denotes the wane, or decrease of the moon, when she is receding from the full towards the new.

In this flate she is called, in blazon, a *moon-decrescent, or en decrescent*; hence to call it a crescent, would be improper, as that term denotes an increase. The moon looking to the left side of the escutcheon, is always supposed to be *decrescent*: when she faces the right she is crescent, or in her growth.

DECREMENT, *equal, of life*. See COMPLEMENT *of life*.

DECREPITATION, in *Chemistry*, the operation of drying and calcining salts over the fire, continuing till such time as they cease to crackle.

DECREPITATION is also applied to the noise or crackling of the salts during the operation.

The design of this operation is to free the salt of its superfluous moisture; that the salt is hereby rendered to powder, and apt to imbibe moisture, that unless it be kept very close afterwards, it soon moulders again.

DECREPITUDE, in *Medicine*, the consequence of the infirmities of old age; which by degrees leads to death. See DEATH.

DECTA, in *Botany*, a name used by some authors for the garden-beet.

DECRETAL, a rescript, or letter of a pope, whereby some point or question in the ecclesiastical law is solved, or determined.

The *decretals*, *jura decretalia*, compose the second part of the CANON-*law*.

All the *decretals* attributed to the popes before Siricius, in 385, are evidently supposititious. They are forged by some the spurious offspring of Isidore, archbishop of Seville, by reason the collection the real bears the name of Isidore Pecceator, or Mercator. They were first published by Rotolph, bishop of Mentz, in the ninth century.

Pope Gregory IX. in the thirteenth century, procured a compilation to be made of all the *decrees* of pontifical constitutions of his predecessors, in five books, by Friar Raimond, a Dominican, his chaplain; which is the only collection authorized by the holy see to be read in schools.

DECUBITUS, in *Medicine*, the manner of lying or reposing in bed.

Every physician knows that the principal indications of the strength or weakness of the motive faculty are taken from the *decubitus*; and indeed we may with very good reason judge of the state of this faculty, by the *decubitus* itself; in the consideration of which two many circumstances occur for us to particularize.

DECUMANNI *Decani*, a term used by the Latin writers in heraldry to express that form of line in arms, which we call dancette, or dancetty. See DANCETTE.

It is a kind of indented line, but is very large, and has very few south, commonly no more than three. It is supposed to have been at its origin no other than the letter M, with its two legs extended from one side of the field to the other.

DECURRENT *leaf*, in *Botany*, See LEAF.

DECUPLE, in *Arithmetic*, a term of relation, or proportion, implying a thing to be ten times as much as another.

DECURIO, the chief, or commander of a *decury*, both in the Roman army, and in the college or assembly of the people. See DECURY.

DECURIA *mercatalis* was a name given to the senators of the Roman colonies.

These were called *decuriones*, because their court, or company always consisted of ten persons. See DECURY.

By means hereof, the citizens of Italy, at least such as had colonies, had a share under Augustus, in the election of the Roman magistrates; the *decuriones*, or senators of those cities, having suffrages therein, which they sent, sealed up, to Rome, a little before the election.

DECURIO was also a name given to certain priests, instituted, as it should seem, for some particular sacrifices, or other religious ceremonies; or for the sacrifices of private families and houses, as Servius conjectures, who thence derives their name.

But the origin of the name what it will, we have an inscription in Gruter, which confirms what we have said of their function: ANCILLAE. VE. AUG. Q. VAR. IS. AEDE. DECURIO. ADJECTVS. EX. CONSENSV. DECVRIORVM. FAMILIAE. VOLVNTATE. Which proves that there was a *decurio* in the house of a private person, Q. Terentius.

DECURSIO, in *Roman Antiquity*. See CAMPIDUCTIO.

DECURY, ten persons ranged under one chief, or leader, called the *decurio*.

The Roman cavalry was divided into *decuries*.

Romulus divided the whole Roman people into three tribes; over each of which he appointed a tribune: each tribe he subdivided into ten centuries, with centurions at their heads; and each century he subdivided further into ten *decuries*, over each of which a *decurio* commanded.

DECUSSATION, in *Geometry*, *Optics*, and *Anatomy*, the points wherein two lines, rays, or nerves, cross, or intersect each other: or the action itself of crossing.

The optic nerves of both eyes are commonly supposed to *decussate* before they reach the brain; to which *decussation* many authors attribute it, that we see single with two eyes; though others deny this *decussation*.

The rays of light *decussate* in the crystalline, before they reach the retina.

There are divers muscles, membranes, &c. that *dissolute*; their fibres running over each other at greater or lesser angles, and by that means giving both strength and convenience of motion, in different ways.

DECUSSIS, a Roman coin, which had different values. At first it was worth ten *as*, under Tiberius fifteen, and under Augustus twelve.

DECUSSORIUM, a surgeon's instrument, wherewith the *dura mater* is pealed down in trepanning, to secure it from damage in the operation.

DEDI, in *Conveyance*, imports a warranty given to the feoffee, and his heirs. See WARRANTY.

DEDICATION, the act of consecrating a temple, altar, statue, place, &c. to the honour of some deity. See TEMPLE, ALTAR, CHURCH, &c.

The use of dedication is very ancient, both among the worshippers of the true God, and among the heathens: the Hebrews call it חנכה, *chanucah*, *initiation*; which the Greek translators render ἐγκαινισμὸς, and ἐγκαινισμὸς δε, *renewing*.

In the Scripture we meet with *dedications* of the tabernacle, of altars, of the first and second temple, and even of the houses of private persons: Exod. xl. 10, 11. Lev. viii. 10. Deut. xx. 5. 1 Kings viii. 63. 2 Chron. vii. 5. 9. Ezra vi. 16, 17. 1 Esdr. xiv. 7. Psalm. xxx. 1. Dan. iii. 2, 3. There are also *dedications* of vessels and garments to the priests and Levites, and even of the men themselves.

Among the Christian differentiam, we call the like ceremonies *consecrating*, *consecration*, *ordination*, &c. and not *dedication*, which is only applied to places, as to churches; and is properly the consecration thereof performed by a bishop with a number of ceremonies prescribed by the church. See CONSECRATION.

The Christians, finding themselves at liberty under Constantine, in lieu of their ruinous churches, built new ones in every place; and *dedicated* them with a great deal of solemnity. The *dedication* was usually performed in a synod; at least there assembled a number of bishops, to assist at the festival. We have the description of those of the churches at Jerusalem and Tyre, in Eusebius, and many others in later writers.

The instrumentary of Optatus, the *dedicator* of the baptistery at Cabarsussi, sufficiently from this of the church, which was performed with less ceremony than at present.

The *Feast of the Dedication*, or, rather, the feast-day of the dedication or patron of a church called, in our law-books, *wake*, *wacha*, was celebrated not only by the inhabitants of the place, but by those of all the neighbouring villages, who usually refused their ale and such victuals as were sold at the king. — *ad dedicationem, vel festum, &c. venientes, vendere non licet.*

The custom is still retained, in divers places, under the name of *feasts*, *wakes*, or *vigils*.

The Jews celebrated the anniversary of the *dedication* of their temple many days, together days; this was first established by Judas Maccabeus, and the whole family, in the 100 year of the Syro-Macedonian æra, 148, 1 Mac. 165 every holiness of the victory obtained by Judas Maccabeus over the Gentiles, it began every year on the 25th day of Casleu, and was continued to the eighth day, during all which time they illuminated their houses by setting up candles at every man's door, whence it was called the feast of lights. This festival Christ honoured with his presence at Jerusalem, John x. 22. Hence Modern says, that they began with one lamp, and added to the number, according to the day of the feast; so that on the last day they had eight lamps in their houses.

The heathens had also dedications of temples, altars, and images of their gods, &c. Nebuchadnezzar had a festival *dedication* of the statue, Daniel iii. 2. Pilate *dedicated* gilt bucklers in Jerusalem, to Tiberius; Philo de Legat. Tiberius would have *dedicated* a statue to the emperor in the same city, Joseph. l. xviii. Livius, Hist. lib. iv. cap. 29. mentions the *dedication* of the Capitol, upon rebuilding it by Vespasian, &c.

These *dedications* were performed with sacrifices proper to the deity they were consecrated to; but they were never performed without publick permission. Among the Greeks, it does not appear who gave that permission; but among the Romans, it was always the magistrate.

The Jews observed their anniversary, with the Jews, at that of the *dedication* of the temple of Pantheon, performed by Boniface.

The heathen temples were *dedicated* with many ceremonies, the principal of which were the following. The *pontifex* and *popæ* accompanied the temple with garlands and festoons of flowers; the vestal virgins, holding branches of olive-trees in their hands, sprinkled the outside of the temple with the lustral water; then the person who consecrated, being the *prætor*, *consul*, &c. drew near the gate with a pontiff at his side, who directed him in pronouncing the words of consecration; after which they sacrificed a beast in the court of the temple, and anointed a statue of the deity to whom it was *dedicated* with oil, and laid it on a pillow rubbed with oil. An inscription was afterwards made on some part of the temple, according to the name of the person who performed the office, and the year of *dedication*, which they usually observed by a sacrifice, or some other solemnity.

DEDICATION, in *Literature*, is an address prefixed to a book, soliciting patronage, or testifying respect for the person to whom it is made. The *dedication* of the fourth part of Sir Edward's History of Birds, is curious: *To God! the ONE eternal! the onely sufficient! the omnipresent! omniscient and Almighty Creator of all things that exist! from the least thing to the greatest, to the minutest points of matter, this ATOM is dedicated and devoted, with all possible gratitude, humiliation, and worship, and the highest adoration that of holy and weak, by his most refigned, low, and humble creature, &c. &c.*

DEDIMUS *potestatem*, in *Law*, a writ whereby commission is given to one or more, private persons, to admit for the expedition of some act belonging to a judge.

The civilians call it *delegatus*; it is granted most commonly upon suggestion, that the party who is to do something before a judge, or in a court, is so weak that he cannot travel.

In order to prove it, or to take a personal answer to a bill in chancery; to examine witnesses, or to levy a fine, &c.

DEDUCTION, in *Commerce*, a subtracting, or retrenching, a little sum yearly, from a greater remaining to pay.

DEDUCTION, in *Logic* and *science*, denotes a process or chain of reasoning, wherein from principles supposed and allowed, we arrive at the truth of any proposition. See REASONING.

DEDUCTOR, in *Antiquity*, a client, who, besides the ordinary ceremony of saluting his patron every morning, was likewise obliged to attend him on public occasions. Pitisc. Lex. Antiq. in voc.

DEDUTIONE, in the *Saxon Laws*, the name which Guido Aretine gave to the rise of the voice, in pronouncing the syllables *ut, re, mi, fa, sol, la*: *quia per has deducitur vox*. On the contrary, when the voice descended by, *la, sol, fa, mi, re, ut*, he called it *Reductione, quia per has revocatur vox*.

DEDUCTIVE *evidence*, in *Ethics*, is derived either from the invariable properties or relations of general ideas, or from the actual, though perhaps variable, connections subsisting among things. The former is called *demonstrative*, and the latter *moral*. Their differ from one another with respect to their subject; with respect to their nature, in the one admits of degrees and contrariety of proofs, which the other does not, and as the former is simple, arising from a coherent series of proofs mutually and essentially connected, and the latter is generally complicated, being composed of a number of independent proofs. Campbell's Hist. Hist. vol. 1. book 1. chap. 5.

DEED, *Fectum*, in *Law*, is called, *a writing sealed*, by way of eminence, because it is the most solemn and authentic act which a man can possibly perform, with respect to his property, in an instrument written on paper, or parchment, the validity of which consists in the following particulars: proper parties to contract with one another, and a proper subject matter to be contracted for; a good and sufficient consideration; writing on paper or parchment duly stamped; sufficient and legal words properly disposed; reading, if desired, before the execution; sealing; and by stat. 29 Car. II. cap. 3. in many cases signing also; and delivery; and which comprehends a contract, or bargain, between party and party.

If a deed wants any of the forementioned requisites, it is void *ab initio*; and it may be also avoided by matter *ex post facto*; as by razure, interlining, or alteration in any material part, without a memorandum made at the time of execution and attestation; by breaking off or defacing the seal; by delivering it up to be cancelled; by the disagreement of such whose concurrence is necessary; and by the judgment and decree of a court of judicature.

Of deeds there are two sorts; *deeds indented*, and *deeds poll*; which denominations arise from the form and fashion thereof; the one being cut in and out in the top or side, called *indented*; *ingles dentium*, in acute angles, or as present in a waving line; and the other *plain*, or *poll*.

A *deed indented*, or an indenture, consists of two parts, or more (for there are *tripartite*, *quadripartite*, *septempartite*, *the deeds*) whereas it is expressed that the parties thereto have to every part thereof interchangeably set their several seals. The cause of their indenting is, that whereas the several parties have each of them one, the indenture may make it appear, that they belong to one

and the same contract by their tallying. See IMPRESSTURE.

A *deed poll*, or *polled*, anciently called *charta decima parte*, or *charta simplex*, is a plain *deed*, without indenting; used when the vendor, for example, only seals, and there is no need for the vendees sealing a counter-part, because the nature of the contract is such, that it requires no covenant from the vendee.

DEED, *date of a.* See DATE.

DEEMSTERS, or DEMSTERS. All controversies, in the Isle of Man are decided, without process, writings, or any charges, by certain judges, chosen yearly from among themselves, called *deemsters*. This institution they are supposed to owe to the ancient Druids.

The word is formed from the Saxon *dema*, *judge*, or, *to give*.

There are two *deemsters* for each division of the island: in ancient court-rolls, they are called *supremi domini regis*. They sit as judges in all courts, either for life or property, and with the advice of the twenty-four keys, declare what is law in uncommon emergencies.

DEEP-*sea line*, or DEEP-*sea line*, in the *Sea Language*, a small line used for sounding, when a ship is in very deep water at sea.

At the end of this line is a piece of lead, called the *deep-sea lead*, at the bottom of which is a coat of white tallow, to bring up stones, gravel, shells, or the like, from the bottom; in order to learn the differences of the ground; which being entered, from time to time, in the seamen's books, by comparing of observations, enable them to guess by their soundings, &c. what coast they are on, though they cannot see land.

DEEP-*waisted*, in *Naval Architecture*, denotes the structure of a ship's deck, when the quarter-deck and fore-castle are elevated from four to six feet above the level of the upper-deck, so as to leave a vacant space, called the WAIST, on the middle of the upper-deck.

DEER, *Cervus*, in *Natural History*, the name of a genus of animals, the characters of which are, that the horns fall off every year, that they are solid and branched, and that the animal has eight cutting teeth in the lower-jaw, and none in the upper.

The word *cervus*, used alone, is understood by authors to mean the stag, or *red-deer*, the others being all distinguished by their several adjectives; the common *fallow-deer* being called *cervus platyceros*, or the broad horned *deer*. Ray.

In the Linnæan system, the several species of *deer* are classed under the genus *cervus*. in the order of *feræ*. The *red-deer* is called *cervus elaphus*; the *fallow-deer*, *cervus dama*; the *roe-deer*, *cervus capreolus*; and the *rein deer*, *tarandus*.

The *common deer* is more preferred in England than in any other part of the world, and carries its distinction from the *roe-deer*, in its size, and in the falcated figure of its horns. See STAG.

They are said to have been introduced here by King James I. out of Norway, who first brought them into Scotland, and from thence into his chases of *Enfield* and Epping. They are scarcely known in France, but are sometimes found in the north of Europe. In Spain they are extremely large: they are met with in Greece, the Holy Land, and China; but in every country, except our own, are in a state of nature, unconfined by man.

We keep several species of these, however, and may perhaps increase them to some sort as many more, as they are very handsome animals, and will be apt to mingle one species with another. The principal kinds we know at present, are, 1. The *Spanish deer*, which is almost as large as the *red-deer*, but has a very slender neck, and is of a deep dusky colour; the tail in this species also is longer than in others, and is black all over, not white next the body. 2. The *emmet-deer*, which are beautifully variegated with black, white, and tawny. 3. The *Virginia deer*, which are larger and stronger than ours, and have thicker necks, and are of a grey or ash-colour, rather than tawny, and are remarkable for the largeness of their penis and scrotum. 4. A species which have their hinder hoofs marked with white on the outside; the ears and tails of these are long, their horns branched, and their forehead a little depressed or hollow between the eyes. These will eat bread, fruits, and any thing that is offered them, and are often beautifully variegated; many of them have black variegations, and a black list down their back, with a series of white spots on each side; others are so beautifully marked with white spots and other variegations, as to equal the zebra in beauty: these they call *striated deer*. Ray.

The method of hunting *deer* in the island of Ceylon is very particular. The huntsmen go out in the night, and only two usually go together; the one of these carries upon his head an earthen vessel, in which there is some fire burning and flaming; the ingredients are generally small sticks cut into pieces, and common rosin: of this the other man carries a supply about him to replenish the pot when it becomes low. The person who has the fire upon his head carries in one hand a staff, on which there are fixed eight bells, and the largest three in the better. This man goes first into the woods, and the other follows close behind, with a spear in his hand. As soon as the *deer* hears the noise of the bells, he turns towards the place whence the sound comes, and seeing the fire, he eagerly runs up to it, and fixes in gazing at it: small difficulties to the second man has then nothing to do but to kill him with the spear, for he sees neither of them.

Not only *deer*, but elks, and even horses, are thus taken; for they gaze at the fire, and never see the men. The profits of this sort of hunting are very large, without any danger; for though these are great numbers of tygers, elephants, and wild beasts in those woods, the huntsmen see no more of them at this time than, for they all run away from it. Phil. Trans. N° 318. p. 1004.

As the *fallow-deer* lives entirely on vegetables and grass, its flesh are not highly exalted; nor is it much inclined to an alkaline putrefaction, on account of its almost. But the habitual exercise of the animal in some degree exalts and volatilizes the salts. The venison of a *deer* killed when cool, differs very much from that of one killed when heated with exercise: the fibres of the first are harder, the flesh more tough, and consequently less easily digested than the second. The second is more tender, more easily digestible, but has a greater tendency to an alkaline putrefaction; which, however, may be a great desire to preserve, by hunting the *deer* to first great duly when killed, as the jews were directed to do with respect to all sorts of beasts and fowls. *Lev.* xvii. 13.

Upon the whole, however, venison is esteemed with justice an excellent ailment. The recent blood of a *fallow-deer* drank immediately from the vein, is said to remove dizziness from the head: the gall is said to be detective, to cure mistiness of sight, and take away films of the eyes: the liver is recommended against a diarrhœa: the horns are used exactly with the same intentions as those of the stag: and the fat or suet agrees exactly with that of the same animal. James.

DEER, *African*. See COW-GOAT.

DEER, *musk*. See MUSK-*deer*.

DEER, *roe*, in *Zoology*, an animal very common in all the northern nations, and called by some authors *tarandus* and *machlis*. It is of the shape of a stag, but its body is thicker, and its whole make much more robust and strong. The head is thick, covered with very long hairs. The legs very hairy, and the hoofs narrower, for the creature expands and opens them in going: it is an extremely swift, as well as strong animal; its horns are very long, and finely branched, and particularly run out immediately from the forehead into two fingered branches; in the middle there is a little branch, like the point in the flower of some plants; and thence arise they are divided into broad fingered segments. They differ from the horns of the elk in their length, and from those of the stag or *red-deer* in their breadth, and from both, in the multitude of branches, and in their colour, which is white. The lower branches, which fall very near the forehead, are said to be used by the creature to break the ice, when the waters are frozen over, that he may get drink. It feeds on shrubs and plants, and on the moss which it finds on the earth, and upon the buds of trees. It is of promiscuous use, as a beast of carriage, to the Laplanders, and almost all the other nations of the north. Scheffer alledges, from Formanus, that the *rein-deer*, though a cloven-footed animal, and plainly of the *deer* kind, does not chew the cud. This, however, is wholly disbelieved by the more accurate naturalists. Ray.

Its horns and hoofs are of use in spasmodic affections.

DEER, *sea*, *Caprea Pisc*, in *Zoology*, a species of *deer* distinguished by Pliny under the name of *capreæ*.

The Latin names are extremely improper, since it has not the least resemblance or analogy to the goat-kind in any respect. It is properly of the *deer* kind, but differs from all the other species in the smallness of its size, and shortness of its horns. The horns in this species are not palmated or compressed, as in most of the *deer*, but are rounded, and serve aptly for the making knife hafts, and other such things. Ray.

These animals do not keep in herds like other *deer*, but only in families; they bring two fawns at a time, which are tender, and difficult to be reared, and which the female is obliged to conceal from the buck while they are very young. The flesh is reckoned delicate food.

This species no longer exists in any part of Great Britain, except

except in the Scottish Highlands. In France they are more frequent; they are also found in Italy, Sweden, and Norway, and also in Siberia. Pennant's British Zoology, vol. i. p. 49, &c.

DEER-*field*, a park, or place, where *deer* are kept.

DEER-*leap*, or *pitch*, or *gin*, made of cords, to catch *deer*. Anno 19 Hen VII. cap. 11.

DEER-*stealers*, in *Law*. There are several statutes for the punishment of *deer-stealers*, as 3 Jac. I. cap. 13.—13 Car. II. cap. 10.—1 and 2 W. and M. cap. 10.—5 Geo. I. cap. 15, and 28.—9 Geo. I. cap. 22.—12 Geo. II. cap. 32. See BLACK *Act*.

DEER-*wood*, in *Botany*, &c. See DEER's *Wood*.

DE ESSENDO *quietum de theolonio*, a writ that lies for those who are by privilege freed from the payment of toll. See *Nat. Br.* fol. 226.

DE EXPENSIS *militum*, a writ commanding the sheriff to levy four shillings per day, to defray the expences of a knight of the shire attending an parliament. See KNIGHT.

There is a like writ *de expensis civium & burgensium*, to levy two shillings per day for every citizen and burgess to parliament. 23 Hen. VI. cap. 12. See BURGESS.

DE FACTO, Something actually in *fact*, or existing in contradistinction to *de jure*, where a thing is only so in justice, or equity, but not in fact.

After the Revolution, the ministers of the abdicated king insisted much on the difference between a king *de jure*, and *de facto*, or a prince in actual but not legal possession of the crown, and another who had the right but not the possession. The nonjurors still hold the pretender for king *de jure*; and only allow king George for king *de facto*.

DEFALCATION, from the French, *defalquer*, *to diminish*, denotes the retention or substraction of a small sum, in matters of account, from a large one.

DEFAMATION, in *Law*, is when a person speaks scandalous words of another, as of a magistrate, &c. whereby they are injured in their reputation, for which the party slandering shall be punished, according to the nature and quality of the offence: reparation by action on the case at common law, sometimes by statute, and sometimes by ecclesiastical law. But *defamation* is properly punished by the spiritual courts; in which causes it ought to have three witnesses at least, or it is to concern matters spiritual, and determinable in the ecclesiastical courts; as for calling a man heretic, schismatic, adulterer, fornicator, &c. Secondly, that it be a matter spiritual only; *for* if the *defamation* concern any thing determinable at the common law, the ecclesiastical judge shall not have cognisance thereof. And thirdly, though such *defamation* be merely spiritual, yet in that it slanders cannot sue for damages in the ecclesiastical courts, but the suit ought to be only for punishment of the fault by way of penance. Cowel of Law, 224, 225.

DEFAMATORY, a term usually used in the phrase *defamatory libels*, signifying a writing intended to scandalize, or vilify a person. See LIBEL.

By the Romans and the ancient ordonnances of France, the authors of *defamatory* libels were punished with death. See Godefroi. Comment. ad Leges de Libellis famosis.

But the historian tells us, that cardinal Ximenes was inclined to try all *defamatory* libels; he found it but reasonable to leave inferiors the liberty of venting their grief by writings, where only free while the person is offended at them, and lose all their spirit and malignity when despised or disregarded.

DEFAULT, in *Law*, non appearance, or an omission of what a person ought to do, particularly before a court of justice, at a day assigned; for which judgment may be given against the *defaulter*.

Jurors making default in their appearance for trying of causes, shall lose and forfeit 10*l.* unless they have a reasonable excuse proved by witnesses.

DEFEASANCE, in *Law*, from the French *defaire*, *to undo*, signifies a condition relating to a deed, which being performed the deed is defeated, and rendered void, as if it had never been made. The difference between a common condition and *defeasance* is, that the condition is annexed to, or inclosed in, the deed; and a *defeasance* is a deed by itself, concluded and agreed on between the parties, and having relation to another deed. To make a good *defeasance* it must be, 1. by deed; for there cannot be a *defeasance* of a deed without a deed; and a writing under hand doth not imply it to be a deed. 2. It must recite the deed it relates to, or at least the most material part thereof. 3. It is to be made between the same persons who were parties to the first deed. 4. It must be made at the time, or after the first deed, and not before. 5. It ought to be made of a thing *defeasible*. 3 Inst. 236. 3 Lev. 234.

DEFECATE, or DEFECATE, a term applied to fossils that is purged and cleared of feces, or impurities. In distillations, and other chemical operations, are necessary to separate the most pure and subtile parts from the gross, or less. See CHEMISTRY.

DEFECTION, the act of abandoning, or relinquishing a party, or an interest, a person has been engaged in.

The word is formed of the Latin *defectio*, *to forsake*.

DEFECTIVE, or DEFICIENT Num. in Grammar, is such as want either a whole number, or a particular case, or are totally indeclinable.

The term *defective* is also applied to a verb that has not all its moods and tenses.

DEFECTIVE *third*, in *Music*. See DIMINISHED THIRD.

DEFENCE, in *Ships*, is used for any thing that serves to preserve or secure the soldiers, or the place. See FORTIFICATION.

The parapets, flanks, casemates, gavelins, and outworks, that cover the place, are called the *defences*, or covers, of the place; and when the cannon has beat down, or ruined their works, so that the men cannot fight under covert, the *defences* of the city are said to be demolished.

DEFENCE, *Law of*, is that which ranks a bastion, being drawn from the flank opposite thereto.

The line of *defence* should not exceed a musket-shot, i. e. 220 fathoms, or 720 feet, or 60 Rhinland perches: Count Mesnil Aubert allows 675; Scheiter 705; the counts De Pagan and Vauban, 75.

Line of DEFENCE *rasant*, or *ichant*, is a right line, as EC (*Tab. Fortif.* fig. 1.) drawn from the point, or centre, of the bastion C, to the courtaine K of the opposite flank I, as the right line EK.

Lines of DEFENCE, *oblique*, called *alternate*, and *frequent*, is the face of the bastion contained by the curtain and CE.

DEFENCE, in *Old Law-books*, is sometimes used for prohibition.

Thus in Rot. Parl. 21 Edw. III. cries and *defence* were made throughout England, *to* proclamation and prohibition. *Defencer minister* in Scotch. Stat. Weth. 1 Cap. 47. Balmores are by that act prohibited to be taken at certain times. *Defencer* solemnie *son Labourer*, se tenir moult *en repos*. Ll. Inæ. Conduct. cap. 37. In the statutes of Edward I. we have one, intituled, *Statutum de defensione pacis et regis*, &c. and it is *defended* by law, to ride out on the high-way.

This use of the word was probably borrowed from the French, in which language it is so applied.

DEFENCE, in its true legal sense, denotes an opposing or denial of the truth or validity of the complaint, answering in the *contrarium sive* of the averment. It is a general allegation, which the defendant makes immediately after the second DECLARATION, that the plaintiff hath no ground of action; which allegation is afterwards extended and maintained in his plea.

DEFENCE-*work* is more usually called *Fence-work*. See FENCE-*work*.

DEFENCES, in *Heraldry*, are the weapons of any beast; as, the horns of a stag, the tusks of a wild boar, &c.

DEFEND, *Defendere*, in our *Ancient Laws and Statutes*, signifies to prohibit or forbid. See DEFENCE. 5 Rich. II. cap. 7. In which sense also Chaucer uses it, in the following passage:

There was no man for to no manner, sye,
That me God defended marriage.

See also Milton's Parad. Lost, book ix. line 86.

DEFENDANT, a term in *Law*, signifying him who is sued in an action personal; a tenant is he who is sued in an action real.

DEFENDEMUS, in *Law*, a term used in feoffments and demises: having this force, that it binds the donor and his heirs to defend the donee, if any man go about to lay any incumbrance on the thing given, other than is contained in the deed of donation. See WARRANTY.

DEFENDER *of the Faith* (*Fidei Defensor*), is a peculiar title belonging to the king of England; so CHRISTIAN to the king of Spain; and *Most Christian* to the king of France, &c. These titles were given by the popes of Rome; and that of *fidei defensor* was first conferred by Leo X. on king Henry VIII. for writing against Martin Luther; and the bull for it bears date *anno vicesimo Octavo* 1521. It was afterwards confirmed by Clement VII. Lord Herbert's Hist. Henry VIII. 105. But the pope, on Henry's suppressing the houses of religion, at the time of the Reformation, not only deprived him of his title, but deposed him from his crown also: though in the thirty-sixth year of his reign, his title, &c. was confirmed by parliament; and hath continued to be used by all succeeding kings to this day. Lex Constitutionis, 47, 48. Chambers's Journ. says, the title belonged to the kings of England before that time; and for proof hereof appeals to several charters granted to the university of Oxford.

So

So that pope Leo's bull was only a renovation of an ancient right. Pref. stat. lib. i. cap. 2.

DEFENDERE *manu manu*, to wage law; by denying the accusation upon oath. *Et si forte forisfactus vicinis fuerit, & forisfactus suus se defendere unica manu ad unicum testem rationabile sit datum, extra abbatiam, & si unicum testem vel plures habuerit, debet se defendere sexta manu, &c.* Charta facta inter W. de Breu, mil. & Abb. & Convent. de Oseney, fine dat. See MANUS.

DEFENDERS were anciently notable dignitaries, both in church and state; whose business was, to look to the preservation of the public weal, and to protect the poor and helpless, and to maintain the interests and rights of churches, and religious houses.

The council of Chalcedon, can. 2. calls the *defender* of a church, τὸν ἔκδικον. Cossin. De Officiis Aulæ Constantinop. makes mention of *defensores* of the palace; to does Bollandus, Act. S. Januar. tom. i. p. 501. There were also a *defender* of the kingdom, *defensor regni*; *defenders* of cities, *defensores civitatum*; *defenders* of the people; *defensores populi*; of the poor, *fatherless*, *widows*, &c.

About the year 440, each patriarchal church began to have its *defender*; which custom was afterwards introduced into other churches, and continued to later days under other names; as those of *advocate*, and *admoner*. See ADVOCATE, and ADMONER.

In the year 407, we find the council of Carthage asking the emperor for *defenders*, of the number of *forty-two*, i. e. advocates who were in office; and that it might be allowed them to enter, and to search the cabinets and papers of the judges, and other civil magistrates, wherever it should be found necessary for the interest of the church.

DEFENDING, in *Fortification*, is ordinarily synonymous with flanking.

Thus, we say, the flank *defends* the curtin, and the opposite face of the bastion; this demilune flanks, or *defends*, the horn, or crown-work. The use of fortifications are eafily taken; there being nothing to *defend*, that is, to flank them.

When they say, the flank *defends* the curtin, they mean, not only that it is placed at the curtin, but, alſo, that it prevents the approaches; that is, ſuch as are poſted on the flank of a baſtion, can ſee any that come to attack the curtin; and can ſhoot them, or prevent their approaches.

Inner DEFENDING *Angle* is the angle CIE (Tab. *Fortification*, fig. 1.) made by the leſſer line of *defence* with the curtin.

Outer DEFENDING *Angle* is the angle COF, formed by the two leſſer lines of *defence* CO, and FO.

The lines, or files, of the ramparts, or wall, are *defended* by muſquetts, or carbines; as more eaſy, cheap, and conſequently, more common.

DEFENSITIVE, in *Medicine* and *Chirurgery*, denotes a bandage, plaiſter, or the like; uſed in the cure of a wound, to moderate the violence of the pain, the flux of blood, and the acceſs, or impreſſion, of the external air.

The cauterization performed, the wound is covered with lint, and the eye with a *defenſative*, and triangular compreſs. For the firſt dreſſing of the entoſtic, M. Dionis uſed a little *defenſative* made of the white of an egg, oleum roſatum, and alum-powder.

DEFENSO, that part of any open field or place, that was allotted for coen and hay, and upon which there was no common or feeding, was anciently ſaid to be *in defenſo*: ſo of any meadow ground, that was laid in for hay only. It was likewiſe the fame of a wood, where part was incloſed and fenced up, to ſecure the growth of the underwood from the injury of cattle.

DEFENSOR. See ADVOCATE.

DEFERENT, DEFERENS, in *Anatomy*, is applied to certain veſſels of the body, appointed for the conveyance of humours from one place to another.

Vaſa DEFERENTIA are two white ſolid ſtatred tubes, one lying on the right ſide, and the other on the left; from the epididymis, of which they are continuations; each of them runs up in the cellular vagina of the ſpermatic veſſels, as high as the openings in the abdominal muſcles, the blood-veſſels lying forward, and the *vas deferens* behind them. Theſe veſſels convey the ſeed as faſt as it is ſecreted and prepared in the teſticles, &c. into the *veſiculæ ſeminales*; there to be depoſited till an emiſſion is required. See *Tab. Anat. (Splanch.) fig.* 1. *lit.* 11. *fig.* 8. *lit.* nn. *fig.* 15. *lit.* ee.

The paſſage of the *vaſa deferentia* into the *veſiculæ ſeminales* is very particular. Theſe canals are incurvated behind the bladder, and their contracted extremities unite at that place. They unite in an angle, and run between the contiguous extremities of the *veſiculæ*; and this union is ſo cloſe, that the adhering portions ſeem only to form the middle ſeptum, between two ſmall tubes; each of which is formed, partly by the extremity of one *vas deferens*, and partly by that of the neighbouring *veſicula*.

Some call them the *ejaculatory veſſels*. They are white, nervous, and round; ſituate partly in the ſcrotum, and partly in the abdomen.

DEFERENT, in DEFERENS, in the *Ancient Aſtronomy*, a circle invented to account for the eccentricity, perigee, and apogee, of the planets.

As the planets are found differently diſtant from the earth, at different times; it was ſuppoſed, that their proper motion was performed in a circle, or ellipſis, which is not concentric with the earth; and this eccentric circle, or ellipſis, they called the *deferent*: becauſe, paſſing through the centers of the planets, it ſerved to ſupport or ſuſtain them.

The *deferents* are ſuppoſed differently inclined to the ecliptic, but no greater than eight degrees, excepting that of the ſun, which is in the plane of the ecliptic itſelf: and is cut differently by the *deferents* of the other planets in two places, called *nodes*.

In the Ptolemaic ſyſtem, the ſame *deferent* is alſo called the *deferent of the epicycle*; becauſe it tranſmits the centers of the epicycle, and ſeems to ſuſtain it.

DEFAIT, or DECAITE, a term uſed, by the French *heraldic*, to denote a beaſt whoſe head is cut off smooth: in which it differs from craſed; where the head is, as it were, torn off, and the neck left ragged.

DEFICIENT *interval*, in *Muſic*, is uſed for an interval leſs than the true by a comma. See INTERVAL.

DEFICIENT *numbers*, are ſuch whoſe parts, added together, make leſs than the integer, whoſe parts they are. See NUMBER.

Such, e. gr. is 8; whoſe quota parts are 1, 2, and 4; which, together, only make 7. See ABUNDANT Number.

DEFICIENT *hyperbola* is a curve of that denomination, having only one aſymptote, and two hyperbolic legs running out infinitely towards the ſide of the aſymptote, but contrary ways. See CURVE.

DEFILE, in *Fortification*, a narrow paſs or way, through which a company of ſoldiers or boat, can paſs only in file, by making a ſmall front; ſo that the enemy may take an opportunity to ſtop their march, and to charge them with ſo much the more advantage, becauſe the front and rear cannot reciprocally come to the relief of one another.

The word is formed from the French *defile*, to *unthread*, or *unſtring*.

The term *defiles* is alſo applied to narrow paſſages, guarded on each ſide by mountains, &c.

To DEFILE, to go off file by file. See FILE.

The army began to *defile* on the left, and was forced to *defile* at each end of the field, on account of the marſhes, and the woods.

DEFINITE, in *Grammar*, is applied to an ARTICLE that has a preciſe, determinate ſignification.

Such are, the article *the* in Engliſh, *le* and *la* in French, &c. which fix and aſcertain the noun they belong to, to ſome particular; as, *the* king, *le* roy: whereas, in the quality of king, *de* roy, the articles *of*, and *de*, mark nothing preciſe; and are therefore called *indefinite*.

DEFINITION, in *Logic*, an enumeration of the chief ſimple ideas, whereof a compound idea conſiſts; in order to aſcertain, or explain, its nature and character.

The ſchoolmen give very imperfect notions of *definition*. Some define it the firſt notion, or conception, that ariſes of a thing, whereby it is diſtinguiſhed from every other, and from which all the other things, that we conceive of it, are deduced: but the uſual *definition* of it is, *oratio explicans quid res eſt*, a diſcourſe explaining what a thing is: that is, as ſome farther explain it, a diſcourſe ſetting forth thoſe attributes which circumſcribe and determine the nature of a thing. For to explain, is only to propoſe the parts ſeparately, and expreſſly, which were before propoſed conjunctly and implicitly; ſo that every explication has regard to ſome whole. Hence, according to the diverſe kinds of parts in any thing, viz. phyſical parts, metaphyſical parts, &c. ariſe ſo many different kinds of *definitions* of the ſame thing: thus, man is either *defined* an animal, conſiſting of ſoul and body; or, a reaſonable animal, &c.

Definitions are of two kinds; the one *nominal*, or, *of the name*; the other *real*, or, *of the thing*.

DEFINITION *of the name*, or *nominal* DEFINITION, is that which explains the ſenſe or ſignification appropriated to a word: or, as Wolfius more accurately conſiders it, it is an enumeration of certain marks, or characters, ſufficient

ficient to distinguish the thing *defined* from any other thing; so as to leave it out of doubt, what the subject is that is intended, or denoted by the name. This is what is meant by *definition* in mathematics.

Such is the *definition* of a square, when it is said to be a quadrilateral, equilateral, rectangular figure.

By *definition of the name*, is either meant a declaration of the ideas and characters appropriated to the word in the common usage of the language; or the peculiar ideas, &c. which the speaker thinks fit to denote by that word, i. e. the special sense wherein he proposes to use it, in his future discourse. For it may be observed, that the significancy of any word depends entirely on our will; and we may affix what idea we please to a sound, which itself signifies nothing at all.

The *definition* of the name, therefore, in the second sense, is merely *arbitrary*, and ought never to be called in question; only it is to be minded, that we keep invariably to the same significance. Hence, a *definition* comes to stand, or to be made use of, as an undoubted, or self-evident maxim; as it frequently does, and particularly among geometricians, who, above all other people, make use of such *definitions*.

Not that we mean, that after having *defined* a thing so and so, there is nothing in our idea affixed to the *defined* term, but must be granted to the thing itself: thus, if any one should *define* heat to be a quality in certain bodies, like that which we feel upon the application of fire, or hot bodies; no man could find fault with the *definition*, as far as it expresses what he means by the word heat; but this does not hinder us from denying, that there is any thing in the body that warms us, like what we feel in ourselves.

DEFINITION *of the thing, or real* DEFINITION, is properly an enumeration of the principal attributes of a thing, in order to convey or explain its nature.

Thus, a circle is *defined* a figure, whose circumference is every where equidistant from its centre.

Wallis *defines a real definition* to be a distinct notion explaining the genesis of a thing: that is, the manner wherein the thing is made, or done: such is that of a circle, whereby it is said to be formed by the motion of a right line round a fixed point. On which footing, what was before instanced as a *real definition* of a circle, amounts to no more than a nominal one.

This notion of *a real definition* is very strict and just: and affords a sufficient distinction between a *real* and a *nominal* one. But though it has the advantages of analogy, distinctness, and convenience, on its side; yet, being only itself a *nominal definition*, i. e. a *definition* of the term *real definition*, we shall consider it in this light, that is, an idea fixed arbitrarily to that word, and which the author always denotes by that word in the course of his book. But, in effect, it is not the usual sense, or acceptation of the term; which is much less convenient and distinct. And it is to that usual acceptation we are here chiefly to have regard.

Definitions are also divided into *accurate* and *inaccurate*; the first make what we strictly call a *definition*; the second, we distinguish under the name of *description*.

Of the parts enumerated in a *definition*, some are common to other things beside the thing *defined*; others are peculiar thereto: the first are called the *genus*, or *kind*; and the second, the *difference*. Thus, in the former *definition* of a circle, by a figure whose circumference is every where equidistant from its centre; the word *figure* is the *kind*, as being a name common to all other figures, as well as the circle: the rest are the *difference*, which specify, or distinguish this figure from every other figure. And hence arises that rule of F. de Colonia, for the making of a *definition*. "Take, says he, *something* that is common to the thing *defined* with other things, and "add to it something that is proper, or peculiar to the "things here join the genus and specific difference, and "you will have a *definition*." Thus, e. gr. eloquence is *defined* the art of speaking well; for that it is an art, is common to it with several other things; but that it is the art of speaking well, is peculiar to it alone.

There are five common rules of a good *definition*. 1. That it be clear, and more easy and obvious than the thing *defined*. 2. That it be universal, or adequate to the thing *defined*; that is, it must agree to all the species or individuals included under the same idea. 3. That it be proper, or peculiar to the thing *defined*. The two ordinary defects of *definitions* are, not to agree either to the whole thing, or the sole thing defined: *neque omni, neque soli*. Thus which nothing is more common, even among the best and justest authors. 4. That it be short. And 5. That rather the thing defined, not a mere synonymous name, make any part of the *definition*.

Isaac Barrow observes of Aristotle's *definitions* in the general, that they are very much like that, wherein man should be *defined* an animal that tills the ground. Nor was his master Plato less exceptionable. The joke put upon him on this account is famous: Plato, it seems, had *defined* man, *animal bipes & implume, a two-footed animal without feathers*. Upon which, Diogenes the Cynic, a great derider of the Academics, threw a cock stripped of his feathers, and quite naked, into the middle of Plato's school; crying, "Here is Plato's man."

Our *definitions* of substances, it must be added, are very defective; and as for individuals, we have no *definition* at all. The ideas of substances are compounded of the various simple ideas jointly imprinted when they perceive themselves; and all we can do to *define* them, is only to enumerate those several sensible ideas, as colour, density, malleability, weight, &c. Thus, gold is *defined* by him a peculiar colour, gravity, &c. Yet such *definitions* may raise an idea clear enough of that substance in the mind of one who has separately received, by his senses, all the simple ideas that are in the composition of the complex idea *defined*; though the intimate nature and essence of substance are unknown, and consequently cannot be *defined*.

It follows, that they are only the modes or attributes, that can be explained by what we properly call a *definition*.

DEFINITIONS, *in Rhetoric*, is one of the common places, and is defined by Tully, a short comprehensive explanation of a thing.

The *definitions* of the orator, it must be observed, differ much from those of the logician and philosopher: these latter define a thing closely and drily by genus and difference; e. gr. man is a reasonable animal, &c.

The orator takes larger compass, and *defines* things more ornamentally from the places of rhetoric, thus: man is a curious work of an Almighty Creator, framed after his own image, endued with reason, and born for immortality. But this rhetorical *definition*, in strictness, comes nearer to the nature of a description, than an accurate *definition*.

DEFINITIVE is applied to somewhat that terminates or decides a question, or process. Thus we say,

The house of lords have passed a *definitive* sentence in such a cause: the church has given a *definitive* judgment on such an article of faith.

The word stands in opposition to *provisional*, and INTERLOCUTORY.

DEFINITIVE *person*, in *Grammar*. See DEMONSTRATIVE.

DEFINITIVES, in *Grammar*, denote according to the Port-Royal Grammarians, one of the four species of words; or such as are significant by relation, called by others ARTICLES.

DEFINITOR, a term used in several religious orders, for an assistor, or counsellor of a general, or superior, in certain monasteries.

In most orders of religious, the *definitor* takes place after the superior of the convent he lives in, when in the convent itself; but out of the convent, the *definitor*'s place is before his own superior.

Definitors are also sub-*definitors*, in the convent they reside in, to the immediate superior of the convent, as to things relating to the monastic discipline, but in nothing else.

DEFLAGRATION, *in Chemistry*, the kindling, or letting fire to a fat, a mineral, or other matter, either alone, or mixed for that purpose, with a sulphureous one, in order to purify it. As is done in the preparing of Æthiops mineral by fire, in tartar, &c.

The word is formed of the Latin *de*, and *flagrare*, *to burn*. That fiery process has been often recommended to the world as of great use in trying the strength of brandies, and other vinous spirits, and has been greatly improved in this respect by Mr. Geoffroy.

The common way of trying spirits by *deflagration*, is to measure out any quantity of it, then to heat it, and set it on fire; it after it will no longer burn, the remainder is half as much as the quantity measured out for the trial was, then the spirit is found to consist of half water, and half entirely inflammable spirit; that is, it is exactly what we understand by the term perfect proof, and according as the remainder is more or less than half the original quantity, it is so much below or so much above proof, or the due strength of brandy.

This method is much more certain than that by the crown of bubbles, which arises upon shaking the spirit in a vial. Mr. Geoffroy's method is thus: take a cylindric vessel two inches high, and as much in diameter, consisting of thin plate silver, that metal being much less liable to rust than copper; this vessel must be fitted with a little rectangular case exactly graduated into three, half-lines, &c. then the vessel being set level upon a copper cake made to contain it, a quantity of the brandy to be examined is poured in, to the height of fifteen lines. This height is to be exactly hit by pouring in more than enough at first, and then with a small tube sucking out what is superfluous; then the vessel being heated a little, so as just to make the

liquor

liquor fume, it is to be set on fire, and left to go out of itself. At the inſtant when the flame expires the gage is plunged perpendicularly into the veſſel, and the ſines and quarters exactly noted, which the liquor wants of its former height: this difference gives the preciſe quantity of pure ſpirit, or alcohol, originally contained in the liquor. Mem. Acad. Paris 1718.

DEFLECTION, the turning any thing aſide from its former courſe, by ſome adventitious or external cauſe.

The word is often applied to the tendency of a ſhip from her true courſe, by reaſon of currents, &c. which divert her, and turn her out of her right way.

DEFLECTION *of the rays of light*, is a property which Dr Hooke obſerved in 1674-5, and read an account of before the Royal Society, March 18, the ſame year. He ſays, he found in different tools from reflexion, and refraction; and that it was made towards the ſurface of the opacous body perpendicularly.

This is the ſame property which ſir Iſaac Newton calls INFLECTION. It is called by others DIFFRACTION.

DEFLORATION, or DEFLOWERING, the act of violating, or taking away a woman's virginity.

Death, or marriage, are deemed by the civil law in caſe of *deflouration*. Many anatomiſts make the hymen a real proof of virginity, perſuaded that where it is not found, the girl muſt have been *deflowered*. See HYMEN.

The ancients had ſo much reſpect for virgins, that they would not put them to death, till they had firſt procured them to be *deflowered*. On the contrary, the gallows of the court of Mad. that hold virginity in ſo little eſtimation, that they pay ſtrangers to come and *deflower* their brides.

Among the Scots, it was a privilege of the lords of the manor, that they ſhould have the firſt night's lodging with their tenant's wives. King Malcolm III. allowed the tenants to redeem this ſervice at certain rates, called *Marcheta*, conſiſting of a certain number of cows. Buchanan ſays, it was redeemed with half a mark of ſilver. The ſame cuſtom had place alſo in Wales, Flanders, Friſeland, and ſome parts of Germany. See BORDAGE-ENGLISH.

By the cuſtom of Anjou and Maine, a maid, after twenty-five years of age, may ſuffer herſelf to be *deflowered*, without being diſinherited for it by her father.

Du-Cange quotes an arret of the nineteenth of March, 1400, obtained by the inhabitants of Abbeville, againſt the biſhop of Amiens, for taking money to diſpenſe with an injunction he had made, not to ſuffer them to conſummate their marriage the three firſt nights; the injunction being founded on a canon of the fourth council of Carthage, which decrees the ſame, out of reverence of the matrimonial conjunction.

DEFLUVIUM, is uſed to expreſs a diſtemper in trees, whereby they loſe their bark: it is thought be cauſed by a ſharp humour, that diſſolves the glue whereby the bark is faſtened to the wood, and ſometimes by too much drought.

DEFLUXION, or FLUXION, a falling, or flowing of ſome humour to any part of the body; as of rheum on the trachea, and oropharynx, in a catarrh.

The word is formed from the Latin *defluo, I flow down*, the humours falling upon ſome part, where they are gathered together.

Defluxions on the lungs are of dangerous conſequence. See CATARRH, and PHTHISIS.

Defluxions on the eyes produce a weakneſs of ſight, and frequently blindneſs. See EYE.

DEFORCEMENT, in *Law*, a withholding lands, or tenements, by force, from the right owner.

DEFORCEMENT, in the law of Scotland, is uſed for the reſiſting, or offering violence to the officers of the law, while they are actually employed in the exerciſe of their functions, by putting its orders and ſentences in execution; whether they be officers of the ſupreme courts of juſtice, as heralds, purſuivants, meſſengers, macers; or of inferior courts, as mayors.

The puniſhment of this crime is confiſcation of moveables, joined with ſome arbitrary puniſhment; as fine, impriſonment, baniſhment, or corporal pains, according to the degrees of violence, and other circumſtances which aggravate the crime: beſides, the party aggrieved may have an action of damages, to be highly taxed out of the firſt and readieſt of the offender's eſcheat, or other eſtate. See Bayne's Criminal Law.

Deforcing of officers of the cuſtom-houſe, is provided againſt by the ſame ſtatutes as in England.

DEFORCIOR, or DEFORCIANT, one that calls out another from his lands, or tenements, by mere *force*.

Deforcer differs from *diſſeiſer*, in that a man may diſſeiſe without *force*: and that a man may *deforce* another who never was in poſſeſſion; as where ſeveral perſons have a right to lands, as common heirs, and one entering firſt keeps out the reſt. See DISSEISOR.

Deforcer alſo differs from *intruder*, in that a man becomes *intruder* by a wrongful entry only into lands void of a poſſeſſor; whereas a *deforcer* holds out the rightful heir. See INTRUSION.

DEFORMITY is immediately oppoſed to BEAUTY, and denotes the want of that uniformity, ſymmetry, and variety, neceſſary to conſtitute beauty. Accordingly, Dr. Hutcheſon defines it by the abſence of beauty, or a deficiency in the beauty expected in any ſpecies. *Deformity* and *beauty* may be conſidered either as natural or moral. Theſe are both referred by the above mentioned ingenious writer to an internal SENSE, and not perceptions of them, as he ſuppoſes, ariſe from an original, arbitrary ſtructure of our own minds, by which certain objects, when obſerved, are rendered the occaſions of certain ſenſations and affections.

That many objects give no pleaſure to our ſenſes, is obvious. Many are certainly void of beauty: but then, ſays this author, there is no form which ſeems neceſſarily diſagreeable of itſelf, when we have no other evil from it, and compare it with nothing better of the kind. Many objects are naturally diſpleaſing, and diſſaffected to our external ſenſes, as well as others pleaſing, and agreeable: as ſmells, taſtes, and ſome ſeparate ſounds: but with regard to our ſenſe of beauty, no compoſition of objects which give not unpleaſant ſimple ideas, ſeems poſitively unpleaſant, or painful of itſelf, but we never obſerved any thing better of the ſame kind.

Had there been a ſpecies of the form which we now denominate ugly, or *deformed*, and had we never ſeen or expected greater beauty, we ſhould have received no diſguſt from it; though the pleaſure would not have been ſo great in this form as in thoſe we now admire. Our ſenſe of beauty ſeems deſigned to give us poſitive pleaſure, but not poſitive pain, or diſguſt, any farther than what ariſes from diſappointment.

There are, indeed, many faces which, at firſt view, are apt to cauſe diſlike. But this is generally not from any poſitive *deformity*, but either from want of expected beauty, or from the carrying ſome natural indications of morally bad diſpoſitions, which we all acquire a faculty of diſcerning in countenances, airs, and geſtures. That this is not occaſioned by any form poſitively diſguſting, appears hence, that if upon long acquaintance we are found of finding ſweetneſs of temper, humanity, and chearfulneſs, though the bodily form continues, it ſhall give us no diſguſt. There are horrors raiſed by ſome objects, which are only the effect of fear for ourſelves, or compaſſion towards others, when either reaſon, or ſome fooliſh aſſociation of ideas, makes us apprehend danger, and not the effect of any thing in the form itſelf. For we find, that moſt of thoſe objects, which excite horror at firſt, when experience, or reaſon, has removed the fear, may become the occaſion of pleaſure.

The uſual conjunction of ideas gives us diſguſt, where there is nothing diſagreeable in the form itſelf. And this, in effect, is the cauſe of moſt of our fantaſtic averſions to the figures of diverſe animals, &c. Thus ſerpents of all kinds, and many inſects, really beautiful enough, are beheld with averſion by many people who have got ſome accidental ideas of miſchief aſſociated to them. A ſimilar reaſoning is applied to our perception of moral beauty and *deformity*. Inquiry into the Original of our Ideas of Beauty and Virtue, paſſim.

But it is more juſt to diſtinguiſh between the ſentiments of delight or diſguſt, excited in us by beautiful or *deformed* objects, which are effects of ſome *cauſe*, and the natural and real qualities of the perceived objects by which they are produced. There are objects, ſays an excellent writer, which have a natural aptitude to pleaſe or offend, or between which and the contemplating mind there is a neceſſary congruity or incongruity; and though the actual perception of the underſtanding, and conſequent feeling of the heart, in contemplating the actions and affections of moral agents may exiſt in very different degrees, on account of the incidental obſtructions, ariſing from bodily diſpoſition, mental prejudices and biaſſes, and the aſſociation of ideas; yet, to every rational mind properly diſpoſed, morally good actions muſt for ever be acceptable, and can never of themſelves offend; and morally evil actions muſt for ever be diſagreeable, and can never of themſelves pleaſe. What is right in actions and characters is beautiful and amiable, and gives pleaſure; what is wrong is *deformed* and odious, and excites diſguſt: right and pleaſure, wrong and pain, are as diſtinct as cauſe and effect. It is no leſs abſurd to maintain, *that* the perception of virtue is nothing diſtinct from the reception of the pleaſure reſulting from it, than to aſſert, with ſome metaphyſicians, that ſolidity, extenſion, and figure, are only particular modes of ſenſation, becauſe attended, whenever they are perceived, with ſome ſenſations of ſight or touch. Thus does this

author

author shew, that moral beauty and *deformity* are real qualities of certain actions; in which consists their aptitude to please or disgust. With respect to natural beauty, he observes, that uniformity amidst variety pleases, because of the *natures* of variety and uniformity, which are such, that whenever united, they are adapted to please every free, unbiassed mind, that discerns them. He accounts for the pleasure they afford, without referring them to an arbitrary, internal sense, by the following circumstances that attend them. They are more easily comprehended by the mind: order and symmetry give things their stability and strength, and subservicncy to any valuable purpose; regularity and order evidence art and design. Disorder and confusion, whence *deformity* arises, denote only the negation of regularity and order; or any arrangement and disposition of things, which are not according to a law, rule, or plan, and prove not design. These are not positively displeasing; except where we previously expected order, or where impotence or want of skill appear, and the contriver has either failed of his design, or executed it ill. See on this subject Dr. Price's Review of the principal Questions and Difficulties in Morals, ch. ii. passim. See an admirable Essay on Bodily *Deformity*, by Mr. Hay, in the Fugitive Pieces, vol. i. p. 93, &c.

DEFOSSION, *Defossio*, the punishment of burying alive, inflicted, among the Romans, on Vestal virgins guilty of incontinency. It is also a custom among the Hungarians to inflict this punishment on women convicted of adultery. Heretics also were punished in this manner. See BURIAL.

DEFTARDAR, or DEFTERDAR, the treasurer of the revenues of the Turkish empire. See TREASURER.

The word is compounded, first, of *defter*, a Turkish name for a book, register, memoir, &c. which Meninski derives from the Greek διφθερα, the skin or parchment anciently wrote on. The second word, whereof *defterdar* is compounded, is *dar*, a Turkish and Persian word, signifying *keeper*, or *bearer*, q. d. book keeper of the monies received and expended.

Meninski calls him *fupr. mus thesaurarius, high treasurer*; and *prafes aerarii, perfect of the exchequer*. Cantelius makes him the keeper, and comptroller of the books of receipts and payments.

The *defterdars*, or, as Vigenere calls him, *defterdari*, has in his charge the rolls and accounts of the militia, and the treasury: he receives all the grand signior's revenues, pays his forces, and furnishes the expences of all public affairs; in which, his office differs from that of the chamberlain, who is treasurer of the seraglio or court, as the *defterdar* is of the state.

Kromi makes a *defterdar*, whom he calls *tefterdar*, in each beglerbeglic, or government. Vigenere affures us, there are but two, the one for Europe, and the other for Asia; the first resides at Constantinople, and has under him two general commissioners, or deputies, one for Hungary, Transylvania, Walachia, Croatia, Servia, Bulgaria, Bosnia, &c. the other for Greece and the Morea, with the islands of the Archipelago.

Each of these has under him as many sub-commissioners, or agents, as there are sangiackats in his province; which sub-commissioners have as many clerks as there are timariots in their sangiackat, to keep the account of the timariots in their districts. The *defterdar* of Asia has two general deputies, the one for Anatolia; the other for Syria, Arabia, and Egypt: these have likewise their subagents, clerks, &c. as those of Europe.

DEGENERATION, the act of falling, or declining from a more perfect, or valuable kind, state, or condition, to an inferior or worse.

It is a great dispute among the naturalists, whether or no animals, plants, &c. be capable of degenerating into other species? The affirmative is urged by many, as a strong objection against the plant being contained in the seed, and that doctrine of generation wherein that is supposed to be so.

But our latest and best naturalists maintain the opinion of such a *degeneration*, or transmutation, to be erroneous, and a chimera; not but they allow, that a plant, by being transplanted to an improper soil, or sun, may be depraved; so as a Dutch rose, of an hundred leaves, may only produce another rose, for short thereof in number of leaves, colour, smell, &c. Such a depravation is possible, and frequently happens: but a specific transformation seems out of the power of nature; a new form ever supposing a new *generation*, which again supposes a corruption of the former kind.

DEGLUTITION, in *Medicine*, the act of swallowing the food.

Deglutition is performed, in the first place, by means of the tongue, driving the aliment into the œsophagus, or gullet; and then, by the contraction of the sphincter, and the fleshy fibres of the same œsophagus, which, lessening the bore, or aperture thereof, protrude the contents downwards into the stomach, in our eating.

Deglutition succeeds *mastication*, and is followed by *ejection*.

A difficulty of swallowing may be occasioned by ulcers in the œsophagus, by a scirrhous bronchocele, by a thickening of the mucus in the œsophagus, by indurations in the œsophagus, by a fungus in it, by a sarculus formed by some hard substance lodged in it, and weakening it, and by spasms.

Dr. Duncan, in his Medical Cases, 1778, mentions the case of a difficult *deglutition*, supposed to arise from a venereal infection, in which electrical sparks, applied to the fauces, were of considerable service, and by degrees removed the complaint.

DEGRADATION, in our law-books called *degradation*, and *depositio*, the act of depriving, or stripping a person for ever of a dignity, or degree of honour; and taking away the title, badge, and privileges thereof.

The *degradation* of a peer, a priest, a knight, a gentleman, an officer, &c. are performed with divers ceremonies. That which anciently obtained in *degrading* a person from his nobility, is very curious. It was practised in the time of Francis I. upon captain Fangel, who had in a cowardly manner given up Fontarabia, whereof he was governor.

On this occasion, twenty or thirty cavaliers, without blemish or reproach, were assembled; before whom the gentleman was accused of treason, and breach of faith, by a king at arms. Two scaffolds were erected; the one for the judges, heralds, and instruments; and the other for the guilty cavalier, who was armed at all points, and his shield placed on a stake before him, reversed with the point upwards. On one side assisted twelve priests, in surplices, who sung the vigils of the dead. At the close of each psalm they made a pause, during which the officers of arms stripped the condemned of some piece of his armour, beginning with the helmet, and proceeding thus, till he was quite unarmed; which done, they broke his shield in three pieces with a hammer. Then the king at arms erected a *bâton* of his office of the criminal's head; and the judges, putting on mourning habits, went to the church. This done, the *degraded* was drawn from off the scaffold, with a rope tied under his armpits, laid on a bier, and covered with mourning cloaths; the priests singing some of the prayers for the dead; and then he was delivered to the civil judge, and the executioner of justice.

For a more domestic instance, Sir Andrew Harcla, earl of Carlisle, being attainted and convicted of treason, 18 Edw. II. *eorum regni*; after judgment was pronounced on him, his sword was broken over his head, and his spurs hewn off his heels; Sir Antony Lucy, the judge, saying to him, "Andrew, now art thou no knight, but a knave." By stat. 13 Car II. William lord Monson, Sir Henry Mildmay, and others, were *degraded* from all titles of honour, dignities, and pre-eminences, and prohibited to bear, or use, the title of lord, knight, esquire, or gentleman, or any coat of arms, for ever afterwards.

It has been maintained that the king may *degrade* a peer; but it appears from later authorities, that he cannot be *degraded* but by act of parliament.

As to ecclesiastics, we have an instance of *degradation* before condemnation to death, in the eighth century, at Constantinople. It is of the person of the patriarch Constantine, whom Constantine Copronymus caused to be executed. He was made to ascend the ambo; and the patriarch Nicetas first came to the bishops to strip him of the pallium, and unfurnished him: then they made him go out of the church backwards.

But we have a much later instance in our own history, when Cranmer, archbishop of Canterbury, was *degraded*, by order of queen Mary, they dressed him in episcopal robes, made only of canvas, put the mitre on his head, and the pastoral staff in his hand; and in this attire shewed him to the people. Which done, they stripped him again, piece by piece.

At present, they do not stand so much on the ceremony of *degradation*, in order to the putting a priest to death; by reason of the delays and difficulties that it would occasion. Pope Boniface pronounced, that six bishops were required to *degrade* a priest; but the difficulty of assembling so many bishops, rendered the punishment frequently impracticable.

Without a priest, after having been delivered to his ordinary, if he cannot purge himself of the crime laid at his door, has his gown, and other robes, stripped over his ears by the common hangman; by which he is declared divested of his orders.

It is decided, however, that *degradation* does not efface the priestly character.

Degradation only seems to differ from deposition in a few ignominious ceremonies, which custom has added thereto. Accordingly, in the business of Arnoul, archbishop of Rheims, sentenced in the council of Orleans, in 991, it was deliberated, what form they should follow in the deposition; whether that of the canons, that is, simple deposition; or that of custom, viz. *degradation*. And it was declared, that he should surrender the ring, pastoral staff, and pallium; but that his robes should not be torn off.

In effect, the canons prescribe no more than a mere reading of the sentence. It is the rest, therefore, added thereto by custom, viz. the stripping off the ornaments, and the tearing the pontifical vestments, that properly constitutes *degradation*.

DEGRADATION, in *Painting*, expresses the softening and rendering dim and confused the appearance of distant objects in a landscape, so that they shall appear there, as they would do to an eye placed at that distance from them. See PERSPECTIVE.

DEGRADED, in *Heraldry*. A cross *degraded*, is a cross marked, or divided into three at each end, diminishing as they ascend towards the middle, or centre; by the French called *pommée*. See CROSS.

DEGREE, in *Algebra*, is used in speaking of equations. If the index of the highest power in the unknown quantity be 2, it is of the second degree, &c.

DEGREE *of a fire*, in *Chemistry*. See FIRE and HEAT.

DEGREE, in *Geometry*, an arc of a circle, including a three hundred and fiftieth part thereof.

Every circle, great and small, is supposed to be divided into 360 parts, called *degrees*: the *degree* is subdivided into 60 lesser parts, called minutes: the minute into 60 others, called seconds: the second into 60 thirds, &c. It follows, that the *degrees*, minutes, &c. of greater circles are greater than those of less.

The subdivisions of *degrees* are tradition, whose denominators proceed in a sexagesimal ratio 1 that is, a first minute is $= \frac{1}{60}$, a second $= \frac{1}{3600}$, a third $= \frac{1}{216000}$, &c. But these denominators being troublesome, their equivalents are substituted in common use, as indices thereof. Thus a *degree*, as being the integer, or unit, is denoted by 0, a first minute, or prime, by 1; a second by 2, or ″; a third by 3, or ‴, &c. Accordingly, 3 *degrees* 25 minutes, 16 thirds, are written 3° 25′ 16‴.

But though the ancient Egyptians, to whom this division is usually ascribed, did, by means hereof, free aftronomical calculations from fractions; fince fexagefimal fractions may be managed as integers; and were very happy in the choice of fuch a number of *degrees* in the circle, as admitted of a juft diuifion, by 2, 3, 4, 5, 6, 8, and 9; yet Sicinius, Ongherod, Wallis, &c. with good reafon, with the fexagefimal fractions for alide, and decimals taken in their room; or that the degree were fubdivided into 100 equal parts, and each of thefe again into 100, &c. For in decimals there is no occafion for reducing leffer fractions into greater, or greater into leffer; which is a tedious article in fexagefimals. Stevinus even holds, that this diuifion of the circle which he contends for, obtained in the wife ages *in fanta fapientia*. Stevin. Cofmog. lib. 1. def. 6.

The magnitude or quantity of angles is accounted in *degrees*; becaufe the curvature of the circle being uniform in all its parts, equal angles at the centre are fubtended by equal arcs, and by fimilar arcs in peripheries of different diameters. Thus we fay, an angle of 90 *degrees*, of 70 *degrees* 50 minutes, of 25 *degrees* 15 minutes 45 feconds.

Such a ftar is mounted fo many *degrees* above the horizon, or deftitute fo many *degrees* from the equator. Such a town is fituate in fo many *degrees* of longitude and latitude.

A ſign includes 30 *degrees* of the ecliptic.

DEGREE *of latitude* is, on the fuppofition of the fphericity of the earth, the 360th part of the meridian; or more generally, it is that fpace through which an obferver muft move on the meridian, in order to increafe or diminifh the diftance of a ftar from the zenith by one *degree*. See LATITUDE.

The quantity of a *degree* of a meridian, or other great circle, on the furface of the earth, is variouſly determined by various obſervers: the methods too made uſe of are various. See EARTH.

Ptolemy fixes the *degree* at 68$\frac{1}{2}$ Arabic miles, accounting 7$\frac{1}{2}$ ſtadia to a mile. The Arabs themſelves, who made an exact computation of the diameter of the earth, by meaſuring the diſtance of two places under the ſame meridian, in the plains of Senna, by order of Almamon, only make 56 miles. Kepler, determining the ſemidiameter of the earth by the diſtance of two mountains, makes a *degree* 15 German miles; but his method is far from being accurate. Snellius, taking the meaſure of the earth, from the diſtance of two parallels of the equator, finds the quantity of a *degree*, by one method, to be 57064 Paris toiſes, or 342384 feet; and by another method, 57057 toiſes, or 342342 feet. The mean between which two numbers, M. Picard found by meaſurement, in 1669, from Amiens to Malvoiſine, the moſt exact, and he makes the quantity of a *degree* 57060 toiſes, or 342360 feet, which reduced to other meaſures, gives the quantity of a degree of a great circle, in

Engliſh miles of 5280 feet each,	69$\frac{1}{6}$
Flemiſhe miles of 2000 braccio	63$\frac{1}{6}$
Common French leagues of 2282 toiſes	25
Rhinland perches of 12 feet.	20539

However M. Caſſini, at the command of the king of France, in the year 1700, repeated the ſame labour, and meaſuring the place of 6 *degrees* in manner, from the obſervatory at Paris, along the meridian to the city of Colioure in Roufſillon, that the greatneſs of the interval might diminiſh the error, found the quantity of a *degree* to be 57292 toiſes, or 343752 Paris feet, amounting to 365862 Engliſh feet. On which footing, the quantity of a minute of a *degree*, or a great circle of the earth is 5710 Paris feet, and that of a ſecond, 95 feet.

With which account pretty nearly agrees that of our countryman Mr. Norwood, who, about the year 1635, meaſured the diſtance between London and York, and found it 905751 Engliſh feet; and finding the difference of latitudes 2° 28′, determined the quantity of one *degree* to be 367369 Engliſh feet, or 57300 Paris toiſes, or 69 Engliſh miles, 288 yards. See Newt. Princ. Phil. Nat. Math. lib. iii. prop. 19. and Hiſt. Acad. R. Scienc. anno 1700. p. 153.

M. Caſſini, the ſon, completed the work of meaſuring the whole arc of the meridian through France in 1739. For this purpoſe he divided the meridian of France into two arcs, which he meaſured ſeparately. The one from Paris to Colliures had given him 57097 *toiſes* to a *degree*; the other from Paris to Dunkirk 56960: and the whole arc from Dunkirk to Collioure 57060, the ſame as M. Picard's. M. Mutchenbroek, in 1700, reſolving to correct the errors of Snellius, found by patiently obſerving, that the *degree* between Alkmaer and Bergen-zoom contained 57033 toiſes. Meſſrs. Maupertuis, Clairaut, Camus, le Monnier, and Outhier of France, were deputed on a northern expedition, and began their operations, aſſiſted by M. Celſius, profeſſor aſtronomiæ of Sweden, in Swediſh Lapland, in July 1736, and finiſhed them by the end of the following May. They obtained the meaſure of a *degree*, the middle point of which was in lat. *the 66th* N. and found it to be 57437, 9 toiſes, which reduced to the level of the ſea. Another company of gentlemen was about the ſame time ſent to the ſouth, viz. Meſſrs. Godin, Bouguer, and la Condamine of France, to whom were joined Don Jorge Juan, and Don Antonio de Ulloa of Spain. They left Europe in 1735, and began their operations in the province of Quito in Peru, about October, 1736, and finiſhed them after many interruptions, about eight years after. The Spaniſh gentlemen publiſhed a ſeparate account, and aſſign for the meaſure of a *degree* of the meridian at the equator 56767, 3 toiſes. M. Bouguer makes it 56753 toiſes, when reduced to the level of the ſea; and M. de la Condamine makes it at 56740 toiſes.

M. de la Caille, being at the Cape of Good Hope in 1752, found the length of a *degree* of the meridian in the latitude 33° 18′ 5″ to be 57037 toiſes. In 1753, Father Boſcovich found the length of a *degree* in latitude 43° 2′ to be 57092 toiſes, as meaſured between Rome and Rimini, in Italy. In the year 1740, Meſſrs. Caſſini and de la Caille again examined the former meaſures in France, and, after making all the neceſſary corrections, found the meaſure of a *degree*, the middle of which is in 49° 22′ N. to be 57074 toiſes; and in the latitude of 45° 2′ 57036 toiſes. From theſe meaſures it appears that the earth is not a ſphere, but an oblate ſpheroid. See *Figure of the* EARTH.

Degree of longitude, is the ſpace between two meridians;

the quantity of which is variable according to the latitude.

These expressions are borrowed from the ancients, who were acquainted with a very large extent of earth, from east to west, which they accounted the length, and a much less from north to south, which passed with them for the breadth, of the earth. See LONGITUDE.

The quantity of a *degree* of a great circle, with the distance of any other parallel from the equator, being given, the quantity of a *degree* in that parallel is found by this canon, as the whole line, or radius, is to the cosine of the distance of the parallel from the equator; so is the quantity of a *degree* of the equator to the quantity of a *degree* of the parallel.

Suppose, e. gr. the latitude of the parallel 51°, and a *degree* of the equator 69 miles.

Log. of whole sine.	10.0000000
Cosine of 51°	9.7981618
Log. 69	1.8388491
Log. required. —	1.6370109

The number corresponding to which in the tables is 43 1/2, nearly; which being multiplied by 5280, the number of feet in a mile, gives the number of English feet in a *degree* in that parallel. On which foundation (supposing Mr. Cassini's proportion of 365184 English feet, or 69 miles 1264 feet to a *degree* of a great circle) is calculated the following table, exhibiting the quantity of a degree of longitude in each parallel of latitude.

Deg. of lat.	English feet. miles of 5280 feet.	Deg. of lat.	English feet. miles of 5280 feet.
Equ.	69 1804		
1	69 1802	46	48 338

45	48 4805	90	0

DEGREE, in *Genl* and *Comm Law*, denotes an interval in consanguinity or kindship, whereby proximity, and remoteness of blood are computed.

Degrees are the intervals whereby it is known what persons are nearest to the stock or root. Or they are the distances of one person from another in the line of consanguinity or affinity, reckoned from some common parent or ancestor. See CONSANGUINITY.

We say, the second *degree*, the third *degree*: Gregory the Great was the first who prohibited marriages in the seventh degree; which restriction was first softened by a second council of Lateran, under Innocent III. and at the prohibition to the fourth *degree* inclusively, that is custom to mean established. See MARRIAGE.

In computing *degrees* of consanguinity, the rule of the civil law is universally either in the direct, or collateral; otherwise called the oblique line. Direct lines ascend or descend; and this method of computation universally agreed in the civil and canon, as to the number both. But in the canon law, the rule is different in the oblique line, and here a distinction is made between the *right*, and *wrong* oblique line.

In the first case the rule is, *Quot generationes ab una stipite ad unum e communi stipite, tot gradus inter eos*. In the other case the rule is, *Tot gradus ex parte utraque dicuntur a communi stipite ad primum, perquem ad alterum venitur*.

Or, generally, in whatsoever *degree* two persons, or the most remote of them, are distant from the common ancestor, thus is the *degree* in which they are related to each other. Thus, Titius and his brother are related in the first *degree*, because from the father to each of them is counted only one; Titius and his nephew are related in the second *degree*; for the nephew is two *degrees* removed from the common ancestor, viz. his own grandfather, the father of Titius. This rule of computation is adopted by our law, though the civilians count upwards, from either of the persons related to the common stock, and then downwards again to the other, reckoning a *degree* for each person both ascending and descending.

DEGREE, in *Mechanics*, denotes a certain pitch, or intenseness, of the elementary qualities.

The *degrees* chiefly observed are four, answering to the number of the Peripatetic elements.

In the school philosophy the same qualities are divided into eight; the first, or eighth *degree* of intension, is called *at ease*.

Thus five, a thing is cold in the second *degree*, pepper is hot in the third *degree*, &c.

Fire was held hot in the eighth *degree*, and dry in the fourth *degree*.

DEGREE, in *Music*, are the four intervals whereof the concords or harmonic intervals are compos'd. See INTERVAL, and CONCORD.

The musical *degrees* are three; the greater tone, the less tone, and the semi-tone.

The primary cause of the invention of *degrees*, or intervals less than concords, and wherein the concords are resolved, and, as it were, graduated, Descartes judges to have been this: that if the voice were always to proceed by harmonical intervals, there would be too great a disproportion, or inequality, in the intenseness thereof, which would weary both the singer and the hearer.

Thus, supposing A and B the distance of a greater third; if the voice were immediately to ascend from A to B, when betwixt B, being nearer, strikes the ear with more force than A, left that disproportion should prove uneasy, another sound, C, is put between them; by which, as by a step, or *degree*, we may ascend more easily, and with less unequal force in raising the voice.

Hence it appears, first that number, that the *degrees* are only certain measures contrived to be put betwixt the extremes of the concords, for moderating their inequality, but which of the middles are most fit enough to satisfy the ear, and are of use only with regard to the concords. So that when the voice has moved one *degree*, the ear is not yet satisfied till we come to another, which therefore must be a concord with the first sound.

The substance of what is here allowed amounts to this; that by a fit division of the concording intervals into lesser ones, the voice will pass smoothly from concord to another, and the hearer be prepared for a more exquisite relish of the perfect intervals, whose sequences are the proper points in which the ear finds the expected rest and pleasure.

Such is the end, and office, of the *degrees*, or defect intervals. Now there are only three, that experience recommends as agreeable, whole tones are 8:9, called the greater tone; 9:10, called the less tone; and 15:16, called the *semi-tone*. By these alone a sound can move upwards or downwards successively, from one extreme of a concord to another, and produce true melody; and, by means of these, several voices are also capable of the most valley variety in passing from concord to concord. As to the original of these *degrees*, they arise out of the simple concords, and are equal to their differences. Thus, 8:9, is the difference of a fifth and fourth; 9:10, is the difference of a lesser third and fourth; or of a fifth and

and greater sixth; and 15:16, the difference of a greater third and fourth, or of a fifth or sixth.

DEGREES, *for the use of*, in the construction of the scale of music, *see* SCALE.

DEGREE, in *Universities*, denotes a quality conferred on the students, or members of them, as a testimony of their proficiency in the arts or faculties; and entitling them to certain privileges, precedencies, &c.

The *degrees* are much the same in the several universities: but the laws of them, and the discipline or exercise previous to their being obtained, differ. The *degrees* are, *bachelor*, *master*, and *doctor*; instead of the second, in some foreign universities, they have *licentiate*.

In each faculty there are but two *degrees*, viz. *bachelor* and *doctor*, which were anciently called *bachelor* and *master*: for the arts admit of more than two, which still retain the denomination of the ancient *degrees*, viz. *bachelor* and *master*. At Oxford, *degrees* of master and doctor are only conferred once a year, viz. on Monday after the seventh of July, when a solemn act is held for the purpose. *See* ACT.

The expences of a *degree* of doctor in any of the faculties, in feasts and fee fees, usually amount to 100*l.* and that of a master of arts to 20 or 30*l.*

The degree of bachelor is only conferred in Lent.

To take the *degree* of bachelor of arts, four years are required, and three more for master of arts. *See* BACHELOR.

At Cambridge, matters are nearly on the same footing, only the discipline is somewhat more severe, and the exercises more difficult. The commencement, which answers to the act of Oxford, is the Monday before the first Tuesday in July. The *degrees* of bachelor are taken up in Lent, beginning on Ash-Wednesday.

The *degree* of master of arts is not given till above three years after that of bachelor; during which time, the candidate is obliged, three several times, to maintain two philosophical questions in the public schools, and to answer the objections raised against him by a master of arts. He must also keep two acts in the bachelor's school, and declaim once.

For the DEGREE *of doctor*, *see* DOCTOR.

DEICIDE, DEICIDA, from *Deus*, *God*, and *cædo*, *I kill*, a term only used by some writers, in speaking of the condemnation, and execution of the Saviour of the world, by Pontius Pilate and the Jews.

Some have objected to the propriety of the term, since Christ suffered and died, not as God, but as man.

DEJECTION, from *dejicio*, *I throw off*, in *Medicine*, properly signifies the act of ejecting, or evacuating the excrements, by means of the peristaltic motion of the guts.

In which sense it comes in the significations of *excretion*.

DEJECTIONS is also, and that more ordinarily, applied to the excrements themselves, thus evacuated: in which sense it is of the same import with *stool*.

Viscid, glutinous, or, as some call them, *sanguinous dejections*, frequent in scorbutic diseases, indicate a colliquation of the solids of the body.

Among the several circumstances from which life and death are prognosticated, stools are noted of the least consequence. Whether the nature of stools in general be good or bad, may be discovered, first, from their degree of concoction or crudity; secondly, from the particular times in which they appear; thirdly, from their solidance; fourthly, from the quantity in which they are discharged; fifthly, from the time during which they continue, or the time when they cease: lastly, from the advantages with which they are attended, and the ease or freedom from pain with which the patient discharges them; and in the seventh and last place, from the stain of good or bad urine, from which prognostics by stools derive their certainty.

DEJECTION, in *Astrology*, is applied to the planets, when in their detriment, as astrologers speak, i.e. when they have lost their force, or influence, as is pretended, by reason of their being in opposition to some others, which check and counteract them.

Or, it is used when a planet is in a sign opposite to that wherein it has its greatest effect, or influence, which is called its exaltation. Thus the sign Aries being the exaltation of the sun, the sign Libra is its *dejection*. *See* EXALTATION.

DEJECTORIA denote purging medicines.

DEIFICATION, in the *Pagan Theology*, the act, or ceremony, of *deifying* their emperors, i.e. of placing them among the gods, and decreeing divine honours to be rendered them. *See* GOD, and CONSECRATION.

The *deification* is the same with APOTHEOSIS.

DEINCLINERS, or DEINCLINATORS *dials*, are such as both decline, and incline or recline, at the same time.

Suppose, for instance, a plane to correspond with the vertical circle at an angle of 30 degrees, and the horizontal plane under an angle of 20 degrees, the elevation of the pole being 52 degrees: a dial, drawn on this plane, is called a *decliner*. *See* DIAL.

DEIPARA, *Virgin*. *See* MOTHER *of God*.

DEIS, or DAIS, the chief table in a *hall*. *See* HALL.

DEISM, the doctrine, or belief of the *Deists*.

Deism, from *Deus*, *God*, may properly be used to denote natural religion, as comprehending those truths which have a real foundation in reason and nature; and in this sense it is so far from being opposite to Christianity, that it is the great design of the Gospel to establish and enforce it. Thus some of the ancient writers have affected to call it; but *deism* among present learned writers that restrict all religion, relating both to doctrine and practice, which every man is to discover for himself by the *mere force* of natural reason, independent of all revelation, and exclusive of it; and this religion Dr. Tindal, and others, pretend is perfect, so as be incapable of receiving any addition or improvement, even from divine revelation.

DEISTS, a class of people known also under the denomination of *Free-thinkers*, whose distinguishing character it is, not to profess any particular form, or system of religion; but only to acknowledge the existence of God, and to follow the light and dictates of nature, rejecting revelation, and opposing Christianity.

This name seems to have been first assumed, or the denomination of a party, about the middle of the sixteenth century, by some gentlemen in France and Italy, who were desirous of thus disguising their opposition to Christianity by a more honourable appellation than that of infidels. Alcer, an eminent reformer, mentions certain persons in his epistle dedicatory, prefixed to the second tome of the instruction Christiane, published in 1563, who called themselves by a new name, that of *Deists*. These, he tells us, professed to believe in God, but shewed no regard to Jesus Christ, nor embraced the doctrine of the apostles and evangelists as sober, and dreams. He adds, that they laughed at all religion, though they outwardly conformed to the religion of those with whom they lived, or whom they wished to please, or feared to offend. Some, he observes, professed to believe the immortality of the soul; others denied both this doctrine, and that of providence. Many of them were considered as persons of acute and liberal genius, and took pains in disseminating their notions. *See* Bayle's Dict. art. VIRET. vol. v. or Zeltner's View of the Doctrinal Writers, vol. i. p. 2.

The *Deists* hold, that, considering the multiplicity of religions, the numerous pretences to revelation, and the precarious arguments generally advanced in proof thereof, the best and surest way is, to return to the simplicity of nature, and the belief of one God; which is the only truth agreed to by all nations.

They complain much of freedom of thinking and reasoning as oppressed under the yoke of religion; and that the minds of men are fettered and tied down by the necessity imposed on them of believing incomprehensible mysteries and contrary, that nothing should be required to be assented to, or believed, but what their reason clearly conceives.

The distinguishing character of modern *Deists* is, that they reject all revealed religion, and discard all pretences to it, as the effects of imposture and enthusiasm. They profess a regard for natural religion, though they are far from being agreed in their notions concerning it. They are divided by some of their own writers into partial and universal *Deists*: the latter admit nothing as future than, and the former denying it, or representing it as very uncertain. Oracles of Reason, p. 67.

Dr. Clarke distinguishes four sorts of *Deists*. 1. Those who pretend to believe the existence of an eternal, infinite, independent, intelligent Being, who made the world, without concerning himself in the government of it. 2. Those who believe the being and natural providence of God, but deny the difference of actions, as morally good or evil, resulting from the authority constitution of human laws; and therefore they suppose that God takes no notice of them. With respect to both these classes, he observes, that their opinion can consistently terminate in nothing but downright atheism. 3. Those who having right apprehensions concerning the nature, attributes, and all governing providence of God, seem also to have some notion of the moral perfections, though they consider them as transcendent, and such in nature and degree, that we can form no true judgment, nor argue with any certainty concerning them. But they deny

deny the immortality of human souls, alledging, that men perish as death, and that the present life is the whole of human existence. 4. Those who believe the existence, perfections, and providence of God, the obligations of natural religion, and a state of future retribution, on the evidence of the light of nature, without a divine revelation. Such as these, he says, be the only true *Deists*, but their principles, as apprehended, should lead them to embrace Christianity; and therefore he concludes, that there is now no confident name of *Deist* in the world. Evidence of Nat. and Rev. Religion, p. 12, &c.

The first *Deistical* writer of any note that appeared in this country, was Herbert baron of Cherbury. He lived and wrote in the last century. His book De Veritate was first published at Paris in 1624. This, together with his book De Causis Errorum, and his Treatise De Religione Laici, were afterwards published in London. His celebrated work De Religione Gentilium, was published at Amsterdam in 1663 in 4to, and in 1700 in 8vo; and an English translation of it was published at London in 1705.

As he was one of the first that formed *Deism* into a system, and inverted the sufficiency, universality, and absolute perfection of natural religion, with a view to discard all extraordinary revelation, as needless and needless, we shall subjoin the five fundamental articles of this universal religion. They are these: 1. That there is one supreme God. 2. That he is chiefly to be worshipped. 3. That piety and virtue are the principal part of his worship. 4. That we must repent of our sins; and if we do so, God will pardon them. 5. That there are rewards for good men, and punishments for bad men, both here and hereafter. Our own age has produced a number of advocates in the same cause; and however they may have differed among themselves, they have been agreed in their attempts of invalidating the evidence and authority of divine revelation. We might mention Hobbes, Blount, Toland, Collins, Woolston, Tindal, Morgan, Chubb, lord Bolingbroke, Hume, &c. Some have also added lord Shaftesbury to the number.

But the friends of Christianity have no reason to regret the free and unrestrained discussion which their religion has undergone. Objections have been stated and urged in their full force, and as fully answered; argument and raillery have been expelled; and the controversy between Christians and *Deists* has called forth a great number of excellent writers, who have illustrated both the doctrines and evidence of Christianity in a manner that will ever reflect honour on their names, and be of lasting service to the cause of genuine religion, and the best interests of mankind.

The number of *Deists* is said to be daily increasing: in England, many men of speculation and letters are said to incline that way; and the like is observed in some of our neighbour nations, where freedom of speaking, writing, and thinking, are indulged. Not that unrestrained liberty in this respect can ever injure Christianity, or serve the cause of *Deism*: truth neither needs nor seeks disguise; but where freedom is allowed, men's sentiments, on the subject of religion, are more generally known.

DEITY, *Godhead*; a common appellation given to God; and also by the poets to the inferior gods and goddesses.

DEIVIRILE, a term in the school theology, signifying something divine and human at the same time. See THEANDRIC.

The word is a compound of *Deus*, *God*, and *virilis*, of *vir*, *man*.

DELEGATES, certain persons *delegated*, or appointed by the king's commission, under the great seal, to sit upon an appeal to the king in the court of chancery. See COURT *of Delegates*.

DELEGATION, a commission extraordinary given a judge to take cognizance of and determine some cause, which ordinarily does not come before him.

In the civil law, *delegation* also denotes a sort of surrender, whereby a person substitutes another debtor in his place. See Digest. l. 36. *tit. de novationibus & delegationibus*.

This *delegation* differs from transferring, or translation, because there pertains no interest in a *delegatee*, viz. the creditor, the debtor, and assignee, who himself is indebted to the debtor, and on whom the debtor transfers the obligation, he was under to pay the creditor, *delegating* him, as it were, for this purpose. But, in a simple transfer, it is enough the transferrer and the transferree be present.

DELETERIOUS, from *δηλεομαι*, to *hurt*; a term sometimes used among naturalists, for such things as are of a pernicious and poisonous nature. See POISON.

DELF, a quarry, or mine, where stone or coal is dug.

From the Saxon word *delfan*, *to delve*, or *dig*.

DELF *of coal*, denotes coal lying in veins under ground, before it is dug up.

DELF, or DELVE *of coals*, is also a certain quantity, dug out of a mine, 18 pit. See COAL.

DELFT is also used in *Heraldry*, for one of the shades of tincture, being a square in the middle of the shield.

A *deffi* terme was anciently due to him who received from his own challenger, or any was departed from his quarrel or word. If there be two, or more *appellees* in an accusation, it is then no longer an appeal or challenge, if it be of murder, or charged upon it then becomes a charge of perfect bearing.

DELFT *ware*, a kind of pottery of baked earth, covered with an enamel, or white glazing, which gives it the appearance and neatness of porcelain. The baking of this pottery is clay; and the kinds of clay chiefly used are the blue and green, with an addition of marle or loam, in order to lessen the contraction of the clay, to render it less compact, and to afford a better ground for the enamel. Red clay is also added, which, on account of its refractorious matter, binds and gives a greater solidity. The proportions of these ingredients vary in different works, according to the different qualities of the earths employed. Three parts of blue clay, two of red clay, and five parts of marle, form the composition used in several manufactories. Vessels formed of these materials should be dried very gently, to avoid cracking. They are then to be placed in a furnace to receive a first baking, and they are lastly to be covered with an enamel or glazing, which is done by passing upon the vessels thus prepared, the enamel, which has been ground very fine, and diluted with water. The glazing, which is nothing but white enamel, ought to be so opake as not to shew the ware under it. The enamels for *delft ware* are composed of lead or litharge, vitrifying salts, calx of lead, and calx of tin. The vitrification of lead is effected by somewhat less than an equal part of pulverine salt, or twice its weight of calx of lead, and one part of calx of tin, which is designed for giving a white opake colour to the whole, is to be added to these or four parts of all the other ingredients taken together. M. D'Antic recommends for the white enamel, used in glazing, a mixture of a hundred pounds of calx of lead with about a seventh part of that quantity of calx of tin for common *delft*, or a fourth part of calx of tin for the finer *delft*, a hundred, or a hundred and two pounds of fine sand, and about twenty or thirty pounds of sea-salt, or salt of glass. To make this enamel, lead and tin are calcined together with a strong fire, or the lead is also to be made into a frit with the tin or ashes. The whole, being well mixed and ground together, is placed under the furnace, where it is melted and vitrified during the baking of the ware. Then it is to be ground in a mill, and applied as above directed. Dict. of Chem. Encyclop. 1777. See ENAMEL, GLAZING, and POTTERY.

DELIA, *Δηλια*, in *Antiquity*, a quinquennial festival in the island of Delos, instituted by Theseus in honour of Venus. Post Archæol. Græc. lib. ii. cap. 20.

DELIA, in *Antiquity*, feasts celebrated by the Athenians, in honour of Apollo, surnamed *Delius*.

The principal ceremony in this feast, was an embassy, or rather a pilgrimage, to Apollo of Delos, performed every five years, by a certain number of persons, deputed for that purpose, and called *Delistæ*, *Δηλιασται*, or *Theori*, *Θεωροι*, q. d. the *seers*; and the first person of the embassy, or deputation, *Architheoros*, *Αρχιθεωρος*. To him were added four more of the family of the *Ceryces*, pretended descended from Mercury, who retired all the year at Delos, to assist in the temples. The whole deputation set out in five vessels, carrying with them every thing necessary for the feast, and the sacrifices.

The *Delistæ*, who went abroad, were crowned with laurel. At their arrival, they immediately offered a sacrifice to Apollo; and, after the sacrifice, a number of young maids danced round the altar, a dance called in Greek Τερεια, whereon, by their various motions, and directions, they represented the turnings and windings of a labyrinth. When the *Delistæ* returned to Athens, the people went out to meet them, and received them with the joy and acclamations imaginable. They never laid aside their crowns till they committed was fully completed; and then they consecrated it to some god in his temple.

The whole time of their going and returning, with all the ceremonies of their embassy, was called the *Delia*; during which time no criminal might be executed, which was a peculiar privilege of this feast, not allowed to any other, not even those of Jupiter. Thus, Plutarch observes, that it was a day consecrated to Jupiter, when Theseus was made to take the psalm to which he was consecrated; wherein they waited thirty days to give it to Socrates, by reason of the *Delia*.

According to Thucydides, the *Delia* were first instituted in the sixth year of the Peloponnesian war, after the Athenians

Athenians had extirpated the isle of Delos, removed all the tombs out of it, and ordained, that nobody should either be born or die in it; but that all the sick people should be removed into a little island, called Rhenia: though the Ionians, and the neighbouring islanders of Ionia, had long before that time held a feast of *Delia*; that is, feasts and games, like those which the Athenians celebrated afterwards.

DELIAC, DELIACUS, among the *Ancients*, denoted a poulterer; or a person who sold fowls, fatted capons, &c. The traders in this way, were called *Deliaci*; the people of the isle of Delos first practised this occupation. They also sold eggs, as appears from Cicero, in his Academic Questions, lib. iv. Pliny, lib. x. cap. 30. and Columella, lib. viii. cap. 8. likewise mention the *Deliaci*.

DELIACAL *problem*, *problema* DELIACUM, a famous problem among the ancients, concerning the duplication of the cube. See DUPLICATION.

DELIAS, Δηλιας, in *Antiquity*, the name of the ship in which the Delian procession was annually made by the Athenians. See DELIA.

DELIBAMENTA, in *Antiquity*, a libation offered to the infernal gods, which was always poured downwards; hence this act was expressed by the word *defundere*.

DELIBERATIVE, is applied to that kind, or branch, of rhetoric employed in proving a thing, or convincing an assembly thereof, in order to oblige them to put it in execution.

The *deliberative* kind was much in vogue among the Greeks and Romans, when the orators harangued the people.

To have a *deliberative* voice in the assembly, is when a person has a right to give his advice, and his vote, therein. In councils, the bishops have *deliberative* voices; those beneath them have only consultative voices.

DELICT, in the *Law of Scotland*, is used to express an offence of an inferior degree to a crime, to be punished only by the effect of a civil action, for reparation of private damage.

DELIGATION, *Deligatio*, that part of surgery which relates to the binding up of wounds, ulcers, broken bones, &c.

That bandages are very useful, and even necessary, for curing the disorders of the human body, is evident not only from the testimony of Hippocrates, Galen, and other eminent physicians; but also from this, that there can scarcely be any operation in surgery performed successfully without their assistance. For should a surgeon perform an operation with the greatest judgment and care, but miscarry in the application of the bandage, all his endeavours would be to no purpose; and more especially in the treatment of wounds, fractures, luxations, and amputations. And we often find that in fractures and luxations, after a proper reduction of the parts, the cure depends more on a skilful application of the bandage, to the part affected, than on the medicines. In the case of violent hemorrhages, a proper application of the bandage and compresses proves the most effectual and speedy remedy, as must be acknowledged by every one who has any skill in surgery: not to mention, that the making and applying a bandage after a genteel and ready manner, is justly reckoned among the good qualifications of a surgeon; as it gains him the esteem of the spectators, and the confidence of the patient, which is of great influence in forwarding the cure: for both the one and the other judge of a surgeon's abilities by his performance on such occasions. See BANDAGE.

DELILERS, a kind of Turkish hussars, collected from Servia, Bulgaria, and Croatia. They are violent and furious, whence their name, and disorderly in their attack, which some have ascribed to their belief of predestination. Encyel.

DELIMA, in *Botany*, a genus of the *polyandria monogynia* class. This genus has no corolla, the calyx is five-leaved, and the fruit is a double-seeded berry. There is one species.

DELINEATING. See DESIGNING.

DELINQUENT, a person who has committed some fault, or offence.

It is the business of a magistrate to be severe in punishing *delinquents*.

DELIQUESCENCE, in *Chemistry*, denotes the property which certain bodies possess of attracting moisture from the air, and of thereby becoming liquid. It is peculiar to saline substances, or bodies containing them, and results from their AFFINITY with water. See DELIQUIUM.

DELIQUIUM, or DELIQUIUM *animi*, from *deliquor*, *I swoon*, a swooning, or fainting away; called also syncope, lipothymia, lipopsychia, eclysis, and asphyxia.

DELIQUIUM, from *deliquesco*, *to be dissolved*, in *Chemistry*, is the dissolution, or melting, of a salt, or calx, by suspending it in a moist cellar.

Salt of tartar, or any fixed alkali, set in a cellar, or other cool moist place, and in an open vessel, resolves, or runs, into a kind of liquor, called by the chemists oil of tartar *per deliquium*.

DELIQUIUM is also used, in some authors, for a distillation by means of fire. See DISTILLATION.

DELIRIUM, light-headedness, in *Medicine*, a symptom frequent in fevers, caused by internal inflammations, wounds, &c. whereby the mind is disordered to a degree of folly, or even phrenzy.

Some derive the word from *de*, and *lira*; which, among the ancients, signified a furrow drawn in a right line; whence *delirare*, *a recto aberrare*.

Delirium also frequently arise from immoderate losses of blood, whereby the brain is too much weakened; from the stings of venomous beasts; from the seed, or menses, being retained in the womb; from the rotting of a gangrened member, &c.

A disorder in the diaphragm commonly produces a *delirium*.

There are various species and degrees of *deliriums*. In some the patient is fierce and outrageous; in others more mild and easy, offering no violence to any body, but only indulging idle, ridiculous discourse; some laugh and sing; others cry and are sullen, &c.

As it is good for a patient under all disorders of the body, to have his mind untouched, or to have all his actions under the command of the ruling faculty, as at other times; so, on the contrary, to be in any manner delirious, or to be deprived in whole or in part of the use of his reason, is a bad prognostic; and in acute diseases often portends death. James.

DELIVERY, *Parturition*, or *child-birth*, the bringing forth of a perfect foetus, or child, out of its mother's womb; whether it be living or dead. See FOETUS, BIRTH, &c.

To a natural *delivery*, according to the physicians, are required three conditions: first, that both the mother and the child strive alike, the one to *deliver*, and the other to be *delivered*: the second, that it come into the world head foremost, which is its natural posture: and the third, that it be quick and easy, without ill accidents.

When the child presents its feet foremost, or comes across or double, it is no natural *delivery*; and the Latins call such children *agrippæ*, q. d. *ægre parti*.

A *legitimate delivery* is that which happens at the just term, i. e. in the tenth lunar month; and an *illegitimate*, that which comes either sooner, or later; as in the eighth, or after the tenth. Hoffman says, that the usual time of gestation is nine *solar* months. Junker is of opinion, that the natural time of *delivery* is in the fortieth week, from the first suppression of the menses, or the twenty-tieth, or twenty-first, from the time when the motion of the foetus is first perceived; and he adds, that it is a good omen if the time of *delivery* be at or near that of the usual discharge of the menses in a state of health. Women are indeed *delivered* at seven, eight, nine, ten, and eleven months, and not later: though there are some physicians who hold, that a *delivery* may be regular in the fourteenth month.

It has been observed, that *deliveries* are more happy in the seventh month than in the eighth, i. e. that the child is easier saved, and more frequently lives, when it comes in the seventh than when in the eighth month.

Mons. Personnel, a physician of Lyons, has a Latin treatise expressly *on the term of delivery*; wherein he undertakes to reconcile all the apparent contradictions of Hippocrates with respect to it. He holds, that the shortest term of a *legitimate* birth, according to Hippocrates, is a hundred and eighty-two days, or six complete months; and the longest two hundred and eighty days, or nine months, and ten days; and that the children who come earlier, or later, than those terms, do not live, or are not *legitimate*.

DELIVERY, *symptoms*, *causes*, *and process of*. Besides the more decisive symptoms of approaching *delivery*, women in these circumstances are subject to pains, which are called false and spurious. They exhault the strength of the patient without promoting the birth: pains of this kind may be distinguished from true labour pains, by their being of a flatulent kind, and running sometimes transversely across the abdomen, and sometimes upwards from it towards the breast; they are usually owing to costiveness, a purging, or a plethora. If the *os tincæ* is shut during these pains, it may be concluded that they are false; and if the patient is costive, a clyster should be administered; if a purging attends them, gentle opiates will relieve; and if a plethora, bleeding will be proper. Some have recommended stimulating cordials; but others have observed, that true labour pains are best promoted by opium. The true symptoms of approaching *delivery*, and the process of it, are as follow. Some days before the labour commences, the contents of the belly sink, and its size is apparently diminished: soon after pains are felt, which are at first slight, and return at con-

conſiderable intervals; in conſequence of theſe the uterus begins to contract, and a mucous matter is diſcharged from the vagina; then the pains return quicker, continue longer, and are more ſevere; the pulſe is affected, the ſkin becomes hotter, the face reddens, and a general agitation follows; the mucus is tinged with blood; the *os tincæ* opens, and its edges grow thin; the membranes protrude with the waters, dilating and widening the orifice. The child, at the inſtant of pain, is raiſed by the compreſſed waters from the *os internum* towards the fundus, whilſt the uterus itſelf deſcends by degrees into the inferior baſin. When the pain ceaſes each time, the womb riſes, the tumor formed by the membranes diſappears, the *os tincæ* is relaxed, and the diameter diminiſhed; the child falls upon the lower part of the womb, and may be eaſily diſtinguiſhed; as well as the part that preſents itſelf to the paſſage, through the relaxed membranes. Towards the end of labour, the pains ſucceed more rapidly, and with greater violence; at firſt, they uſually begin in the ſmall of the back, and terminate about the pudenda, but now they begin in the *regio umbilicalis*, and die away towards the fundament, where they commonly leave a ſenſibility of weight. The tumor formed by the waters diſtending the membranes below the mouth of the womb, dilates the parts, till at length it burſts, and diſcharges the waters. If the child's head preſents fairly, it ſtops the diſcharge of the waters. Sometimes the ſame effort which burſts the membranes, expels the infant, and terminates labour. At other times, the interval is long before the *delivery* of the child. The head of the child, having paſſed the *os internum*, enters the vagina, which widens in proportion as it ſhortens; the perinæum is much ſtretched, and the frenulum ſometimes torn in the paſſage; the nymphæ are obliterated, and the labia pudendi turned inward, and confounded in the general diſtenſion. At length the head forces the *os externum*, and the body readily follows, with the reſt of the waters mixed with blood. In this laſt period the woman trembles, and is convulſed, but is ſoon relieved by the expulſion of the child; ſome time after which, returning efforts are exerted for the excluſion of the PLACENTA.

The proximate cauſe of *delivery* is the contraction and compreſſion of the womb, which is muſcular and reticulated, formed of fibres running parallel on its inner ſurface from the fundus to the neck, of others croſſing theſe diagonally, and of others again horizontally interlaced, and cloſely wove towards the fundus; and the irritation which the womb ſuffers at the end of pregnancy from the increaſed bulk of the fœtus, and the conſequent dilatation of the uterine fibres beyond their limited dimenſions, is the remote cauſe of *delivery*. For a recital of the principal circumſtances attending *delivery* in caſes of difficult and preternatural labour, ſee LABOUR.

In order to *delivery* in a natural labour, the moſt convenient poſture both for the woman and her aſſiſtant, is that of lying on her left ſide upon a bed, with the knees drawn up towards the belly. The perſon who aſſiſts on this occaſion ſhould be attentive and patient, and watch every opportunity of aiding the efforts of nature, without forcing them. Whenever he examines the patient by touch, in order to know the ſtate of the uterus, he ſhould convey a ſmall portion of ſome oily matter, as freſh pomatum, &c. into the vagina, to anoint the mouth of the uterus, that it may dilate itſelf with greater eaſe and expedition. When the infant preſents itſelf for birth, he may gently draw it forward, obſerving that it is not in any part entangled by the navel-ſtring. When it is brought alive into the world, it ſhould be laid on its ſide, that it may breathe more freely, and have its face kept out of the waters, &c. diſcharged, during the *delivery*. If after the *delivery* of one child, the uterus is much diſtended, and the operator upon touch finds another fœt of membranes, he may conclude that another child remains in the uterus; he ſhould therefore tie the navel-ſtring of the firſt in two places, and wait for pains coming on to deliver the next, unleſs it preſents itſelf in a bad poſition, in which caſe it ſhould be brought away by the feet. But if after the *delivery* of one child, the uterus is contracted into a firm hard ball above the *os pubis*, he may infer that there is not another, and proceed to bring away the ſecundines. When the infant is diſengaged from the navel-ſtring, which now hangs out of the vagina, the operator ſhould twiſt it about two or three fingers of his left-hand, then paſſing his right-hand up the vagina, he muſt, with his thumb and fore-finger, hold the navel-ſtring as near the ſecundines as he poſſibly can; and if on drawing the navel-ſtring gently, he perceives the after-birth advancing gradually, there is hope that he may ſoon bring it away. If, on the contrary, he perceives, that it does not in the leaſt yield to his attempts, it adheres too ſtrongly to the uterus; in this caſe he muſt draw the navel-ſtring ſometimes to the right, and ſometimes to the left, in order gradually to diſengage the ſecundines. But this muſt be done gently, and without the leaſt violence. If, through inadvertence and precipitation, the navel-ſtring ſhould be pulled with violence, it might be broke, which would render the extraction of the after-birth very difficult; or the ſecundines being forcibly ſeparated from the uterus might occaſion an hæmorrhage, in conſequence of a rupture of the veſſels of the womb, or it might bring along with it the bottom of the womb; a falling down of which often occaſions the death of the mother. See SECUNDINE.

As ſoon as the woman is delivered, the parts of generation ſhould be covered with a moderately warm cloth, conſiſting of ſeveral folds. She is to be kept warm in bed, and left for ſome time in a ſtate of repoſe. James, and Motherby's Med. Dict. See LABOUR, LYING-IN, PREGNANCY, &c. &c.

Bartholine has compoſed a book, De Infolitis Partus Viis, on the extraordinary paſſage of the fœtus; where he gives divers inſtances of very extraordinary *deliveries*. Some have been delivered by the navel, and others by the anus. See Salmuth, Obſ. 94. Cent. 3. Phil. Tranſ. N° 416. p. 435.

In the year 1686, at Leckerkerck, eight or ten leagues from the Hague, the wife of one Chriſtian Claes was *delivered* of five children: the firſt was a boy, who lived two months; ſeventeen hours afterwards came a ſecond ſon, who was dead; twenty-four hours afterwards a third ſon was born, who lived about two hours; in twenty-four hours more the had a fourth, dead: laſtly, ſhe died in bringing forth the fifth, who died alſo in the birth.

DELIVERY, in *Law*, is an eſſential requiſite of a valid DEED, which is done by the party himſelf, or his attorney, lawfully authoriſed, and expreſſed in the atteſtation. This *delivery* is either abſolute, i. e. to the party or granter himſelf; or conditional, to a third perſon to hold, till ſome conditions be performed on the part of the granter.

DELPHIN, in *Literary Hiſtory*. See DAUPHINS.

DELPHINIA, in *Antiquity*, feaſts which the inhabitants of Egina celebrated in honour of Apollo, ſurnamed Delphinius, ſo called, as it is pretended, becauſe he aſſumed the form of a dolphin to conduct Caſtalius and his colony from the iſle of Crete to the *Sinus Criſſæus Delphinium*, one of the courts of judicature of the Athenians; ſo called from the proximity of the place, where they held their aſſemblies, to the temple of Apollo Delphinius.

DELPHINIUM, in *Botany*. See LARKSPUR.

DELPHINUS, the *Dolphin*, in *Aſtronomy*, a conſtellation of the northern hemiſphere; whoſe ſtars, according to Ptolemy, are 10; according to Tycho, 12; many; according to Hevelius 14; and, according to Mr. Flamſteed, 18. The longitudes, latitudes, magnitudes, &c. whereof, are as follow:

DELPHINUS, in *Ichthyology*. See DOLPHIN.

DELPHOS, in *Antiquity*, now called Caſtri, the capital of Phocis in Achaia; anciently much celebrated for its temple, and oracle of Apollo. This temple was a magnificent ſtructure, enriched with innumerable gifts; in it was the dark cave Pythium, where the prieſteſs, named PYTHIA, ſitting on a tripos, or three-legged ſtool,

ſtood, pretended to receive the inſpiration of the god, ſwelling, foaming, and raving, like one diſtracted. The anſwers were always ambiguous, and ſo myſterious, that it was difficult to underſtand them; yet were they plainer than others; for Hermes the philoſopher ſays, that thoſe who did not underſtand the anſwers given at Dodona, came hither for an explanation. *Delphos* ſtands in the middle of Greece, and was by the ancients called the navel of the earth; the poets ſaying, that Jupiter let fly two eagles, the one from the eaſt, and the other from the weſt, that he might diſcover the middle; and that thoſe eagles met at this place. At preſent the town of Caſtri does not conſiſt of above two hundred houſes, and thoſe very ill built. It ſtands between Salona and Livadia, about ten miles diſtant from the latter, on the ſouth ſide of mount Parnaſſus, ſo famous in antiquity, and ſacred to the Muſes and Apollo.

DELTOIDES, in *Anatomy*, a triangular muſcle of the ſhoulder; thus called from the Greek *delta*, Δ, and *eidos*, *form*. See *Tab. Anat. (Myol.) fig. 1. n. 21. fig. 6. n. 10.* It ariſes exactly oppoſite to the trapezius, from one third part of the clavicula, from the acromium, and ſpine of the ſcapula, and is inſerted tendinous into the middle of the os humeri, which bone it lifts up directly; and it aſſiſts, with the ſupra ſpinatus, and coracobrachialis, in all the actions of the humerus, except the depreſſion; it being conventent, that the arm ſhould be raiſed and ſuſtained, in order to its moving on any ſide.

DELTOTE *leaf*, among *Botaniſts*. See LEAF.

DELTOTON, a conſtellation, the ſame as the Northern Triangle, which ſee.

DELUBRUM, in *Roman Antiquity*, a temple with a large ſpace of conſecrated ground round it. See TEMPLE.

DELUGE, DILUVIUM, in *Natural Hiſtory*, a flood, or inundation, of water, covering the earth, either in the whole, or part.

We meet with divers accounts of *deluges* in ancient hiſtory, both ſacred and profane: that which happened in Greece, in the time of Deucalion, called *diluvium Deucalionenan*, is famous: this *deluge* only overflowed Theſſaly. Its date is fixed to the year before Chriſt 1529, being the third year before the Iſraelites coming out of Egypt, according to the computation of Petavius, Rat. Temp. par. i. lib. i. cap. 7.

The *deluge* of Ogyges happened near three hundred years *before* that of Deucalion, 1020 years before the firſt Olympiad, and 1796 before Jeſus Chriſt, according to the ſame author, Rat. Tem. par. i. lib i. cap. 4. par. ii. lib. ii. cap. 5. This only ravaged Attica.

Theſe two *deluges* are frequently mentioned, in'ancient Greek authors, under the denomination of *cataclyſmus prior*, and *poſterior*.

Of the like kind were thoſe inundations in the Netherlands, which, in 1727, overwhelmed and covered with ſea all that part now called the Gulf Dollart in the United Netherlands; and in 1421, all that part between Brabant and Holland.

But the moſt memorable *deluge* is that which we particularly, by way of eminence, call the *deluge*, or the *univerſal deluge*, or *Noah's flood*; recorded in Scripture as a general inundation ſent by God to puniſh the corruption of the world, at that time, by deſtroying every thing (Noah and his family, and what was ſhut up with him in the ark, only excepted) from the face of the earth.

This flood makes one of the moſt conſiderable epochas in chronology. Its hiſtory is given by Moſes, Gen. ch. vi. and vii. Its time is fixed, by the beſt chronologers, to the year from the creation 1656, anſwering to the year before Chriſt 2293. From this flood, the ſtate of the world is divided into *diluvian*, and *antediluvian*.

The *deluge* has been, and remains, a ſubject of much inquiry and diſpute among naturaliſts, critics, &c. The points chiefly controverted may be reduced to three: firſt, its extent; viz. whether it were *general*, or *partial*; ſecondly, its natural cauſe; and, thirdly, its effects.

1. The immenſe quantity of water, requiſite to furniſh an univerſal *deluge*, has occaſioned ſeveral authors to ſuſpect it only partial. An univerſal *deluge*, they think, had been unneceſſary, conſidering the end for which it was brought; viz. to extirpate the wicked inhabitants. The world was then but new, and the people not very many; the holy Scriptures making only eight generations from Adam to Noah. It was but a ſmall part of the earth that could be yet inhabited: the country about the Euphrates, which is ſuppoſed to have been the ſcene of the firſt antediluvian inhabitants, was ſufficient to bear them all. Now Providence, ſay they, which ever acts wiſely, and frugally, would never have diſproportioned the means to the end, ſo far as to overflow the whole globe, only to drown a little corner of it. They add, that, in the Scripture-language, the *whole earth* expreſſes no more than *all the inhabitants*; and on this principle advance, that an overflowing of the Euphrates and Tigris, with a vehement rain, &c. might anſwer all the phenomena of the *deluge*.

But the *deluge* was univerſal. God declared to Noah, Gen. vi. 17. that he was reſolved to deſtroy every thing that had breath under heaven, or had life on the earth, by a flood of waters: ſuch was the menace; ſuch the execution. The waters, Moſes aſſures us, covered the whole earth, buried all the mountains, and were no leſs than fifteen cubits above the higheſt of them: every thing periſhed therein; birds, beaſts, men, and all that had life, excepting Noah, and thoſe with him in the ark, Gen. vii. 19, &c. Can an univerſal *deluge* be more clearly expreſſed? If the *deluge* had only been partial, there had been no neceſſity to ſpend an hundred years in the building of an ark, and ſhutting up all the ſorts of animals therein, in order to re-ſtock the world: they had been eaſily and readily brought from thoſe parts of the world not overflowed, into thoſe that were; at leaſt, all the birds would never have been deſtroyed, as Moſes ſays they were, ſo long as they had wings to bear them to thoſe parts where the flood did not reach. If the waters had only overflowed the neighbourhood of the Euphrates and Tigris, they could not be fifteen cubits above the higheſt mountains; they could not have riſen to that height, but they muſt ſpread themſelves, by the laws of gravity, over the reſt of the earth: unleſs, perhaps, they had been retained there by a miracle; and, in that caſe, Moſes, no doubt, would have related the miracle, as he did that of the waters of the Red ſea, and the river Jordan, which were ſuſtained in a heap, to give paſſage to the Iſraelites, Exod. xiv. 22. and Joſh. iii. 16. Add, that, in regions far remote from the Euphrates and Tigris, viz. in Italy, France, Switzerland, Germany, England, &c. there are frequently found, in places many ſcores of leagues from any ſea, and even in the tops of high mountains, whole trees ſunk deep under-ground; as alſo teeth and bones of animals, fiſhes entire, ſea ſhells, ears of corn, &c. petrified; which the beſt naturaliſts are agreed could never have come there but by the *deluge*; to which may be added the almoſt univerſal traditions of this great event in all countries of the globe.

2. The *deluge* allowed univerſal, the philoſophers are ſolicitous to find water to effect it.

Moſes brings it from two ſources: *the fountains of the great deep were broken up; and the windows of heaven were opened.* Dr. Burnet, in his Telluris Theoria ſacra, ſhews, that all the waters of the ocean were not near enough to cover the earth fifteen cubits above the tops of the higheſt mountains. According to his computation, no leſs than eight oceans were required. Suppoſing the ſea, therefore, drained quite dry, and all the clouds of the atmoſphere diſſolved into rain, we ſhould ſtill want much the greateſt part of the water of a *deluge*.

To get clear of this embarraſſment, many of our beſt naturaliſts, as Steno, Burnet, Woodward, Scheuchzer, &c. adopt Des Cartes' ſyſtem of the formation of the earth. That philoſopher will have the primitive world to have been perfectly round and equal, without mountains, or vales; and accounts for its formation on mechanical principles, by ſuppoſing it at firſt in the condition of a thick turbid fluid, replete with diverſe heterogeneous matters, which, ſubſiding by ſlow degrees, formed themſelves into different concentric ſtrata, or beds, by the laws of gravity; and thus, at length, left a dry, ſolid earth. Dr. Burnet improves on this theory: he ſuppoſes the primitive earth to have been no more than an orbicular cruſt, inveſting the face of the abyſs, or deep, which grew chinky, clave, burſt, and fell down into the water, and ſo drowned its inhabitants.

The ſame theoriſt adds, that by this cataſtrophe, the globe of the earth was not only ſhaken, and broken in a thouſand places, but the violence of the ſhock it then underwent ſhifted its ſituation; ſo that the earth, which before was placed directly under the zodiac, became thenceforth oblique to the ſame. Whence ariſe the difference of ſeaſons, which the antediluvian earth was not expoſed to.

Dr. Burnet's hypotheſis is very elegantly recited; but it not only contradicts the phyſical principles of nature, but is alſo utterly inconſiſtent with the ſacred text above cited, which expreſly mentions mountains as the ſtandard of the height of the water; or with that other paſſage, Gen. viii. 22. where God, promiſing not to bring any more *deluges*, but that every thing ſhould be reſtored to its ancient ſtate, ſays, *ſeed-time and harveſt, and cold and heat, and ſummer and winter, and day and night, ſhall ceaſe no more.* See Keil's Exam. of the Theory of the Earth.

Other authors, ſuppoſing a ſufficient fund of water in the abyſs, or ſea, are only concerned for an expedient to bring it forth: accordingly, ſome, as Mr. Bay, &c. have recourſe

recourse to a shifting of the earth's centre, which, drawing after it the water out of its channel, overwhelmed the several parts of the earth successively. But this could only occasion a partial deluge in that part of the globe towards which the centre of gravity was transflated: nor can the possibility of such a translation be allowed, since the centre of gravity is the necessary result of the materials composing our globe, and not alterable whilst the parts remained in the same position.

Dr. Hook's opinion of the compression of a shell of earth into a prolate spheroid, thereby pressing out the water of an abyss under the earth, may very well account for the waters overflowing two opposite zones of the globe; but the middle zone being by much the greater part of the earth's surface, must by this means be raised higher from the centre, and consequently arise more out of the water than before.

Dr. Halley ascribes the *deluge* to the shock of a comet, or some other such transient body, whereby the polar and diurnal rotation of the globe would be instantly changed. The great agitation that must have been occasioned by it in the sea, he observes, would be sufficient to account for all those strange appearances of heaping vast quantities of earth and high cliffs upon beds of shells, which were once the bottom of the sea, and raising up mountains where none were before. Such a shock as this impelling the solid parts, would occasion the waters, and all fluid substances that were unconfined, as the sea is, to run violently with an impetus towards that part of the globe where the blow was received, and that with force sufficient to take with it the very bottom of the ocean, and remove it to the land. In this case, it is much more difficult to say, how Noah and his family could be preserved, than how all other creatures were destroyed: such a shock would change the length of the day and year, by altering the axis of the globe, according to the obliquity of the incidence of the stroke. It is objected to this system, that such a shock must have brought on the *deluge* instantaneously, and not gradually, as it is said to have happened. Phil. Trans. N° 383. p. 120, or Abr. vol. vii. p. 3, &c.

The inquisitive Mr. Whiston, in his New Theory of the Earth, has a very ingenious hypothesis, similar to that suggested by Dr. Halley, with respect to the primary cause of the *deluge*, but much more largely applied and explained. He shews, from several remarkable coincidences, that a comet, descending in the plane of the ecliptic towards its perihelion, passed just before the earth on the first day of the *deluge*; the consequences whereof would be, first, that this comet, when it came below the moon, would raise a prodigious, vast, and strong tide, both in the small seas, which, according to his hypothesis, were in the antediluvian earth, for he allows no great ocean there, as in ours; and also in the abyss, which was under the upper crust of the earth; and that this tide would rise, and increase all the time of the approach of the comet towards the earth; and would be at its greatest height when the comet was at its least distance from it. By the force of which tide, as also by the attraction of the comet, he judges, that the abyss must put on an elliptic figure, whose surface being considerably larger than the former spherical one, the outward crust of the earth, incumbent on the abyss, must accommodate itself to that figure, which it could not do while it remained solid, and conjoined together. He concludes, therefore, that it must of necessity be extended, and at last broke, by the violence of the said tides, and attraction; out of which, the included water issuing, was a great means of the *deluge*; this answering to what Moses speaks of the *fountains of the great deep being broken open*. Again, the same comet, he shews, in its descent towards the sun, must have passed so close by the body of the earth as to involve it in its atmosphere, and tail, for a considerable time; and of consequence, it must have left a vast quantity of its vapours, both expanded and condensed, on its surface; a great part of which, being afterwards rarefied by the solar heat, would be drawn up again into the atmosphere, and afterwards return again in violent rains; and this he takes to be what Moses intimates *by the windows of heaven being opened*; and particularly by the *forty days rain*. For as to the following rain, which, with this, made the whole time of raining a hundred and fifty days, Mr. Whiston attributes it to the earth coming a second time within the atmosphere of the comet, as the comet was on its return from the sun. Lastly, to remove this vast orb of waters again, he supposes a mighty wind to have arisen, which dried up some, and forced the rest into the abyss again through the clefts by which it came up: only a good quantity remained in the alveus of the great ocean, now first made, and in lesser seas, lakes, &c.

To the credit of this theory, it must be observed, that it was at first only proposed hypothetically: that is, the author only supposed such a comet, merely as it would account well, and philosophically, for the phenomena of the *deluge*; without any assurance, that there really was any comet so near the earth at that time; and the hypothesis pleased even under such circumstances; but, upon further consideration, he has since, he thinks, proved, that there actually was a comet near the earth at that time, on 28th November, in the 2365th year of the Julian period, or the 2349th year before Christ, to which time he assigns the beginning of the *deluge*, viz. the same great comet which appeared again in 1680. The author no longer, therefore, looks upon it as an hypothesis, but has republished it in a particular tract, intituled, The Cause of the Deluge demonstrated.

3. But the great difficulty still remains. The orderly strata, or layers of the earth, with the exuviæ, or remains of fishes, as their teeth, bones, shells, &c. both marine, and fluviatile, found in the bodies even of the most solid strata, and in flints, marbles, &c. are not yet accounted for. Those who adhere to Des Cartes' system, as Steno, &c. take the finding of the part of terrestrial, and aquatic animals, branches of trees, leaves, &c. in the beds, or strata of stone, to be a direct proof of the primitive fluidity of the earth. But then they are obliged to have recourse to a second formation of [illegible], much later than the first; because at the time of the first there was neither plant nor animal, in being. Steno, therefore, maintains second formations, occasioned at different times by extraordinary inundations, earthquakes, volcanos, &c. But Burnet, Woodward, Scheuchzer, &c. choose rather to attribute a second general formation to the *deluge*; without excluding, however, the particular ones of Steno. But the great objection against this system of fluidity, is mountains; for the whole globe being liquid, whence should such inequalities arise? Mr. Scheuchzer, rather than part with a system which seems so promising, gives into the opinion of those who hold, that, after the *deluge*, God, to remit the waters into their subterranean reservoirs, broke, and displaced, with his own almighty hand, a great number of strata, that were before horizontal, and raised them above the surface of the earth; whence it is, that the strata in mountains, though concentrical, are never horizontal. Hist. de l'Acad. 1708. p. 32.

Dr. Woodward, taking the several strata for the sediments of a *deluge*, and considering the circumstances of those fishes, shells, and other exuviæ, found in them, drawn several inferences, which very much illustrate the effects of the *deluge*. As, first, that these marine bodies, and other spoils of salt-water fishes, were borne forth out of the sea, by the universal *deluge*; and, on the return of the water back again, were left behind upon the land. Secondly, that while the flood covered the globe, all the solid matters, as stones, metals, minerals, and fossils, were totally dissolved, and the cohesion of their corpuscles destroyed; and that their corpuscles, with those of the less solid bodies, as earth, flesh of animals, and vegetables, were sustained promiscuously in the water, and made one common mass. Thirdly, that all the mass, thus sustained, was at length precipitated to the bottom; and that according to the laws of gravity, the heaviest settled first, and the rest in order. And that the matters, thus subsiding, constituted the several strata of stone, earth, coal, &c. Fourthly, that these strata were originally all parallel, even, and regular, and rendered the surface of the earth perfectly spherical; and that the whole mass of water lay upon them, and constituted a fluid sphere encompassing the globe. Fifthly, that after some time, by the force of an agent seated within the earth, these strata were broken on all sides of the globe, and their situation varied; being elevated in some places, and depressed in others; whence mountains, valleys, grottos, &c. with the channel of the sea, islands, &c. In one word, the whole terraqueous globe was put, by this disruption, and dislocation of the strata, into the condition we now behold it in. Sixthly, that upon the disruption of the strata, and the depression of some, and elevation of other parts, which happened towards the end of the *deluge*, the mass of water fell back again into the depressed, and lowest parts of the earth, into lakes, and other cavities, and the channel of the ocean, and through the fissures, whereby this communicates with the abyss, which it filled till it came to an equilibrium with the ocean. Nat. Hist. of Earth, p. 1. and 2.

But of all the systems yet advanced, there seems none better calculated to solve the phenomena of these petrified exuviæ, than that of M. de la Peyrere. The antediluvian world, according to this author, had an external sea, as well as land, with mountains, rivers, &c. and the *deluge* was effected by breaking the subterraneous caverns, and pillars thereof, with dreadful earthquakes,

and causing the same to be for the most part, if not wholly absorbed, and swallowed up, and covered by the seas that we now have. Lastly, this earth of ours arose out of the bottom of the antediluvian sea, and in its room; just as many islands are swallowed down, and others thrust up in their stead.

From this system, which is very agreeable to Scripture, the great difficulties that clog all the other systems, seem easily solved. It is no longer a wonder, that shells, and shell-fish, and the bones of fishes, and sea-footed creatures, with *trunks*, &c. should be found in beds and quarries, in mountains and valleys, and the very bowels of the earth: for here they bred in the antediluvian sea; thither they were elevated with the hills and mountains, in the time of the *deluge*; and there they fell into, were absorbed, and buried in chasms, and holes and clefts, that would necessarily happen in the extrusion of the earth. Phil. Trans. N° 206.

Mr. King has more lately adopted an hypothesis resembling this last. He ascribes the *deluge* to subterraneous fires found within the bowels of the earth, which, at the appointed time, burst forth with great violence under the sea, and raised up the bottom of the ocean, so as to pour out the waters over the face of what was before dry land, which by that means became the sea, and has since continued, and that which was before the bottom of the sea became dry land. An earthquake thus occasioned will account, he supposes, for the access of the *deluge*, and the confused disposition of marine productions in the post-diluvian earth. Phil. Trans. vol. lvii. p. 44, &c. M. Buffon recites the principal hypotheses relating to the universal *deluge*, in his Hist. Nat. tom. i.

DELUGE *of Deucalion.* See DEUCALION.

DELVIN, in *Natural History*, a name sometimes given by the miners in Cornwall to that sort of taley stone or slate, which they more generally call *killas*; but in some places, as at Lowancowiggan, they use it as the name of a coarse, but very hard stone, in which the ore lies. The ore is tin, and is considerably rich there, but the hardness of this stone makes it difficult to be got out.

DEMAIN, or DEMESNE, in its popular sense, denotes the lord's manor-place, with the lands thereto belonging; which he and his ancestors have from time to time kept in their own manual occupation. See MANOR.

DEMAIN, or DEMESNE, in a law-sense, signifies, according to Hottoman, *patrimonium domini*, *the lord's patrimony*; called also *domain*, and by the civilians, *dominicum*.

The same author proveth those lands to be *demain*, which a man holdeth originally of himself; and those to be *feodum*, which he holdeth of a superior lord.

In England, no common person has any *demain*, simply understood; for all depends either mediately, or immediately on the crown. When a man, therefore, in pleading, would signify his land to be his own, he saith, that he is or was seised thereof in his *demain*, as of fee; whereby he means, that although his land be to him and his heirs for ever, yet it is no true *demain*, but depends upon a superior lord, and he holdeth by service, or rent in lieu of service, or by both service and rent.

DEMAIN is sometimes also taken, more largely, for lands and tenements held for life, &c. and sometimes more strictly for such only as are generally held in fee.

DEMAIN is sometimes again used for a distinction between those lands that the lord of a manor has in his own hands, or in the hands of his lessee, demised upon a rent, for a term of years, or life; and such other lands, pertaining to the said manor, which belong to the free, or copyholders.

The reason why the copy-hold is accounted *demain*, is because they, who are tenants to it, are judged in law to have no other right but at the will of the lord; so that it is reputed still after a fort, to be in the lord's hands; and yet in common speech that is ordinarily called *demain*, which is, neither free, nor copy-free.

DEMAIN, again, is used in a more special signification, in opposition to *frank-fee*.

Thus, those lands which were in the possession of Edward the Confessor, are called *ancient demain*; and all others are called *frank-fee*; and the tenants who hold any of those former lands, are called *tenants in ancient demain*; and the others, *tenants in frank-fee*, and also, *tenants at common law*. The reason is, because tenants in *ancient demain* cannot be sued out of the lord's court.

DEMAND, in its proper sense, denotes a calling for, or requiring one's due.

DEMAND, in *Law*, has a more special signification, as contradistinguished from *plaint*: for all civil actions are pursued, either by *demands* or plaints; according to which the pursuer is called either *demandant*, or *plaintiff*: viz. in real actions, *demandant*; and in personal actions, *plaintiff*.

Where the party pursuing is called *demandant*, the party pursued is called *tenant*; and where the former is called *plaintiff*, the latter is termed *defendant*.

There are two kinds of *demands*: the one in *deed*, *de facto*, as in every precipe; the other in *law*, *de jure*; such is entry in land, distress for rent, &c.

If a man release another from *all demands*, it is the best release the release can have, and shall redound most to his advantage. A release of facts is more large than of quarrels or actions; and a release of *demands* more large and beneficial than either: by a release of all *demands* to the disseisor, the right of entry into the land, and all contained therein, is released; and he that releaseth all *demands*, excludes himself from all actions, entries, and seizures. But it is no bar to a writ of error to release an outlawry.

DEMANDANT, *Pleas*, he who is actor, or plaintiff, in a real action; thus called, because he *demands* lands, &c.

DEMARCHUS, in *Antiquity*, the chief of a region, or district, in the country of Attica.

The Athenians divided their country into certain regions, or districts, which they called δῆμοι, i. e. *people*; and established a magistrate at the head of each, under the denomination of δημάρχος, *demarchus*, of δῆμος, and ἄρχω, *rule*, *governments*.

It was also an appellation given to the chief magistrate of the city Megalopolis.

DEMEMBRE, in *Heraldry*, is when an animal is *dismembered*, i. e. the limbs cut off its body.

DEMESNE. See DEMAIN.

DEMETRIA, Δήμητρια, in *Antiquity*, a festival in honour of Ceres, called by the Greeks *demeter*, δήμητερ, of δῆ, i. e. *ye*, *earth*, and μητερ, *mother*. It was usual on this occasion for the worshippers to lash themselves with whips made of the bark of trees, and called μάστιγες. Potr. Archæol. Græc. tom. i. lib. ii. cap. 20. p. 379.

DEMETRIA was likewise the name of another festival celebrated by the Athenians in honour of Demetrius Poliorcetes, and was the same with that afterwards called *Demetria*. Potr. loc. cit.

DEMI, a word of the same use and effect in the French language with *semi*, in the Latin and English; being formed from *dimidium*; and used, in composition with other words, to signify *half*.

In words borrowed from the Latins, we use *semi*; and in those from the French, we retain their *demi*. See SEMI.

DEMI, or DEMY, in *Heraldry*, signifies the *half* of a thing; as, a *demy lion*, &c.

Colombiere has what he calls *croix de demy*, a cross and a half; being a staff crossed in the upper-part like the Cavalry cross, and having but one arm at the lower-part.

DEMI-AIR, or DEMI-VOLT, in *Horsemanship*, is one of the seven artificial motions of a horse; being an air, in which his fore-parts are more raised than in terra à terra: but the motion of the horse's legs is more quick in the latter than in the *demi-volt*.

DEMI-BASTION, is a kind of fortification, that has only one face, and one flank. See BASTION.

DEMI-CANNON, a piece of ordnance, usually about six inches bore, 5400 pounds weight, ten or eleven feet long, and carrying a shot of 30 or 32 pounds weight.

It carries point-blank 150 paces; its charge of powder is 14 pound weight.

There are also two sizes of *demi-cannon* above this, which are something larger; as, the *ordinary demi-cannon*, which is six inches ½ bore, twelve feet long, weighs 5600 pounds; its charge of powder 17 pounds 8 ounces, carries a shot six inches and a half diameter, and whose weight is 32 pounds: this piece shoots point-blank 162 paces.

Demi-cannon of the largest size, is six inches ½ bore, twelve feet long, 6000 pounds weight; its charge is 18 pounds of powder, and it carries 180 paces. See CANNON, and ORDNANCE.

DEMI-CROSS, an instrument used by the Dutch to take the *sun's* altitude, or that of a star at sea; but instead of which we use the cross-staff or fore-staff. See *Tab.* II. *Astronomy*, *fig.* 67.

The staff A G is graduated easily, being only a line of whole tangents, whose radius is E B, the length of the cross piece, or transom. It hath three vanes; a horizontal vane, at A; a sight vane, at H; and the shade vane, at E.

When the vanes are on the staff and cross-piece, to take the sun's altitude, hold the instrument with the transom as upright as you can, and looking through the sight vane, at H, look for the horizon through the slit in the horizon vane, and then slide the cross-piece or transom to and fro, till you make the shade of the vane at E to fall at the same time upon the slit of the horizon vane, and also at A; then are the degrees cut on the staff, by the edge of the cross-piece, the sun's altitude required. But to take the height of a star, you must remove the horizon vane A, and put it on the end G, and transfer

the fight vane H to A; then holding up the inſtrument as before, looking through the ſight vane, ſee for the horizon through the horizon vane, and for the ſtar by the ſhade vane, ſliding the tranſom to and fro, till the horizon and ſtar are both ſeen by their reſpective vanes, and then the tranſom will cut the degrees of the ſtar's altitude on the ſtaff, allowing about eight or ten minutes for your height above the level of the water, as muſt be done in all ſuch caſes.

DEMI-CULVERIN, is a piece of ordnance commonly 4½ inches bore, ten feet long, 2700 pounds weight; its charge is 7 pounds 4 ounces of powder; and it carries a ſhot of 10 pounds 11 ounces, and ſhoots point-blank 175 paces.

Demi-culverin of the leaſt ſize, is 4 ½ inches bore, ten feet long, 2000 pounds weight; it carries a ball of 4 inches diameter, its charge is 6 pounds 4 ounces of powder, and its level range is 174 paces.

Demi-culverin of the largeſt ſort, is 4 inches ½ bore, ten feet long; its charge of powder is 8 pounds and 8 ounces; the ball is 4¼ inches diameter, weighs 12 pounds 11 ounces; and the point-blank ſhoots 178 paces. See CANNON, and ORDNANCE.

DEMI-DITONE, in *Muſic*, is uſed by ſome for a third minor.

DEMI-GOD, &c. See GOD, HERO, &c.

DEMI-GORGE, in *Fortification*, is half the gorge, or entrance, into the baſtion; not taken directly from angle to angle, where the baſtion joins to the curtin, but from the angle of the flank to the centre of the baſtion; or the angle the two curtins would make, were they thus protracted to meet in the baſtion.

DEMI-HUQUE. See HARQUEBUSE.

DEMI-LUNE, *Half-Moon*, in *Fortification*, an outwork, as E F G H K (*Tab. Fortif. fig.* 3.) conſiſting of two faces, and two little flanks; frequently built before the angle of a baſtion, and ſometimes alſo before the curtin, though now much diſuſed. The gorge terminates in a creſcent or half-moon, whence the denomination *demi-lune*. See RAVELIN.

DEMI-QUAVER, is a note in muſic, two of which are equal to the quaver.

DEMI-SEMI-QUAVER. See QUAVER.

DEMI-SEXTILE. See SEMI-SEXTILE.

DEMISE, in *Law*, is applied to an eſtate either in fee, ſimple, fee-tail, or for term of life, or years; and ſo it is commonly taken in many writs.

The king's death is, in law, termed, the *demiſe* of the king.

DEMISE *of the king* does not diſcontinue any writ or proceſs. Vide Stat. 1 Ed. VI. cap. 7. ſect. 1, 2, 3.

Nor does it determine any commiſſion civil or military, or great office of ſtate, but they ſhall continue in force for ſix months after the ſovereign's *demiſe*, unleſs made void by the next ſucceſſor. Stat. 7 & 8 Will. III. cap. 27. ſect. 21. 1 Ann. ſtat. 1. cap. 8. 6 Ann. cap. 7. ſect. 8.

Neither is a parliament thereby determined till after ſix months. 7 & 8 Will. III. cap. 15.

Nor is a defendant, who hath pleaded to an information, obliged to plead to it again. But he may plead again upon requeſt made to the court, within five months after the *demiſe*. 4 & 5 Will. & Mar. cap. 18. ſect. 7.

DEMISE, and REDEMISE, denote a conveyance where there are mutual leaſes made from one to another of the ſame land, or ſomething out of it.

DEMI-VILLS. See VILL.

DEMIURGE, *Δημιουργος*, from *δημος*, which denotes a *public ſervant* and *εργον*, *work*, in the *Mythology of the Eaſtern Philoſophers*, was one of the AEONS, employed by the ſupreme Deity in the creation of the world. The character they give him is a compound of ſhining qualities, and inſupportable arrogance; and his exceſſive luſt of empire effaces his talents and virtues. He is repreſented as claiming dominion over the new world he has formed as his ſovereign right; and, excluding totally the ſupreme Deity from all concernment in it, he demands from mankind, for himſelf and his aſſociates, divine honours.

DEMOCRACY, a form of government, wherein the ſoveraignty, or ſupreme authority, is lodged in the people, who exerciſe the ſame by perſons of their own order, deputed for that purpoſe.

The word is formed of the Greek *δημος*, *people*, and *κρατεω*, *to command, govern*.

The moſt flouriſhing *democracies* were thoſe of Rome and Athens; the modern republics, as Venice, and the United Provinces, are rather ariſtocracies than *democracies*. The government of Baſil, however, is a *democracy*, and ſo are ſome of the free cities in Germany.

In a *democracy*, where the right of making laws reſides in the people at large, public virtue, or goodneſs of intention, is more likely to be found than either of the other qualities of government; and therefore it uſually poſſeſſes a conſiderable degree of patriotiſm and public ſpirit. *Democracies* are uſually the beſt calculated to direct the end of a law; ARISTOCRACIES to invent the means by which that end ſhall be obtained; and MONARCHIES to carry thoſe means into execution. See REPUBLIC.

DEMOISELLE, the *dancing-bird*, a long-legged and long-necked bird of the crane kind, a native of Numidia. It is remarkable for its jumping or dancing in its walk. It has the ſame kind of plication in the wind-pipe with the common CRANE. See *Tab.* II. of *Birds*, N° 12. Phil. Tranſ. vol. lvi. p. 211.

DEMON. See DAEMON.

DEMONIAC. See DAEMONIAC.

DEMONIACAL *poſſeſſion*. See DAEMONIACAL *poſſeſſion*.

DEMONIUS *lapis*, in *Natural Hiſtory*, a name given to a ſtone famous among the writers of the middle ages for a number of imaginary virtues, ſuch as rendering people victorious over their enemies, and the like. All the deſcription they have left us of it is, that it was variegated with two colours laid in lines ſo as to repreſent a rainbow. It was probably an agate.

DEMONSTRABLE, a term uſed in the ſchools, to ſignify ſomewhat that may be clearly and evidently proved.

It is *demonſtrable*, that the ſide of a ſquare is incommenſurable with the diagonal.

DEMONSTRATION, in *Logic*, a ſyllogiſm in form, containing a clear and irrefragable proof of the truth of a propoſition.

A *demonſtration* is a convincing argument, the two firſt propoſitions whereof are certain, clear, and evident; whence of neceſſity ariſes an infallible concluſion.

A *demonſtration* uſually conſiſts of three parts: *expoſition*, *preparation*, and *concluſion*.

The *expoſition* is the laying down of the things ſuppoſed to be given or granted; from which the *demonſtration* is to be made.

The *preparation* is ſomething to be previouſly done, according to the nature of the *demonſtration* intended.

The *concluſion* is a propoſition that concludes the thing to be *demonſtrated*, fully perſuading, and convincing the mind.

The method of *demonſtrating* things in mathematics is the ſame with that of drawing concluſions from principles in logic. In effect, the *demonſtrations* of mathematicians are no other than ſeries of enthymemes; every thing is concluded by force of ſyllogiſm, only omitting the premiſes, which either occur of their own accord, or are recollected by means of quotations. To have the *demonſtration* perfect, the premiſes of the ſyllogiſms ſhould be proved by new ſyllogiſms, till at length you arrive at a ſyllogiſm, wherein the premiſes are either definitions, or identic propoſitions.

Indeed it might be *demonſtrated*, that there cannot be a genuine *demonſtration*, i. e. ſuch a one as ſhall give full conviction, unleſs the thoughts be directed therein according to the rules of ſyllogiſm. Clavius, it is well known, reſolved the *demonſtration* of the firſt propoſition of Euclid into ſyllogiſms: Berlinus, and Daſipodius, *demonſtrated* the whole ſix firſt books of Euclid; and Heniſchius, all arithmetic, in the ſyllogiſtic form.

Yet people, and even mathematicians, uſually imagine, that mathematical *demonſtrations* are conducted in a manner far remote from the laws of ſyllogiſm; ſo far are they from allowing that thoſe derive all their force and conviction from theſe. But we have men of the firſt rank on our ſide the queſtion. M. Leibnitz, for inſtance, declares that *demonſtration* to be firm and valid, which is in the form preſcribed by logic; and Dr. Wallis confeſſes, that whilſt is propoſed to be proved in mathematics, is deduced by means of one, or more ſyllogiſms: the great Huygens, too, obſerves, that paralogiſms frequently happen in mathematics, through want of obſerving the ſyllogiſtic form. See SYLLOGISM.

Problems conſiſt of three parts: a *propoſition*, *reſolution*, and *demonſtration*.

In the *propoſition* is indicated the thing to be done.

In the *reſolution*, the ſeveral ſteps are orderly rehearſed, whereby the thing propoſed is performed.

Laſtly, in the *demonſtration* it is ſhewed, that the things enjoined by the reſolution being done, that which was required in the propoſition is effected. As often, therefore, as a problem is to be *demonſtrated*, it is converted into a theorem; the reſolution being the hypotheſis, and the propoſition the theſis: for the general tenor of all problems to be *demonſtrated* is this; that the thing preſcribed in the reſolution being performed, the thing required is done.

The ſchoolmen make two kinds of *demonſtration*: the one *a cauſa*, or *propter quid*; wherein an effect is proved by the next cauſe. As when it is proved, that the moon is eclipſed,

eclipsed, because the earth is then between the sun and moon. The second *a tri*, or *quia*; wherein the cause is proved from a remote effect: as when it is proved, that fire is hot, because it burns; or that plants do not breathe, because they are not animals; or that there is a God, from the works of creation. The former is called *demonstration à priori*, and the latter *demonstration à posteriori*.

DEMONSTRATION, *affirmative*, is that which, proceeding by affirmative and evident propositions, dependent on each other, ends in the thing to be *demonstrated*.

DEMONSTRATION, *apagogical*. See APAGOGICAL.

DEMONSTRATION, *geometrical*, is that framed of reasonings drawn from the elements of geometry.

DEMONSTRATION, *mechanical*, is that, the reasonings whereof are drawn from the rules of mechanics.

DEMONSTRATION *à priori*, is that whereby an effect is proved from a cause, either a next, or remote one; or a conclusion proved by something previous, whether it be a cause, or only an antecedent.

DEMONSTRATION *à posteriori*, is that whereby either a cause is removed from an effect, or a conclusion is proved by something posterior; whether it be an effect, or only a consequent.

DEMONSTRATIVE, in *Rhetoric*, one of the genera, or kinds, of eloquence; being that which obtains in the composing of panegyrics, ingratiatives, &c.

Rhetoric is divided into three kinds; *deliberative*, *demonstrative*, and *judiciary*. See RHETORIC.

DEMONSTRATIVE, in *Grammar*, is applied to pronouns which serve to shew, point out, or indicate a thing; as, *this*, *that*, *those*, &c.

They are also called definitive, because they define and limit the extent of the common name, or general term, to which they either refer, or are joined.

DEMONSTRATIVE *evidence*. See DEDUCTIVE and EVIDENCE.

DEMULCENTS, *Demulcentia*, in *Pharmacy*, are medicines which render the acrimonious humours mild. This they do by obtunding or sheathing their sharp particles.

They are distributed into general and specific; the former including those which certain to all kinds of acrids indiscriminately; and the latter such as obtund only a particular kind of acrimony. See EMOLLIENTS.

DEMURRAGE, in *Trade*, an allowance made to the master of a ship, by the merchants, for staying in a port longer than the time first appointed for his departure.

DEMURRER, in *Law*, a kind of pause or stop, put to the proceeding of any action, upon some difficult point, which must be determined by the court, before any further progress can be had in it.

In every action, the controversy is either as to fact, or as to law; the first, decided by the jury; the second, by the judge. Now, if any thing turn up in the cause so rare and difficult, that the judge cannot pronounce upon it, a *demurrer*, or stop, is made, and time taken, either for the court to consider and agree of it among themselves, or otherwise for the judges to meet in the exchequer chamber, there, after hearing counsel on both sides, to determine what is law. For this purpose a *demurrer* book is made up, containing all the proceedings at length, which are afterwards entered on record, and copies thereof, called paper books, are delivered to the judges to perufe.—This *demurrer* is expreſſed, in our records, by *mouatur in lege*.

In common law, the defendant sometimes *demurreth* to the plaintiff's count, or declaration: and sometimes the plaintiff *demurreth* to the defendant's plea, by averring, that it is not a sufficient plea in law, &c.

In chancery, the defendant *demurreth* to the plaintiff's bill, averring it to be defective in such and such a point; and demands the judgment of the court thereupon, whether he shall not be compelled to make any farther or other answer thereunto.

DEMURRER *to evidence* takes place, when a record, or other matter, is produced in evidence, concerning the legal consequences, of which there arises a doubt or question in law; in which case the adverse party may, if he pleases, *demur* to the whole evidence. This draws the question of law from the cognizance of the jury, to be decided by the court. But this kind of *demurrer* is now seldom used.

DEMURRER *to indictments* is incident to criminal cases, as well as civil, when the fact as alleged is allowed to be true, but the prisoner joins issue upon some point of law in the indictment; by which he insists that the fact, as stated, does not amount to the crime charged.

Some have held, that if, on *demurrer*, the point of law be adjudged against the prisoner, he shall have judgment and execution, as if convicted by verdict: but this is denied by others, who maintain, that in such case he shall be directed and received to plead the general issue, not guilty, after a *demurrer* determined against him. However, upon this doubt, *demurrers* to indictments are seldom used; since the same advantages may be taken upon a plea of not guilty; or, afterwards, in arrest of judgment, when the verdict has established the fact. Blackst. Comm. vol. iv. p. 328.

DEMY *Sanguis*. See HALF *Blood*.

DEN, a syllable added to the names of places, and shews their situation to be in a valley, or near woods, as Tenterden, Biddenden, &c.

The word is Saxon *den*, i. e. *vallis*, or *locus sylvestris*.

DEN *and ferend*, &c. in *Law*, was a liberty for ships or vessels to run or come ashore. King Edward I. by charter, granted this privilege to the barons of the cinque ports.

DENARIATUS *terræ*, in *Ancient Law-Books*, as much land as is worth a penny by the year. See FARDING-*deal*. *Sibylla Bartholot tenet unum messuagium, & 5 denariatos terræ in eadem tenementa*. Du Cange.

DENARIUS, in *Antiquity*, the Roman penny; a silver coin equivalent to, from six to eight pence half-penny sterling. See COIN.

The Romans, having, for a long time, used brass money, which they call *as*, quaſi *æs*; or *libra* and *pondo*, because it was a pound weight, began in the year of Rome 485, to coin silver; and coined first the *denarius*, which was marked with the letter X, because it was worth ten asses, and divided into two quinarii, marked with V, which were subdivided into two ſeſtertii, marked with these three letters, IIS. Afterwards, about the year 537, the silver *denarius* was made to paſs for ſixteen asses, the quinarius for eight, and the ſeſterce for four; though in the pay of the army the soldier always received a silver *denarius* for ten asses. Pliny, Nat. Hiſt. lib. xxxiii. cap. 3. Livy, lib. xv.

The moſt ancient *denarii* have on one side the head of a woman in a helmet, with the inſcription ROMA, and the mark of the *denarius* X or Ж, and some few XVI, and a biga or quadriga on the other; whence they are denominated bigati and quadrigati. The next to these in antiquity have the head of Roma, or some other deity, on one side, and on the reverſe, the name of the mint-master, with hiſtorical or emblematical figures. Many of these have the mark X or Ж, which remained long after the *denarius* paſſed for ſixteen asses. A third sort have the head of a conſul or general on one side, with an hiſtorical or emblematical reverſe; few of these have the mark X or Ж upon them. These three sorts are called conſular *denarii*, because they were ſtruck during the republican government by conſuls. The imperial *denarii* have commonly the head of the reigning emperor, with his names and titles on one side, and some emblematical figures on the reverſe, with ſuitable inſcription. The Romans did not uſe the *denarius* for a weight, as the Greeks did their drachm, till the Greek phyſicians coming to Rome, and finding the two coins nearly equal, preſcribed by it, as they had been uſed to do by the drachm in their own country.

We are informed both by Celſus and Pliny, that eighty-four *denarii* were coined out of the pound of ſilver; and therefore by determining the true weight of the Roman pound, we ſhall obtain that of the *denarius*, which depended upon it. Celſus de Medicina, lib. v. cap. 17. Pliny, Nat. Hiſt. lib. xxxiii. cap. 9.

If we take 5040 troy grains for the weight of the Roman pound, as determined from the gold coins, the conſular *denarius* of 84 in the pound will weigh juſt 60 troy grains. Mr. Raper took the mean weight of forty-ſix of the faireſt *denarii* in the Britiſh Muſeum, and found it to be 60,95 troy grains; but as ſome of theſe were imperfect, he found the mean of twenty perfect *denarii* to amount to 60,92: and he queſtions whether the *denarii* of above ſixty-three grains ever paſſed as current coin. The weight of the *denarius* was diminiſhed under the emperors; and Greaves found, by examining many imperial *denarii*, that from Auguſtus's time to Veſpaſian they continually almoſt decreaſed, till, from being the ſeventh part of the Roman ounce, they came now to be the eighth part; and ninety ſix were coined out of the Roman libra, whereas under the conſuls they coined only eighty-four. Under Severus and Gordianus they recovered their weight, but with a conſiderable mixture of allay. J. Caſpar Eiſenſchmid of Straſburg, in a book De Ponderibus & Menſuris veterum, &c. publiſhed in 1708, informs us, that he found the weight of the imperial *denarius* from Nero to Sept. Severus, to be to the conſular *denarius* in the proportion of 7 to 8.

In order to determine the value of the conſular *denarius* of 60 troy grains of fine ſilver, we are to conſider, that ſixty-two Engliſh ſhillings are coined out of eleven ounces two penny weight, troy, of fine ſilver, and eighteen penny weight allay; and therefore the troy grain of fine

ſilver

silver is worth $\frac{1}{24}$ths of a farthing; and sixty grains, or the *denarius*, worth somewhat more than eight pence farthing and a half sterling; and the 96, or sixteenth part of the *denarius*, a little more than a half-penny. Phil. Trans. vol. lxi. part ii. art. 48.

Others, as Greaves, and after him Arbuthnot, have made the consular *denarius* the seventh part of an ounce in weight, a little more than sixty-two grains, allowing 5256 troy grains to the Roman pound, and its value, allowing eight English grains to the silver penny, 7½*d*. of our money; and the imperial *denarius* the eighth part of an ounce, and worth about 6½*d*. sterling.

M. Tillemont observes, that the *denarius* was held sufficient to keep a person handsomely for a day: and, upon the whole, seems to estimate, that it was equal to twelve French sous, or eleven English pence: but this estimate errs in excess more than the preceding does in defect.

The *denarius* continued to be the current silver money of the empire, till Constantine substituted the milliarensis in its stead. See Greaves's Discourse of the *Denarius*, in his works, by Dr. Birch, vol. i. p. 235. and Arbuthnot on Coins, p. 15. See MILLIARENSIS and POUND.

DENARIUS is also used, in our *Law-Books*, for an English penny:

Denarius *Angliæ, qui nominatur sterlingus, rotundus sine tonsura, ponderabit* 32 *grana frumenti in media spica*; & 20 *denarii faciunt unciam*; & 12 *unciæ faciunt librum*. Stat. Ed. I. De mensuris.

DENARIUS *Dei* denotes *earnest-money*; called also *argentum Dei*, by the French *deniers de Dieu*, and in some parts of our country *arles*.

Ita quod neuter mercatorum ab illo contractu possit discedere, vel resilire pofquam denarius Dei *inter personas contrahentes datus fuerit & receptus*. Charti Eduardi I.

DENARIUS *sortius comitatus*, denoted a third part of the profits of county courts. When those courts had superior jurisdiction, before other courts were erected, two parts of the fines, and other profits belonging to them, were referred to the king, and a third part to the earl of the county. Paroch. Ant. 418.

DENARII *de caritate* were customary oblations made to cathedral churches charged upon parish priests; though at first they were but a gift of charity for maintaining and adorning the bishop's see.

DENARIUS *St. Petri*. See PETER-PENCE.

DENATES, in *Antiquity*, domestic gods, more frequently called PENATES.

DENCHE', DENCHEA, or ENDENCHE', in *Heraldry*. See DANCHE'.

DENDRITIS, or DENDRACHATES, in *Natural History*, a sort of flate or agate, whereon are seen trees, shrubs, and other ruftic figures; represented, in miniature, in blackish or yellowish figures, now called Mochoa stones. Some rank the *dendritis* in the class of entrochi, which they wrongly call stone plants: but against this it is urged, first, that the branches of trees, &c. represented on the *dendritis*, are never confounded together, nor shoot across each other, as those of entrochi are usually found to do.

Secondly, that the fire strips the *dendritis* of all its figures, without destroying the stone, or reducing it to ashes; which does not hold of any entrochus. See *Tab. Fossil. Class* 5.

Their true history is no more than this: the stone, or flate, on which the *dendrita* most frequently occur, is subject, like our common flints, to imperceptible cracks and flaws, into which the steams and effluvia from minerals, and other fossil bodies, continually pervading the whole structure of the earth, find their way, and perhaps in some cases water itself has been at some time in them: either water or these vapours, we well know, may be naturally enough tinged with black, or capable of leaving a black tinge on the surfaces of the bodies they have long remained on; and these finding their way into the natural cracks or small crevices of the stone, have from the sides of these insinuated themselves farther and farther into the mass, and run into branched figures; or the water wherever included has, as the mass of the stone shrunk and contracted in the drying, spread and diffused itself into the various detached figures we see; for all the delineations we find in these stones may be referred either to these loose detached figures or cloudy spots, or to those which evidently arise from the sides of some long cracks or fissures.

That water is continually to this day getting into these natural crevices of stone, and diffusing itself beyond their natural limits in irregular, and often in beautifully branched figures, we see in many of our gravel-pits, where many of the larger flints and pebbles being struck easily fall to pieces at these crevices, the sides of which are always either wet, or plainly marked with waters having been once there; and if from these we trace the lesser cracks, we shall usually find numbers of figures imperfectly resembling the delineations in the agates, and the very same often also on their surfaces, merely the effect of mineral effluvia.

From hence it appears, that the figures of the *dendritis* are accidental: and the effect of a colour applied on the stone not artificially, but by nature. Two polished marbles being applied on each other, with oil between, upon parting them again, the oil running into certain tracks, its impression exhibits divers figures like those on the *dendritis*; the ramification always beginning on the side on which the marbles are began to be separated. So that it appears, the figures of the *dendritis* are formed by some bituminous, vitriolic, ferruginous, or cupreous exhalation, insinuating between the beds or strata of the stones; and, accordingly, we actually find, that the *dendritis* being exposed to the fire, yields a bituminous smell; and other experiments prove the existence of the other mineral principles.

In some *dendritis*, the figures, or figurines, penetrate quite through; in others they go but to the middle; and, in others, not so deep.

On the surfaces of the natural crevices of our septaria, or ludus Helmontii of the harder kinds, we often also meet with what authors call *dendritæ*, or fuliginous delineations of trees, which are of the very same kind with those of this agate, and are so far from being inferior to them in beauty, that they even greatly excel them; and so low and poor a substance as common chalk is not without them, but is frequently found beautifully marked with branches, trees, flars, and a thousand other figures like those formed by pulling asunder two levigating stones with the fine matter between them, or the shooting of salts in chemical vessels, or the figures of hoar-frost on our windows. Da Costa's Hist. of Foss. p. 178. Hill's Hist. of *Foss.* p. 473. See AGAT.

DENDRANATOMY, from *δένδρον*, *tree*, and *ἀνατομὴ*, *anatomy*, a term used by Malpighi, and others, to express the dissection of the ligneous parts of trees and shrubs, in order to the examination of their structure and uses. Galen has used the same word, and taken some pains to discover some of the subjects of these researches. There is a very remarkable analogy between the parts of some trees, and those of peculiar parts of animal bodies; and Malpighi has, with great justice, used the comparative anatomy of trees, to explain by the formation of the galls, and other preternatural tumors on them, the pustules and other unnatural fleshy excrescences on animal bodies.

DENDROMETER, from *δένδρον*, a *tree*, and *μέτρον*, a *measure*, an instrument lately invented by Messrs. Duncombe and Whittel, for which they obtained a patent, so called from its use in measuring trees. This instrument (*Tab.* II. *Surveying*, *fig.* 39.) consists of a semicircle A, divided into two quadrants, and graduated from the middle; upon the diameter B there hangs a plummet L for fixing the instrument in a vertical position; there is also a chord D parallel to the diameter, and a radius E, passing at right angles through the diameter and chord. From a point on the radius hangs an altimeter C, between the chord and diameter, to which is fixed a small semicircle G, and a screw to confine it in any position. The altimeter, which is contrived to form the same angle with the radius of the instrument as the tree forms with the horizon, is divided from its centre both ways into forty equal parts; and these parts are again subdivided into halves and quarters. Upon the small semicircle G, on which is accounted the quantity of the angle made by the altimeter and radius, are expressed degrees from 60 to 120, being 30 on each quadrant. The radius is numbered with the same scale of divisions as the altimeter. There is also a nonius to the small semicircle, which shews the quantity of an angle to every five minutes. On the back of the instrument the stock M (*fig.* 40.) of the sliding-piece is confined to the axis N, which moves concentrically parallel to the elevation index F (*fig.* 39.) on the opposite side, to which it is fixed. This index is numbered by a scale of equal divisions with the altimeter and radius: at the end of the index is a nonius, by which the angles of elevation above, or of depression below the horizon, measured upon the semicircle of the instrument, are determined to every five minutes. There is also a groove in the radius, that slides across the axis by means of a screw I, working between the chord and semicircle of the instrument; and this screw is turned by the key O. Upon the stock M (*fig.* 40.) is a sliding piece P, that always acts at right angles with the altimeter, by means of a groove in the latter. To the shank of the sliding piece is affixed a moveable limb Q, which forms the same angle with the altimeter as the bough forms with the body, or trunk of the tree. This limb

limb may be of any convenient length, divided into equal parts of the ſame ſcale with all the foregoing diviſions. At the extremity of the fixed axis, on a centre, an index R, with teleſcopic ſights, works horizontally upon the moveable limb of the ſliding piece. Upon this horizontal index R may be fixed a ſmall quadrant T, deſcribed with any convenient radius from the centre on which the index moves, and divided into 90 degrees, beginning at a right line drawn from the centre at right angles with the fiducial edge of the ſaid index; and upon the extremity of the axis is a nonius, whereby to determine the quantity of an angle upon the quadrant to every five minutes. There are alſo two ſmall circular arches S, S, ſerving to keep the ſights in a parallel poſition, each containing an equal number of degrees. Upon theſe arches is meaſured the angle, ſubtending a ſide equal to the difference of the altitudes of the obſerved objects above the plane of the horizon, and whoſe baſe is the neareſt diſtance between the perpendiculars, in which theſe objects are ſituated. The *dendrometer* is fitted to a theodolite, and may be uſed either with or without it, as occaſion requires.

The principal uſe of this inſtrument is for meaſuring the length and diameter of any tree, perpendicular or oblique, to an horizontal plane, or in any ſituation of the plane on which it reſts, or of any figure, whether regular or irregular, and alſo the length and diameter of the boughs, by mere inſpection; and the inventors of it have calculated tables, annexed to their account of the inſtrument itſelf, by the help of which the quantity of timber in any tree is obtained without calculation, or the uſe of the ſliding rule. The inſtrument is rectified by ſetting it in a perpendicular poſition, by means of the plummet, and ſcrewing it to the ſtaff; then the altimeter is placed in the exact poſition of the tree, whether perpendicular, reclining, or inclining, and ſcrewed faſt. If the tree ſtands on level ground, the horizontal diſtance from the tree to the axis of the inſtrument is meaſured with a tape line, and the radius is moved with the key, till that diſtance be cut upon it by the inſide of the diameter: but if the ground be ſtanting, the diſtance from the tree to the inſtrument is meaſured, and the elevation index is moved, till the point of the tree from which the diſtance was meaſured is ſeen through the ſights, and there ſcrewed faſt; and the radius is moved backwards or forwards with the key, till this diſtance is cut upon the elevation index by the perpendicular line of the altimeter; and the horizontal line will be marked upon the radius by the inſide of the diameter. In order to obtain the length of the tree, the elevation index is firſt moved downwards, till the bottom of the tree cut by the horizontal wires is obſerved through the ſights, and the feet and inches marked by the index upon the altimeter below the point of ſight, or horizontal line, are noted down: then the index is moved upwards, till the part to which you would meaſure, cut by the horizontal wires, is ſeen, and the feet and inches marked on the altimeter above the point of ſight, are noted: theſe two quantities added together give the exact length of the tree, which is inſerted in a field-book. For the girth of the tree, the circumference in that part where the horizontal diſtance was taken, is meaſured with the tape line; and a ſixth part of this circumference is added to the diſtance on the radius, which was before cut by the inſide of the diameter, becauſe the tape-line, in taking the diſtance, cannot be applied to the centre of the body of the tree; then the elevation index is lowered to that part of the tree, of which the diameter is to be taken and ſcrewed faſt. Set the moveable limb of the ſliding piece quite ſtraight, and the edge of the horizontal index upon the firſt diviſion of it. Turn the whole inſtrument about to the left hand, till you ſee, through the ſights, the left ſide of the tree cut exactly by the perpendicular wires; then, the inſtrument being fixed, move the ſights only upon the ſliding piece, till you ſee the right ſide of the tree cut alſo by the perpendicular wires; and you will find the true diameter marked by the horizontal index upon the ſliding piece, which is to be entered in a diſtinct column of the field-book.

For the boughs: let the diſtance on the radius be now reduced to its former quantity, and the elevation index moved upwards, till the bough is ſeen through the ſights, and ſcrewed faſt: ſet the moveable part of the ſliding piece in a poſition parallel to the bough, and the edge of the horizontal index on the firſt diviſion of it. Turn the whole inſtrument about, till you ſee, through the ſights, the ſhoot of the bough, cloſe to the trunk cut by the perpendicular wires; then move the ſights, till you ſee the other end of the bough cut by the ſaid wires, and note the feet and inches marked by the horizontal index on the moveable limb of the ſliding piece, which will give the true length of the bough, to be inſerted in the field-book. And the girth of the bough may be obtained, by directing the ſights to that part of it, whoſe girth is deſired; then by moving the elevation index downward, till you ſee the under ſide of the bough cut by the horizontal wires; and there noting the feet and inches marked by the ſaid index on the altimeter: after which, let the elevation index be moved upwards, till the upper-ſide of the bough cut by the horizontal wires is ſeen; the feet and inches marked upon the altimeter are to be noted as before: the former quantity ſubtracted from the latter will give the true diameter of the bough, which is entered in the field-book. The true ſolidity both of the body of the tree, and of the boughs, may be found from the diameter and length in tables calculated for this purpoſe.

The *dendrometer*, fitted to a theodolite, may be applied to meaſuring the heights and diſtances of objects, acceſſible or inacceſſible, whether ſituated in planes parallel, or oblique, to the plane in which the inſtrument is placed. It may be alſo uſed for taking all angles, whether vertical, horizontal, or oblique, in any poſition of the planes in which they are formed; and thus for facilitating the practical operations of engineering, land-ſurveying, levelling, mining, &c. and for performing the various caſes of plane trigonometry, without calculation; of which the inventors have ſubjoined to their account of this inſtrument many examples. See a Treatiſe upon the *Dendrometer*.

DENDROPHORIA, in *Antiquity*, the carrying of one, or more, trees, in ceremony, through a city, at certain feaſts, and in honour of certain deities.

The word is formed of δενδρον, *tree*, and φερω, *I bear*.

The *dendrophoria* was performed at the ſacrifices of Bacchus, Cybele, and the god Sylvanus. Arnobius, lib. v. makes mention of that performed in the ſacrifices of the mother of the gods. It conſiſted in carrying a pine in proceſſion through the city; which pine was afterwards planted in memory of that under which Atys, the favourite of this goddeſs, mutilated himſelf. The branches of this tree they crowned, in memory of Cybele's doing the ſame; and they covered its trunk with wool, becauſe the goddeſs covered Atys's breaſt with the ſame matter.

The perſons who performed the office of carrying the tree were called *dendrophori*.

In the Roman hiſtory we find mention made of a company, or college of *dendrophori*, who attended the army; and the critics have laboured much to aſſign their office. Some hold, that they hewed and faſhioned the wood for the tents: others, that they provided the wood neceſſary for the military works, machines of war, &c. Salmaſius, in his notes on the Life of Caracalla by Spartian, owns this to be the general opinion of all the learned men of his time; but aſſures us, that they were all miſtaken, and that the *dendrophori* of the army were the ſame with thoſe of the feaſts and ſacrifices.

DENEB, an Arabic term, ſignifying *tail*; uſed by aſtronomers as a denomination of ſeveral fixed ſtars.

Thus *deneb elect* ſignifies the bright ſtar in the lion's tail; *deneb adigege*, that in the ſwan's tail, &c.

DENER, or ALDENEB *Alcabli*, in the *Writings of the Arabian Phyſicians*, the name of the equiſetum or horſe-tail: there is, however, no great dependence to be had on what authors ſay of this plant.

DENIER, the French penny; a ſmall copper coin; twelve whereof make a ſol, or French ſhilling.

The French *denier* is now about the twenty-third part of the Engliſh penny. It is ſubdivided into two mailles, and the maille into two oboles. Anciently *denier* was a general name for all ſort of monies in France; as nummus for thoſe of Rome. Thus, a piece of gold money was called *denier d'or*; ſilver money, *denier d'argent*: after the ſame manner as the Romans ſaid *nummus aureus*, and *nummus argenteus*.

There are two kinds of *deniers*; the one Tournois, the other Pariſis; whereof the latter was worth a fourth part more than the former, and was called *monnoye royale*, or *forte monnoye*, and ſometimes *denier d'or*, and *denier à volaur d'or*. See MONEY, &c.

There are at preſent in France ſeveral little copper pieces, which having no proper name, are diſtinguiſhed only by their value in *deniers*: ſuch are the pieces of 36. 30. 24. 18. 12. 6. 4. and 2 *deniers*. The pieces of 4 and 2 *deniers* were coined at Straſburg for currency in the province of Alſace, purſuant to the declaration of Sept. 6, 1695. Thoſe of ſix *deniers* were coined in the mints of Aix, Montpelier, Rochelle, Bourdeaux, and Nantz, by the edict of 1709, and are little current. Poſt. Dict. Comm.

DENIZEN, from the Britiſh *dinoſſidyn*, *man of the city*, or *dinaſydd*, *free of the city*, in *Law*, an alien enfranchiſed in England by the king's letters-patent, and donation;

and thereby enabled, in many reſpects, to do as the king's native ſubjects do; namely, to purchaſe, poſſeſs, and deviſe lands, &c.

Denizenſhip is a right inferior to naturalization by parliament: for a ſtranger naturalized may inherit lands by deſcent, which a *denizen* cannot. Neither can his iſſue, born *before denization*, inherit to him; but his iſſue, born after may. No *denizen* can be of the privy-council, or either houſe of parliament, or have any office of truſt civil or military, or be capable of any grant from the crown. Stat. 12 Will. III. cap. 2.

Add, that, in the charter, whereby a perſon is made a *denizen*, there is uſually ſome clauſe or other, which abridges him of that full benefit which natural ſubjects enjoy.

When a man is thus enfranchiſed, he is ſaid to be, *ad fidem regis ductus*, or, *under the king's protection*; till ſuch time his goods might be ſeiſed to the king's uſe.

DENOMINATION, from *denomino*, of *de* and *nomen*, a *name*, a name impoſed on any thing, uſually expreſſing ſome quality predominant therein.

Hence, as the qualities and forms of things are of two kinds, viz. internal and external, *denomination* becomes twofold.

DENOMINATION, *internal*, is that founded on the intrinſic form: thus Peter is *denominated* learned, on account of his learning, which is ſomething internal.

DENOMINATION, *external*, is that founded on, or ariſing from the external form. Thus, a wall is ſaid to be ſeen, and known, from the viſion and cognition employed upon it; and thus Peter is *denominated* honoured, by reaſon of honour, which is not in the perſon honoured, but in him that honours.

DENOMINATOR, in *Arithmetic*, a term only uſed in ſpeaking of fractions, or broken numbers. See FRACTION.

The *denominator of a fraction* is the number or letter below the line; ſhewing into how many parts the integer is ſuppoſed to be divided by the fraction.

Thus in the fraction $\frac{5}{7}$ ſeven twelfths, the number 12 is the *denominator*, and ſhews, that the integer is here divided in 12 parts. So in the fraction $\frac{a}{b}$, b is the *denominator*.

The *denominator* always repreſents an integer.

The number above the line, 7, is called the *numerator*.

DENOMINATOR *of a ratio* is the quotient ariſing from the diviſion of the antecedent by the conſequent.

Thus 6 is the *denominator* of the ratio 30 : 5, becauſe 5) 30 (6. The *denominator* is what we otherwiſe call the *exponent* of the ratio.

DE NON *reſidentia clerici regis*, in *Law*, the name of an ancient writ, the form whereof ſee 2 Inſt. fol. 624. for excuſing a parſon employed in the king's ſervice for non-reſidence.

DENS *canis*, in *Botany*. See DOG'S *Tooth*.

DENSHIRING *of land*, in *Agriculture*, is the caſting parings of earth, turf, and ſtubble, into heaps, which when dried are burnt to aſhes, for a compoſt on poor barren land. This method of improvement is uſed, on taking in and incloſing common waſte grounds. In many parts of England this is called burn-beating; but in Staffordſhire, and other counties, they term it *denſhiring* of land. See BURNING *of land*.

DENSITY, *Denſitas*, that property, or habitude of bodies whereby they contain ſuch a quantity of matter, under ſuch a bulk.

Accordingly, a body that contains more matter than another, under the ſame bulk, is ſaid to be *denſer* than the other.

Denſity ſtands in oppoſition to *rarity*.

Hence, ſince the maſs is proportional to the gravity, a *denſer* body is ſpecifically heavier than a rarer; and a ſpecifically heavier is *denſer* than a ſpecifically lighter.

The *denſities*, and bulks of bodies, are the two great points, whereon all mechanics, or laws of motion, turn: it is an axiom, that bodies of the ſame *denſity* contain equal maſſes under equal bulks. If the bulks of two bodies be equal, their *denſities* are as their maſſes: conſequently the *denſities* of equal bodies are as their gravities. If two bodies have the ſame *denſity*, their maſſes are as their bulks: and hence, the gravities of bodies of the ſame *denſity* are in the ratio of their bulks. The maſſes of two bodies are in a ratio compounded of their *denſities* and bulks; conſequently, their gravities are in the ſame ratio; and if their maſſes or gravities be equal, their *denſities* are reciprocally as their bulks. The *denſities* of any two bodies are in a ratio compounded of the direct ratio of their maſſes, and the reciprocal one of their bulks. Thus, let D repreſent the *denſity*, M the magnitude or bulk, and Q the maſs or weight of one body; and d, m, q, thoſe reſpectively of another: then we ſhall have $D = \frac{Q}{M}$ and $d = \frac{q}{m}$, and therefore $D : d :: \frac{Q}{M} : \frac{q}{m}$; and $DM.q = Q.m.d$; whence the preceding propoſitions may be eaſily deduced.

The Peripatetics define *denſity* a ſecondary quality, whereby a body is full of itſelf; its parts cohering without any interſtice. So that the form of *denſity* conſiſts in the immediate coherence of parts. Hence Porphyry in his Predicaments defines a *denſe* body, that whoſe parts are placed ſo near each other, that no other body can come between them; as gold.

The efficient cauſe of *denſity* they uſually attribute to cold. Scaliger and ſome others, attribute it to moiſture. Many of the moderns take the ſmallneſs of the parts of bodies, to contribute much to their *denſity*; as by this means the pores are leſs the ſmaller: though it is added, that the *denſity* of bodies does not only depend on the ſmallneſs of the pores, but alſo on their fewneſs; ſo far are we from having any body abſolutely *denſe* in the ſenſe of the ancients, that gold itſelf, the *denſeſt* and heavieſt of all natural bodies, Sir Iſaac Newton obſerves, contains a great deal more pore, or vacuity, than ſubſtance.

When the preſſures of two liquids are equal, the quantities of matter in columns which have equal baſes do not differ; wherefore the bulks, that is, the height of the columns, are inverſely as the *denſities*: whence may be deduced a method of comparing them together. For if in communicating tubes there be different fluids, and they remain at reſt, their preſſures are equal; and by meaſuring their altitudes, the ratio of their *denſities* is found.

The *denſities* of liquids are alſo compared together by immerging a ſolid into them: for if a ſolid lighter than the liquids to be compared together, be immerſed ſucceſſively into different liquids, the immerſed parts will be inverſely as the *denſities* of the liquids. For, becauſe the ſame ſolid is made uſe of, the portions of the different liquors, which in every caſe would fill the ſpace taken up by the immerſed parts, are of the ſame weight: therefore the bulks of thoſe portions, that is, the immerſed parts themſelves, are inverſely as the *denſities*.

DENSITY *of the air* is a property that has much employed the later philoſophers, ſince the diſcovery of the Torricellian experiment, and the air-pump.

It is demonſtrated, that in the ſame veſſel, or even in veſſels communicating with each other, at the ſame diſtance from the centre, the air has every where the ſame *denſity*. The *denſity* of the air always increaſes in proportion to the compreſſion, or the compreſſing powers.

And hence, the lower air is always *denſer* than the upper; yet the *denſity* of the lower air is not proportional to the weight of the atmoſphere, by reaſon of heat and cold, which make conſiderable alterations as to rarity and *denſity*. If the air be rendered *denſer*, the weight of bodies therein is diminiſhed; and if rarer, increaſed; becauſe bodies loſe more in heavier than in lighter mediums.

And hence, if the *denſity* of the air be ſenſibly altered, bodies equally heavy in a lighter air, if their ſpecific gravities be conſiderably different, will have their equilibrium taken away in a *denſer* air, and the ſpecifically heavier will preponderate; which is the foundation of the MANOMETER, an inſtrument for meaſuring the alterations in the *denſity* of the air.

DENSITY *of the planets*; in homogeneous, unequal, ſpherical bodies, the gravities on their ſurfaces are as their diameters, if the *denſities* are equal. But if the bodies be equal, the gravities will be as the *denſities*. Therefore in bodies of unequal bulks and *denſities*, the gravity will be in a compound ratio of the diameters and *denſities*; conſequently the *denſities* will be as the gravities divided by the diameters, and therefore in the ſeveral bodies as follows, viz.

In the Sun.	Jupiter.	Saturn.	Earth.	Moon.
10000	9385	6567	39539	48911
Or 25$\frac{1}{4}$	19	15	100	123$\frac{1}{4}$

As it is not likely that theſe bodies are homogeneal, the *denſities* here determined are not ſuppoſed to be true; but rather the mean *denſities*, or ſuch as the bodies would have if they were homogeneal, and of the ſame maſs of matter and magnitude.

DENTAL, DENTALIS, from *dens*, a *tooth*, is applied to certain letters, in the pronunciation whereof the teeth have a principal ſhare.

Grammarians, and eſpecially the Hebrew ones, diſtinguiſh the letters into *dental*, *labial*, *guttural*, *lingual*, *palatal*, &c.

DENTALIS, or DENTALIUM, is a kind of univalve ſhell, which the apothecaries are ordered to pulverize, and uſe in ſeveral medicaments, as an alkali.

The

The genuine *dentalis*, described by M. Tournefort, is of a tubular, or conical form, about three inches long; of a shining, greenish-white colour; hollow, light, and divided lengthwise by parallel lines running from top to bottom. It is about the thickness of a quill, and bears some resemblance to a dog's tooth, whence its name.

The *gentalium* is a genus of the *teftacea* worms, in the Linnæan fyſtem. It is very ſcarce; and therefore, in lieu of it, they uſually ſubſtitute a ſhell of divers colours found among the ſand when the ſea is withdrawn; but not channelled, or fluted, like the *dentalis*.

Dr. Liſter, in the Philoſophical Tranſactions, makes mention of two ſpecies of *dentalis*; the firſt commonly enough found about the iſland of Guernſey, &c. being a long, ſlender, white pipe, a little bending and tapering, and open at both ends; the other properly called *entalium*, longer and thicker than the former; and beſides, ſtreaked with ridges; whence the Italian term *intaglia*. See *Tab.* III. *of Foſſils, Claſs* 9. See ENTALIUM.

There are two principal kinds of them, the one ſmooth, the others ſtriated. Of the ſmooth kind, ſome are all over white, others are tipped with red at the end; and of the ſtriated ones, ſome are altogether white, others are green, and in ſome the ſtriæ are more prominent, in others fainter, eſpecially in the leſſer ones. See *Tab. of Shells*, N° 4.

This ſhell is alſo called *dentalium* and *ſyringites*. Taken inwardly, it is uſed as an alkali to ſweeten acids, to ſtop a looſeneſs of the belly, and for ſpitting of blood. It is alſo uſed externally as a drier.

DENTALIUM. See the preceeding article.

DENTARIA, in *Botany*. See TOOTH-WORT.

DENTATED *Leaf*, in *Botany*. See LEAF.

DENTED, *indented, toothed*. See INDENTED.

DENTED *verge*, among *Botaniſts*, is applied to ſuch leaves of plants as are notched, or jagged about the edge or rim: of theſe ſome are *fine-dented*; others *large*, or *deep dented*, i. e. cut into the leaf. See LEAF.

DENTED *wheel, rota* DENTATA. See WHEEL.

DENTES, in *Anatomy*. See TEETH.

DENTEX, in *Ichthyology*, the name of a ſea-fiſh, caught in great plenty in the Mediterranean, and common in the markets of Italy. See SYNODON.

It is a well-tailed fiſh, and is caught of five, or ſix, and ſometimes ten pounds weight; it is ſomewhat broad and flat in its ſhape, yet conſiderably thick and long. Its head is flatted, its ſnout very long, and its back ſidged and ſharp; its back and ſides are of a duſky yellowiſh green colour, and ſometimes, in the full-grown fiſh, purpliſh, always ſpotted with very bright blue and black ſpots; the back and gill-fins have each a black ſpot near their origin, and their belly-fins are yellow.

The teeth are diſpoſed in a ſingle row in each jaw, and there are at diſtances four, which are longer and broader than the reſt, and look like the canine teeth of men, or of quadrupeds: it is from theſe that it has its name, and theſe as well as the reſt of the teeth are in this fiſh covered with lips, as in quadrupeds; its tail is forked, and its ſcales are very large. Geſner.

DENTICLES, or DENTILS, in *Architecture*, an ornament in cornices, bearing ſome reſemblance to teeth; particularly affected in the Ionic and Corinthian orders; and of late alſo in the Doric.

They are cut on a little ſquare member, properly called *denticulus*; and the notches, or ornaments themſelves, *dentils*; by the Italians, *dentelli*, and *denticoli*, from *dens, tooth*, as having the appearance of a ſet of teeth.

Anciently *dentils* were ſcarce ever uſed but in the Ionic cornich; yet we find them in the remains of the theatre of Marcellus; and this is an argument with ſome, that Vitruvius had not the direction of that building. Vitruvius preſcribes the breadth of each *dentil*, or tooth, to be half its height; and the metopa, or interval between each two, he orders to be two-thirds of the breadth of the *dentil*, lib iii. cap. 4.

The ſame author, cap. ii. of his fourth book, obſerves, that the Greeks never uſed *dentils* underneath modillions, becauſe modillions repreſent purlins, and *dentils* repreſent ends of rafters, which can never be placed underneath purlins.

The Romans were not ſo ſcrupulous as to this decorum; excepting in the Pantheon, where there are no *dentils* under the modillions, neither in the portico, nor in the inſide of the building.

DENTICULI *Elephantis*, in the *Hiſtory of Shells*, a name given by many authors to the *dentale*, a ſmall ſhell of the tubulus marinus kind, which is ſomewhat bent and pointed at one end, and in ſome meaſure repreſents the elephant's tuſk. See DENTALIS.

DENTIFORMIS *proceſſus*, the ſame as PYRENOIDES.

DENTRIFICE, from *dens, a tooth*, and *frico, I rub*, in *Medicine, tooth-powder*; a remedy to rub the teeth, in order to cleanſe, or faſten them.

There are *dentrifices* of divers kinds and forms: ſome in form of a powder, compoſed of corals, pumice-ſtone, ſalt, alum, egg-ſhells, crabs-claws, hartſhorn, cuttle-bone, tartar vitriolated, &c. Others in form of an electary, conſiſting of the ſame powders mixed up with honey.

There are others, prepared with roots boiled with alum, and dried in the oven. Others in form of a liquor, drawn by diſtillations from drying herbs, and aſtringent medicines.

The Dutch hold butter the beſt *dentrifice*, to keep the teeth white and ſound; and the Scaniards, urine.

The generality of operators for the teeth allow acids, ſuch as ſpirit of vitriol, &c. to be the readieſt of all *dentrifices*, to take off the foulneſs and yellowneſs of the teeth; but though they allow that theſe render them white, for the preſent, they diſcountenance a frequent uſe of them, as wearing away too much of the teeth, and injuring the gums.

Tachenius attacks ſpirit of vitriol even in a ſtronger manner, and affirms that it cannot anſwer the firſt purpoſe of making the teeth whiter, he alledges, that the mixture of ſpirit of vitriol, with any white alkali, produces a yellowiſh colour, not a white one. It is evident that our ſweat, and all other matter, tranſpiring through the pores, is of an alkaline nature, and there continually tranſpires through the gums ſomething of this kind, which lodging itſelf upon the teeth, muſt needs mix with the remains of the ſpirit of vitriol left on them in the cleaning; and, by that means, the whiteneſs at firſt given will gradually go off; and the yellow, which is the natural reſult of an alkali, with ſpirit of vitriol, will appear in its place. Tachenii Hippocrat. Chym.

DENTIL, in *Architecture*. See DENTICLES.

DENTILLARIA, in *Botany*, a name by which ſome authors call the *plumbago*, or LEADWORT.

DENTISCALPRA, from *dens, tooth*, and *ſculprum, ſcraping inſtrument*, in *Surgery*, an inſtrument for ſcouring yellow, livid, or black teeth; to which being applied near the gums, it ſcrapes off the foul morbid cruſt. Some of theſe inſtruments are furniſhed with narrow points; others with broader, and with edges; and ſome again are falciform; but all of them adapted to one and the ſame handle.

DENTITION, *Dentitio*, the act of breeding or cutting the teeth.

The time of *dentition*, is uſually from about the ſixth or ſeventh month to the age of twenty. The *inciſores* come firſt; then the *canini*; after them the *molares*: ſo that at the end of the ſecond year, in general, a child is furniſhed with ten teeth in each jaw, called the milk-teeth; this is the firſt *dentition*. Theſe generally laſt till the ſixth or ſeventh year, when they fall ſucceſſively without any conſiderable pain, and are ſucceeded by others, till the fourteenth or fifteenth year. The ſeventh year is uſually the period of the ſecond *dentition*: it often happens at this period, ſays an ingenious dentiſt, Mr. Magenis, that the roots of the milk-teeth are too firmly fixed, to give way to the progreſſive growth of the ſucceeding ones, which are in a ſoft feeble ſtate, and incapable of forcing their way in a proper order. In this caſe the new teeth become indented, and otherwiſe deformed; and by forcing their way on either ſide of the milk-teeth, form a double row, and aſſume the appearance of ſuperumerary teeth: and beſides, the root of the milk-tooth is ſometimes united in the ſocket with the root of the adult tooth, thus forming one root with two diſtinct teeth in the crown; in conſequence of which, the partitions of the ſockets are immoderately diſtended and weakened, and become incapable of retaining the ſtamina in their diſtinct alveoli or ſockets. It will therefore require peculiar attention, to determine when an extraction of the milk-teeth is neceſſary, whether they be faſt or looſe in their ſockets, in order to inſure a quicker growth, and a beautiful arrangement of the ſucceeding ſet. This ſecond *dentition* produces the four firſt great *dentes molares*, one at either extremity of both jaws: and from the tenth to the fifteenth year a third *dentition* happens, which furniſhes four other great *molares*, one cloſe by each of the former. The *molares* of the ſeventh year are ſubject to a caries and early decay, which is ſometimes attended with violent inflammations, tumors, and ulcerations of the gums. When theſe ſymptoms appear, and before the ulcer corrodes deeply, it will be neceſſary to extract the tooth, which will commonly remove theſe dreadful ſymptoms. It has been obſerved, that in ſome caſes the increaſed ſize of the *molares* forces and diſtends the lower jaw beyond its proper place, ſo that the lower teeth project as they approach the upper ones: and a timely extraction of the two great grinders in the lower

jaw,

jaw, whether they are decayed or not, has been recommended for preventing this deformity. About the twentieth year comes the laſt *dentition*, which gives the four extreme *dentes ſapientiæ*, becauſe they come after puberty.

Dentition, Hippocrates obſerves, is uſually preceded with an itching of the gums, and with convulſions, fevers, and looſeneſs; eſpecially when the canine teeth are cut. Moſt of theſe ſymptoms Dr. Liſter, on this paſſage of Hippocrates, obſerves, happen to birds upon moulting, or caſting their feathers; on which occaſion alſo they become mute, and fullen.

The germen, or ſeed of the tooth, ſays Dolæus, is a tender mucous matter, like the white of an egg, contained in the cells, or alveoli, of the jaw-bone, which grows harder and bigger every day, till it be fit to break through the gum. In this rupture the poor child is afflicted with terrible ſymptoms, inflammations of the jaws, gripes, waking, inquietude, terrors, dejections, vomiting, laſſitude, epilepſy, abſceſſes, and frequently death.

There are two terms, or periods of *dentition*; the one, when the tooth makes its firſt endeavour to get out of the maxillary bone, and wherein the outer and upper part of the gum uſes to be encompaſſed with a whitiſh circle; the other, when the tooth, conſiderably enlarged in bulk, renders the gum tumid, and ſtrives with all its force to break its way through the ſame. The remedies againſt the ſymptoms of *dentition* are abſorbents, and gentle purgatives.

If the fever be high, bleeding will be neceſſary: though this is an evacuation which children bear the worſt of any. Sydenham ſays, that in fevers occaſioned by *dentition*, he never found any remedy ſo effectual, as two, three, or four drops of ſpirit of hartſhorn, in a ſpoonful of ſimple water, given every four hours. It may be given from five drops to fifteen or twenty, according to the age of the child; and when coſtiveneſs does not forbid it, three or four drops of laudanum may be added to each doſe. In convulſion fits, a bliſtering plaſter may be applied betwixt the ſhoulders, or one behind each ear. A ſmall Burgundy pitch plaſter between the ſhoulders has been ſometimes applied, when children are cutting their teeth; and has been found to eaſe the tickling cough which attends teething. The gums may be rubbed with a little fine boney three or four times a day: and children ſhould be always ſupplied with ſomething that will yield a little to the preſſure of their gums, as a cruſt of bread, a wax-candle, a bit of liquorice-root, &c. Cutting the gums is ſeldom of any uſe; however, in obſtinate caſes it ought to be tried. The food of children ſhould at this time be light, and their nerves braced by ſufficient exerciſe without doors, the uſe of the cold bath, &c. With theſe precautions, there would be little occaſion for teething necklaces, and other abſurd amulets, which are often worn, under the notion of aiding *dentition*.

DENUDATION, from *de*, and *nudus*, *naked*. See EXPOLIATION.

DENUNCIATION, *Denunciatio*, a ſolemn publication, or promulgation of any thing.

All veſſels of enemies are lawful prize after *denunciation*, or proclamation of war.

The deſign of the *denunciation* of excommunicated perſons is, that the ſentence may be the more fully executed; that the perſons may be known, the entrance into the church refuſed them, and that other people may be warned not to have any communication with them.

DEOBSTRUENTS, from *de*, and *obſtruo*, *I obſtruct*, are ſuch medicines as open obſtructions.

There is ſomething farther intimated by *deobſtruent* than by *detergent*: for a medicine may be *deobſtruent*, that is not in the ſtricteſt ſenſe *detergent*: as, in effect, are moſt of thoſe which are made of metalline ſubſtances, ſuch as ſteel and mercury; which obtain the appellation *deobſtruents* from their acting by their natural weights, whereby they increaſe the momentum of the circulating fluid, and make it ſtrike againſt the ſecretory outlets with greater force; becauſe the momentum, or *vis percuſſionis*, of all projectiles, of which kind is a circulating fluid, is as their ſolidities, ſuppoſing their velocities equal. The more, therefore, the animal fluids are ſaturated with denſe and ſolid particles, with the greater force they diſtend the veſſels, and the more eaſily break through, where the ſtructure favours their eſcape: and upon that account are medicines which add to theſe qualities in the fluids called *deobſtruents*.

DEODAND, in our *Cuſtoms*, a thing given, or forfeited, as it were, to God, for the pacification of his wrath in a caſe of miſadventure, whereby a man or woman comes to a violent end, without the fault of any reaſonable creature.

As, if a horſe ſtrike his keeper, and kill him; if a man in driving a cart falls, ſo that the cart-wheel runs over him, and preſſes him to death; if one be felling a tree, and gives warning to the ſtanders by, to take care of themſelves, yet a man is killed by the fall thereof: in the firſt place, the horſe; in the ſecond, the cart-wheel, or the cart and horſes; and in the third, the tree, is *Deo dandus, to be given to God*, that is, to the king, to be diſtributed to the poor by his almoner, for expiation of this unhappy event; though effected by unreaſonable creatures, or inanimate ſubſtances.

Omnia quæ movent ad mortem ſunt deodanda.

What moves to death
Is *deodand*.

This law ſeems to be an imitation of that in Exodus, chap. xxi. *If an ox gore a man, or a woman, with his horn, ſo that he die, the ox ſhall be ſtoned to death, and his fleſh not be eat; ſo ſhall his owner be innocent.*

Fleta ſays, the *deodand* is to be ſold, and the price diſtributed to the poor, for the ſoul of the king, his anceſtors, and all faithful people departed this life.

It was originally deſigned, in the ſuperſtitious times of popery, as an expiation for the ſouls of ſuch as were ſnatched away by death; and was given to the church in order to procure the ſoul of ſuch deceaſed perſon to be prayed out of purgatory.

DE ONERANDO *pro rata portionis*, in the law of England, a writ that lies where one is diſtrained for a rent that is to be paid proportionably by others: thus, if a man holds ten acres of land by fealty, and ten ſhillings rent, of the king; and aliens, one acre to one, and another to another, in fee; and afterwards the ſheriff diſtrains only one of them for the rent; he that is ſo diſtrained may have his writ for this relief.

DEOPPILATIVE, from *de*, and *oppilo*, *I obſtruct*, a remedy proper to ſoften, reſolve, and remove obſtructions. See OBSTRUCTION.

Oppilatives are the ſame with what we otherwiſe call *deobſtruents*. See DEOBSTRUENT.

DEOSCULATION, *Deoſculatio*, in *Antiquity*, one of the moſt ancient forms of ADORATION.

DEPART, a method of refining, or ſeparating gold from ſilver by means of *aqua fortis*.

There are three ways of refining gold: the firſt by antimony, the ſecond by ſublimate; and the third, which is the moſt uſual, by *aqua fortis*. The two former, ſee under REFINING.

For the operation of the *depart*, they take at the rate of one pound of impure gold, and two or three of ſilver; theſe they fuſe together in a crucible, and, when fuſed, caſt them into cold water, where they become divided into grains of the bigneſs of peas. Theſe grains taken out, and dried by the fire, are put in a *departing* veſſel, which is a ſtone matraſs, and to the metal are added four pounds of *aqua fortis*. Then taking the veſſel, they ſet it on the coals, and in about an hour's ſpace the refining is done. For, upon opening the veſſel, they find nothing appear therein but the *aqua fortis*, and the gold reduced into a calx, or ſand; the ſilver being all diſſolved, and imbibed by the liquor.

To raiſe the gold to its due fineneſs, they uſually give it the *aqua fortis* again and again; uſing for the firſt time half a pound, and for the ſecond a quarter of a pound of the water, to eight ounces of metal. If the third water be found good and clear the operation is ended: and the calx of the gold, being waſhed in repeated waters, is melted down again in a crucible, firſt by a gentle, and afterwards a vehement fire, to be caſt into ingots, or wedges.

It muſt be added, that the ſilver, with the impurities of the gold, is ſo thoroughly incorporated with the water, that to the eye there does not appear any thing beſide the pure liquid; yet is not this ſilver loſt. To recover it again out of the menſtruum, they divide their ſtock of *aqua fortis* into ſeveral ſtone veſſels, which they fill up with ſpring water, obſerving to put ſeven or eight times as much of this, as that. This done, in each veſſel they put a quantity of copper; and leaving the whole for twenty-four hours, at the end thereof they find the ſpirits of the *aqua fortis* have quitted the ſilver, and are with the copper, leaving the former in form of a calx, or incorporated aſhes at bottom. This calx, being dried, is melted into an ingot, with a little ſalpetre.

To huſband the *aqua fortis*, and make it ſerve again for a ſecond operation, they diſtil it in an earthen, or glaſs alembic; and when the diſtillation is about a third over, change the recipient. The water of the firſt recipient ſerves for the firſt operation of *departing*, and the reſt for the ſubſequent ones.

If the *aqua fortis*, having quitted the ſilver, and being united with the copper, be then filtrated, it is called *aqua ſecunda*; in which if you ſteep an iron plate ſome

hours,

hours, you will have another *departure*: for the menstruum will let go the copper, and prey on the iron, leaving the copper in powder on the iron plate. And filtrating this solution, you may get the iron out of it, by laying in it a piece of *lapis calaminaris*; for the iron in this case will *depart* to the bottom, and the calamine be dissolved. And if you again filtrate this water, and pour on it the liquor of fixed nitre, you will have another *depart*, the calamine precipitating to the bottom. And lastly, filtrating this water, as before, and evaporating part of it, you will have crystals of saltpetre. See ASSAYING, and QUARTATION.

DEPARTERS *of gold and silver*. See DEPART, and PARTER.

DEPARTMENT, in *Jurisprudence*, fignifies diſtribution, diviſion, or allotment of certain employments among ſeveral perſons. Thus the great officers of ſtate, &c. have each their ſeveral *departments*: and the buſineſs of the ſecretaries of ſtate in particular, is generally divided into two partitions; the one officiating for the ſouthern, the other for the northern *department*: though ſometimes another is added on particular occaſions.

DEPARTMENT, in *Architecture*, that part of an edifice, deſtined for ſome peculiar purpoſe: as in a palace, the *departments* of the kitchen, of the ſtables, &c.

DEPARTURE, or DEPARTER, in *Law*, a term properly applied to a perſon, who firſt pleading one thing in bar of an action, and that being replied to, waives it, and inſiſts on ſomething different from his firſt plea.

Or, it may be applied to a plaintiff, who in his replication ſhews a new matter different from that in his declaration. So if a man plead a general agreement in bar, and in his rejoinder allege a ſpecial one, it ſhall be adjudged a *departure* in pleading. The defendant hereupon demurrers, becauſe it was a departure from the declaration. Coke, part ii. fol. 107.

DEPARTURE *in deſpite of the court*, is when the tenant, or defendant, after appearing to the action brought againſt him, and having a day over in the ſame term, does not appear at the day, but makes a default. This is a *departure in deſpite of the court*; and therefore he ſhall be condemned.

The *departure* is always on the part of the tenant, or defendant; and its entry is, *Quid prædictus A. hic ſe-cundo exactus, non venit, ſed in contemptum curiæ receſſit.*

DEPARTURE, in *Navigation*, is the ſailing, or weſting of a ſhip, with reſpect to the meridian from which it *departed* or ſailed. Or, it is the difference of longitude, either eaſt or weſt, between the preſent meridian the ſhip is under, and that where the laſt reckoning or obſervation was made. This *departure*, and where but under the equator, muſt be accounted according to the number of miles in a degree proper to the parallel the ſhip is under.

DEPESTA, in *Antiquity*, a wine veſſel, which the Sabines, on any feſtival day, ſet on the table of their gods.

DEPHLEGMATION, in *Chemiſtry*, is the act of purifying, or clearing a fluid of its phlegm, or water.

This is performed either by EVAPORATION, or by diſtilling the ſpirit, or other fluid, again and again; by which means the ſpirituous part riſes, and leaves the phlegm, or water, behind. When the ſpirit is thus diſengaged of all its phlegm, or, at leaſt, as much as it can be, it is called a *dephlegmated ſpirit*.

Dephlegmation is alſo called CONCENTRATION, particularly when acids are the ſubject.

DEPILATORY, in *Medicine*, a plaſter, or medicine, applied on any hairy place, in order to bring off the hair.

The word is formed of the particle *de*, and *pilus*, *hair*.

Depilatories are principally compoſed of lime and orpiment, which is very cauſtic, and even a dangerous mineral.

DEPONENT, *Deponens*, in the Latin *Grammar*, a term applied to verbs which have active ſignifications, but paſſive terminations, or conjugations, and want one of their participles paſſive.

Such is *miror*, *I admire*, which has for participles *mirans*, *mirantem*, and *mirandus*, but no *miratus*, which ſhould be the participle paſſive.

They are called *deponents*, as having depoſited, or laid aſide, their paſſive ſignification.

DEPONENT, in a legal ſenſe, a perſon who makes a depoſition or affidavit.

DEPOPULATION, the act of waſting, deſtroying, deſolating, or unpeopling a place. Coke, Inſtit. part iii. fol. 204.

DEPOPULATORES *agrorum*, in our *Statutes*, ſuch as depopulate or diſpeople lands.

It appears by the ſtatute 4 Hen. IV. c. 2. that theſe were great offenders by the ancient law, and that the appeal or indictment againſt them ought not to be in a general, but in a ſpecial manner. They get their name of *depopulatores agrorum*, becauſe by proſtrating or decaying the houſes and habitations of the king's people, they depopulate towns. Coke, 3 Inſt. fol. 204.

DEPORTATION, from *deporto*, *I carry away*, a ſort of baniſhment in uſe among the Romans, whereby ſome iſland, or other place, was allotted to a criminal for the place of his abode, with a prohibition from ſtirring out of the ſame on pain of death.

Ulpian makes this difference between *deportation* and *relegation*, that the former confined the party to one certain place for ever; whereas relegation was frequently revoked, and allowed the exile a little more liberty.

By *deportation* a perſon loſt the rights of a Roman citizen.

DEPOSIT, *Depoſitum*, a thing put into the hands of another, to be kept gratis.

The civilians divide *depoſitum* into *ſimple* and *ſequeſtrary*.

DEPOSIT, *Voluntary*, is that whoſe property is conteſted between ſeveral perſons, and depoſited in the hands of ſome third perſon, by decree of a judge.

DEPOSIT, *Simple*, is either voluntary, or neceſſary. Neceſſary is that done in caſe of hoſtility, ſhipwreck, fire, &c.

Innholders are reſponſible for the baggage brought to them, as being a *neceſſary depoſit*.

DEPOSITARY, in the *French* law, a perſon entruſted as keeper, or guardian of any thing.

Ordinary depoſitaries are not to warrant the thing left with them, in caſe it be ſtolen: They are only to anſwer for a fraud, or breach of faith; not for negligence. But a *neceſſary depoſitary*, as an innkeeper, is accountable for a theft or robbery, if there have been any negligence in the caſe: and by the *Engliſh* law, even whether there were any negligence or not.

DEPOSITIO, in *Grammar*, is a name which the Latins gave to the final cadence, which terminates as it were the meaſure of the verſe. The Greeks called it καταληξις, and καταλογος. Hence ariſeth the diſtinction of verſe into four ſpecies, viz. *acatalectic*, *catalectic*, *hypercatalectic*, and *hypercatalectic*.

DEPOSITION, *Depoſitio*, among the *Jews*, a ceremony obſerved immediately upon a perſon's expiring, and was a ſolemn manner of laying the corpſe upon the ground. See BURIAL.

DEPOSITION, in *Law*, a teſtimony given in court by a witneſs upon oath.

In chancery, *depoſition* is a teſtimony ſet down in writing, by way of anſwer to the interrogatories exhibited in chancery, where ſuch witneſs is called *deponent*.

DEPOSITION is alſo uſed for the ſequeſtering, or depriving a perſon of his dignity and office.

This *depoſition* only differs from abdication, in that the latter is ſuppoſed voluntary, and the act of the dignitary, or officer himſelf; and the former of compulſion, being the act of a ſuperior power, whoſe authority extends thereto. Some ſay the *depoſition*, and ſome the abdication, of king James II.

Depoſition does not differ from deprivation: we ſay indifferently, *a depoſed*, or deprived biſhop, official, &c.

Depoſition differs from ſuſpenſion, in that it abſolutely and for ever ſtrips or diveſts a prieſt, &c. of all dignity, office, &c. whereas ſuſpenſion only prohibits, or reſtrains, the exerciſe thereof.

Depoſition only differs from degradation, in that the latter is more formal, and attended with more circumſtances, than the former; but in effect and ſubſtance they are the ſame; thoſe additional circumſtances being only matter of ſhew, firſt ſet on foot out of zeal and indignation, and kept up by cuſtom, but not warranted by the laws or canons. See DEGRADATION.

DEPOT, in *Military Language*, denotes a particular place at the tail of the trenches, out of the reach of the cannon of the place, where the troops commonly aſſemble, that are ordered either to attack the outworks, or to ſupport the troops in the trenches, when there is reaſon to imagine that the beſieged intend to make a vigorous attack.

DEPOT, alſo ſignifies a temporary magazine for forage, faſcines, gabions, tools, &c. neceſſary for the ſupport of an army, or for carrying on a ſiege.

DEPRECATION, from *deprecor*, *I intreat*, in *Rhetoric*, a figure whereby the orator invokes the aid or aſſiſtance of ſome one; or prays for ſome great evil or puniſhment to befal him who ſpeaks falſely, either himſelf, or his adverſary.

DEPRECATORY, or DEPRECATIVE, in *Theology*, a term applied to the manner of performing ſome ceremonies in the form of prayer.

Among the Greeks, the form of abſolution is *deprecatory*; being conceived in theſe terms, *May God abſolve you!* whereas in the Latin, and even in ſome of the reformed churches, it is in the declarative form, *I abſolve you.*

DEPRESSED *Leaf*, in *Botany*. See LEAF.

DEPRESSION *of equations*. See EQUATION.

DEPRESSION *of the pole*. So many degrees as you ſail, or travel from the pole towards the equator, ſo many you

are said to *depress* the pole, because it becomes, respectively, so much lower, or nearer to the horizon.

DEPRESSION *of the visible horizon*, denotes its sinking or dipping below the true horizontal plane; whether caused by some variation of the atmosphere, or by the different height of the observer's eye above the surface of the sea. Thus, let *ASf* (*Tab. II. Surveying, fig.* 48.) be the surface of the sea, ES the height of the eye above that surface, and AF the observer's horizon: then the eye looking along EB for the boat only which dips below the true one by the arc AB, perceives the apparent altitude aB of an object, inclined by the arc Aa; but if the observer has his back towards the object B, then looking along the line Ef, the apparent horizon now becoming the line fE, and dipping below the true one by the arc Ff or Aa, is to gain the apparent altitude eB is too little, and must be augmented by the arc $a = Ff$. The *depression* or dip of the horizon may be easily computed, thus, let C be the earth's centre, E the eye, and the tangent Ef meeting the surface in f, where the eye and water from to meet: then CfE is a triangle, right-angled at f, wherein are known $Cf = CS = 20890939$ feet, the earth's semidiameter, and $CE = (CS + SE)$ the height of the eye added to the earth's radius: then as CE : rad. :: Cf : the $\angle CEf$, which complement is the angle FEf, the dip sought. The following table shews the *depression* or dip of the horizon of the sea for different heights of the eye, from one to a hundred feet.

Heights of the eye above the sea, in feet.	Depression of the bottom of object.	Elevation, &c. Feet.	Depression, &c.

See Robertson's Elem. of Navigation, book ix. p. 391. and Tables requisite to be used with the Nautical Ephemeris, p. 14. See LEVELLING.

DEPRESSION *of the sun, or of a star*, is its distance from the horizon, below it, measured by an arch of the VERTICAL circle, intercepted between it and the HORIZON.

DEPRESSOR, in *Anatomy*, a name common to divers muscles, from their office in lowering, or bringing down, the parts they are fastened to.

DEPRESSOR *alæ nasi*, in *Anatomy*, a name given by Albinus to a muscle of the face, called by Cowper *constrictor alæ nasi*, and *depressor labii superioris*.

DEPRESSOR *anguli oris*, in *Anatomy*, a name given by Albinus to the muscle called by others *depressor labiorum communis*, which see.

DEPRESSOR *labii superioris*, is a muscle called *alæus depressor labii sup.* q. v. See CONSTRICTORES *oris*.

DEPRESSOR *labii inferioris proprius*, or *quadratus*, a muscle placed between the *depressor labiorum communis*, or the part called the *chin*. It appears to be but one muscle, ascending with a twisted course from the lower margin of the under jaw, by the side of the chin, and is inserted with a narrow fat into each lip near their cushion: therefore to draw them obliquely down. See *Tab. Anat. Albini*, fig. 1. n. 7.

DEPRESSOR *menti inferioris*. See DIGASTRICUS and EVERTENS.

DEPRESSORES *oculi*, a pair of muscles springing from each corner of the eye, and answered by another pair of like figure and situation in the lower eye-lid. These are often considered together as constituting as one double muscle; the fibres environing the eye-lids, and being inserted into them, not unlike the sphincters of other parts.

DEPRIMENS, in *Anatomy*, the same with DEPRESSOR.

DEPRIMENS *lateralis*, in *Anatomy*, a name given by Spigelius, and others, to one of the muscles of the lower jaw, called by others *digastricus sive biventer*; and, by Albinus, *biventer maxillæ inferioris*.

DEPRIMENS *palpebram retundens*, in *Anatomy*, a name given by Spigelius, and others, to a muscle called by others *the levator major*, and *retundens major*.

DEPRIMENS *rectus*, in *Anatomy*, a name given by Riolanus, and others, to one of the muscles of the eye, called the *humilis*, and *rectus inferior* by others. It is the *depressor* and of Cowper and of Albinus, being one of his four *recti*.

DEPRIMENS *septum*, in *Anatomy*, a name given by Spigelius, and some others, to the muscle called the CERATOGLOSSUM.

DEPRIVATION, in the *Canon Law*, the act of bereaving, disabling, or taking away a spiritual promotion, or dignity: as when a bishop, vicar, prebend, or the like, is deposed, or *deprived* of his preferment, for some matter, or fault, in fact, or in law. See DEPOSITION.

Deprivation is of two kinds; *à beneficio*, & *ab officio*.

DEPRIVATION *à beneficio*, is when for some great crime a minister is wholly and forever deprived of his function or preferment: which differs from suspension, in that the latter is only temporary.

DEPRIVATION *ab officio*, is when a minister is for ever deprived of his order; which is the same, in reality, with what we otherwise call *degradation* and *deposition*, and usually for some heinous crime deserving death, and is performed by the bishop in a solemn manner. See DEGRADATION.

DEPTH, in *Geometry*, &c. See ALTITUDE, ELEVATION, &c.

DEPTH *of a sail*, denotes the extent of any square or oblong sail from the head-rope to the foot-rope; or the length of the after-leech of any boom-sail or fore-sail.

DEPTH *of a square*, or *battalion*, is the number of men in a file, or the number of ranks. Infantry is now generally drawn up three deep, and in the defence of a breast-work only two deep. The cavalry is commonly drawn up three deep, and sometimes only two deep. See RANK.

DEPURATION, from *depuro, I purify*, in *Pharmacy*, the same as clarification, or purification; viz. the purging a body of all the less pure, and other crass, tough, and excrementitious parts contained therein.

Fermentation serves to *depurate* liquors: syrups, juices, &c. are *depurated* by passing them through the *manica Hippocratica*, or strainer-bag. See CLARIFICATION.

DEPURATORIA *Pilulæ*, in *Medicine*, a name thus called by the Arabians Serapion, whose prescriptions in the year 1063, 25 p. 3. This form he says is the only one, as far as would universally serve, which nature regulated all the purgents in such a manner, as to fit the febrile matter prepared by proper concoction, for expulsion in a certain time, either by eruption (were it a liver perspiration), and upon this account I call it *the depurative form*: and in reality, considered so, I am inclined to believe, that this is the regular and primary fever of nature, as well with respect to the regular method which nature uses in promoting and accomplishing the digestion of the morbific matter at the appointed time, as also because it occurs more frequently than other forms. It seems also reasonable to think, that the ancient and excellent rules left us by Hippocrates and other ancient physicians, are adapted to this primary fever; by means of which it is to be regulated in such a manner, that the febrile matter may be prepared to make a proper exit by sweat.

DEPUTATION, from *deputo, to depute*, a million of certain *selected* persons out of a company or body, to a prince, or assembly, to treat of matters in their name, *or to prosecute some affair* there.

Deputations are more or less solemn, according to the quality of those who send them, and the business they are employed in.

Deputation is not properly applied where a single person sends another with letters or commission; but only where a body are concerned. The parliament sends deputies to another, and the members to present their orders to the sovereign. The chapter *deputes* two canons to solicit their affairs in council.

DEPUTATUS, among the *Romans*, was applied, first, to ambassadors, or workmen employed in the making of armour in the *fabricæ*, &c. And secondly, to a sort of active people, who followed the army, and in engagements were trusted to bring off, and take care of the wounded.

DEPUTATUS, *Constantinop.* was also an inferior officer in the church of Constantinople, whose business was to call

call persons of condition the patriarch had a mind to speak with, and to keep off the crowd where that people walked.

This *deputy* appears to have been a sort of usher, or beadle; but he had likewise the care of the sacred vestments, in which he approached the office of a lucullus.

DEPUTY, a person sent, or *deputed*, by some community, in their name and behalf.

The several provinces of the French dominions send *deputies* to the king every year, to present him the *cayer des etats*: there are always three *deputies*, one from each order. It is the *deputy* of the first order that makes the compliment to the king. In the cities of Turky there are always *deputies* to treat with the grand signior's officers, as to taxes, and other concerns. These *deputies* are three or four of the richest and most considerable among the burghers.

DEPUTY is also frequently used among us for an office, or employ, not a dignity, and stands indifferently for a vice, or lieutenant.

DEPUTY, in *Law*, is one who exercises an office in another's right: and the forfeiture or misdemeanor of such *deputy* shall cause the person whom he represents to lose his office. A principal officer may not appoint a *deputy* in all cases, unless the grant of the office will justify him in so doing: but when an office descends to an infant, idiot, &c. he may make a *deputy* of course. A superior officer shall answer for his *deputy* in civil actions, but not in criminal cases. Judges have no power to hold their courts by *deputy*: recorders, however, may do it. Coroners cannot appoint *deputies*, because theirs is a judicial office of trust, annexed to their persons. Sheriffs, stewards of a court, bailiffs of a liberty, and constables, are allowed to appoint *deputies*.

DE QUIBUS *for a deputy*, in *Law*, a writ of entry. See Fitzherb. Nat. Brev. fol. 191.

DER, a syllable frequently prefixed to the names of places in England. It is said to signify that such were formerly places where wild beasts herded together, so called from the Saxon *deer*, *fera*, unless the situation was near some river.

DERBY *ped.* See BROMICOLE.

DERDER, in the *Materia Medica of the Arabians*, a name used by Avicenna and Serapion, to express the common elm, whose bark they used on many occasions.

DERFELD, in our *Old Writers*, is used for a park, q. d. a field of deer.

DERREIGNMENT, or DERAIGNMENT, in *Law*. The substantive *derreinment*, is sometimes used in the same sense with the French *derroger* or *desroger*; that is, to displace or set out of order. Thus we find *derreignment* or displacing out of order, ann. 31 Hen. VIII. c. 6. and 3 and 5 Edw. VI. c. 13. Thus also we meet with *derreinment* or dischargeing of their profession, 35 Hen. VIII. cap. 29. which is said of those religious ones, who forsook their orders or profession. See Kitchin, fol. 142. *To leave* entirely into religion, and *afterwards to return*. And Britton, c. 118. uses *remuer le franchise*, for a humorous that may be challenged as defective, or not lawfully made. Skene, De Verb. Signific. verbo *derainare*, makes it signify what we call waging and making of law.

DERELICTS, from *de*, and *relinquo*, *I leave*, in the *Civil Law*, are such goods as are wilfully thrown away, or relinquished by the owner.

DERELICT is also applied to such lands, as the sea receding from, leaves dry, and fit for cultivation.

If they are left by a gradual recess of the sea, they are adjudged to belong to the owner of the adjoining lands: but when an island is formed in the sea, or a large quantity of new land appears, such *derelict* lands belong to the king.

DERELSIDE, in *Botony*, a name by which some authors have called the tamarind-tree. Alpin Egypt. p. 38.

DE REVOCATIONE *parliamenti*, the name of a writ for recalling a parliament. Thus in 5 Edw. III. the parliament being summoned, was recalled by such a writ before it met. Vide Pryn's Antimad. on the 4 *Inst.* f. 44.

DEREYN, or DARAIN, *disrationare* vel *derationare*, in our *Old Laws*, is generally used for the act of proving: thus we find *derationatum fuit per juratores*. Glanv. lib. xi. c. 6. *Item, derationatum fuerat coram rege in curia sua*. Id. lib. iii. c. 20. Bracton uses it in the same sense. *Habere judicium derationationum & probationum*, lib. iv. tract. 3. c. 16. And to be maker, &c. of *derationes*, lib. iv. c. 22. And we find to *derein the warranty*, in Old Nat. Br. fol. 146. To *derreign* that right, 3 Edw. I. c. 4. and Westmin. 1st. c. 5. When the patron of any church is disturbed to demand tithes in the next parish, by a writ of *indicavit*, the patron shall have a writ to demand the advowson of the tithes, being in demand; and when it is *derained*, then shall the plea pass in the court Christian, as far forth as it is *derained* in the king's court.

DERIVATIO, in *Rhetoric*, is a figure in which words that are *derived* from the same root come together in the same sentence. The figure is repeated in the following example. *He wished rather to die a present death, than to live a future life.*

DERIVATION, from *de*, and *rivus*, a *stream*, in *Grammar*, the affinity one word has with another, by having been originally formed from it.

DERIVATION, in *Medicine*, the act of diverting a humour which flows on some noble part, and drawing it to some other neighbouring part, where it is less dangerous.

Thus, in defluxions upon the eyes, or teeth, they apply a blister behind the neck, to draw the matter thither: and in a quinsy, they prescribe bleeding in the *ranulæ*, or veins under the tongue, to divert the humour from falling on the throat.

DERIVATION. See ARGILE.

DERIVATIVE, in *Grammar*, a word which takes its origin from another word, called its *primitive*.

Such is the word *caristatus* itself, which takes its origin from the primitive *cirrus*, a tuft, or crown, out of which feller threads are drawn; and thus *master*, *may*, *lawyer*, &c. are *derived* from *man*, *do*, *law*, &c.

DERIVATIVE or *secondary Conveyances*, in *Law*, are those which presuppose some other conveyance precedent, and only serve to enlarge, confirm, alter, restrain, restore, or transfer the interest granted by such original conveyance. These are *release*, *confirmation*, *surrender*, *defeasance*, and *defeazance*.

DERM, in *Anatomy*, the *pulle*, or skin of an animal; or that tegument investing the whole body immediately under the cuticle, or scarf-skin.

The word comes from the Greek δερμα, *a skin*, or *covering*.

The *derma* consists of two parts; the *corpus reticulare*, and *papillare pyramidale*. See SKIN.

DERMESTES, in *Zoology*, a genus of insects of the order of the *coleoptera*, the antennæ of which are of a clavated figure, and perfoliated transversely. There are several species of this genus, confounded by some with beetles, or *scarabæi*.

DERNIER *resort*. See RESORT.

Whatever power is committed by the king to any other, the *dernier resort* is still remaining in himself; so that he may sit in court, and take cognizance of all causes (except in treasons, and other cases, where he himself is a party).

DEROGATION, from *derogo*, an act contrary to the preceding one, and that annuls, destroys, and revokes it, either in whole, or part.

Derogations, in general terms, are not regarded in judicatures; they must be in specifics, and in formal terms.

A new one imports a *derogation* of a former one: a second testament is a *derogation* of a first.

DEROGATORY, a clause importing *derogation*.

By the French law, if a person own himself indebted in a certain sum, no withstanding any assurance he has obtained for the same, the said sum is to be paid.

DERVIS, or DERVICH, a name given to a sort of monks among the Turks, who lead a very austere life, and profess extreme poverty; though they are allowed to marry. The word is originally Persian, درويش signifying a *beggar*, or person who has nothing; and because the religious, and particularly the followers of Mev'lana, profess not to possess any thing, they call both the religious in general, and the Mevlatiehs in particular, *Dervises*, or *Dervishes*.

The *Dervises*, called also *Metolachies*, are a Mahometan order of religious: the chief, or founder whereof, was one Mevlieva. They are now very numerous. Their chief monastery is that near Cogni in Natolia, where the general makes his residence, and where all the assemblies of the order are held; the other houses being all dependent on this, by a privilege granted to this monastery under Ottoman I.

The *Dervises* affect a great deal of modesty, patience, humility, and charity. They always go bare-legged, and open-breasted, and frequently burn themselves with hot irons, to inure themselves to patience. They always fast on Wednesdays, eating nothing on those days till after sun-set. Tuesdays and Fridays they hold meetings, at which the superiors of the houses preside. One of them plays all the while on a flute, and the rest dance, turning their bodies round and round with the greatest swiftness imaginable. Large cassocks with extreme full sleeves, which they have worn from their youth, have brought them to such a habit, that it does not incommode them at all. This exercise they observe with great devotion, in memory of Mevlieva; these postures, a turning miraculously round, as they pretend, for the space of four days, without any food or refreshment, his companion Hamdi playing all the while on the flute: after which he fell into an ecstasy, and therein received wonderful revelations for the

eſtabliſhment of his order. They believe the flute an inſtrument conſecrated by Jacob, and the shepherds of the Old Teſtament, becauſe they ſung the praiſes of God upon them. They profeſs poverty, chaſtity, and obedience, and really obſerve them while they remain *Dervifes*; but if they chooſe to go out, and marry, they are always allowed.

The generality of *Dervifes* are mountebanks: ſome apply themſelves to legerdemain, poſtures, &c. to amuſe the people; others give into ſorcery and magic: but all of them, contrary to Mahomet's precept, are ſaid to drink wine, brandy, and other ſtrong liquors, to give them the degree of gaiety their order requires.

Beſides their great ſaint Mevelava, there are particular ſaints honoured in ſome particular monaſteries: as Kidderie, great's revered in the monaſteries of Egypt, and held by ſome to be St. George; and by others, with more probability, the prophet Eliaſ.

The *Dervifes* are great travellers; and, under pretence of preaching, and propagating their ſect, are continually paſſing from one place to another; on which account they have been frequently uſed as ſpies.

There are alſo *Dervifes* in Perſia, called in that country *Abdals*, or *ſervants of God*. They lead a very penurious, auſtere life, and preach the Alcoran in the ſtreets, coffee-houſes, and wherever they can meet with auditors. The Perſian *Dervifes* uſually take no tables to the people, and are in the utmoſt contempt among the men of ſenſe, and letters.

There are in Egypt two or three kinds: thoſe that are in convents, are in a manner of religious order, and live retired; though there are of theſe ſome who travel and return again to their convents. Some take this character, and yet live with their families, and exerciſe their trades: of this kind are the dancing *Dervifes* at Damaſcus, who go once or twice a week to a little uninhabited convent, and perform their extraordinary exerciſes; theſe alſo ſeem to be a good people: but there is a third ſort of them who travel about the country, and beg, or rather oblige people to give, for whenever they ſound them born ſomething muſt be given them. The people of theſe orders, in Egypt, wear an octagonal badge, of a greeniſh white alabaſter, at their girdles, and a high flat cap without any thing round it. Pococke's Egypt. p. 178.

DESART, or DESERT, a wild, uncultivated, uninhabited place or country: as the *deſarts* of Lybia, of the Thebaid, &c. Geographers uſe the word in the general for all countries little, or not at all, inhabited. In Scripture, we find ſeveral places in the Holy Land, or places adjoining thereto, called *deſarts*. The *Deſart*, or wilderneſs, abſolutely ſo called, is that part of Arabia on the ſouth of the Holy Land, wherein the Iſraelites wandered, from the time of their evacuating Egypt to their entry into the Promiſed Land. The *Deſart* of Beerſheba was that part of the *Deſart* juſt mentioned, which bordered on the Holy Land, running towards the Mediterranean. The *Deſarts* of Iduméa is Idumea itſelf, a barren, mountainous country. The *Deſarts* of Bethaven, Beerſheba, Cadeſh, Damaſcus, Dibon, Engeddi, Edom, Gibeon, Horeb, Jaar, Javo, Moab, Pharan, Sin, Sinai, Zara, Zin, &c. are ſo many dry, uncultivated, and in general mountainous places, like our downs, &c. where there are few or no habitations or inhabitants; whence the Hebrews call them by antiphraſis מדבר, which properly ſignifies *human word*, or *ſpeech*, becauſe there is none heard there.

DESART, in *Cookery*. See DESSERT.

DESCANT, from *de*, and *cantus*, *ſong*, in *Muſic*, originally ſignified an extemporaneous ſong, which was no ſooner uttered than loſt; but it was afterwards applied to the art of compoſing in ſeveral parts.

Deſcant is threefold; viz. *plain*, *figurative*, and *double*.

DESCANT, *Plain*, is the ground-work or foundation of muſical compoſition, and conſiſts altogether in the orderly placing of many concords; anſwering to ſimple COUNTERPOINT.

DESCANT, *Figurative*, or *Aried*, is that wherein diſcords are concerned as well, though not ſo much, as concords. This may be well termed the ornamental or theatrical part of muſic; becauſe that in this are introduced all the varieties of points, figures, ſymphonies, diverſities of meaſures, and whatſoever elſe is capable of adorning the compoſition.

DESCANT, *Double*, is when the parts are ſo contrived, that the treble may be made the baſs; and, on the contrary, the baſs the treble.

DESCENDANT, in *Genealogy*, a term relative to *aſcendant*, and applied to a perſon who is born or ſprung from ſome other reſpected as the ſtock. Thus, mankind are ſaid to be *deſcendants* of Adam. The *deſcendants* from the brothers of the Maid of Orleans are confirmed in their exemption from all taxes and impoſts, by a regulation of the year 1634. See DESCENT.

DESCENDENS *abdomen*, in *Anatomy*, a name given by Fabricius, and others, to the muſcle, called by Albinus *obliquus externus abdominis*.

DESCENDING, ſomething that falls, or moves, from above downwards.

There are *aſcending* and *deſcending* ſtars; and *aſcending* and *deſcending* degrees.

There are alſo *aſcending* and *deſcending* veins ſpringing out of the *cava*; and *aſcending* and *deſcending* arteries riſing out of the *aorta*.

DESCENDING *latitude*, is the latitude of a planet in its return from the nodes to the equator.

DESCENSION, in *Aſtronomy*, is either *right* or *oblique*.

DESCENSION, *Right*, of a ſtar, or ſign, is a point, or arch, of the equator, which *deſcends* with the ſtar, or ſign, below the horizon, in a right ſphere.

DESCENSION, *Oblique*, is a point, or arch, of the equator, which *deſcends* at the ſame time with a ſtar, or ſign, below the horizon, in an oblique ſphere.

Deſcenſions, both *right* and *oblique*, are accounted from the firſt point of *Aries*, or the vernal interſection, according to the order of the ſigns; that is, from weſt to eaſt. And, as they are unequal, when it happens that they anſwer to equal arches of the ecliptic, as, e. gr. to the twelve ſigns of the zodiac, it follows, that luminaries a greater part of the equator riſes, or *aſcends*, with a ſign, on which caſe the ſign is ſaid to aſcend, or aſcend rightly; and ſometimes again, a leſs part of the equator riſes, or ſets, with the ſame ſign; in which caſe it is ſaid to aſcend and *deſcend* obliquely. See ASCENSION.

DESCENSION, *Refraction of the*. See REFRACTION.

DESCENSIONAL *difference*, is the difference between the right and oblique deſcenſion of the ſame ſtar, or point of the heavens, &c.

DESCENT, in *Chemiſtry*. The ſeparating mercury from its ore by *deſcent*, is performed in the following manner: take two earthern pots, with orifices of equal diameter; adapt an iron plate to the orifice of one of the two pots, in ſuch a manner that it may reſt upon the brink of it, but not jut out too much all round: let this have ſeveral holes bored here and there in it, but not near to bottom; pour into this pure water, to about two inches high, then ſhut it with the iron plate; put upon this plate a ſmaller veſſel, containing the ore of mercury; then cloſe theſe veſſels, with the ſecond pot inverted, ſtopping the joint well with lute; bury the inferior pot in aſhes, and put about the whole a moderate fire, continue it till the upper veſſel is ſlightly red hot, and the mercury will be driven into the lower, in fumes, which will be condenſed by the water into running quickſilver. Cramer's Art of Aſſaying, p. 352.

DESCENT *into a pit*, in *Fortification*, is a deep trench, or ſap, cut through the eſplanade, and under the covert-way; covered above with planks and timber, and loaded with earth againſt artificial fires. See MINES.

In wet ditches the *deſcent* is made even to the ſurface of the water: in dry ditches, it is carried to the bottom of the moat, where traverſes are made to lodge and ſecure the miners.

DESCENT, in *Genealogy* and *Heraldry*, the order, or ſucceſſion, of *deſcendants* in a line, or family.

We ſay, *one deſcent*, *two deſcents*, &c. A gentleman is of perfect blood who has four *deſcents* of gentility, both by his father's and mother's ſide, i. e. whoſe great grandfather, grandfather, and father, on both ſides, were all gentlemen.

DESCENT is alſo uſed, in *Heraldry*, to expreſs the coming down of any thing from above.

Thus, a *lion in deſcent* is a lion with his head towards one of the baſe points, and his heels towards one of the corners of the eſcutcheon, as if he were leaping from ſome high place.

DESCENT, or DISCENT, in *Law*, the order, or manner, wherein lands and tenements are derived to any man from his anceſtors: and this is by cuſtom, ſtatute, or common law. By cuſtom, as in GAVELKIND or BOROUGH-English; by ſtatute, as in TUTE; and by common law, when a perſon has lands of inheritance in fee-ſimple, and dies without diſpoſing them; in which caſe the land deſcends in courſe to the eldeſt ſon and heir.

Thus, to *make his deſcent* from his anceſtors, is to ſhew how, and by what particular degrees, the land in queſtion came to a perſon from his anceſtors. See CONTANGUINITY.

Deſcent, in common law, is either *lineal*, or *collateral*.

DESCENT, *Lineal*, is that conveyed down, in a right line, from the grandfather to the father, and from the father to the ſon, from the ſon to the grandſon, &c.

DESCENT,

DESCENT, *Collateral*, is that ſpringing out of the ſide of the line, or blood; as from a man to his brother, nephew, or the like.

Judge Blackſtone has collected and illuſtrated the following rules or canons of inheritance, according to which eſtates are tranſmitted from the anceſtor to the heir. "Inheritances ſhall lineally deſcend to the iſſue of the "perſon laſt actually ſeiſed *in infinitum*; but ſhall never lineally aſcend." The affirmative part of this rule has been almoſt univerſally adopted by all nations: but the negative part, whereby parents and all lineal anceſtors are excluded from ſucceeding to the inheritance of their offspring, is peculiar to our laws, and thoſe of the ſame original: for, by the Jewiſh law, on failure of iſſue the father ſucceeded to the ſon, in excluſion of brethren, unleſs one of them married the widow, and raiſed up ſeed to his brother. And, by the laws of Rome, the children or lineal deſcendants were firſt preferred; and, on failure of theſe, the father and mother or lineal aſcendants ſucceeded together with the brethren and ſiſters; though by the law of the Twelve Tables, the mother was originally excluded, on account of her ſex. This rule was introduced into our law at the ſame time with, and in conſequence of, feodal tenures: and though the right of ſucceſſion in the aſcending line was reſtored by Henry I. it was ſoon diſuſed; for it was laid down as an eſtabliſhed law in Glanvil's time, under Henry II. *hereditas nunquam aſcendit*; and this maxim has been invariable ever ſince. Another rule of inheritance is, "that the male iſſue ſhall be admitted before the female." This preference of males to females is entirely agreeable to the laws of ſucceſſion among the Jews, and alſo among the ſtates of Greece, or at leaſt among the Athenians; but was totally unknown to the laws of Rome, now extant, which allow brethren and ſiſters to ſucceed to equal portions of the inheritance. It was derived to us from the feodal law, and admitted on the principle, that no female could ſucceed to a proper feud, becauſe they were incapable of military ſervice. However, according to our law, though daughters are excluded by ſons, they ſucceed before any collateral relations. A third rule of *deſcent* is, "that where there are two or more males in "equal degree, the eldeſt only ſhall inherit, but the fe- "males all together." The Greeks, Romans, Britons, Saxons, and even originally the feudiſts, divided the lands equally; but when the emperors began to create honorary feuds, or titles of nobility, it was found neceſſary to make them impartible, or *feuda individua*, and deſcendible to the eldeſt ſon alone: in conſequence of which, the eldeſt male began univerſally to ſucceed to the whole of the lands in all military tenures; and in this condition the feodal conſtitution was eſtabliſhed in England by William the Conqueror. The fourth rule of *deſcent* is, "that the lineal deſcendants, *in infinitum*, "of any perſon deceaſed, ſhall repreſent their anceſtor, "or ſtand in the ſame place as the perſon himſelf would "have done, had he been living." Thus the child, grand-child, or great-grand-child, male or female, of the eldeſt ſon ſucceeds before the younger ſon, and *ſo in infinitum*; and theſe repreſentatives ſhall take neither more nor leſs, but juſt ſo much as their principals would have done. This is called a ſucceſſion *in ſtirpes*, according to the roots; ſince all the branches inherit the ſame ſhare that their root, whom they repreſent, would have done. The Jewiſh ſucceſſion was directed in the ſame manner; but the Romans ſomewhat different. This rule was indiſputably ſettled in the time of king Henry III. and has continued ever ſince. A fifth rule is, "that, on failure "of lineal deſcendants, or iſſue, of the perſon laſt ſeiſed, "the inheritance ſhall deſcend to the blood of the firſt "purchaſer; ſubject to the preceding rules." This rule was entirely unknown among the Jews, Greeks, and Romans; but the law of Normandy is the ſame with ours in this reſpect; both being derived from the ſame feodal origin. The ſixth rule is, "that the collateral "heir of the perſon laſt ſeiſed muſt be his next collateral "kinſman of the whole BLOOD." The laſt rule of *deſcent* is, "that in collateral inheritances the male ſtocks ſhall "be preferred to the female; that is, kindred derived "from the blood of the male anceſtors ſhall be admitted "before thoſe from the blood of the female; unleſs "where the lands have, in fact, deſcended from a fe- "male." This is warranted by the examples of the Hebrew, Athenian, and Roman laws; and alſo of the cuſtomary law of Normandy. See farther on this ſubject Blackſt. Com. vol. ii. chap. 14, paſſim.

If one dies ſeiſed of land, wherein another has a right to enter, and it *deſcends* to his heir; ſuch *deſcent* ſhall take away the others right of entry, and put him to his action for recovery thereof. Stat. 32 Hen. VIII.

DESCENT, *fall*, in *Mechanics*, &c. is the motion, or tendency, of a body towards the centre of the earth, either directly or obliquely.

It is to be here obſerved, firſt, that a body cannot *deſcend*, unleſs it can divide and ſeparate the medium; which it cannot do, unleſs it be ſpecifically heavier than the medium. For ſince bodies cannot penetrate each other, one muſt give way before the other can move: and again, though a medium, e. gr. water, be diviſible, yet, if it be ſpecifically heavier than another, e. gr. wood, it is only heavier as it contains more particles of matter in the ſame bulk, all which have an impulſe downwards; and, conſequently, in water there is a greater impulſe than in the ſame bulk of wood.

Secondly, The *deſcending* body loſes as much of its weight, as is the weight of the medium, with the force of its cohæſion.

And, therefore, a body ſpecifically heavier *deſcends* in a fluid medium ſpecifically lighter (e. gr. the air) with a force equal to the exceſs of the weight of the body above an equal bulk of the medium: for a body only *deſcends* in a medium with the force remaining, after a part has been ſpent in overcoming the reſiſtance of the medium; and this reſiſtance is equal to the weight of an equal bulk of the medium; conſequently, the body only falls with the exceſs of its weight above that of an equal bulk of the medium.

Hence, the power that ſuſtains a body in a ſpecifically lighter medium, is equal to the exceſs of the abſolute weight of the body above an equal bulk of the medium. Thus, 47½ pounds of copper in water loſe 5½ of their weight. A power, therefore, of 42 pounds is able to ſuſtain them.

Thirdly, If two bodies have the ſame ſpecific gravity, the leſs the bulk of the *deſcending* body is, the more of its gravity does it loſe, and the ſlower does it *deſcend*, in the ſame medium. For, though the proportion of the ſpecific gravity of the body to that of the fluid be ſtill the ſame in a greater or leſſer bulk, yet the leſs the body, the more the ſurface, in proportion to the maſs; and the more the ſurface, the more the friction of reſiſtance.

Fourthly, If the ſpecific gravities of two bodies are different, that which has the greateſt ſpecific gravity will *deſcend* with greater velocity in the air or other reſiſting medium than the other. Thus a ball of lead *deſcends* ſwifter than a feather, becauſe it loſes leſs of its weight, though in vacuo they both fall with equal velocity.

The cauſe of this *deſcent*, or tendency downwards, has been greatly controverted. There are two oppoſite hypotheſes advanced; the one holding it to proceed from an internal, and the other from an external principle: the firſt maintained by the PERIPATETICS and EPICUREANS, and by the NEWTONIANS; and the latter by the CARTESIANS and GASSENDISTS. See alſo ACCELERATION.

Laws of the DESCENT *of bodies*. 1. Heavy bodies, in an unreſiſting medium, fall with an uniformly accelerated motion. See the *laws of uniformly accelerated motion*, under the articles ACCELERATION and MOTION.

In ſuppoſing heavy bodies to *deſcend* in an unreſiſting medium, we conceive them free of all external impediments, from what cauſe ſoever. So that we even ſet aſide that oblique impulſe, given to bodies while in falling, by the rotation of the earth, though this produces no ſenſible irregularity in a little diſtance. Galileo, who firſt diſcovered the *laws of the deſcent* of heavy bodies by reaſoning, afterwards confirmed the ſame by experiments; the reſult of which, repeated often both by him and ſince his time, was, that the ſpaces of *deſcent* were as the ſquares of times.

Grimaldi and Riccioli made experiments to the ſame effect, though in a different manner, by letting fall a number of balls, weighing eight ounces a-piece, from the tops of ſeveral towers, and meaſuring the times of falling by a pendulum. Ricciol. Almag. Nov. tom. i. lib. ii. cap. 21. prop. 4. Theſe experiments are exhibited in the following table.

Vibrations of the Pendulum.	Time.		Space at the end of the Time.	Space deſcended each Time
	'	"	Rom. Foot.	Rom. Foot.
5	0	50	10	10
10	1	40	40	30
15	2	30	90	50
20	3	20	160	70
25	4	10	250	90
6	1	0	15	15
12	2	0	60	45
18	3	0	135	75
24	4	0	240	105

Since, then, the experiments of Riccioli, made in such considerable distances, agree so well with the theory, it is scarce worth taking notice of what is urged to the contrary by Dechales, in his Mund. Math. who writes, that he had found by experiment, that heavy bodies, in half a second of time, *descend* 2½ feet; in two, 16½: in three 36; in four, 60: in five, 90¾ in six, 123. It is sufficient that he denotes the irregularity from the resistance of the air, which we suppose out of the question.

2. If a heavy body *descend*, in an unresisting medium, through an interval not over-large, the space it describes, is the subduple of that which it would describe, in the same time with the velocity acquired at the end of the fall.

3. The time wherein a body falls from a given height being given, to determine the spaces it fell in the several parts of that time.

Suppose the given altitude $= a$, the time $= t$, and the space it fell in one part of time x: then

$$\frac{t : x = t^2 : a}{t^2 x = a}$$

$$x = \frac{a}{t^2}.$$

Therefore the space passed over in the first part of time is $\frac{a}{t^2}$; consequently, that passed over in the second time $= \frac{3a}{t^2}$; that in the third $= \frac{5a}{t^2}$, &c. See ACCELERATION, *art.* 3.

E. gr. In the experiments of Riccioli, above delivered, the ball fell 240 feet in four seconds. Therefore the space fallen the first second was $= 240 \div 16 = 15$. The space in the second was $= 15 \times 3 = 45$. That in the third $= 15 \times 5 = 75$. And that in the fourth $15 \times 7 = 105$.

4. The time wherein a body falls through a given space being given, to determine the time wherein it will fall through any other given space, in the same medium.

Since the spaces are as the squares of the times, to the space which the body falls in the given time, the space in the question, and the square of the given time, find a fourth proportional, which will be the square of the time sought. The square root, therefore, being extracted therefrom, the problem is solved.

For example; one of Riccioli's balls, in four minutes time, falling 240 feet, it is inquired in what time it would fall 135 feet? The answer will be found $= \sqrt{(135 \times 16 \div 240)} = \sqrt{(135 \div 15)} = \sqrt{9} = 3$.

5. The space a body falls in a given time being given; to determine the space through which it will fall in any other given time.

To the square of the time wherein the body falls through the given space, the square of the time wherein it should fall through the space required, and the given space, seek a fourth proportional; this will be the space required.

For instance, Riccioli's ball falling 60 feet in 2 seconds, it is asked what space it will fall through in 4 seconds? The answer is, $16 \times 60 \div 4 = 4 \times 60 = 240$. Wolf. Elem. Math. tom. ii. p. 14, &c.

For the *Laws of the* DESCENT *of bodies on inclined planes*, see *Inclined* PLANE.

For the *Laws of* DESCENT *in cycloids*, see CYCLOID, and PENDULUM.

DESCENT, *Line of swiftest*, is that which a body falling by the action of gravity, describes in the shortest time; which is proved by geometricians to be the cycloid.

DESCRIBENT, is a term in *Geometry*, expressing some line or surface, which by its motion produces a plane figure, or a solid.

DESCRIPTION, in *Logic*, an imperfect, or inaccurate definition of a thing, giving a sort of knowledge thereof from some accidents and circumstances peculiar to it, which determine it enough to give an idea that may distinguish it from other things; but without explaining its nature or essence.

Grammarians content themselves with *descriptions*: philosophers require definitions of things. See DEFINITION.

A *description* is an enumeration of divers attributes of a thing, most of which are only accidental: as, when a person is *described* by his dress, his sayings, his writings, his humours, &c. A *description*, as to its outward appearance, resembles a *definition*, and is even convertible with the thing described; but does not explain it. For, instead of bringing several things essential to the thing described, it only brings a number of accidents belonging thereto. E. gr. Peter is the tall young man who lives on the green, wears black cloaths, frequents the college, courts N——, &c. where it is evident, we do not give any explication of Peter, as not bringing things that are in Peter, but only circumstances of things about him, *viz.* young, living, wearing, frequenting, courting, &c. A *description*, therefore, is no proper answer to the question, *quod est*, what is he? but to that, *quis est*, who is he?

Description, in effect, are principally used for singulars, or individuals; for things of the same species do not differ in essence, but only as to *this*, and *that*, which difference contains nothing very notable, or distinguishable. But individuals of the same kind, differ much in accidents; e. gr. George is a king, and William a citizen; Charles is a male, and Anne a female; Henry is wife, and John a blockhead, &c. Thus, a *description* is an accumulation of accidents, whereby things are notably distinguished from each other, though they scarce differ at all in essence.

Some authors call a *description* a quasi-definition, as, body is a thing divisible, moveable, solid, extended, &c. which only falls short of a definition in this, that, instead of the form or essence of a thing, it gives one or more properties arising from the form or essence.

DESCRIPTION, in *Geometry*. To *describe* a circle, ellipsis, parabola, &c. is to construct, or form those figures, with rules, compasses, &c.

DESCRIPTION, in *Poetry* and *Rhetoric*, is a figure, which, by the aid of imagery and ornament, exhibits such a strong and lively representation of a subject, as gives a distinct view and satisfactory notion of it to the reader or hearer; and whilst it convinces the mind, it moves and sways the passions. This figure is principally used by poets, not only with a design to move the passions, but to please the fancy. Historians also *describe* things, places and persons; and orators produce the greatest effect by *description*. The *description* of a person is called a character.

DESERTER, from *desero*, *I forsake*, in *War*, a soldier on the muster-roll, who quits the service without leave, or lists himself under another officer, into a different regiment.

All soldiers found half a league from a garrison, or army, going towards an enemy's country, or quarter, without a pass, are deemed and treated as *deserters*.

A *deserter* is, by the articles of war, punishable by death, and after conviction is hanged at the head of the regiment he formerly belonged to, with his crime written on his breast; and is suffered to hang until the army leave the camp, for a terror to others.

For the manner of punishing *deserters* among the ancients, see TRANSFUGA.

The ancient church excommunicated *deserters*, as having violated their oath.

By the ancient laws of this kingdom, *desertion* was deemed felony; but it is now punished by courts martial, under the annual acts against mutiny and *desertion*.

DESHABILLE, a French term, naturalized of late. It properly signifies a night-gown, and other necessaries, made use of in dressing or undressing. Mr. —— is not to be spoken with, he is yet in his *deshabille*, i. e. undressed, or in his night-gown.

The word is compounded of the privative *de*, and *habiller*, *to dress one's self*.

DESHACHE, Fr. from *de*, and *hacher*, *to cut*, in *Heraldry*, is when a beast has its limbs separated from the body, so as they still remain on the escutcheon, with only a small separation from their natural places.

DESIDERATUM, from *desiderare*, *I desire*, is used to signify desirable improvements in any art or science, as yet unattained. Thus, it is a *desideratum* with the blacksmith, to render iron fusible, by a gentle heat, and yet preserve it hard enough for ordinary uses; with the glass-man and looking-glass maker, to render glass malleable; with the clock-maker, to bring pendulums to be useful where there are irregular motions; with the brazier and coppersmith, to make malleable solder; with the shipwright, to build vessels that will sail under water; with the diver, to procure manageable instruments for conveying fresh air to the bottom of the sea sufficient for respiration, and the burning of lights; with the alkymist, to melt or copel ores, or metals immediately, without the use of bellows or furnace; and with the carvers and joiners, to fashion wood in moulds like plaister of Paris, or burnt alabaster, &c. And though, as Mr. Boyle observes, the obtaining of these *desiderata* may be thought chimerical, yet it is proper they should be proposed; for although perfection may not be attainable, yet approaches to it may be made, and arts thereby improved. Vide Boyle's Works abr. vol. i. p. 129, 130.

In short, all arts and sciences have their defects, and it is not at first to be guessed, for how many of these remedies may be found, by means of chemical and philosophical researches properly directed.

If a proper number of persons duly qualified for making experiments, and improving from them, would set about each his particular share of the necessary experiments, and communicate the result of all their processes to one another,

another, the buſineſs of chemical and philoſophical experiments would be much better directed in regard to future ſtudents, and many of the *deſiderata* in the art probably ſupplied.

DESIGN, from *deſigno*, *I mark out*, the plan, or repreſentation of the order, general diſtribution, and conſtruction of a painting, poem, book, building, or the like.

The painter has ſhewn the firſt *deſign* of his piece, in which the figures are well diſpoſed. The *deſign* of that poem, or book, is artfully laid. Claudian never ſees his whole *deſign* together: when he compoſes a part, he thinks of nothing elſe, and works up every member, as if it were ſeparate from all the reſt.

In building we uſe the term ICHNOGRAPHY, when by *deſign* is only meant the plan of a building, or a flat figure drawn on paper. ORTHOGRAPHY, when ſome face, or ſide, of the building, is raiſed from the ground. And SCENOGRAPHY, when both front and ſides are ſeen in perſpective.

DESIGN, in *Weaving Manufactories*, expreſſes the figures wherewith the workman enriches his ſtuff, or ſilk; and which he copies after ſome painter or draughtſman.

In undertaking ſuch kinds of figured ſtuffs, it is neceſſary, that, before the firſt ſtroke of the ſhuttle, the whole *deſign* be repreſented on the threads of the warp; we do not mean in colours, but with an infinite number of little packthreads, which, being diſpoſed ſo as to raiſe the threads of the warp, let the workman ſee, from time to time, what kind of ſilk is to be put into the eye of the ſhuttle, for woof.

This method of preparing the work, is called *reading the deſign*, or reading the figure, which is performed after the following manner. A paper is provided, conſiderably broader than the ſtuff, and of a length proportionate to that which is intended to be repreſented thereon. This they divide lengthwiſe, by as many black lines as there are intended to be threads in the warp; and croſs theſe lines by others drawn breadthwiſe, which, with the former, make little equal ſquares. On the paper thus ſquared the painter *deſigns* his figures, and heightens them with colours, as he thinks fit. When the *deſign* is finiſhed, a workman reads it, while another lays it on the ſimbor.

Now, to read the *deſign*, is to tell the perſon who manages the loom, the number of ſquares, or threads, comprized in the ſpace he is reading; intimating, at the ſame time, whether it is ground or figure.

To put what is read on the ſimblor, is to faſten little ſtrings to the ſeveral packthreads which are to raiſe the threads named. And thus they continue to do till the whole *deſign* is read.

Every piece being compoſed of ſeveral repetitions of the ſame *deſign*, when the whole *deſign* is drawn, the drawer, to re-begin, as I may ſay, the *deſign* afreſh, has nothing to do, but to raiſe the little ſtrings, with ſlip-knots, to the top of the ſimblot, which he had let down to the bottom; and this he is to repeat as often as is neceſſary, till the whole be manufactured.

The ribband-weavers have likewiſe a *deſign*, but much more ſimple than that now deſcribed: it is drawn on paper, with lines and ſquares, repreſenting the threads of the warp, and woof. But in lieu of lines, whereof the figures of the former conſiſt, theſe only conſiſt of points or dots, placed in certain of the little ſquares formed by the interſection of the lines; theſe points mark the threads of the warp that are to be raiſed, and the ſpaces left blank denote the threads that are to keep their ſituation. The reſt is managed as in the former.

DESIGN is particularly uſed, in *Painting*, for the firſt idea of a large work, drawn roughly, and in little, with intention to be executed, and finiſhed in large.

In this ſenſe, the *deſign* is the ſimple contour, or outlines, of the figures, or things intended to be repreſented, or the lines that terminate and circumſcribe them.

Such a *deſign* is ſometimes drawn in crayons, or ink, without any ſhadows at all: ſometimes it is hatched, that is, the ſhadows are expreſſed by ſenſible lines, uſually drawn across each other with the pen, crayon, or graver. Sometimes, again, the ſhadows are done with the crayon rubbed, ſo that there do not appear any lines; ſometimes the grain, or ſtrokes of the crayon, appear, as not being rubbed; ſometimes the *deſign* is waſhed, that is, the ſhadows are done with a pencil in Indian ink, or ſome other liquor; and ſometimes the *deſign* is coloured, that is, colours are laid on much like thoſe intended for the grand work.

The qualities, or conditions, required in a *deſign*, are correctneſs, good taſte, elegance, character, diverſity, expreſſion, and perſpective.

Correctneſs depends principally on the juſtneſs of the proportions, and a knowledge of anatomy. Taſte is an idea or manner of deſigning, which ariſes either from the complexion, and natural diſpoſition, or from education, one's maſter, ſtudies, &c. Elegance gives the figures a kind of delicacy which ſtrikes people of judgment, and a certain agreeableneſs, which pleaſes every body. The character, is what is peculiar to each thing, in which there muſt be a diverſity; in as much as every thing has its peculiar character to diſtinguiſh it. The expreſſion, is the repreſentation of an object according to its character, and the ſeveral circumſtances it is ſuppoſed to be in. The perſpective is the repreſentation of the parts of a painting, or figure, according to the ſituation they are in, with reſpect to the point of ſight.

The *deſign*, or draught, is a part of the greateſt import and extent in painting: it is acquired chiefly by habit and application, rules being of leſs avail here than in any of the other branches of the art, as colouring, clair-obſcure, expreſſion, &c.

The principal rules that regard the *deſign* are, that novices accuſtom themſelves to copy good originals at firſt ſight; not to uſe ſquares in drawing, for fear of ſtinting and confining their judgment; to ſtay till they can *deſign* well after the life, before they begin the practice of perſpective rules; in *deſigning* after the life, to learn to adjuſt the bigneſs of their figures to the viſual angle, and the diſtance of the eye from the model, or object; to mark out all the parts of the *deſign*, before they begin to ſhadow; to make their contours in great pieces, without taking notice of the little muſcles, and other breaks; to make themſelves maſters of the rules of perſpective; to obſerve every ſtroke, as to its perpendicular, parallel, and diſtance; and particularly to compare, and oppoſe the parts that meet upon, and traverſe the perpendicular, as to form a kind of ſquare in the mind, which is the great, and almoſt the only rule of *deſigning* juſtly; to have a regard, not only to the model, but alſo to the part already deſigned, there being no ſuch thing as *deſigning* with ſtrict juſtneſs, but by comparing and proportioning every part to the reſt.

The laſt relates to perſpective: as, that thoſe objects be ſeen at one view, whoſe rays meet in a point; that the eye and object be always conceived as immoveable; that the ſpace, or medium between them, be conceived tranſparent; and that the eye, object, and picture, be at a juſt diſtance, which is uſually double the bigneſs of the ſubject, or picture. See DESIGNING, and PERSPECTIVE.

DESIGNATION, the act of marking or aſſigning, and making a thing known. The *deſignation* of ſuch an eſtate is made by the tenants, buttments, and boundings.

Among the Romans, there were *deſignations* of the conſuls and other magiſtrates, ſome time before their election.

DESIGNATOR, a Roman officer who aſſigned and marked each perſon his place and rank in publick ceremonies, ſhews, proceſſions, &c.

The word is formed from the verb *deſignare*, *to deſign*.

The *deſignator* was a kind of marſhal, or maſter of the ceremonies, who regulated the feaſts, march, order, &c. There were *deſignators* at funeral ſolemnities, and at the games, theatres, and ſhews, who not only aſſigned every one his place, but alſo led him to it; as appears from the prologue to to the Pœnulus of Plautus.

Much of the ſame nature were the *œconothetæ* of the Greeks.

DESIGNING, the art of delineating or drawing the appearance of natural objects, by lines, on a plane.

To deſign, according to the rules of mathematics, makes the object of perſpective.

To deſign by the camera obſcura, ſee CAMERA *obſcura*.

Mechanical method of DESIGNING *objects*. Provide a ſquare piece of glaſs, fixed into a frame, ABDC (*Tab. Perſpective, fig.* 1.); and waſh and ſmear it over with water, wherein a little gum has been diſſolved. When it is well dried again, turn it towards the object or objects to be deſigned, ſo as that the whole thereof may be ſeen through a diopſtra, or ſight GH, fixed thereto: then proceed to work, and, applying the eye to the ſight, with a pen and ink draw every thing on the glaſs, as you ſee it appear thereon: or the outlines of the objects may be drawn with black colour in drying oil. Having finiſhed the draught, lay a fair moiſt paper thereon; and, preſſing it pretty tight down, the whole will be tranſferred from the glaſs to the paper. This method is very good, eaſy, and exact, and deſerves to be more uſed by painters. Some have uſed a piece of tiffany or fine lawn; and others, paper made tranſparent by means of oil of turpentine, inſtead of the glaſs: and the outlines of the object are traced out by a crayon, formed of white or red chalk, charcoal, or any proper ſubſtance. If tiffany or lawn be uſed, they muſt be carefully laid on paper or vellum, and ſtruck in every part with ſome flat body; by which means the matter of the crayon will

will be transferred from the old to the new ground; and the impreſſion ſhould be overtraced with a black lead pencil. The ſketch on tranſparent paper may be tranſmitted to any ground, by puncturing it with holes near each other in the lines of the drawing, then fixing it on the ground, and duſting over it black lead, or any other coloured matter finely powdered, and tied up in a fine linen cloth. This duſt will mark a ſketch on the new ground, ſo that it may be over-traced by any kind of pencil or crayon.

The eye may be aſſiſted in *deſigning* from nature by means of a plane divided into ſquares, which is formed by drawing croſs lines, parallel to each other, on a taffany or lawn framed; or on tranſparent paper or glaſs. This may be done with common writing ink, or in any other way that will render the lines viſible; and the divided plane muſt be placed before the ſight-board, as already directed. The ground, on which the ſketch is to be taken, muſt be alſo formed into an equal number of ſquares; and the objects, thus ſeen through the ſquares of the tranſparent plane, will be eaſily diſpoſed in their proper ſituation, and formed of a juſt magnitude, by placing them in the correſpondent ſquare of the ground: or, a frame may be prepared of a proper ſize, and the area of it divided into ſquares, by threads of a moderate thickneſs. A portable machine may be eaſily contrived for ſupporting the frame of the tranſparent plane, and the ſight-board; this machine may be conſtructed by joining three legs together, in the manner of the ſurveyor's inſtruments, in a block; and fixing the frame, by means of a ſliding foot, into the ſame box, that it may be raiſed higher or lower. The ſight-board muſt have a foot likewiſe, by which it might be raiſed higher or lower; though this muſt not be fixed into the block, but into a ſliding piece, which muſt paſs through the block horizontally; ſo that the foot of the ſight-board being fixed into it at right angles, the board may be brought nearer to, or drawn farther from, the tranſparent plane at pleaſure.

The following apparatus was uſed by Sir Chriſtopher Wren for the purpoſe of *deſigning*. A is a ſmall ſight with a ſhort arm B (ſee *Tab. Perſpective, fig.* 2.) which may be turned round about, and moved up and down on the ſmall cylinder CD, which is ſcrewed into ED at D: this piece ED moving round about the centre E, by which means the ſight may be removed either towards E or F. EF is a ruler faſtened on the two rulers GG, which rulers ſerve both to keep the ſquare frame SSSS perpendicular, and, by ſliding through the ſquare holes I I, to ſtay the ſight, either nearer to or farther from the ſaid frame; on which frame is ſtuck on with a little wax the paper OOOO, on which the picture is to be drawn by the pen I. This pen I is ſo fixed, by a ſmall braſs handle V, to the ruler HH, that the point I may be kept very firm, ſo as always to touch the paper. HH is a ruler, that is always moved horizontally, or parallel to itſelf, by means of the ſmall ſtrings *aao*, *bbb*; at the end of this ruler, is ſtuck a ſmall pin, whoſe head P is the ſight, which is to be moved up and down on the outlines of any object. The two ſtrings *aao*, *bbb*, are exactly of an equal length. Two ends of them are faſtened into a ſmall leaden weight, which is moved in a locker on the back ſide of the frame, and ſerves exactly to counterpoiſe the ruler HH: the other two ends are faſtened to two ſmall pins HH, after they have rolled about the ſmall pullies MM, LL, KK; by means of which pullies, if the pen I be taken hold of and moved up and down the paper, the ſtrings moving very eaſily, the ruler will always remain in an horizontal poſition. When the inſtrument is uſed, it is ſet upon a table, and the ſight A is fixed at any height above the table, and at any diſtance from the frame SSSS, at pleaſure. Then the deſigner, looking through the ſight A, and holding the pen I in his hand, moves the head of the pin P up and down, over the outlines of the object, and the point I will deſcribe, on the paper OOOO, the ſhape of the object ſo traced.

DESIN, in *Chronology*, the Macedonian name of the Athenian Month ANTHESTERION.

DE SON TORT *demeſne*, in our *Law*, words of form, uſed in an action of treſpaſs by way of reply to the defendant's plea. Thus, if A. ſues B. in ſuch an action; B. anſwers for himſelf, that he did that which it calls a treſpaſs by the command of C. his maſter. A. replies that B. did it *de ſon tort demeſne, ſans ce que C. luy commande modo et formâ*, that is, B. did it of his own wrong, without C.'s commanding him in ſuch manner and form.

DESPOT, a title or quality given to the princes of Walachia, Servia, and ſome of the neighbouring countries.

The word, in its firſt origin, ſignified the ſame with the Latin *herus*, and the Engliſh *maſter*; but, in time, it underwent the ſame fate on medals, as, among the Latins, Cæſar did with regard to Auguſtus; BACIAEYC anſwering to Auguſtus, and ΔECΠOTHC, *deſpotes*, to CEΔAP.

Thus Nicephorus, having ordered his ſon Stauracious to be crowned, the ſon, out of reſpect, would only take the name ΔECΠOTHC, leaving to his father that of BACIAEYC. For it is to be noted, that it was juſt about the time that the emperors began to ceaſe to uſe Latin inſcriptions.

This delicacy, however, did not laſt long; for the following emperors preferred the quality of ΔECΠOTHC, to that of BACIAEYC, particularly Conſtantine, Michael Ducas, Nicephorus Botoniates, Romanus Diogenes, the Comneni, and ſome others.

In imitation of the princes, the princeſſes likewiſe aſſumed the title of ΔECΠOINA.

It was the emperor Alexius, ſurnamed the Angel, who created the dignity of *deſpot*, and made it the firſt after that of emperor, above that of Auguſtus, or Sebaſtocrator, and Cæſar. See AUGUST.

The *deſpots* were uſually the emperors ſons, or ſons in law, and their colleagues, and copartners in the empire, as well as their preſumptive heirs. The *deſpots*, that were ſons of the emperors, had more privileges and authority than thoſe that were only ſons in law. Codin. p. 38. deſcribes the habits and ornaments of the *deſpot*. See the notes of father Goar on that author.

Under the ſucceſſors of Conſtantine the Great, the title *deſpot of Sparta* was given to the emperor's ſon, or brother, who had the city of Sparta, or Lacedæmon, by way of appanage.

DESPOTISM, or DESPOTIC *government*, a form of government wherein the prince is abſolute and arbitrary, doing whatever he liſts, without being checked by any other power. Such are moſt of the eaſtern governments, as thoſe of the mogul, grand ſignior, ſophi of Perſia, &c.

DESPOUILLE, Fr. in *Heraldry*, is the whole caſe, ſkin, or ſlough of a beaſt, with the head, feet, tail, and all appurtenances, ſo that being filled, or ſtuffed, it looks like the entire creature.

DESPUMATION, of *de*, priv. and *ſpuma*, *froth*, the clarification of any liquor, by throwing up its foulneſs in a froth, and taking that off.

DESQUAMATION, from *de* and *ſquama*, *I ſcale*, expreſſes the ſtaking or ſcaling of carious bones. See EXFOLIATION.

DESSERT, or DESSART, Fr. the laſt ſervice brought on the tables of people of quality, when the meats are all taken off. The *deſſert* conſiſts of fruits, paſtry-works, confections, &c.

DESSICATIVE, or DESICCATIVE, from *deſicco*, *I dry up*, in *Medicine*, a remedy that has the virtue of drying up ſuperfluous moiſture; uſed to ſkin over old ſores, &c. We ſay a *deſſicative* unguent, &c.

Pimpinella is held deterſive, *deſſicative*, and vulnerary. Lemery.

DESTILLATION, or DISTILLATION, in *Chemiſtry*. See DISTILLATION.

DESTINIES, in *Mythology*. See PARCÆ.

DESTINY, from *deſtino*, *I order*, the order, diſpoſition, or chain of ſecond cauſes appointed by Providence; and importing or carrying with it, a neceſſity of event.

According to many of the heathen philoſophers, *deſtiny* was a ſecret and inviſible power, or virtue, which, with incomprehenſible wiſdom, conducted what to us appears irregular and fortuitous. This amounts to what we call God.

The Stoics, by *deſtiny*, underſtood a certain concatenation of things, which, from all eternity, follow each other of abſolute neceſſity, there being no power able to interrupt their connexion. This anſwers, in a great degree, to our idea of Providence.

But the Stoics made even the gods themſelves ſubject to the neceſſity of this *deſtiny*. The truth is, the Stoics rather define what the word *deſtiny* ſhould ſignify, than what it did ſignify in common language; for they had no diſtinct idea of this power, to which they attributed thoſe events. They had only a vague, confuſed idea of I know not what chimera, or unknown cauſe, to which they referred that inviolable diſpoſition, and the eternal concatenation of all things. There is no real being that the name *deſtiny* can agree to. The heathen philoſophers, who had framed a notion thereof, ſuppoſed it to exiſt, without knowing preciſely what they meant by it. But men, not daring on the one ſide to impute to Providence the evils and misfortunes that befel them, as they imagined, undeſervedly; and, on the other ſide, not being willing to allow that it was their own fault, formed this phantom of *deſtiny*, to bear the weight of all the evil.

DESTRUCTION, paſſively taken, is the corruption or anni-

annihilation of something before existing. See CORRUPTION.

A thing passes from *esse* to *non esse*, either by corruption, when nothing of the substance is lost, but only the accidents, viz. the disposition of parts; or, by annihilation, when both substance and accidents are lost.

DESUDATION, from *desudo*, *I sweat much*, expresses a profuse and inordinate sweating, followed by the irruption of SUDAMINA, or heat-pimples.

DESULTOR, from *desilio*, *I vault*, in *Antiquity*, a vaulter, or leaper, who jumped off one horse upon another.

Among the Scythians, Indians, and Numidians, the cavaliers, or horsemen, who served in the wars, were very expert *desultores*; that is, they always carried with them at least two horses, and when that they were mounted on grew weary, or wanted breath, they leaped, with great agility and address, upon the other which they led in their hand.

The Greeks and Romans borrowed the same practice from those barbarous nations; but they only used it in their games, races, and funeral solemnities; and never, that we read of, in war. The *desultores*, therefore, were, among the people of Asia and Africa, soldiers; but, among the Romans, &c. they were no more than tumblers and posture-masters. Eustathius, on Homer's Iliad, lib. iv. assures us, that, instead of two, they had sometimes four or six horses, all a-breast, and would jump from the first to the fourth, or sixth, which was the shatter-piece of their art.

DETACHED *Piece*, in *Fortification*, are demi-lunes, ravelins, horn and crown-works, and even bastions, when separated, or at a distance from the body of the place.

In *Painting*, the figures are said to be well *detached*, or loosened, when they stand free, and disengaged from each other, are no where confounded together, but stand out with a strong relievo from the ground, and from each other.

DETACHMENT, from the French *detacher*, *to part from*, a military term, signifying a certain number of soldiers, taken out of several regiments or companies equally, to be employed in some particular enterprize; as, to form a kind of flying camp, to relieve a party already engaged in battle, to join a separate army, to assist at the siege of a place, or to enter into some garrison. The number depends on the dignity of the officer in command; thus, two thousand or three thousand men form a *detachment* for a general officer, eight hundred for a colonel, five hundred for a lieutenant-colonel, two or three hundred for a major, eighty or a hundred for a captain, forty for a lieutenant or ensign, twelve for a serjeant, and six for a corporal.

DETACHMENT *of a fleet or squadron*, a certain number of ships chosen by an admiral or commodore from the rest of the fleet, and charged to execute some particular service.

DETAINER, in *Law*. See FORCIBLE *entry*.

DETENTION, from *detineo*, *I detain*, the possession, or holding, of lands, or the like, from some other claimant.

The word is chiefly used in an ill sense, for an unjust with-holding, &c.

The canons condemn a person who has intruded into a benefice, to make restitution of all the fruits thereof, during the time of his unjust *detention*.

DETENTS, in a clock, are those stops, which by being lifted up or let fall down, lock and unlock the CLOCK in striking.

DETENT-*wheel*, or HOOP-*wheel*, in a clock, that wheel which has a hoop almost round it, wherein there is a vacancy, at which the CLOCK locks.

DETERGENT, from *detergo*, *I cleanse*, in *Medicine*, is applied to remedies that cleanse, and carry off viscid and glutinous humours.

The plant buckthorn deterges, and consolidates wounds.

Rhaponticum is aperitive, and good against the gravel and stone; it also deterges, and expels poison.

Detergents are not only softening and adhesive, but also, by a peculiar activity, or disposition to motion, joined with a suitable configuration of parts, are apt to abrade, and carry along with them, such particles as they lay hold of in their passage. All medicines of this intention are supposed to cleanse and heal, that is, incarnate, or fill up with new flesh, all ulcerations and foulnesses occasioned thereby, whether internal or external. To do this, in all internal cases especially, the medicine must be supposed to maintain its primary properties, until it arrives at the place of action; and there it does what entitles it to the appellation of a *detergent*, and a vulnerary: first, by its adhesive quality, which consists in the comparative largeness of surface, and flexibility of its component parts, by which it readily falls into contact with, and adheres to, the slough of ulcerous exudations, which, by their loose situations, are easily carried along with the medicine; and when such matter is so carried away, which is the cleansing and deterging part, what was instrumental in this office, will afterwards stick and adhere to the cutaneous filaments, until, by their addition, and the protrusion of proper nourishment, *ab interno*, to the same place, the waste is made up, that is, the ulcer is healed. Quincy.

After the like manner is the operation of *detergents* to be accounted for in external application. By the warmth of their parts they rarefy, and by their adhesive quality they join with, and take off along with them, in every dressing, what is thrown upon the place to which they are applied, until a more convenient matter is brought thither by the circulating juices, which they assist in adhering to, and incarnating the eroded cavities. Only this may be taken notice of, that internally, whatsoever of this kind is mixed with the animal fluids, by the known laws of circulation, will be first separated, and left behind; for all those parts which are specifically heaviest, will move nearest the axis of the canals, because their moments are the greatest, and will carry them, as near as can be, in straight lines; but the lighter parts will always be driven to the sides, where they soonest meet with outlets to get quite off, or are struck into such cavities as we are here speaking of, in which they adhere, and make part of the substance.

This is understood of the milder sort of *detergents*; and it is easy to conceive from hence, how an increase of those qualities of activity and adhesion conjoinly, may make a medicine arise to the greatest efficacy in this respect. And it is upon this foot that all those medicines operate which are given to cleanse obstructions, or foulnesses, in any of the *viscera*, or passages; and which may be increased in efficacy so far, as to fetch off even the membranes, and part of the capillary vessels.

Many *detergents* are of the genus of balsamics; and some only differ in their degree of subtility and efficacy, from what are called vulneraries.

The principal simples in this class are the leaves of wormwood, garlic, leeks, capers, scurvygrass, fumitory, liverwort, tansy, and vervain; bitter almonds, figs, jujebs, raisins, dates, juniper-berries; gum ammoniac, balsam of Capivi, balm of Gilead, tacamahaca; turpentines; barberries, liquorice, turmeric, madder, spermaceti, mummy, sulphur, salt, mercury, and native cinnabar. These the reader will find particularly described under their proper articles.

The pectoral *detergents* are the best of all medicines in the decline of an haemorrhage by the mouth, in which blood has been voided clear from the lungs; in this case they never fail to resolve any grumes that may remain in the part; and at the same time, wonderfully restore the due tone of the *viscera*. The most proper on this occasion are decoctions of daisy-leaves, ground-ivy, speedwell, and the small nettle, with powders of nitre, and dried goat's blood, and a mixture of an ounce of crab's eyes in a pint of white wine.

They are given in consumptions in many cases, and the most proper on this occasion are the saline ones, with the common absorbents, saturated with acids.

DETERIORATION, an act whereby a thing is impaired or rendered worse.

When the *deterioration* of a commodity, seized by an officer, arises from the fault of the keeper, he is answerable for the same.

J. Frederic Mayer, professor at Leipsic, printed a treatise of *deterioration*, in the year 1695, under the title of Tractatus de *Deterioratione*.

DETERMINATE *Number*. See NUMBER.

DETERMINATE *Problem*, is that which has but one, or at least but a certain number of solutions, in contradistinction to an indeterminate problem, which admits of infinite solutions.

Such, e. gr. is the problem, To describe an isosceles triangle on a given line, whose angles at the base shall be double that at the vertex; which has only one solution; as that which follows has two, viz. To find an isosceles triangle, whose area and perimeter are given.

A *determinate* problem may either be simple or linear, plane, solid, or surfolid.

DETERMINATION, in *Physics*, the disposition or tendency of a body towards one way, rather than another.

Heavy bodies have a *determination* towards the centre of the earth.

DETERMINATION is also used for the action whereby a cause or agent is limited, or restrained, to act, or not act, in this or in that manner.

Determinations, say the schoolmen, proceed either from an efficient cause; in which case the *determination* is called effective; as, when an artist determines an instrument to a certain action; or from the form, as that determines

termines the indifference of the matter; and thus our senses are said to be *determinations* to have ideas upon the presence of external objects.

Or the *determination* is from the matter or subject that receives the action; and thus the heating of fire upon clay *determines* it to harden, upon wax to soften, &c.

Or it is from the object; as when we say, colour *determines* the visual power: or, lastly, it is from the end, as the end *determines* the desire.

Determination, again, are either moral or physical. A *moral determination* is that proceeding from a cause which operates morally, i. e. by commanding, persuading, or advising, some effect. This is the only kind of influence or *determination*, which is consistent with man's free *moral* agency; or indeed with any *agency* at all.

Physical determination, is an act whereby God excites and applies a second cause to act, antecedently to all operation of the creature. Such a *determination* the Thomists and Dominicans maintain necessary to all the actions of every creature. The Jesuits, on the contrary, deny that God thus *determines* even second causes; and hold, that God exerts no influence on second causes, but only with the second cause on the action. And thus they exclude a physical *determination*, both from natural causes, as supposing them already *determined* by nature to act; for that there needs no other external *determination* from God to the several actions; and from free causes, as supposing such a predetermination contrary to our natural liberty.

A *determination* to be pleased with certain *forms*, or ideas, an ingenious author calls an *external fense*; and a *determination* to be pleased with virtuous actions, characters, manners, &c. a *moral sense*.

DETERMINATIVE *Proposition*, in *Logic*. See COMPLEX *Proposition*.

DETERRATION, from *de*, and *terra*, is used to signify a removal of the earth, sands, &c. from the mountains and higher grounds, down into the valleys and lower parts. This is occasioned by rains, which wash the earthy matter down by degrees; but this cannot be very considerable, or much raise the surface of the earth, as some have imagined, because a good part of it is sunk into the clefts and caverns of the rocks and mountains, a great quantity is borne down into rivers, and thence into the sea, and the richer and finer part help to compose the bodies of plants and vegetables.

DETERSIVES, in *Medicine*, the same with DETERGENT.

A clyster is a *detersive* medicine, which cleanses the lower venter. *Detersive* unguents are also called *mundificatives*. The leaves and summits of the strawberry are *detersive* and astringent.

DETERSOR, from *detergo*, *I shear away*, in *Antiquity*, a servant whose business it was to attend at dinner, and wipe the table. Finke.

DETERSORIUM, in *Antiquity*, a name given to the common wash, which was bean-meal, called *lomentum*, or the meal of a sort of pulse called *lupines*: this last they called *faucium*.

The ancients, when they bathed, used various washes for cleansing the skin; but *natron*, and this thin flour, called in Greek *aphronitron*, were most common.

DETINUE, a writ which lies against a man who, having goods, or chattels, delivered to keep, refuses to redeliver them.

Detinue answers, in great measure, to the *actio depositi* of the civilians. He takes his *action of detinue*, to recover the thing *detained*; not the damages sustained by the *detinue*. For this reason this action is seldom brought: actions of trover and conversion being used instead of actions of *detinue*.

DETINUE *of charters*. A man may have *detinue* for deeds and charters concerning land: but if they concern the freehold, it must be in C. B. and no other court. Action of *detinue* lies for charters which make the title of lands: and the heir may have *detinue* of charters, although he hath not the land. If my father be disseised, and dieth, I shall have *detinue* for the charters, notwithstanding I have not the land: but the executors shall not have the action for them. New Nat. Br. 308.

DETINUE *of goods in fraud marriage*, is on a divorce between a man and his wife; after which the wife shall have this writ of *detinue* for the goods given with her in marriage. Mich. 35 Eliz. 1. New Nat. Br. 308.

DETONATION, in *Chemistry*, the noise which some minerals, and other bodies, make, when they begin to heat in crucibles; by the volatile parts rushing out with impetuosity, and the humidity escaping.

The word is formed of *de*, and *tono*, *I thunder*.

Detonation is much the same with *decrepitation*; only its action is more forcible, and the noise is greater. Such are the explosions of gunpowder, fulminating gold, and fulminating powder: but as nitre is the cause of most explosions, the word *detonation* has been appropriated to the inflammation of the acid of this salt with bodies containing phlogiston; and it is frequently given to those inflammations of nitrous acid with sulphur, coals, and metals, which are not accompanied with explosion.

Detonation takes away the impure volatile sulphur from bodies.

DETONATION denotes the act, or operation, of expelling the impure, volatile, and sulphureous part, out of antimony, and leaving behind the fixed and internal parts. This is chiefly performed by means of saltpetre, &c. See ANTIMONY.

DETONATION *of nitre*, consists in the instantaneous inflammation and decomposition of the acid of nitre, when it immediately touches combustible bodies, the phlogiston of which is ignited, or when the acid is ignited. This is effected by applying the nitre to a red-hot combustible body, or by making the acid itself red-hot, and applying a combustible body to it in that state. During the *detonation*, a considerable smoke arises, containing no acid. See *Elements of nitre*. What remains in the crucible, after the nitrous acid is thus burnt, is the fixed alkali, which was the basis of the nitre. Mr. Macquer conjectures that the *detonation* of nitre cannot take place, unless a combination be previously formed between its acid and the phlogistion of the combustible substance used in the operation; that this combination is entirely similar to that of vitriolic acid with phlogiston, when sulphur is formed; and that, in the present instance, a nitrous sulphur is formed, infinitely more combustible than the vitriolic sulphur, and even so combustible, that it cannot exist an instant without being entirely burnt: and on this account, it is inflamed with extreme rapidity and violence as soon as it is formed. He alleges a number of facts to establish this conjecture; from which he also infers, that nitrous acid, whilst disengaged from any basis, is incapable of *detonation*; and that the strength or weakness of the *detonation* depends on the greater or less adhesion of the nitrous acid with its basis. He observes that there is a very considerable difference in the phenomena of their combustion, between the vitriolic and nitrous sulphur; the former burns very weakly; produces a flame which is very little luminous; requires for the continuance of its burning a constant supply of new air: and its acid undergoes no change by this combustion. Nitrous sulphur, on the contrary, appears incapable of existing an instant without burning; its vivid, dazzling flame, accompanied with noise, resembles the flame of a fire strongly actuated by a blast of air: it needs not the contact of external air; it burns with the same violence and rapidity in close vessels, no obstacle is capable of containing it; and if it be confined, it bursts with a terrible noise the sides of the containing vessels; and offers its combustion no sense is to be found of its *acid*. In order to account for this difference, he adopts the opinion of Stahl, who considers the nitrous acid as composed of a watery and an earthy principle, as well as all other acids; and besides these, of a third principle, which is phlogiston, in such a quantity as to assume all the properties, and particularly the inflammability, essential to its nature. Thus he accounts for the destruction or total decomposition of the acid in nitrous sulphur when it is inflamed. The explosion accompanying the *detonation* of nitre proceeds from a great and sudden dilatation of some very expansible body: this body Stahl and Macquer suppose to be the water of the nitre, or rather of its acid; which acquires in the operation the properties of air. But others, with greater reason, maintain, that this elastic fluid is not the water of the nitre rarefied and converted into air; because the water of the nitre is only rarefied by the heat of the deflagration, and is afterwards condensed by cold, forming the water called CLYSSUS *of nitre*. Besides, the elastic fluid thus produced is permanent, and not condensible into a liquid. Mr. Robins found, by accurate experiments, that the fluid produced by firing gunpowder, when confined within a space equal to that of the gunpowder which was fired and reduced to the heat of the atmosphere, was capable of sustaining a pressure equal to 244 times the pressure of the atmosphere; and that the elastic force of the fluid was increased probably about four times by the heat produced by the firing of the powder; and consequently, that it is thereby rendered superior to the violence of explosion, of sustaining a pressure nearly equal to a thousand times the pressure of the atmosphere. Dr. Priestley controverts the opinion advanced by Stahl, and adopted by Macquer and other chemists, that the nitrous acid is destroyed and utterly decomposed, in the process of *detonation*; he supposes, that, though the common properties of the acid, as combined with water, disappear, it is only in consequence of its combination with some earthy or inflammable matter, with which it forms some of the many species of air, into the composition of which this wonderful acid enters. Dict. of Chemistry. Robins's

New

New Principles of Gunnery, prop. 4. and 6, in his Tracts, vol. i. p. 68—72. Priestley's Exper. &c. on Air, vol. ii. p. 61.

DETRAHENS *quadratus*, in *Anatomy*, a name given by some authors, particularly Spigelius, to a muscle, called by the generality of anatomists the *platysma myodes*; and, by Albinus, *latissimus colli*. Douglas calls it also *quadratus genæ*.

DETRANCHE', among the *French Heralds*, signifies a line bending, which does not come from the very dexter angle, but either from some part of the upper edge, and thence falling athwart, or diagonally; or from part of the dexter side. They say, *tranché, retranché*, and *re-tranché*; to denote, that there are two diagonal lines, making two partitions in the escutcheon, and coming from the angles, and a third from some of the other parts above mentioned. See TRANCHÉ.

DEVASTAVIT, or DEVASTAVERUNT *bona testatoris*, is a writ that lies against executors or administrators, for paying debts upon simple contract and legacies, before debts on bonds and specialties, &c. for in this case they are as liable to action, as if they had squandered away the goods of the deceased, or converted them to their own use; and are compellable to pay such debts by specialty out of their own goods, to the value of what they so paid illegally. Dyer, 252. But if an executor pays debts upon simple contract, before he hath any notice of bonds, it is no *devastavit*; and regularly this notice is by an action commenced against him: for the law doth not oblige him to take notice of it himself, not of a judgment against his testator; because he is not privy to acts done either by or against him. 1 Mod. 175. 3 Lev. 115.

DEUCALION, in *Mythology*, was the son of Prometheus who married Pyrrha, the daughter of Epimetheus. Some have supposed that *Deucalion*, whom the Greeks have represented under a variety of characters, and concerning whom their poets have given many fabulous accounts, was the same with the patriarch Noah: and that *Deucalion*'s flood in Thessaly, as well as that of Ogyges in Attica, and of Prometheus in Egypt, were the same with that of Noah, recorded in Scripture. Diodorus Siculus expressly says, that in the deluge which happened in the time of *Deucalion*, almost all flesh died. Apollodorus having mentioned *Deucalion re-baptized, configned to an ark*, takes notice upon his quitting it, of his offering up an immediate sacrifice, *to Jupiter, to the god who delivered him*. As he was the father of all mankind, the ancients have given him great dignity and universal monarchy; though sometimes he is reduced to a petty king of Thessaly. Apollonius Rhodius makes him a native of Greece, and the son of Prometheus. We may learn, however, from their confused history, that the person represented was the first of men, through whom religious rites were renewed, cities built, and civil polity established in the world: none of which circumstances are applicable to any king of Greece. Philo assures us, that the Grecians call the person *Deucalion*, but the Chaldeans style him Noe, in whose time there happened the great eruption of waters. But as Lucian has given us the most particular history of the deluge, and that which comes nearest to the account given by Moses; and as he was a native of Samosata, a city of Commagene upon the Euphrates, a part of the world where memorials of the deluge were particularly preserved, and where an obvious reference to that history may be observed in the rites and worship of the country, we shall terminate this article with an extract of what he says on the subject.

Having described Noah under the name of *Deucalion*, he says, that the present race of mankind are different from those who first existed, for those of the antediluvian world were all destroyed. The present world is peopled from the sons of *Deucalion*; having increased to so great a number from one person. In respect to the former brood, they were men of violence, and lawless in their dealings. They regarded not oaths, nor observed the rites of hospitality, nor shewed mercy to those who sued for it. On this account they were doomed to destruction; and for this purpose there was a mighty eruption of waters from the earth, attended with heavy showers from above; so that the rivers swelled, and the sea overflowed, till the whole earth was covered with a flood, and all flesh drowned. *Deucalion* alone was preserved to re-people the world. This mercy was shewn to him on account of his justice and piety. His preservation was effected in this manner: he put all his family, both his sons and their wives, into a vast ark which he had provided, and he went into it himself. At the same time animals of every species, boars, horses, lions, serpents, whatever lived upon the face of the earth, followed him by pairs; all which he received into the ark, and experienced no evil from them; for there prevailed a wonderful harmony throughout by the immediate influence of the Deity. Thus were they wafted with him, as long as the flood endured.

After this he proceeds to mention that, upon the disappearing of the waters, *Deucalion* went forth from the ark, and raised an altar to God. Diod. Sic. lib. i. p. 10. Apollod. lib. i. p. 20. Apollon. Rhod. lib. iii. v. 1085. Philo Jud. de Præmio & Pœna, vol. ii. p. 412. Lucian de Dea Syria, vol. ii. p. 882.

Dr. Bryant produces a variety of monuments, that bear an obvious reference to the deluge, in the gentile history, besides this account of *Deucalion* and his flood. Analysis of Ancient Mythology, vol. ii. p. 193—250.

DEVENERUNT, a writ anciently directed to the escheator, on the death of the heir of a tenant of the king holding *in capite*, within age, and in the king's custody; commanding the escheator to enquire, upon the oaths of good and lawful men, what lands and tenements, by the death of the tenant, come to the king. This writ is now disused.

DEVEST, *Devestire*, in *Feudal Writers*, is used for the opposite to investing. *Investire* signifies *possessionem feudi tradere*. On the contrary, *devestire is possessionem auferre*. Feud. lib. i. c. 7. Covel.

DEVIATION, in the *Old Astronomy*, a motion of the deferent, or eccentric, whereby it advances to, or recedes from, the ecliptic. See DEFERENT.

The greatest *deviation* of a planet is equal to the inclination of its orbit to the plane of the ecliptic. See INCLINATION *of a planet*.

DEVICE, in *Painting*. See DEVISE.

DEVIL, *Diabolus*, an evil angel; one of those celestial spirits cast down from heaven, for pretending to equal himself with God.

The word is formed from the French *diable*, of the Latin *diabolus*, which comes from the Greek διαβολος, *accuser*, or *calumniator*; or from the ancient British *diefol*.

The Ethiopians paint the *devil* white, to be even with the Europeans, who paint him black. Ludolph.

We find no mention of the word *devil* in the Old Testament; but only of Satan: nor do we meet with the word *devils*, in any heathen authors, in the signification attached to it among Christians; that is, as a creature revolted from God: their theology went no farther than to evil genii, or dæmons, who harassed and persecuted mankind. Thus the Chaldeans believed both a good principle, and an evil principle, which was an enemy of mankind. See DÆMON, and DEMONIACS.

The relations we have of the religion of the Americans affuse us of some idolatrous nations, who worship the *devil*; but the term *devil* must not be here taken in the common sense: those people have an idea of two collateral independent beings; one whereof is good, and the other evil. And they place the earth under the guidance and direction of that evil being, which our authors, with some impropriety, call the *devil*.

DEVIL, *Sea*, *Diabolus marinus*, in *Ichthyology*, the name of an ugly and strangely ill shaped fish, of the ray kind. Its nose or snout is bifid, and runs out into two horns; and its sides are both terminated by thin fins: its skin toward the head is variegated with dusky spots. It grows to a very considerable size, being sometimes caught of six or seven feet length. Ray's Ichthyog. Append. p. 5. See *Tab. of Fish*, N° 6.

DEVIL *in a bush*, *Nigella*, in *Botany*. See FENNEL-*flower*.

DEVIL's *bit*. See SCABIOUS.

DEVIL's *bit*, *Yellow*, *Leontodon*. See DANDELION.

DEVINCTION, *Devinctio*, in *Antiquity*, was used to signify a love-charm or incantation to gain the affection of a person beloved.

It was done by tying knots, and differed little from what was called *obligatio*, or *catadesmus*. Virgil, in his eighth Eclogue, describes it thus:

Nodo tribus nodis ternos, Amarylli, colores
Necte, Amarylli, modo; & Veneris, dic, vincula necto.

DEVISE, or DEVICE, in *Heraldry*, a name common to all figures, ciphers, characters, rebuses, mottoes, &c. which by their allusion to the names of persons, or families, denote their qualities, nobility, or the like.

Devise, in this sense, is of a much older standing than heraldry itself; being that which gave the first rise to armories. Thus, the eagle was the *devise* of the Roman empire; S. P. Q. R. was the *devise* of the Roman people, and still continues to be what they call *the escutcheon of the city of Rome*.

The first *devises* were mere letters distributed on the borders of the liveries, housings, and banners, and at length on the shields. Thus the K was the *devise* of the French kings of the name of Charles, from Charles V. to Charles IX.

There were also *devises* by rebuses, equivocals, or allusions, both to names and arms. The dukes of Guise took

took for their *devise* an A in an O, to signify, *chacun A son tour*, every one in his turn: and the house of Senesai, *in virtute & honore senescit*: some, that had towers in their arms, *turris mea Deus*, &c.

There are also enigmatical *devises*: as that of the Golden Fleece, with *Autre n'aurai*; intimating, that Philip the Good, who instituted that order, renounced every other woman, but Isabella of Portugal, whom he then married. *Devises* sometimes contain entire proverbs: as that of Cæsar Borgia, *aut Cæsar, aut nihil*.

The word *devise* is formed from the Latin *dividere*, and was applied to the things just mentioned, as well as those hereafter mentioned; because they serve to divide, separate, and distinguish persons, parties, &c.

Father Menetrier observes, that there are as many different kinds of *devises*, as there are different manners of distinguishing one another, or as there are simple figures, or words, capable of expressing qualities, offices, virtues, actions, &c. of persons; and of notifying, or distinguishing them from others.

DEVISE is now taken, in a more restrained sense, for an emblem; or a representation of some natural body, with a motto, or sentence, applied in a figurative sense to the advantage of some person.

Father Bouhours gives an accurate explication of the word *devise*, in an extract inserted in the Memoires de Trevoux. A *devise*, says he, is a composition, or assemblage, of figures drawn from nature and art, called the *body*; and of a few words adapted to the figure called the *soul*: such a compound, adds he, we make use of to denote our thought, or intention, by comparison: for the essence of the *devise* consists in a comparison taken from nature, or art, and founded on a metaphor.

This he illustrates in the following instance: a young nobleman, of great courage and ambition, bore, for his *devise*, in the last carousal at the court of France, a rocket mounted in the air, with this Italian motto, *poco durri, purche m'innalzi; may I last but a short time, provided I mount high*: which may be explained thus; as the rocket rises a great pitch, though it only endures a little while, so it does not concern me to live long, provided I attain to glory and eminence: which is a just comparison.

On this footing, a *devise*, to define it rightly, is, a painted metaphor; or, rather, an enigma inverted: for, whereas enigmas represent nature, or art, by the events of history, and the adventures of fables; a *devise* is, a representation of human qualities by natural, or artificial bodies.

Thus, to express the character of Louis XIV. a sun was painted; which yet, luminous as it is, has more power than lustre: and the better to determine the sense of the painting to this signification, the Castilian motto is added; *Mas virtud que lum*. The personal merit of Mary, queen of Scots, was represented by a pomgranate, with these words; *Mon prix n'est pas de ma couronne*: and the talents of an apostolical person, who became all things to all men, by a looking-glass, with those words of St. Paul, *Omnibus omnia*.

Devises are used on coins, counters, seals, shields, triumphal arches, artificial fire-works, and other solemnities. They are a sort of images, very pertinently and artfully representing the enterprises and intrigues of war, love, piety, study, fortune, &c.

The French have distinguished themselves in this way, especially since the time of cardinal Mazarin, who had a wonderful fancy for *devises*.

The Italians have reduced the making of *devises* into an art, and laid down laws and rules for this purpose. Some of the principal are, 1. That there be nothing monstrous, or extravagant, in the figures; and nothing contrary to the nature of things, or to the common opinion of mankind. 2. That figures be not joined which have no affinity, or relation, to each other; the metaphor being to be founded on something real, and not on hazard, or imagination, excepting some whimsical combinations established in mythology, which custom, and the authority of the poets have made pass for natural. 3. That the human body be never taken into *devises*; as this would be to compare a man with himself. 4. That there be a sort of unity in the figures which compose the body: we do not mean, that there must only be a simple figure; but that, if there be several, they must have a relation and subordination to each other, so that there be one principal figure whereon all the rest depend: though still the fewer figures there are in the body of the *devise*, and the less they are confused, the more perfect and elegant is the *devise*. 5. The motto, which is to animate the figure, must agree so accurately thereto, as that it could not serve for any other. 6. Nothing is to be named that appears to the eye, and which the bare inspection might notify. 7. The motto is to have a complete sense of itself; for, being to make a compound with the figure it must only be a part, and, consequently, must not signify the whole. If the words alone have a complete signification, you have a full and distinct notion independently of the figure; whereas the signification should result from both. 8. The shorter the motto, the more beautiful: and a suspension of the sense, which leaves somewhat to guess, is one of the principal graces of the *devise*. Lastly, it is accounted a happiness, where the words of a poet are applied in a sense which he never dreamed of, and yet to pertinently, that it should seem they had been intended for the same.

DEVISE, or DEVISE, in *Common Law*, the act whereby a testator gives, or bequeaths, his lands, or goods, by his last will, in writing. Though, in strictness, a *devise* of goods is more properly termed a bequest.

He who makes the *devise*, is called the *devisor*; and he to whom it is made, the *devisee*.

The words of a will the law interprets in a larger, and more favourable sense, than those of a deed: for if land be *devised* to a man to have to him for ever, or to have to him, and his assigns; in those cases, the *devisee* shall have a fee-simple: yet if given in the same manner by feoffment, he shall have but an estate for life.

So, if one *devise* land to an infant in his mother's belly, it is a good and valid *devise*; though it is otherwise by feoffment, grant, or gift. For, in those cases, there ought to be one of ability to receive presently; otherwise it is void. See DEED, and WILL.

DEVISE, *Executory*. See EXECUTORY *devise*.

DEUNX, a division of the Roman libra, or pound, containing eleven ounces; or eleven twelfths of any thing. See AS.

DEVOIRS *of Calais*, in our *Old Statutes*, customs due to the king for merchandize brought to, or carried out of Calais, when our staple was there. 34 Edw. III. c. 18. and 2 Rich. II. cap. 1. c. 3.

Devoir is French, signifying *duty*.

DEVOLVED, something acquired by right of *devolution*.

Such a right is *devolved* to the crown: such an estate *devolved* on M—— by the death of N——.

The word is also used for a right, acquired by a superior, of conferring a benefice, when the inferior, and ordinary collator, has neglected to confer, or has conferred it on an unqualified person.

If a patron neglects to present a benefice in six months, the presentation lapses, or *devolves*, upon the bishop, from thence to the primate, and from thence to the king.

DEVOLUTION, in the *French Law*, a right acquired by descent, or succession, from degree to degree.

Devolution, in general, is an impediment provided by the customs of several provinces, whereby the husband who survives his wife, or the wife surviving her husband, is prohibited to alienate the real and immoveable effects of the deceased, and obliged to preserve them for the children issued from that marriage; so that they may succeed thereto in exclusion of those born of a second marriage.

DEVOTION, of *devote*, from *devoveo*, *I consecrate*, a sincere, ardent worship of God.

Monf. Juricu defines *devotion*, a softening and yielding heart, with an inward consolation, which the souls of believers feel in the exercises of piety.

Under the name of *devotions* are usually understood certain religious practices, which a person makes it a rule to discharge regularly; and with reason, if this exactitude be founded on solid piety; otherwise it is vanity, or superstition.

DEVOTION, among the Romans, was a sort of sacrifice, or ceremony, whereby they consecrated themselves to the service of some person.

The ancients had a notion, that the life of one might be redeemed by the death of another: and hence were those *devotions* so frequent for the lives of the emperors.

The *devotion* of Decius, who, after devoting himself to his country, threw himself into the hands of his enemies, and was killed, is said to have gained the Romans the victory.

But *devotion* to any particular person was not known till Augustus. The day after the title Augustus had been given Octavius, Pacuvius, a tribune of the people, began to say, he would devote and consecrate himself to him, as was practised among the barbarous nations, to obey him even at the expence of life, if he were commanded. His example was immediately followed by all the rest; and it came at length to be established into a custom, never to go to salute the emperor, without declaring, they were devoted to him. Augustus, though seeming to oppose this vile and infamous flattery, yet rewarded the author.

Cornelius Nepos uses the word *devotion* for a kind of punishment, consisting of direful curses and marks of infamy. See ACCURSED, and EXECRATION.

DEVOURING, in *Heraldry*. When fishes are borne in an

an escutcheon, in a feeding posture, the heralds denominate it *devouring*; because fishes swallow all their food whole.

DEUTEROCANONICAL, in the *School Theology*, an appellation given to certain books of Holy Scripture, which were added to the canon after the rest; either because they were not wrote till after the compilation of the canon, or because of some disputes as to their canonical authority.

The word is Greek; being compounded of δευτερος, *second*, and κανονικος, *canonical*.

The Jews, it is certain, acknowledge several books in their canon, which were put there later than the rest. They say, that, under Ezra, a great assembly of their doctors, which they call, by way of eminence, the *great synagogue*, made the collection of the sacred books, which we now have in the Hebrew Old Testament: and they agree, that they put books therein which had not been so before the Babylonish captivity. Such are those of Daniel, Ezekiel, Haggai, &c. and those of Ezra and Nehemiah.

And the Romish church has since added others to the canon, that were not, nor could be, in the canon of the Jews; because some of them were not composed till after the canon was formed. Such is the book of Ecclesiasticus; with several of the apocryphal books, as that of the Maccabees, Wisdom, &c. Others were added still later, because their canonical authority had not been yet examined; and, till such examen, and judgment, they might be set aside, at pleasure.

But since that church has pronounced as to the canonical authority of those books, there is no more room now for her members to doubt of them than there was for the Jews to doubt of those of the canon of Ezra: and the *deutero-canonical* books are, with them, as canonical as the proto-canonical; the only difference between them consisting in this, that the canonical authority of the one was not generally known, examined, and settled, so soon as that of the others.

The *deutero-canonical* books, in the modern canon, are, the book of Esther, either the whole, or at least the seven last chapters of it; the Epistle to the Hebrews; that of James; and that of Jude; the second of St. Peter; the second and third of St. John; and the Revelation. The *deutero-canonical* parts of books are, the hymn of the three children; the prayer of Azariah; the histories of Susanna, of Bel and the dragon; the last chapter of St. Mark; the bloody sweat, and the appearance of the angel, related in St. Luke, chap. xxii. and the history of the adulterous woman in St. John, chap. viii. See CANON.

DEUTERONOMY, one of the sacred books of the Old Testament; being the fifth book of the LAW, and the last of those written by Moses; closing, according to the computation of Usher, the history of 2552 years, from the beginning of the world to the death of Moses.

The word is Greek; compounded of δευτερος, *second*, and νομος, *law*.

It does not appear that Moses made any division of what he wrote, into books; or that he gave different names and titles to the different parts of his work; nor do the Jews, even at this day, distinguish them in the copies they use in the synagogues, but write them all running as one single work, without any other distinction beside that of little and great parashcas. It is true, in the other copies, used by private persons, they are divided into five parts, as among us; but they give them no other name, but the first word wherewith each division begins; much as we do in quoting a decree, or chapter, of the canon law.

Thus, the first part of Moses's work they call בראשית *Bereschit*, because beginning with that word; the second they call ואלה שמות *Veelleh Schemoth*; the third, ויקרא *Vaiyikra*; the fourth, וידבר *Vajiedabber*; and the fifth, הדברים אלה *Elleh Haddeborim*; which is one of the first words thereof. This custom is very ancient among the rabbins, as appears from the ancient commentaries on those books, called בראשית רבה *Bereschit Rabba*, ואלה שמות רבה *Veelleh Schemoth Rabba*, &c. and from the *Prologus galeatus* of St. Jerom. The Greeks, when they first translated the law, gave the five parts, into which it was divided, the names of Genesis, Exodus, Leviticus, Numbers, and *Deuteronomy*. Accordingly, the names are Greek, excepting that of Leviticus, which is Hebrew; and they express what is contained in those books, or at least the most remarkable things contained therein: which is the usual Greek manner of giving titles.

The book of *Deuteronomy* was so called, because this last part of the work of Moses comprehends a repetition, or recapitulation, which that legislator made to the Israelites, before his death, of the law he had before delivered to them at large: and hence *Deuteronomy* is still called, by the rabbins, משנה *Mischneh*, *repetition*; משנה תורה *Repetition of the law*, *second law*: they likewise call it ספר תוכחות *the Books of Reprimands*; on account of the twenty-eighth chapter, which is full of blessings, promised to such as keep the law; and of curses, threatened to such as transgress it.

The book of *Deuteronomy* was written in the fortieth year after the delivery from Egypt, in the country of the Moabites beyond Jordan; Moses being then in the 120th year of his age. It contains, in Hebrew, eleven parashes, though only ten in the editions of the rabbins at Venice; twenty chapters, and 955 verses. In the Greek, Latin, and other versions, it contains thirty-four chapters: the last was not written by Moses. Some say, it was added by Joshua, immediately after Moses's death: others will have it added by Ezra, which is the most probable opinion; who likewise made some interpolations in the book itself, as chap. ii. ver. 12. chap. iii. 11, and 14.

DEUTEROPOTMI, Δευτεροποτμοι, from δευτερος, *secundus*, and ποτος, *fortuna*, or *mors*, among the Athenians, a designation given to such who had been thought dead, and, after the celebration of the funeral rites, unexpectedly recovered. It was unlawful for the *deuteropotmi* to enter into the temple of the Eumenides, or to be admitted to the holy rites, till after they were purified by being let through the lap of a woman's gown, that they might seem to be new born. Pott. Archæol. Græc tom. 1. lib. ii. cap. 4. p. 223.

DEUTEROSIS, the Greek name by which the Jews called their MISCHNA, or second law. *Deuterosis* in Greek has the same signification almost as *mischna* in Hebrew; both signify an iteration. Eusebius accuses the Jews with corrupting the true sense of Scripture with the trifling explanations of their *deuterosis*. Calmet, Dict. Bibl. in voc.

DEVUIDER, in the *Manege*, is applied to a horse, that upon working upon *volts* make his shoulders go too fast for the croupe to follow; so that instead of going upon two treads, as he ought, he endeavours to go only upon one. This comes from the resistance he makes in defending against the heels; or from the fault of the horseman, who is too hasty with his hand. See HASTE.

DEW, *ros*, a thin, light, insensible mist, or rain, ascending with a slow motion, and falling while the sun is below the horizon.

Casaubon derives the word from the Greek δευω, *I moisten*.

Naturalists usually rank *dew* among the number of meteors of the watery kind. Some define it a vapour liquified, and let fall in drops; others, a vapour having a like relation to frost, as rain has to snow, &c. Among the dissertations of Mons. Huet, is a letter to shew that *dew* does not fall, but rises. M. Gersten likewise adopted the same opinion. To us, *dew* appears only to differ from rain as more, and less. Its origin, and matter, no doubt, is from the vapours, and exhalations of the earth and water, raised as shewn under the article EVAPORATION, where the theory of its ascent and precipitation is particularly explained.

M. du Fay made several experiments, first with glasses, and then with pieces of cloth, fastened to two ladders, joined at top, and spreading wide at bottom, and reaching about thirty-two feet high, in order to evince the ascent of *dew*; and he found that the lower bodies, with their under surfaces, were wetted before those that were placed higher, or their upper surfaces. Both M. du Fay, and M. Muschenbroeck, exposed several different substances to the same *dew*, and found that they received and charged themselves with it in a very different manner; some more, others less, and some even not at all. The drops affixed themselves, by a kind of election, to glass and crystals, but not to metals. Mercury was exposed in a china plate; and the *dew* run in streams on the edges of the plate, while the least drop did not appear on the mercury. Muschenbroeck has observed, that bodies of different colours attract the *dew* differently, and that this difference of attractive force depends on the structure and size of the coloured bodies. Mem. Acad. Sc. 1736. and Muschenbroek, &c. ubi infra.

From the principles proposed and illustrated, under the article EVAPORATION, the several phenomena of *dews* are easily accounted for. Hence, e. gr. it is, that *dews* are more copious in the spring, than in the other seasons; there being then a greater stock of vapour in readiness, through the small expence thereof in the winter's cold and frost, than at other times. Hence, what Pliny relates of Egypt, that it abounds in *dews* throughout all the heats of summer; for the air there being too hot to constipate the vapours in the day-time, they never gather into clouds, and hence they have no rain; but we know,

that in climates where the days are exceſſive hot, the nights are remarkably cold; ſo that the vapours raiſed after ſun-ſet are readily condenſed into *dews*.

The quantity and quality of the aſcending *dew* in particular places depend on a variety of circumſtances, as the ſituation, the nature of the ſoil, the ſtate of the air, and the ſeaſon of the year. Chemiſts, in analyſing it, have found that it is a kind of chaos of various ſubſtances: ſome *dew* has afforded a liquor, by diſtillation, which ſtruck the colours of the rainbow on glaſs, ſo ſtrong as not to be affected by friction, alkaline lixiviums, or aqua regia: it alſo burnt like ſpirits of wine. Other diſtilled *dews*, having been digeſted with a gentle heat for eight days, and then rectified ſix times over, till it was exceeding ſubtile, is ſaid to have broke three glaſſes ſucceſſively; though it ſtill remained perfectly inſipid. It is natural to conclude, from the different ſubſtances which are combined with *dew*, that it muſt be either ſalutary or injurious both to plants and animals.

It is not eaſy to aſcertain the quantity of *dew* that ariſes every night, or in the whole year, becauſe of the winds which diſperſe it, the rains which carry it down, and other inconveniencies: but it ries in greater abundance after rain than after dry weather, and in warm countries than in cold. There are ſome places in which *dew* is obſerved only to aſcend, and not to fall; and others in which it is carried upwards in greater plenty than downwards, being diſperſed by the winds.

Dr. Hales made ſome experiments, in order to determine the quantity of *dew* that falls in the night; for this purpoſe, Aug. 15. 7 P. M. he filled two glaſs earthen pans, three inches deep and twelve inches diameter in ſurface, with moiſt earth: and he obſerves, that the moiſter the earth, the more *dew* falls on it in a night; and that more than a double quantity of *dew* falls on a ſurface of water, than on an equal ſurface of moiſt earth. Theſe pans increaſed in weight by the night's *dew*, 180 grains; and decreaſed in weight by the evaporation of the day, 1 ounce, 282 grains: ſo that 540 grains more are evaporated from the earth every 24 hours in ſummer, than the *dew* that falls in the night; i. e. in 21 days near 26 ounces from a circular area of a foot diameter. If 180 grains of *dew*, falling in a night on ſuch an area, which is equal to 113 ſquare inches, be equally ſpread on the ſurface, its depth will be $\frac{180}{113 \times 254}$, th part of an inch. He likewiſe found the depth of *dew* in a winter's night to be the th part of an inch. If therefore we allow 159 nights for the extent of the ſummer's *dew*, it will in that time ariſe to one inch depth; and reckoning the remaining 206 nights for the extent of the winter's *dew*, it will produce 2,28 inches depth; and the *dew* of the whole year will amount to 3,28 inches depth. But the quantity, which evaporated in a fair ſummer's day from the ſame ſurface, being 1 ounce and 282 grains, gives th part of an inch depth for evaporation, which is four times as much as fell at night. Dr. Hales obſerves that the evaporation of a winter's day is nearly the ſame as in a ſummer's day; the earth's greater moiſture in winter anſwering to the ſun's greater heat in ſummer. Hales's Vegetable Statics, vol. i. p. 52, &c. ed. 4th. See EVAPORATION.

Signior Beccaria made ſeveral experiments to demonſtrate the exiſtence of the electricity that is produced by *dew*. He obſerves in general, that ſuch electricity took place in clear and dry weather, during which no ſtrong wind prevailed; and that it depends on the quantity of the *dew*, as the electricity of the rain depends on the quantity of rain. He has ſometimes found it to begin before ſun-ſet; at other times not till eleven o'clock at night. Artificial Electricity, Eng. ed. Appendix, Letter iii. p. 466.

The *dew* of plants is probably only the moiſture that continually exhales through the orifices of their veſſels, and not a vapour collected by their leaves: for this *dew* is expired by each plant, according to the peculiar ſtructure of its veſſels, and the ſituation of their orifices. Plants likewiſe that have been ſhut up in veſſels, and covered by glaſſes, have collected a greater quantity of *dew* in the night, than thoſe that ſtood in the open air; and farther the drops are gathered in thoſe parts, where the orifices of the veſſels are manifeſtly open, and not all over the leaves, and not in the upper or lower leaves only, which would be the caſe if they aroſe from ambient vapour, but in all the leaves, without diſtinction. The oily or honey *dew*, which is ſometimes exhaled in ſummer by trees and herbs, and which has been found to ſettle on the oak, aſh, &c. is of this kind. Muſchenbroeck Introd. ad Philoſ. Nat. vol. ii. p. 987. 995. ed. 1772. See *Perſpiration of* PLANTS.

Subſtances of a very different kind from the uſual and natural manner of the *dew*, have ſometimes fallen in that form. Our Philoſophical Tranſactions give an account, that in the year 1695, there fell in Ireland, in ſeveral parts of the provinces of Leinſter and Munſter, for a conſiderable part of the winter and ſpring, a fatty ſubſtance, reſembling butter, inſtead of the common *dew*; it was of a clammy texture, and dark yellow colour; and was, from its great reſemblance, generally called *dew-butter* by the country people. It always fell in the night, and chiefly in the moiſtiſh low grounds, and was found hanging on the tops of the graſs, and on the thatch of the houſes of the poor people. It was ſeldom obſerved to fall twice in the ſame place, and uſually wherever it fell it lay a fortnight upon the ground before it changed colour, but after that it gradually dried up, and became black. The cattle fed in the fields where it lay as well as in others, and received no hurt from it: it fell in pieces of the bigneſs of one's finger-end, but they were diſperſed ſcatteringly about, and it had an offenſive ſmell, like that of a church-yard. There were in the ſame places very ſtinking fogs during the winter, and ſome people ſuppoſed this no other than a ſediment or collection of the heavier matter of thoſe fogs. It would not keep very long, but it never bred worms. The country people willing to have ſome good of it, tried it on their children's ſore heads, and it always cured them. Phil. Tranſ. N° 220. p. 272.

DEW, *cryſtalline*, a term uſed by ſome modern writers, to expreſs certain *dews*, or ſteams; which, in their fall upon the earth, become, as they ſay, cryſtal.

Whatever the cryſtals are, which authors ſeem to ſuppoſe to have been generated in this manner, it is very certain that they have in reality another origin; and theſe are only the accounts of ignorant and inconſiderate people. Phil. Tranſ. N° 220.

DEW, *May*. The dew that falls in the beginning of ſummer, particularly in this month, has great virtues attributed to it by many authors, when newly gathered and clean filtered. It is not of a watery appearance, or colourleſs, but is yellowiſh, and much reſembles the urine of a healthful perſon. It is uſed for whitening linen and wax. The common methods of putrefying water have no effect on *this*. Several quantities of it have been placed in digeſtion with different degrees of heat, from that of dung to that of a ſand-furnace, but no putrefaction was brought on it, though continued two months together; the heat, in whatever degree, ſerving to purify it, not to hurt it. The ſummer-ſun, for all the hot months together, has no more effect on it. It only ſends out a green vegetable matter of the conferva kind, which floats on the ſurface, and adheres to the ſides of the veſſel, and the whole quantity of the liquor remains as pure as before.

Though theſe common methods of putrefaction do not take place in this fluid, a much more ſimple proceſs will. If a quantity of it be put into an open wooden veſſel, and ſet in a cool ſhady place, with a canvas ſtretched over it to keep out duſt and inſects, it will in three or four weeks putrefy and ſtink, and depoſit a large quantity of a black and thick mud. The manner of the formation of this ſediment is this; a ſmall quantity of a foul matter firſt ſeparates itſelf from the liquor, and floats at the top in form of a ſkin or film; this ſoon after precipitates itſelf to the bottom, and another ſucceeds in its place at the top, which is ſoon after precipitated in the ſame manner. Thus the mud is a congeries of theſe films one on another. If a quantity of *dew* be put into a long and narrow glaſs veſſel, theſe films, inſtead of ſinking as ſoon as formed, will combine one with another at the top, and form a thick ſcum, which may be taken off with a ſpoon, and is very different from the black mud, ſeparated to the bottom in the former experiment, being a white and thick ſlime: if a quantity of this be put into a drinking-glaſs, or other ſuch veſſel, and the water drained from it, it will ſomewhat ſhrink in twelve hours ſtanding, and will become ſo ſolid as to take the form of the glaſs, and may be ſhook out; it then reſembles a lump of boiled white ſtarch, but is ſomewhat more tranſparent.

We have, in the Philoſophical Tranſactions, very odd accounts of productions of the animal kingdom, in the ſame *dew*; which might puzzle any one not verſed in experiments of this kind with other fluids. In one of the veſſels of this *dew* were found millepedes, differing from the common kind in ſome particulars; theſe were the common water millepedes: and in another, a quantity of green matter, probably a conferva, with numerous eulæ of inſects inhabiting it; for in a few days there were produced from this a vaſt number of flies. Another quantity of the *dew*, ſet in an open glaſs, was found after ſome days filled with the eulæ of the common gnat, and the flies were hatched from theſe. Phil. Tranſ. N° 3.

It is eaſy for a bad philoſopher to infer from theſe accounts

counts the equivocal generation of theſe creatures in the water; but the inſight we have had into the wonders of nature in the inſect world are ſuch, that at preſent we know their generation to be in many ſpecies, particularly in the gnat and fly kinds, from the eggs of their parents depoſited in water, or any watery fluids, and that common diſh-water will at any time do what the *dew* does in this experiment.

There is a ſpirit drawn from *May dew*, which has wonderful virtues attributed to it. The method of collecting and preparing it is preſcribed by Hanneman, phyſician at Kiel. The *dew* is to be gathered in clean linen cloths, expoſed to the ſun in cloſe phials; then diſtilled, and the ſpirit thrown upon the caput mortuum; this is to be repeated till the earth unite with the ſpirit, and become liquid; which happens about the ſeventh or eighth cohobation, or diſtillation. By ſuch means you gain a very red odoriferous ſpirit. Stolterfoht, a phyſician of Lubec, thinks *May dew* ſhould be gathered in glaſs plates, eſpecially in ſtill weather, and before ſun riſe. And Ettmuller is of the ſame opinion. It might likewiſe be collected with a glaſs funnel, expoſed to the air, having a crooked neck to bring the *dew* into a phial in a chamber. See Phil. Tranſ. N°3. Hoffman, and others.

It is apparently from the preparation of this *dew*, that the brothers of the Roſycroſs took their denomination.

DEW, in *Chemiſtry*, a name formerly given to the phlegm that roſe firſt in the diſtillation of ſeveral ſubſtances. Thus, the *dew* of vitriol, and the *dew* of honey, were watery liquors, which roſe firſt when theſe ſubſtances were diſtilled.

DEW, *orange*. See ORANGE.

DEW, *ſun*. See SUN-*dew*.

DEW, *earth of*. See EARTH.

DEW-*horn*, in the *Management of Cattle*, an exceſſive ſwelling of the body, proceeding from the greedineſs of a beaſt to feed, when put into rank paſture.

This ſwelling is often ſo great that the creature runs the utmoſt hazard of burſting; in which caſe it ſhould be made to ſtir much, and purge well; but the proper cure is to bleed the creature in the tail, then putting a nutmeg into an egg, to thruſt it down the creature's throat, ſhell and all; after which, by walking him up and down, he will ſoon recover.

DEW-*lap*, the fleſh that hangs down from the throat of oxen.

DEWBERRY-*bush*. See RASPBERRY.

DEX, a name uſed by many Greek writers, for a worm or maggot, hatched of the egg of a beetle, and remarkable for its eroding wood. It is alſo called thrips and enxylon. The old Greeks uſed the pieces of wood eroded by it in various directions as ſeals. See THRIPS.

DEXTANS, in *Antiquity*. See AS.

DEXTER, in *Heraldry*, is applied to the *right* ſide, as *ſiniſter* is to the *left*.

DEXTER-*baſe*, is the right ſide of the baſe.

DEXTER-*chief*, the angle on the right hand of the chief.

DEXTER-*point*. See POINT.

The word is pure Latin, ſignifying right-handed; whence the word *dexterity* for addreſs and ability in the performing of any thing.

DEXTRARIUS, is underſtood of one who takes the right-hand of another; and the word *dextrarii* has been uſed for light horſes, or horſes for the great ſaddle; from the French *deſtrier*, a horſe for ſervice.

DEXTROCHERE, or DESTROCHERE, in *Heraldry*, is applied to the right-arm, painted in a ſhield, ſometimes naked, ſometimes clothed, or adorned with a bracelet, and ſometimes armed, or holding ſome moveable, or member uſed in the arms.

The word is formed from the Latin *dextrocherium*, which ſignifies a bracelet worn on the right wriſt, mentioned in the Acts of the Martyrdom of St. Agnes, and the Life of the Emperor Maximus.

The *dextrochere* is ſometimes placed as the creſt.

DEY, the title of the ſovereign of Algiers, under the protection of the grand ſeignior. A prince under this title was appointed by the ſultan, at the requeſt of the Turkiſh ſoldiers, in the year 1710. The term *dey*, in the Turkiſh language, ſignifies *an uncle* by the mother's ſide; and the reaſon of the denomination is this; that the Turkiſh military conſider the grand ſeignior as their father, the republic as their mother, by which they are nouriſhed and maintained, and the *dey* as the brother of the republic, and conſequently the uncle of all who are under his dominion. Beſides the age, experience, and valour, which are neceſſary qualifications of a perſon to be elected, he muſt alſo be a native Turk, and have made the voyage to Mecca. He has no guards, nor conſiderable retinue; he preſides at the divan, and is moſt diſtinguiſhed by the reſpect and ſubmiſſion which are paid him.

DIA, *Δια*, the beginning of divers terms in medicine, chirurgery, pharmacy, &c. Where theſe three letters commence the name of a remedy, unguent, plaiſter, cataplaſm, &c. they ſignify compoſition and mixture; as in *diapajma*, *diecbylon*, &c.

DIA is likewiſe the beginning of many terms in the other arts: as, *diameter*, *dialogue*, &c. on all which occaſions, *dia*, which is an inſeparable particle, or prepoſition, is borrowed from the Greek *δια*, *εν*, or *εκ*; which begins the ſame words in the Greek.

Indeed we have words wherein *dia* is no prepoſition borrowed from a foreign language; though it is poſſible, the words themſelves may: as in *diamond*, *dial*, &c.

DIA, in *Mythology*, a goddeſs among the Romans, probably the ſame with CYBELE.

DIABATHRA, in *Antiquity*, a kind of ſhoe worn by the Grecian women. Pitiſc. Lex. Ant. in voc.

DIABE, in *Ichthyology*, the name of a prickly-ſcaled fiſh of the orbis or globe-fiſh kind, and in all things reſembling the briſtix or porcupine-fiſh, except that its ſpines or prickles are all fixed into its ſkin by three inſertions.

DIABETES, *Διαβητης*, in *Medicine*, a haſty and profuſe evacuation of the drink by the urinary paſſages, accompanied with an ardent thirſt, and leanneſs of the whole body.

The word is derived from the Greek *διαβαινειν*, *to pervade*, or *paſs quick*.

The drink, thus diſcharged, is uſually a little altered from what it was when taken down, and turned chylous, and milky; but ſometimes not at all.

The *diabetes* ſeems owing to a too great laxity of the fibres of the arteries of the kidneys; or too great a quantity of ſharp ſalts in the blood, which diſſolve the maſs of blood, or diſunite the parts thereof, ſo that the ſerofity is eaſily ſeparated from the thicker parts.

According to Quincy, the evident, and moſt common cauſe of the *diabetes* is the too great uſe of ſpirituous liquors, wherewith the ſerum becomes ſo impregnated, that it will not attract, and join with the cruor, or globules of the blood, but runs off through the kidneys, ſweet or inſipid.

It happens moſt frequently to thoſe who, without due exerciſe, indulge themſelves with drinking vinous liquors, and then quench their thirſt ariſing from thence by too great a quantity of ſuch as are cooling.

In this diſeaſe the urine is thin and pellucid, and has no ſediment, and is of a *ſweetiſh* taſte; though caſes have occurred, in which it has not had this taſte; the quantity voided is always very great; and if the patients endeavour to retain it, they are afflicted with ſwellings about the loins, and a ſenſation of weight and preſſure in the hypochondria. It is attended with thirſt, a hectic heat, a weak but quick pulſe, and a gradual waſting of the fleſh.

Perſons ſubject to the diabetes. It is a very rare diſeaſe, and ſeems to have been ſo in other ages as well as in later times. Galen expreſſly ſays, that he never met with more than two perſons who had it; the people affected with it are uſually ſuch as have diſorders of the viſcera in general; and it is often but a ſymptomatic affection, ariſing from an improper treatment of perſons in fevers.

Prognoſtication it. It is always a very terrible diſeaſe, but the longer ſtanding it is of, the more difficult it is to be cured; it is not, however, ſuddenly of fatal conſequence, but the people uſually live ſome time with it, though they in the end generally die tabid, after having been afflicted with it for a length of time.

Method of cure. The infarctions of the viſcera, which are the occaſion of this, are firſt to be regarded, and are to be attacked with ſuch aperients as are not ſtrongly diuretic; of this kind are decoctions of the roots of dandelion, ſuccory, polypody, and the like, and of the capillary herbs. Pills alſo are to be taken, made of ammoniacum, and the other reſolvent gums, with the bitter extracts; and interchangeably with theſe the digeſtive neutral ſalts, ſuch as tartarum vitriolatum, and the like. During this courſe, the febrile heat, which always attends this diſtemper, is to be taken off by the vegetable acids, ſuch as ſorrel and purſlain, and tincture of roſes made in the uſual way. Some recommend the teſtaceous powders, in general; and others are peculiarly laviſh in the praiſes of craw-fiſh, reduced to powder whole, after baking them in an oven. The great diſcharge of urine is to be leſſened, in the mean time, by gentle laxatives now and then given, ſuch as infuſions of ſena, rhubarb, and the like; and finally, if the diſeaſe goes off, or remits conſiderably of its violence, the chalybeates, and other reſtoratives, are to be given, to reſtore the parts to their due ſtate. It is a common error to give aſtringents in a *diabetes*; for, if they take effect, they too violently conſtringe the viſcera, and bring on pains and ſwellings in the loins, and not rarely an aſcites and death itſelf in the end.

Perſons ſubject to this diſeaſe ſhould be extremely careful

ful of themſelves in their regimen; they ſhould avoid all hot things, and beware of themſelves that they do not fall into violent paſſions; they ſhould feed principally on emulſive and gelatinous diet, to make up for the waſte of fleſh that always attends this diſeaſe. Junker's Conſp. Med. p. 540.

The bark, lime-water, Briſtol-water, and antimonials combined with the *tinctura thebaica*, have been recommended and uſed for the cure of this diſorder. Moderate exerciſe, and friction of the body are uſeful.

Dr. Morgan thinks the tincture of cantharides may almoſt be abſolutely depended on for ſtopping the immediate flow of urine in the *diabetes*. The way he prepares his tincture is, by infuſing half an ounce of cantharides upon a pound of the elixir vitrioli; of which tincture, from fifteen to thirty or forty drops, may be given twice or thrice a day in Briſtol hot-well water. Mechan. Pract. of Phyſ. p. 114.

Dr. Jurin found the chalybeate waters acidulated with the oil of ſulphur, very ſucceſsful in this diſtemper. Med. Eſſ. Edinb. abr. vol. ii. p. 469.

Alum-poſſet drink is alſo ſaid to be an effectual cure for a *diabetes*. Ibid.

According to Dr. Mead, the *diabetes* is a diſeaſe of the liver, and not of the ſecretory veſſels of the kidneys, as has been generally thought. See Monit. & Pract. Medic. cap. ix. ſect. 2. and Mechanic Account of Poiſons, Eſſay 1. ed. 4.

The doctor recommends the following medicine as efficacious in this diſtemper: take four pints of milk, boil it a little, and turn it with three drachms of alum; four ounces of this ſhould be taken three times a day at leaſt.

Dr. Brocklesby attributes great efficacy, in a caſe where he was concerned, to alum whey, made by boiling from fifty to thirty grains of powdered roche alum, in a ſufficient quantity of new milk from the cow, to afford a full pint of whey; half of which was drunk by the patient every night and morning, for ſix weeks. Med. Obſ. vol. iii. p. 279.

Dr. Dobſon, of Liverpool, made ſeveral experiments, in order to aſcertain the nature of this diſeaſe; and he conſiders it as a ſpecies of imperfect digeſtion or aſſimilation, and to be more a diſeaſe of the ſyſtem in general, than either of the liver or kidneys. On this ſyſtem he accounts for the different taſte of the urine in different ſubjects, the emaciating effects of this diſeaſe, the acid ſweats, and the ſenſation of hunger that attend it. From hence he infers, that the obvious indications of cure, are to ſtrengthen the digeſtive powers, to promote a due ſanguification, and to eſtabliſh a perfect aſſimilation through the whole œconomy. Med. Obſ. vol. v. art. 27.

There is another kind of *diabetes*, wherein the perſon affected renders a great deal more by urine than he drinks, nay, ſometimes more than he both eats and drinks. Some phyſicians attribute this exceſſive quantity of liquor to the air he reſpires, which, they ſuppoſe, becomes converted into water; or, at leaſt, the water in the air reſpired is here abſorbed, and collected. But others, with more probability, attribute it to a colliquation of the blood, fat, and even the ſolid parts of the body.

DIABETES, in *Hydraulics*, is applied to a ſiphon, the two legs or branches whereof are incloſed in one another; as in the glaſs deſcribed by Hero, which runs itſelf quite empty, without being inverted, as ſoon as the water is arrived at the height of the upper branch of the ſiphon.

DIABOLUS *marinus*. See *Sea*-DEVIL.

DIABOTANUM, from διὰ and βοτανη, *herb*, in *Pharmacy* and *Chirurgery*, denotes a plaſter of herbs, wherewith wens, &c. are reſolved and diſcuſſed. The *diabotanum* is ſovereign for the hydatides.

DIABROSIS, in *Medicine*, a ſolution of the continuity of a part, cauſed by ſharp, corroſive humours, gnawing and devouring the ſame.

The word is Greek, compounded of διὰ, *per*, *through*, and βρωσις, *to eat*.

DIACARTHAMI, in *Pharmacy*, an electary compoſed, of turbith, manna, ſcammony, hermodactyls, and other purgatives; with the addition of the pulp of the ſeed of the *carthamus*, which gives it the denomination.

Diacarthami chiefly purges *pituita*. It was formerly preſcribed in diſeaſes of the brain, and frequently mixed in medicines along with other purgatives, but is now wholly out of uſe.

DIACARYON, or DIANUCUM, in *Pharmacy*. See DIANUCUM.

The word is formed from διὰ, and καρυον, *walnut*.

Galen is ſaid to have prepared his *diacaryon* with the juice of walnuts, mixed with as much honey as ſufficed to render it an agreeable compoſition.

DIACAUSTIC *curve*, or *cauſtic* by REFRACTION, is a ſpecies of cauſtic curves, whoſe geneſis may be thus conceived.

Imagine an infinite number of *rays*, as B A, B M, B D, &c. (*Tab. Geom. fig.* 20.) iſſuing from the ſame luminous point, B, to be refracted from or to the perpendicular M C, in the curve A M D; and ſo as that C E, the ſines of the angles of incidence C M E be always to C G, the ſines of the refracted angles C M G, in a given ratio: then the curve line, which touches all the refracted rays, is called the *diacauſtic*.

DIACELTATESSON, in *Chemiſtry*, a name given by Van Helmont, to a purging preparation, procured from the fixed flowers of antimony, in the following manner: take eighteen grains of the fixed diaphoretic flowers of antimony, fifteen grains of reſin of ſcammony, and ſeven grains of cream of tartar, make altogether into a powder. Or take nine grains of the fixed antimony, nine grains of reſin of ſcammony, and three grains of cream of tartar; make them into a fine powder. The former is the largeſt doſe for a grown perſon, and the latter the leaſt; they are to be taken without any acid; and if they operate too violently, the violence may be ſtopped by taking any thing acid: it is to be given in intermittents, ſo as to finiſh its operation immediately before the coming on of the fit: it is ſaid by the author always to cure quartans before the fourth doſe, and all intermittent and continued fevers.

Boerhaave obſerves, that he had often given it with good effects, but never with that great ſucceſs which the author aſcribes to it; who ſays, that it radically cures the gout and fevers, heals ulcers of the larynx, œſophagus, and bladder, and purges the body when in perfect health, but not otherwiſe. This candid writer obſerves, that Helmont ſeems always to have carried the virtues of his medicines by a ſubtilty of reaſoning, beyond what will be found warrantable of them from experience. Boerh. Chem. part ii. p. 338.

DIACENTROS, from διὰ, *through*, and κεντρον, *centre*, is uſed by Kepler to ſignify the ſhorteſt diameter of the elliptical orbit of any planet; probably becauſe it paſſed through the centre, and not through the focus, which diſtinguiſhes it from the longer diameter.

DIACHALASIS, from διαχαλαω, *to be relaxed*, in the *Medicinal Works of the Ancients*, a term uſed to expreſs a ſolution of continuity in the bones of the cranium at the ſutures; that is, when the bones recede from their mutual indentation, an accident that frequently happens from large wounds in the head.

DIACHALCITIS, in *Chirurgery* and *Pharmacy*, a plaſter which formerly uſed to be applied after the amputation of a cancer, and on many other occaſions.

The *emplaſtrum diachalcitidis* is compoſed of oil, axungia, and chalcitis; from the laſt of which drugs it derives its name.

DIACHRISTA, from διὰ and χριω, *I anoint*, a name given by the ancient writers in medicine to certain compoſitions, whoſe uſe was to be applied to the ſauces, uvula, palate, and tongue, for the abſterſion of phlegm.

DIACHYLON, in *Pharmacy*, a name given to divers plaſters, on account of the mucilages mixed therein, which are viſcid juices, called by the Greeks χυλοι, drawn from certain plants. See MUCILAGE.

DIACHYLON, *white*, or *ſimple*, ſhould be compounded of common oil, litharge of gold, and mucilages drawn from marſhmallow roots, fenugreek, and aniſeeds. It is proper to ſoften, digeſt, ripen, and reſolve.

The *diachylon*, called *irenton*, has for its baſis the common white *diachylon*, with a pound of which, an ounce of powder of iris is mixed. This plaſter digeſts, incides, and ripens with more force than the ſimple *diachylon*.

There is alſo the *great diachylon*, *diachylon magnum*, compoſed of litharge of gold, oils of orris, camomile, and dill, turpentine, reſin of the pine, yellow wax, and mucilages of line and fenugreek, with new figs, raiſins of Damaſcus, ichthyocolla, juices of orris, ſquills, and hyſſop.

This *diachylon* ſoftens ſcirrhuſes, and reſolves and diſſipates tumors. It is called *the great*, not only on account of its extraordinary virtues, but alſo becauſe compounded of a greater number of ingredients than the reſt.

The DIACHYLON *gummatum*, or *diachylon cum gummi*, is the *great diachylon* with the addition of gum ammoniac galbanum, and ſagapenum, diſſolved with wine, and boiled to the conſiſtence of honey. This plaſter is the moſt powerful of all for digeſting, ripening, and reſolving.

DIACODIUM, in *Pharmacy*, a ſyrup prepared from poppy-heads; called alſo *ſyrupus de meconio*.

The word is formed from the Greek διὰ, *per*, and κωδια, *poppy-heads*.

The ancients had two kinds: *ſimple*, and *compound*.

DIACODIUM, *the ſimple*, was a kind of opiate, made of the juice expreſſed from the heads of white poppies, and boiled up with ſugar. See OPIATE.

It was preſcribed to ſoften ſharp, ſerous humours, to appeaſe

peaſe coughs, and to provoke ſleep. This preparation was of great uſe among the ancients; but it is now laid aſide, ſince it has been found, that the ſyrup made of an infuſion of white poppy-heads, which is what we now call *diacodium*, produces the ſame effect.

DIACODIUM, *compound*, was made of the *ſimple*, with the addition of the troches of hamec, hypocyſtis, myrrh, ſaffron, and balauſtines. It was uſed to ſtop and ſoften catarrhs, hæmorrhoids, and fluxes of the belly.

DIACODUS, in *Natural Hiſtory*, a name given by ſome to the *diadochos*, a kind of beryl or ſapphire, of which many fabulous things are aſſerted.

DIACOLOCYNTHUS, in *Pharmacy*, δια κολοκυνθιδος, from κολοκυνθις, *colocynth*; a remedy, of which colocynth is a principal ingredient. See COLOCYNTH.

DIACONICON, *Sacriſty*, a place adjoining to the ancient churches, where the ſacred veſtments, with the veſſels, relics, and other ornaments of the altar, were preſerved, anſwering to our veſtry.

The word is Greek, formed from διακονω, *I ſerve, I miniſter*, becauſe here was kept every thing belonging to divine ſervice. It was alſo called ἀρμαριον, and in Latin *ſalutatorium*; becauſe it was here that the biſhop received and ſaluted ſtrangers. Sometimes, too, it was called παστοφορεῖον, or παστοφόριον, *manſio*, on account of the tables kept therein, for diſpoſing the ſacred ornaments on; or rather δόμος παστοφόρου, a ſort of inn, or houſe, for the lodging of ſoldiers.

DIACONISSA, and DIACONATE. See DEACON, and DEACONRY.

DIACOPE, διακοπη, from δια and κοπτω, *I cut off*, in *Grammar*, the ſame with what is otherwiſe called TMESIS.

DIACOPE, in *Surgery*, denotes a deep cut or wound; or the act of cutting off any part.

DIACORALLIUM, in *Medicine*, a preparation of coral in the London diſpenſatory.

DIACOUSTICS, or DIAPHONICS, the conſideration of the properties of ſound refracted in paſſing through different mediums; that is, out of a denſer into a more ſubtile, or out of a more ſubtile into a denſer medium. See SOUND.

The word is formed from the Greek δια, *per, through*, which intimates a paſſage; and ακουω, *I hear*, q. d. the conſideration of the paſſage of the ſounds we hear.

DIACRII, in *Antiquity*, was the name of a party or faction at Athens.

That city, we read, was divided into two parties; the one favourers of an oligarchy, who would only have a few perſons employed in the government. The other conſiſted of ſuch as were for a democratical, or popular government, wherein the whole people ſhould have a ſhare. The firſt were called *diacrii*, and the latter *pediæi*; the latter inhabiting the lower, and the former the ἀκρον, or upper quarter, or part of the city.

The laws of Solon imported, that Piſiſtratus ſhould be chief of the *diacrii*; though the ſcholaſt on Ariſtophanes's comedy, The Waſps, affirms, that Pandion diſtributed the quarter of the *diacrii* among his ſons, and put Lycus at their head.

DIACTORE, in *Mythology*, a ſurname of Mercury; derived from διαγω, *I attend*, becauſe Mercury was the meſſenger of the gods.

DIACYDONITES, in *Pharmacy*, is applied to things and remedies, wherein quinces are a principal ingredient.

The word comes from δια, and κυδωνια, *quince*.

Confectio diacydonites, or *diacydonium*, is marmalade, a confection of quinces, or wherein quinces have a chief ſhare.

DIADELPHIA, in *Botany*, the ſeventeenth claſs of plants with hermaphrodite flowers, whoſe ſtamina, by the conjunction of their filaments, are formed into two bodies, the one ſtanding about the piſtil, and the other ſurrounding it. The lower part of this laſt is membranaceous, of a cylindric figure, and ſplit lengthwiſe on its oppoſite ſide; but the upper half terminates in nine ſubulate or awl-ſhaped parts, of which the intermediate are alternately longer and ſhorter by pairs. The upper filament is awl-ſhaped, and like a briſtle, and covers the ſlit of the cylindraceous filament incumbent on it. The antheræ are ten; the piſtil is ſingle; the germen oblong and roundiſh; the ſtyle ſubulate and filiform; the ſtigma downy, of the length of the ſtyle, and placed immediately under the antheræ; the calyx is a monophyllous, campanulate, and withering perianthium; the papilionaceous corolla unequal, and its petals have diſtinct names, as *vexillum*, the ſtandard, covering the reſt; *alæ*, the wings, which are two equal petals, one at each ſide of the flower, under the *vexillum*; and *carina*, the keel, which is the loweſt petal, often bipartite, placed under the *vexillum* and between the *alæ*; the pericarpium is an oblong, compreſſed, bivalve legumen, with a longitudinal future both above and below; the ſeeds are few, roundiſh, ſmooth, fleſhy, and pendulous, in a ſmall, ſhort, proper receptacle, thinner towards the baſe, and obtuſe at the diſk that faſtens them.

The word is formed of the Greek δις, *twice*, and αδελφος, *brother*. Among the plants of this claſs are the fumitory, milk-wort, broom, &c. See *Tab. of Botany, Claſs* 17.

This is a perfect natural claſs of plants, and is the moſt remarkable of all others in the ſtructure of the flower. The common ſituation of the flower is an obliquely pendulous direction, or in an acute angle from a perpendicular line. The former ſyſtematiſts in botany, as Linnæus obſerves, took great notice of the pod in this claſs of plants, and thought it the principal ſubject of diſtinction; but he very judiciouſly makes it but of very little conſequence, and will not allow it ſufficient to diſtinguiſh the genera one from another: but the cup, which had always before his time been diſregarded, he eſteems a very eſſential part of the plant, and ſufficiently certain to erect the different genera upon in many caſes. Some of the old writers had been uſed to take the leaves into their marks, by which to diſtinguiſh genera of this claſs; but Linnæus wholly excludes this part of a plant from this office. Magnol has obſerved, that the cauſes of the *diadelphia*, or papilionaceous flowers, is ſtipendiate, and is compoſed of two diſtinct oblong petals; the lower edges of which join ſo nicely and cloſely together, that they ſeem only one; and are not joined in their ſubſtance, but only in their ſituation. Linnæus has ſtrictly examined this, and finds that the author is ſo far right, that this is really the caſe in many of the papilionaceous flowers, but not in all: ſome not only appearing to have, but really and certainly having a cauſus compoſed of only one petal.

The conſideration of the ſtigma is of more conſequence in this than in moſt other flowers, and even more than that of any other part of the fructification in this. The ſeeds of all the plants of this claſs are eatable, excepting in a very few particulars; their leaves alſo are a grateful food to cattle. Lin. Gen. Plant. p. 377.

Of this claſs there are four orders, viz. the *pentandria*, comprehending one genus; the *hexandria*, two; the *octandria*, two; and the *decandria*, forty-nine.

DIADEM, Διαδημα, in *Antiquity*, a head-band, or fillet, worn by kings as a badge of their royalty; while the crown was left to the gods.

The word comes from the Latin *diadema*, of the Greek διαδεω, *a little band encompaſſing the head*, of the verb διαδεω, *cinge, I gird*.

The *diadem* was a ſort of ribbon, or fillet, woven of ſilk, thread, or wool, more or leſs broad. It was tied round the temples, and forehead; the two ends being knotted behind, and let fall on the neck.

It was uſually white, and quite plain, though ſometimes embroidered with gold, and ſet with pearls, and precious ſtones. In later times it likewiſe came to be twiſted round crowns, laurels, &c. and even appears to have been worn on divers parts of the body: thus Phavorinus obſerves, that Pompey was ſuſpected of aſpiring to the royalty, becauſe of his wearing a white garter, which was no other than a ligature for an ulcer he had on his leg, but which the people miſtook for a *diadem*.

Pliny, lib. vii. cap. 5. obſerves, that Bacchus was the firſt inventor of the *diadem*. Athenæus aſſures us, that the topers, and good fellows, firſt made uſe of it, to preſerve themſelves from the fumes of wine, by tying it tight round their heads; and that it long afterwards came to be a royal ornament.

The *diadem* remained a long time the peculiar badge of kings; at length it was aſſumed by the Roman emperors, as the mark of imperial dignity.

Authors are not agreed about the time when the Roman emperors firſt aſſumed the *diadem*. Some refer it to Caligula, others to Aurelian, and others to Conſtantine the Great. The younger Victor ſays, poſitively, that Aurelian took the *diadem*, which no emperor had dared to do before him. For though it ſhould ſeem from the ſame writer, that Caligula had done the like, yet Suetonius aſſures us, he had it only in view, and that he never executed it. Heliogabalus, indeed, took a *diadem*; but it was only in the palace he wore it, and never appeared with it in public. Jornandes even goes as low as Dioclefian for the introduction of the *diadem*; but it is certain, there is a medal of Aurelian, with a crown like one of our ducal crowns, which is ſuſtained by a border of pearls, that bears a very great affinity to a *diadem*. And the authors, who have explained that medal, are all agreed that it is one. Mr. Spanheim alſo allows Aurelian to have taken it: his ſucceſſors imitated him therein; and yet the ornament did not become common till the time of Conſtantine. After him the empreſſes were allowed

lowed to wear it; accordingly we find them repreſented therewith on medals; though till that time we have no inſtance either of crown, or *diadem*, on a woman's head, in all the Roman empire.

An author of the fifth century, quoted by Bollandus, pretends that Conſtantine firſt wore the *diadem*, and that he only took it to bind his hair, and keep it in order. But this is not very probable; and it is certain, that at leaſt ſome emperors had worn it before him, as Aurelian and Carinus.

Euſebius gives it to Conſtantius Chlorus, when only Cæſar; which is confirmed by one of his medals, wherein he is repreſented with a *diadem*, adorned with rays; though even after Conſtantine, when the *diadem* was become the uſual ornament of the Auguſti, it was not always given to the Cæſars. Indeed, we ſee it on ſome of the medals of Julian, while only Cæſar; though it is pretty certain, he did not wear it till he became Auguſtus. Du-Cange will not aſſert, that Conſtantine firſt took the *diadem*; but only, that he firſt made it into a kind of caſk, or cloſe crown, as is ſeen in ſome of his medals, and thoſe of his ſucceſſors.

DIADEM, in *Heraldry*, is applied to certain circles or rims, ſerving to bind or encloſe the crowns of ſovereign princes; and to bear the globe, and croſs, or the fleurs-de-lys, for their creſt.

The crowns of ſovereigns differ in this, that ſome are bound with a greater, and ſome with a leſs, number of *diadems*.

Prelates likewiſe appear to have anciently worn a ſort of *diadem*: thus Baronius writes, that St. James the apoſtle wore a gold plate on his forehead, as a mark of his epiſcopal dignity.

In blazoning, the bandage about the heads of Moors, on ſhields, is ſometimes alſo called *diadem*.

DIADOCHUS, in *Natural Hiſtory*, the name given by the ancients to a gem, approaching to the nature of the beryl, or aqua-marina, probably a pale ſapphire; for they had no peculiar generical name for that gem, but called the beautiful deep-coloured ones only ſky-blue beryls, beryllı acroides. The writers of the middle age have given ſtrange accounts of the magical virtues of this ſtone, ſuch as its calling up ſpirits, and many other the like things, on being thrown into water: they ſaid, however, that if it happened by any accident to touch a dead body it loſt all its virtue.

DIADROME, from διὰ and δρόμος, *curſus*, is ſometimes uſed for the vibration, motion, or ſwing of a pendulum.

DIÆRESIS, in *Surgery*, the operation of dividing and ſeparating parts, whoſe union and continuity were an obſtacle to the cure; or which were joined and conglutinated contrary to the order of nature.

The word, in its original Greek, διαίρεσις, ſignifies *diviſion*.

There are five ways of performing the *diæreſis*, viz. by cutting, picking, tearing, drawing, and burning.

DIÆRESIS is alſo uſed, in *Medicine*, for the deſtroying or conſuming of the veſſels, or canals, of an animal body; when, from ſome cutting, or corroding humour, certain paſſages are made, which naturally ought not to have been; or certain natural paſſages are dilated beyond their ordinary dimenſions; ſo that the juices, which ſhould have been contained therein, extravaſate, or run out.

DIÆRESIS, in *Grammar*, is a figure whereby a diphthong is divided into two ſyllables: as *aulæ* into *aulai*, *pictæ* into *pictai*, *aquæ* into *aquai*.

DIÆRESIS is alſo uſed, in a general ſenſe, for any diviſion of one ſyllable into two: as in that verſe of Tibullus, *Stamina non ullı diſſolvenda dea*, for *diſſolvenda*.

This is uſually noted by two points placed over a letter, to ſhew that it is to be founded by itſelf, and not joined with any other ſo as to make it a diphthong: thus *aëra*, by the points over the *e*, is diſtinguiſhed from *æra*.

It is alſo a kind of metaplaſm, or addition to a word, by dividing one ſyllable into two: as *aulæ*, by a *diæreſis*, is a word of three ſyllables, inſtead of *aulæ*. See THERIS.

DIÆTETÆ, Διαιτηταὶ, from διαιτάω, *I arbitrate*, among the Athenians, were of two ſorts, the cleroti and dialecteti. The former were a kind of public arbitrators, choſen by lot, to determine all cauſes exceeding ten drachms within their own tribe. Their office was annual, at the expiration of which they were obliged to give up their accounts; and if it was proved, that they refuſed to give judgment, or to have been corrupted, they were puniſhed with infamy. Their ſentence, however, was not final, an appeal lying from it to the ſuperior courts.

The *dialecteti*, on the contrary, were private arbitrators, from whoſe ſentence there lay no appeal; and accordingly they always took an oath to adminiſter juſtice, without partiality, which the *cleroti* did not. Potter's Archæol. Græc. lib. i. cap. 22. tom. i. p. 122, ſeq.

O

DIAGLAUCIUM, a name given by the old writers on medicine to a ſort of collyrium, in which the juice of the glaucium, or yellow poppy, was a principal ingredient. It was uſed for beginning lippitudes and ophthalmies.

DIAGLYPHICE, from διαγλύφω, *I engrave*, the art of ENGRAVING, cutting, or otherwiſe working, hollow or concave figures, in metals; ſuch as ſeals, intaglios, matrices, or coins for medals, &c. See SCULPTURE.

DIAGNOSTIC, in *Medicine*, a term applied to thoſe ſigns, or ſymptoms, which indicate, or diſcover, the preſent ſtate of a diſeaſe, its nature and cauſe.

The word is compounded of the Greek διὰ, *per*, *through*, or *by*; and γινώσκω, *I know*.

The phyſicians have *diagnoſtic* ſigns, as well as *prognoſtic* ſigns; the firſt, with regard to the preſent ſtate of the diſeaſe, and the patient; and the ſecond to the future.

DIAGONAL, in *Geometry*, a right line drawn acroſs a parallelogram, or other quadrilateral figure, from the vertex of one angle to that of another.

Such is the line FN (*Tab. Geometry, fig.* 21.) drawn from the angle F, to N.

Some authors call it *diameter*, and others the *diametral* of the figure.

It is demonſtrated, 1. That every *diagonal* divides a parallelogram into two equal parts. 2. Two *diagonals*, drawn in any parallelogram, biſect each other. 3. The *diagonal* of a ſquare is incommenſurable with one of its ſides.

Add, 4. A very noble theorem in elementary geometry, firſt demonſtrated by Mr. Lagny, in the Memoires de l'Academie Royale des Sciences, an. 1706, is, that the ſum of the ſquares of the two *diagonals* of every parallelogram is equal to the ſum of the ſquares of the four ſides.

It is evident, at firſt ſight, that the famed 47th propoſition of Euclid, ſo richly worth the hecatomb it coſt the author, is only a particular caſe of this propoſition: for if the parallelogram be rectangled, it follows of courſe, that the two *diagonals* are equal; and of conſequence, that the ſquare of a *diagonal*, or, which is the ſame thing, the ſquare of the hypothenuſe of a right angle, is equal to the ſquares of the two ſides. If a parallelogram be oblique-angled, and, of conſequence, the two *diagonals* unequal, as is the more uſual caſe, the propoſition becomes of more extenſive uſe.

The demonſtration, in oblique-angled parallelograms, is thus: ſuppoſe the oblique-angled parallelogram ABCD (*Tab. Geometry, fig.* 22.) whereof B D is the greater *diagonal*, and AC the leſſer: from the point A, of the obtuſe angle DAB, let fall a perpendicular AE, to the ſide CD; and from the point B another perpendicular BF to the ſide DC. Then are the triangles ADE, BCF equal, and ſimilar, as AD is equal to BC, and the angle ADE, BCF, as well as AED, BFC, are alſo equal; conſequently, DE is equal to CF. Now, by Euclid, prop. 13. lib. ii. in the obtuſe-angled triangle BDC, the ſquare of the ſide BD is equal to the ſum of the ſquares of BC, and CD, together with double the rectangle of CF by CD; and by the 12th, lib. ii. in the triangle DAC, the ſquare of the ſide AC is equal to the ſum of the ſquares of AD, and CD, abating double the rectangle of the ſame, CD, by DE, equal to CF. Conſequently, the former exceſs preciſely compenſating this defect, the ſum of the ſquares of the two *diagonals* is equal to the ſum of the ſquares of the four ſides. *Q. E. D.*

Hence, in every rhombus, or lozenge, knowing one ſide, and a *diagonal*, the other *diagonal* will likewiſe be known: for, as the four ſides are equal, ſubtracting the ſquare of the given *diagonal* from quadruple the ſquare of the given ſide, the remainder is the ſquare of the *diagonal* required.

The propoſition is likewiſe of great uſe in the theory of compound motions; for, in an oblique-angled parallelogram, the greater *diagonal* being the ſubtenſe of an obtuſe, and the leſſer of an acute angle, which is the complement of the former, the greater will be the greater, and the leſs the leſs, as the obtuſe angle is the greater; ſo that if the obtuſe angle be conceived to increaſe till it be infinitely great, with regard to the acute one; or, which amounts to the ſame thing, if the two contiguous ſides of the parallelogram be extended directly, end to end, in a right line, the great *diagonal* becomes the ſum of the two ſides, and the leſſer one, nothing. Now, two contiguous ſides of a parallelogram being known, together with the angle they include, it is eaſy to find the ſubtenſe of that angle, i. e. one of the *diagonals* of the parallelogram, in numbers; which done, Mr. de Lagny's propoſition gives the other. Which ſecond *diagonal*, thus found, is the line that would be deſcribed by a body impelled at the ſame time by two forces, which ſhould have the ſame ratio to each other as the contiguous ſides have,

have, and act in those two directions; which *diagonal* the body would describe in the same time, as it would have described either of the contiguous sides in, if only impelled by the force corresponding thereto. This is one of the great uses of the proposition; for the ratio of two forces, and the angle they make, being given, it is frequently necessary to determine, in numbers, the line a body, impelled by two forces, would describe in a certain time. See COMPOSITION *of Motion*.

All the sides of a rectilinear figure, as AB, BC, CD, DE, EA (*fig.* 23.) and the angles O, and Y, being given, to find the *diagonals*.

In the triangle ABE, the sides AB, and AE, being given, and the angle O, the angle A is easily found by trigonometry; and, from this, the *diagonal* BE. And, after the like manner, the triangle BCD is resolved, and the *diagonal* BD found.

Since ICHNOGRAPHIES, or plans, are best taken, by having all the sides and *diagonals*, the use of this problem, in planimetry, is of some importance; especially to such as are willing to have their work accurate, though at the expence of calculation.

DIAGONAL *scale*. See PLOTTING-*scale*, and SCALE.

DIAGRAM, from διαγραφω, *I describe*, in *Geometry*, &c. a scheme for the explanation, or demonstration, of any figure, or the properties thereto belonging.

DIAGRAM, or DIAGRAMMA, in the *Ancient Music*, was what we call the *scale*, or GAMMUT, in the modern.

The extent of the *diagramma*, which they also called *systema perfectum*, was a disdiapason, or two octaves in the ratio 1 : 4. In that space they had eighteen chords, though these had not all different sounds.

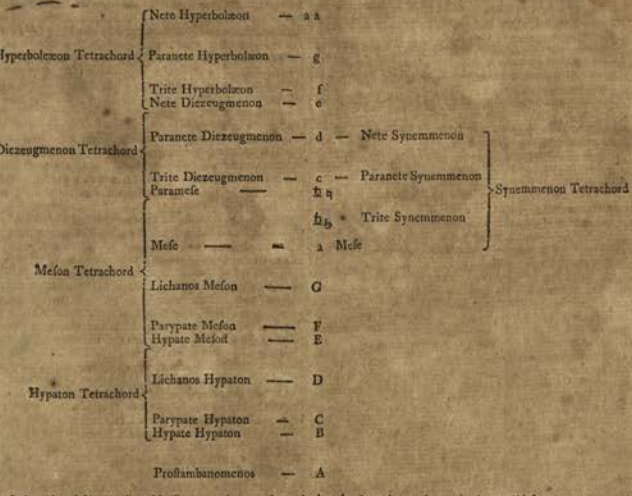
To explain it, they represent to us eighteen chords, or strings, of an instrument, as the lyre, supposed to be tuned according to the proportions in any of the genera; viz. DIATONIC, ENHARMONIC, or CHROMATIC.

As the lyre was improved, and more chords added to it, so was the *diagramma*: by such means it came from 4 chords to 7, then 8, then 10, then 14, and at last 18. See Malcolm's Treatise on Music, p. 519.

Guido Aretine improved this scale, or *diagram*, very greatly: finding it of two small extent, he added five more chords, or notes, to it; laid them all down on a staff of five lines; and, instead of the long Greek names, named all his notes by Gregory's seven letters. See NOTE.

The first, or lowest, note of his scale, he marged Γ, and called *gamma*; whence the whole scale came to be denominated.

We shall here insert the whole *diagram*, or Greek scale, with the corresponding letters of our modern notation.



It is to be observed, that this *diagram* only represents the diatonic genus; and, therefore, after the names *lychanos hypaton*, and *lychanos meſon*, some add *diatoni*, to distinguish them from the lichanoi of the chromatic or harmonic genera. Wallis, Append. ad Ptolem. Harm. p. 157. See LICHANUS.

The tetrachords in this *diagram* are conjunct or disjunct. The conjunct have a common note, chord, or sound. Thus the hypate meſon, which is the last of the hypaton tetrachord, is the first of the meſon. The meſe also is the last chord of the meſon, and the first of the synemmenon tetrachord. So likewise the nete diezeugmenon is the last chord of the diezeugmenon, and the first of the hyperbolæon tetrachord. The disjunct tetrachords are those which are separated by a tone. Thus the meſon and diezeugmenon tetrachords are separated by the tone between the meſe and parameſe: so likewise the synemmenon and hyperbolæon tetrachords are separated by the tone between the nete synemmenon, and the nete diezeugmenon.

Some of the names of the chords in this *diagram* being placed nearer to each other than the rest, signify that there is only a semi-tone between them. Thus, between the hypate hypaton and the parypate hypaton, or between the meſe and the trite synemmenon, or between the parameſe and trite diezeugmenon, the interval is no more than a semi-tone.

It has been observed by Dr. Pepusch, that the ancients considered a descending as well as an ascending scale; the former proceeding from acute to grave precisely by the same intervals, as the latter did from grave to acute, and the same name served for both. But the proſlambanomenos, and the rest of the names, correspond to different notes of our scale. An example of one octave will explain the learned author's meaning.

Aſcending	Deſcending
A — Proſlambanomenos	— g
B — Hypate hypaton	— f
C — Parypate hypaton	— e
D — Lichanos hypaton	— d
E — Hypate meſon	— c
F — Parypate meſon	— b
G — Lichanos meſon	— a
a — Meſe	— G

The intervals here, both aſcending and deſcending, are the same, and in the same order, viz. tone, semi-tone, tone, tone, semi-tone, tone, tone. So that the one scale is precisely the reverſe of the other. This distinction of an aſcending and a deſcending scale, is said to be conducive to the variety and perfection of melody, though little understood by modern compoſers. Phil. Tranſ. N° 481. p. 369.

The eighteen names of the scale of the ancients do not ſeem

seem to signify so many distinct sounds, especially in the diatonic genus, where the paranete synemmenon and the trite diezeugmenon, as also the nete synemmenon, and the paranete diezeugmenon, are reputed to coincide. Nor do the eighteen chords seem perfectly distinct in any of the other genera, except in the enharmonic. Wallis's Append. ad Ptolem. Harm. p. 158. See ENHARMONIC and SCALE.

DIAGRYDIUM, in *Pharmacy*, is crammony prepared, or corrected, for medicinal use.

The preparation is ordinarily performed by baking the SCAMMONY in a quince. Others make it to receive the fumes of lighted sulphur, whence it is called, *sulphuratum*, or *diagrydium sulphureum*. Some incorporate it with a quantity of spirit of vitriol rectified, sufficient to make a sort of liquid paste, which is afterwards set to dry in the sun, or by a gentle fire: and this preparation they call *diagrydium rectum*. The end of all these preparations is to correct the scammony; but the generality of authors now are of opinion, it has nothing that needs correction, and that it may be used in its natural state.

DIAH, or DIAT, a name given by the Arabs to the punishment of retaliation. By the Mahometan law, a brother, or the next relation of a murdered person, ought to take part against the murderer, and demand his blood in reparation for that which he has shed. Before the time of Mahomet, the Arabs had a custom of putting a freeman of their prisoners to death, in lieu of every slave they lost in battle, and a man for every woman that was killed. But Mahomet regulated the laws of reprisal; directing in the Alcoran, by the *diat*, that a freeman should be required for a freeman, and a slave for a slave. The Turks, probably in consequence of this law, formerly massacred almost all their prisoners of war, but they now content themselves with enslaving and selling them. Encyclop.

DIAHEXAPLA, from *hex* and *haplous*, *fimple*, among *Farriers*, a drink made for horses, denominated from the six ingredients it consists of; viz. birth-wort, gentian-roots, juniper-berries, bay-berries, myrrh, and ivory-shavings. It is esteemed as good stomachic, and cures bites of venomous beasts, colds, consumptions, &c.

DIAION, in the *Ancient Writers of Medicine*, the name of a composition made into the form of troches, of which violet flowers were one of the principal ingredients. The composition is described at large by Myrepsus.

DIAL, or *Sun-Dial*, an instrument serving to measure time, by means of the shadow of the sun.

The word is formed from *dies*, *day*, because indicating the hour of the day. See HOUR.

The ancients also call it *feiatherican*, from its doing it by the shadow.

DIAL is more accurately defined, a draught, or description, of certain lines on a plane, or surface, of a body given, so contrived, as that the shadow of a style, or ray, of the sun, passed through a hole therein, shall touch certain points at certain hours.

The antiquity of *dials* is beyond doubt. Some attribute their invention to Anaximenes Milesius; and others to Thales. Vitruvius mentions one made by the ancient Chaldee historian Berosus, on a reclining plane, almost parallel to the equinoctial. Aristarchus Samius invented the hemispherical *dial*. And there were at the same time some spherical ones, with a needle for a gnomon. The disciple of Aristarchus was an horizontal *dial*, with its limb raised up all around, to prevent the shadow stretching too far.

But it was late before the Romans became acquainted with *dials*. The first sun-*dial* at Rome was set up by Papirius Cursor, about the year of the city 460, before which time, says Pliny, there is no mention of any account of time but by the sun's rising and setting: the first *dial* was set up at or near the temple of Quirinus, but it went ill: about thirty years after, M. Valerius Messala being consul, brought out of Sicily another *dial*, which he fet up on a pillar near the rostrum; but for want of its being made for that latitude, it could not go true. They made use of it ninety-nine years; till Marcius Philippus fet up another more exact.

But there seem to have been *dials* among the Jews much earlier than any of these. Witness the *dial* of Ahaz, who began to reign four hundred years before Alexander, and within twelve years of the building of Rome; mentioned by Isaiah, chap. xxxviii. ver. 8.

The diversity of *sun-dials* arises from the different situation of the planes, and the different figure of the surfaces whereon they are described; whence they become denominated *equinoctial*, *horizontal*, *vertical*, *polar*, *direct*, *erect*, *declining*, *inclining*, *reclining*, *cylindrical*, &c. For the general principles of their construction, see DIALLING.

Dials are sometimes distinguished into *primary*, and *secondary*.

DIALS, *primary*, are those either drawn on the plane of the horizon, called *horizontal dials*; or, perpendicular thereto, on the planes either of the meridian, or prime vertical, called *vertical dials*: to which number are also usually added, those drawn on the polar and equinoctial planes, though neither horizontal, nor vertical.

DIAL, *equinoctial*, is that described on an equinoctial plane, or a plane representing that of the equinoctial.

A plane oblique to the horizon, either hangs over towards it, and makes an acute angle with the plane of the horizon, or it falls off backwards from it, and makes an obtuse angle therewith. This latter is called a *reclining plane*; which, if it recline back at an angle equal to the complement of the latitude of the place, then it lies in the plane of the equinoctial; and a *dial* drawn thereon, is denominated an *equinoctial dial*.

Equinoctial dials are usually distinguished into *upper*, which looks towards the zenith; and *lower*, which respects the nadir.

Now, as the sun only illumines the upper surface of an equinoctial plane, while he is in our hemisphere, or on the northern side of the equator, an *upper equinoctial dial* will only shew the hour, during the spring and summer season.

And again, as the sun only illumines the lower surface of an equinoctial plane, while he is in the southern hemisphere, or on the other side of the equator; a *lower equinoctial dial* will only shew the hour in autumn and winter.

To have an *equinoctial dial*, therefore, that shall serve all the year round, the *upper* and *lower* must be joined together; that is, it must be drawn on each side of the plane.

And, since the sun shines on one side or on the other of an equinoctial plane the whole day, such a *dial* will shew all the hours of an artificial day.

To describe an equinoctial DIAL *geometrically*.—The *equinoctial* is the first, easiest, and most natural, of all *dials*; but the needlity of drawing it double, prevents it being much in use. However, as its structure shews the reason of the other kinds, and as it even furnishes a good mechanical method of drawing all the other kinds of *dials*, it shall be here laid down.

First, then, to describe an upper *equinoctial dial*: from a centre C (*Tab. Dialling, fig.* 4.) describe a circle ABDE, and by two diameters AD, and BE, intersecting each other at right angles, divide it into quadrants AB, BD, DE, and EA. Subdivide each quadrant into six equal parts, by the right lines C I, C II, C III, &c. which lines will be hour-lines. Through the centre C drive a style, or pin, perpendicular to the plane ABDE.

The *dial* thus described being rafted so as to be in the plane of the equator, the line C XII in the plane of the meridian, and the point A looking towards the south, the shadow of the style will shew the hours both of the forenoon and afternoon.

For horary circles include arches of the equator of fifteen degrees each; consequently, the plane ABDE being supposed in the plane of the equator, the horary circles will likewise include arches of 15 degrees of the circle ABDE. Wherefore, since the angles XII C XI, XI C X, X C IX, &c. are each here supposed 15 degrees, the lines C XII, C XI, C X, C IX, &c. are intersections of horary circles with the plane of the equinoctial.

Again, since the style passing through the centre C represents the axis of the world; its distance from the centre of the earth being inconsiderable, and it being the common diameter of the horary circles, its shadow will cover the hour-line C XII, when the sun is in the meridian, or circle of 12 o'clock; C XI, when in the circle of 11 o'clock; C X, when in the circle of 10 o'clock, &c.

Secondly, to describe a lower *equinoctial dial*: the method is the same as that for the *upper dial*, already described; except that no hour-lines are to be drawn beyond that of six o'clock.

Thirdly, to describe an universal *equinoctial dial*: join two metal, or ivory planes, ABCD, and CDEF (*fig.* 5.) so as to be moveable at the joint. On the upper surface of the plane ABCD, describe an *upper equinoctial dial*, and upon the lower a *lower*, as already directed; and through the centre I drive a style. In the plane DEFC cut a box, and put a magnetical needle G therein, so that the same plane a brass quadrant nicely graduated, and moving through a hole cut in the plane ABCD. Now since this may be so placed, by means of the needle G, that the line I 12 shall be in the plane of the meridian; and, by means of the quadrant, may be so raised, as that the angle BCF shall be equal to the elevation, or the equator; it will serve as a *dial* in any part of the world. When the sun is in the equator, these *dials* can be of no use.

The best universal *dial* is that of Mr. Pardie, of which the following description is given by Mr. Ferguson. This *dial*

dial consists of three principal parts: the first is called the horizontal plane A (*fig.* 6) because in practice it must be parallel to the horizon; in this plane is fixed an upright rim, which enters into the edge of the second part BD, called the meridional plate, which is made of two pieces, the lower whereof, B, is called the *quadrant*, because it contains a quarter of a circle divided into 90 degrees; in which part, near B, the pin enters. The other piece is a semicircle D, adjusted to the quadrant, and turning in it by a groove for rising or depressing the diameter EF of the semicircle, which diameter is called the axis of the instrument. The third piece is a circle G, divided on both sides into twenty-four equal parts, which are the hours. This circle is put on the meridional plane, so that the axis EF may be perpendicular to the circle; and the point C be the common centre of the circle, semicircle, and quadrant. The straight edge of the semicircle is chamfered on both sides to a sharp edge, which passes through the centre of the circle. On one face of the chamfered part, the next six months of the year are laid down, according to the sun's declination for their respective days, and on the other side the last six months. And against the days for which the sun enters the signs, there are straight lines drawn upon the semicircle, with the characters of the signs marked upon them. There is a black line drawn along the middle of the upright edge of the quadrant, over which hangs a thread H, with its plummet I, for levelling the instrument. From the point of September to the 20th of March, the upper surface of the circle must touch both the centre C of the semicircle, and the line of 0 and 0; and from the 20th of March to the 23d of September, the lower surface of the circle must touch that centre and line. In order to find the time of the day by this *dial*, it must be set on a level place in sun-shine, and adjusted by the levelling screws 2 and 4, till the plumb-line hangs over the black line upon the edge of the quadrant, and parallel to the said edge; then move the semicircle in the quadrant, till the line of 0 and 0 (where the circle touches) comes to the latitude of the place in the quadrant; and turn the whole meridional plane BD, with its circle G, upon the horizontal plane A, till the edge of the shadow of the circle falls precisely on the day of the month in the semicircle; and then the meridional plane will be due north and south, the axis EF will be parallel to the axis of the world, and will cast a shadow upon the true time of the day, among the hours on the circle, which is made in the plane of the meridian. The upper surface of the circle will serve from the 20th of March to the 23d of September; and the lower for the rest of the year.

The months and signs are laid down on the semicircle in the following method. Draw the right line ACB (*fig.* 7.) equal to the diameter of the semicircle ADB, and erect it in the middle at right angles with the line ECD, equal in length to ADB; then EC will be the radius of the circle FCG, which is the same as that of the semicircle. Upon E, as a centre, describe the circle FCG, on which set off the arcs C 8 and C 4, each equal to 23½ degrees, and graduate them accordingly, for the sun's declination. Then, laying the edge of a ruler over the centre E, and also over the sun's declination for every fifth day of each month, as found in tables of declination, mark the points on the diameter AB of the semicircle from *a* to *g*, which are cut by the ruler; and here place the days of the months, answering to the sun's declination. Set one foot of the compasses in C, and extending the other to *a* or *g*, describe the semicircle *a f d e g*; then divide this into six equal parts, and through the points of division draw right lines parallel to CD, for the beginning of the signs (of which one half are on one side of the semicircle, and the other half on the other) and set the characters of the signs to their proper lines. Ferguson's Lectures, *&c.* Lect. 10.

DIAL, *horizontal*, is that described on an horizontal plane, or a plane parallel to the horizon.

Since the sun may illumine an horizontal plane at all times of the year, while he is above the horizon; an *horizontal dial* may shew all the hours of the artificial day throughout the year; so that a more perfect *dial* than this kind cannot be required.

To describe an horizontal DIAL *geometrically.* Draw a meridian line AB (*fig.* 8.) on the given immoveable plane; allume B, at pleasure, on a moveable one. See Marking *line.*

Upon a point taken at pleasure, as C, erect a perpendicular CD, and make the angle CAD equal to the elevation of the pole. In D make another angle CDE equal likewise to the elevation of the pole, and draw the right line DE meeting AB in E. Then make EB equal to ED, and from the centre B, with the radius EB, describe a quadrant EBF, which divide into 6 equal parts. Through E draw the right line GH, cutting AB at right angles. From the centre B, through the several subdivisions of the quadrant EF, draw right lines Ba, Bb, Bc, Bd, BH, meeting the line GH, in the points, *a*, *b*, *c*, *d*, H. From E upon the right line EG set off the intervals Ea, Eb, &c. viz. Ea from E to *c*, Eb from E to *d*, Ec from E to *g*, &c. From the centre A describe a little circle, and applying a little ruler to A, and the finite points of division *a*, *b*, *c*, *d*, H, and *e*, *f*, *g*, *h*, G, draw the lines A XI, A X, A IX, A VIII, A VII, and A VI, A II. A III. A IV, A V. Through A draw a right line VI, VI, perpendicular to AB. Continue the right line A VII, beyond the little circle in VII, A VIII to VIII, A V to V, and A IV to IV. Round the whole scheme draw a square, circle, or oval figure. And lastly, in A fix an index, making an angle DAG with the meridian AB, equal to the elevation of the pole; as in C erect a perpendicular the equal to CD; or at AE fix a triangular plate ADE perpendicular to the plane of the *dial*. In this case, the lines A XI, A X, A IX, &c. are the hour lines of the forenoon; and A I, A II, A III, &c. those of the afternoon; and the shadows of any of the plummets of flyes, above mentioned, at the several hours, will fall on the respective hour-lines.

To describe an horizontal DIAL *by projection.* In large *dials*, where the nicest accuracy is required, geometrical lines are best set aside; and in lieu thereof, the lines of the *dial* are to be determined by trigonometrical calculation. M. Cassini, in the Memoires de l'Academie Royale des Sciences, anno 1703; has done the world good service herein; having rendered the calculation of the hour-lines, which before had been operose enough, exceedingly easy and expeditious: his canons, or analogies, we shall lay down under the respective kinds of *dials*. And, first, for an *horizontal dial*, the elevation of the pole of the place being given, to find the angles, which the hour-lines make with the meridian in the centre of the *dial*.

The analogy, or canon, is thus: as the whole line is to the sine of the elevation of the pole of the place; so is the tangent of the sun's distance from the meridian, for the hour required, to the tangent of the angle required: that is, as the side AC (*fig.* 9.) is to DC, so is the tangent of FDC to the tangent FC, of the angle FAC. See TANGENT, *&c.*

To describe an horizontal DIAL *by the meridional plate.* Let a common globe of twelve inches diameter, upon which are equally drawn twenty-four meridian semicircles, be elevated to the latitude of any given place, and screwed about until any one of these meridian semicircles, as the horizon in the north point, where the hour of XII is supposed to be marked, that is, of the meridians will cut the horizon at the respective distances of all the other hours from XII. Let these points of distance be marked on the horizon, the globe be removed, and a flat board or plate, even with the surface of the horizon, put into its place: then straight lines drawn from the centre of the board to these points will be the hour lines of an *horizontal dial* for that latitude; and the gnomon will be in the situation of the axis of the globe, or make an angle with the plane of the *dial* equal to the latitude of the place. If the globe be elevated to the complement of the latitude of the given place, and you proceed as above, you will have a *direct south dial*: observing, that the gnomon makes an angle with the *dial* plane equal to the colatitude of the place, and that the hours on the *dial* must be set the contrary way to that on the horizontals. If the globe has more than twenty-four meridian semicircles, the process is somewhat different. Elevate the pole to the latitude 51° 32′ N. or 52 of London, and bring the first meridian, or that of London on the English globe, to the north: set the hour index to the uppermost XII on the horary circle; then turn the globe eastward, till the index points successively to I, II, III, IV, V, and VI in the afternoon; or until 15, 30, 45, &c. 75, and 90 degrees of the equator pass under the brazen meridian; and the first meridian will mark the following degrees on the horizon from the north towards the east, viz. 11′, 24′, 38′, 53′, 71°, and 90°, which are the respective distances of the above hours from XII on the plane of the horizon.

In order to transfer these and the rest of the hours to an horizontal plane, draw the parallel right lines *ac* and *bd* (*fig.* 10.) upon that plane, at a distance equal to the thickness of the gnomon; and the space between them will be the meridian or twelve o'clock line on the *dial*. At right angles to this meridian, draw *e f*, and on *a* and *b* as centres, with the same radius of any length, describe the quadrants *g c*, and *f h*, and graduate them. The centre of the plane C, and the centres of these quadrants *a* and *b*, are at a little distance from each other, in order to enlarge the hour distances about noon. Lay a ruler on the centre A, and on the several distances already found, viz. 11°, 24′, &c. in the quadrant *f h*, and draw the respective afternoon hour lines to I, II, &c.

&c. As the sun rises about four in the morning, on the longest days in London, continue the hour lines of III and V in the afternoon through the centre *c* to the opposite side of the *dial*. Then lay the ruler on the centre *c* through the same distances, respectively in the quadrant *e f*, draw the forenoon hour-lines of X, XI, &c. and as the sun does not set before eight in the evening on the longest days, continue the hour lines of VII and VIII through the centre *c* to the other side. Through 53½ degrees of either quadrant from the centre draw the right line *c g*, which will be the hypothenuse or axis of the gnomon *c g i*; and from *g* let fall a perpendicular to the meridian *c i*, and a plate found at the triangle *c g i* set up between *c i* and *c g* will have its hypothenuse *c g* parallel to the axis of the world, when the *dial* is truly set, and will cast a true line on the hours of the day. A line of chords will superfede the trouble of measuring the quadrants. An *east south dial* (*fig.* 11, *g*, *g*, *g*, *g*) is constructed in the same manner, observing the rule already given with respect to the elevation of the pole, and of the gnomon, and the position of the hours. Ferguson's Lect. lect 10.

To describe an horizontal DIAL *on a plane, by the* DIAL-LING *lines.* Draw a double meridian line *a b*, *c d*, (*fig.* 11) on the horizontal plane, and erect it at right angles by the fix o'clock line *f e*; take the latitude of the place with the compasses, in the scale of latitudes, and for that extent from *e* to *i*, and from *e* to *h*, on the fix o'clock lines; then, taking the whole fix hours between the points of the compasses in the scale of hours, with that extent fet one foot in the point *i*, and let the other foot fall where it will upon the meridian line *f d*, and at *h*. Do the fame from *f* to *k*, and draw the right lines *i d* and *k h*, each of which will be equal in length to the whole fcale of hours. When this is done, fet one foot of the compaſſes in the beginning of the fcale at XII, and extending the other to each hour on the fcale, lay off thoſe extents from *d* to *f* for the afternoon hours, and from *h* to *f* for thoſe of the forenoon; and thus the lines *d e* and *h f* will be divided in the fame manner as the hour fcale is divided, at 1, 2, 3, 4, 5, and 6; on which the quarters may alſo be laid down, if required.

Then, laying a ruler on the point *f*, draw the firſt five hours in the afternoon from that point through the dots at the numeral figures 1, 2, 3, 4, 5, on the line *d e*, and continue the lines of III and V through the centre *c* to the other ſide of the *dial* for the like hours of the morning; that lay the ruler on the point *e*, and draw the laſt five hours in the forenoon through the dots 7, 8, 9, 10, 11, on the line *f h*; and continue the hour-lines of VII and VIII through the centre *c* to the other ſide, for the like hours of the evening; ſet the hours to the reſpective lines, and make the gnomon in the manner already directed for the *horizontal dial*.

An *east ſouth dial* may be made, by taking the co-latitude of the place from the ſcale of latitudes, and proceeding in all reſpects for the hour-lines, as in the *horizontal dial*, only reverſing the hours, as in *fig.* 15; and making the angle of the ſtyle's height equal to the co-latitude.

An *horizontal dial* may be eaſily deſcribed with only a line of chords, or a graduated quadrant of a circle. With any opening of the compaſſes, as ZL (*fig.* 12.) deſcribe the two ſemicircles LF, and LQ*d*, on the centres Z and *a*, where the ſix o'clock hour line croſſes the double meridian line, and divide each ſemicircle into twelve equal parts, beginning at L; then connect the diviſions, which are equidiſtant from L, by the parallel lines R*r*, IN, HO, GP, and FQ. Draw VZ for the hypothenuſe of the ſtyle, making the angle VZE equal to the latitude of the place; and continue the line VZ to R*r*. Draw the line R*r* parallel to the ſix o'clock line, and ſet off the diſtance *z* K from Z to V, the diſtances *z*I from Z to X, *z* H from Z to W, *z* G from *z* to Y, and *z* F from Z to Z. Then draw the lines X*x*, Y*y*, W*w*, X*x*, and V*y*, each parallel to R*r*. Set off the diſtance *z* Y from *z* to 11, and from *f* to 12, the diſtance *z* X from *z* to 12, and from *z* to 1; *z* W from *z* to 9, and from *r* to 3; *z* V from *z* to 8, and from *s* to 4; *z* S from *z* to 7, and from *t* to 5. Then laying a ruler to the centre *z*, draw the forenoon hour-lines through the points 11, 10, 9, 8, 7, and laying it to the centre *z*, draw the afternoon lines through the points 1, 2, 3, 4, 5, continuing the forenoon lines of VII and VIII through Z, to the oppoſite ſide of the *dial*, for the like afternoon hours; and the afternoon lines III and V through *z* for the like morning hours. Set the hours to the lines, and erect the ſtyle, and the *dial* is compleat.

A *ſouth dial* may be conſtructed in the ſame manner, by drawing the line VZ to make an angle with the meridian ZL, equal to the co-latitude of the place, &c. inverting the hours, as in *fig.* 15. Ferguſon, ubi ſupra.

DIAL, *vertical*, is that drawn on the plane of a vertical circle. See VERTICAL.

Of theſe there are ſeveral varieties, according to the vertical pitched upon. The verticals chiefly uſed, are the *prime vertical*, and the *meridian*; from which reſpectively ariſe, *ſouth, north, eaſt*, and *weſt dials*.

Dials which reſpect the cardinal points of the horizon, are particularly called *direct dials*. See DIRECT.

If any other vertical be choſen, the *dial* is ſaid to decline. Further, if the circle, whoſe plane is uſed, be perpendicular to the horizon, as is ſuppoſed to be the caſe in all thoſe now mentioned, the *dials* are particularly denominated *erect*. E. g. *erect ſouth, erect weſt*, &c.

Otherwiſe, the plane being oblique to the horizon, they are ſaid either to *decline, or recline*.

DIAL, *ſouthern*, more peculiarly, an *erect direct ſouth* DIAL, is that deſcribed on the ſurface of the prime vertical circle, looking towards the ſouth.

Since the ſun juſt illumines the plane of the prime vertical looking ſouth, when, in its progreſs, he paſſes from the prime vertical to the meridian, or returns back from this to that; in which he is employed ſix hours before, and ſix after noon; a *ſouth dial* ſhews the hours from ſix in the morning to ſix at night.

DIAL, *to draw a vertical ſouth*. On the plane of the prime vertical looking ſouthwards, draw a meridian line A B (*fig.* 13), and taking the tangent of AC, at pleaſure, for the magnitude of the future gnomon, [illegible] angular, or an indefinite length C D; [illegible] gle CAD equal to the elevation of the [illegible] right line A D, meeting the perpendicular [illegible] D in the point D make the angle [illegible] equal to the elevation of the equator, and draw the right line DE cutting the meridian in E. Through E draw the right line GH, cutting the meridian AB at right angles. Make EB equal to ED, and with the radius deſcribe a quadrant BF. The reſt is performed as in *horizontal dials*, except that the hours of the afternoon are to be written on the right hand, and thoſe of the forenoon on the left; as may be conceived from the figure. Laſtly, in the point A fix an oblique ſtyle, in an angle equal to the elevation of the equator; or in C erect a perpendicular ſtyle, equal to CD; or, laſtly, a triangular plate ADE, upon AE, ſo as to be perpendicular to the plane of the *dial*.

Then will the ſhadow of any of theſe intexes touch the ſeveral hour-lines at their reſpective hours.

DIAL, *north, or erect direct north* DIAL, is that deſcribed on the ſurface of the prime vertical looking northwards. Since the ſun only illumines this ſurface, while he advances from the eaſt to the prime vertical, and proceeds from the ſame vertical to the weſt; and ſince he is in the prime vertical at ſix o'clock in the morning, and at ſix in the evening; a *north dial* ſhews the hours before ſix in the morning, and thoſe after ſix in the evening. And hence, as in autumn and winter-time, the ſun does not riſe before ſix, and ſet before ſix, in the evening, a *north dial* is of no uſe at thoſe times; but the ſame joined with a *ſouth dial* ſupplies the defect thereof.

DIAL, *to deſcribe a north erect dial*. Draw a meridian line E B, (*Tab. II. fig.* 14) and from A deſcribe a ſemicircle at pleaſure. At A make the angle DAU equal to the elevation of the equator, and from the point C, taken at pleaſure, erect a perpendicular CD, meeting AD in D. Make another angle, CDE, likewiſe equal to the elevation of the equator, and draw likewiſe a line DE, meeting AB in E; then take EB equal to ED, and through E draw GH, cutting AB at right angles; and from the centre B, with the radius EB, deſcribe a quadrant, which divide into ſix equal parts, through the two extreme diviſions draw lines from the centre B, viz. BA, and BG, meeting GH in A and G, and make IA equal to IE, and IH equal to IG; then applying a ruler to A and 6, and G, and again to I and 2, and H, draw the right lines A V, A IV, A VII, and A VIII. Laſtly, in A fix an oblique index AD, making an angle DAE, with a meridian line in the plane of the meridian, equal to the elevation of the equator; or a perpendicular index in C, equal to CD; or, inſtead of any index, a triangular plate EDA, on the meridian line EA, perpendicular to the plane of the *dial*.

Then will A IV, A V, A VI, be the hours of the forenoon; and A VII, A VII, and A VIII, thoſe of the afternoon; and, accordingly, will be pointed out by the ſhadow of the ſeveral indexes. Or elſe, in a *ſouth dial*, the hour lines IV and V, as alſo VII and VIII, beyond the line VI A VI, and the triangle [illegible] about its pole A, will A E fall directly [illegible] ſhewed; as is evident, a *north dial* is [illegible] ſaving what has been ſaid about writing [illegible]

To draw a weſtern ſouth or north DIAL. [illegible] Theſe only differ from the *horizontal dial*, in that the angle CAB is equal to the complement of the elevation of the pole of the place; ſo that the ſame analogy ſerves as for the horizontal one; only making the ſecond term the

complement of the elevation of the pole of the place. For the method of describing this *dial* by a globe, and by DIALLING *scales*, see *Horizontal* DIAL.

DIAL, *east, or erect direct east* DIAL, is that drawn on the plane of the meridian, looking to the east.

Since the sun only illumines the plane of the meridian looking eastward, before noon, an *east dial* can only shew the hours till twelve o'clock.

DIAL, *to describe an east*. On the eastern side of the plane of the meridian draw a right line AB (*Plate II. fig. IV.*) parallel to the horizon, and to this join AK, making with it an angle KAB, equal to the elevation of the equator: then, with the radius DE, describe a circle, and through the centre D draw EC perpendicular to AB, by which means the circle will be divided into four quadrants. Each of these quadrants subdivide into six equal parts. And from the centre D through the several divisions draw the right lines DIV, DV, DVI, DVII, DVIII, DIX, DX, DXI. Lastly, to D erect a style equal to the radius DE, perpendicular to the plane; or, on two little pieces perpendicularly fixed in EC, and equal to the same radius DE, fit an iron rod, parallel to EC.

Thus will each index at the several hours project a shadow to the respective hour lines IV, V, VI, &c.

DIAL, *west, or erect direct west* DIAL, is that described on the western side of the meridian.

As the sun only illumines that side of the plane of the meridian looking to the west after noon, a *west dial* can only shew the hours from noon to night.

This, therefore, joined with an *east dial*, shews all hours of the day.

DIAL, *to draw a west*. The construction is perfectly the same as that of an *east dial*, only that its position is inverted, and the hours are written accordingly.

DIAL, *polar*, is that described on a plane passing through the poles of the world, and the east and west points of the horizon. It is of two kinds; the first looking up towards the zenith, and called *upper*; the latter down to the nadir, called *lower*.

The *lower dial*, therefore, is inclined to the horizon in an angle equal to the elevation of the pole.

Since the polar plane PQQS (*fig. 18.*) equally passes through the east and west points Q and S, a quadrant of the equator is intercepted between them and the meridian; consequently the upper half is illumined by the sun from six in the morning to six at night; and the lower, from the same place in the morning, and from six in the evening at night. A *lower polar dial*, therefore, shews the hours of the morning from sun rise to six o'clock, and that of the evening, from six to sun set; and an *upper*, the hours from six in the morning to six in the evening.

DIAL, *to draw an upper polar*. Draw a right line AB (*fig. 18.*) parallel to the horizon; and if the place be impeccantile, find the meridian line CE. Divide CE into two equal parts, and through C draw a right line FG parallel to AB. Then, from the centre D, with the interval DE, describe a quadrant, which divide into six equal parts; and from the same centre D, through the several points of division, draw right lines, DI, DII, DIII, DIV, DV, and the interval EI, EII, EIII, EIV, EV, for all the contrary way, viz. EXI, EX, EIX, EVIII, and EVII. From the points V, IV, III, II, I, &c. raise perpendiculars meeting the line FG in the correspondent points. Lastly, in D erect a perpendicular style equal to DE, or on two equal pieces, E and C, fix a cross iron rod.

Then will XII XII, I I, II II, III III, &c. be hour-lines, to be pointed out at the proper times by the shadow of the index.

DIAL, *an upper polar*, only differs in situation, and the manner of writing the hours, from *east* and *west dials*, joined together in the line of six o'clock.

DIAL, *a lower polar*, is that by pointing out the hours of the forenoon, IX, X, and XI, and those of the afternoon I, II, and III, with the corresponding XII itself; and only denoting the hours VII and VIII of the morning, and IV and V in the evening.

To make three DIALS *on three different planes, so that they may all form the sum of the day to one gnomon.* On the flat board ABC (*fig. 19.*) describe an horizontal *dial*, with its gnomon FGH, the edge of the shadow of which shews the time of the day. To this horizontal board join the upright board EDC, touching the edge GH of the gnomon; then making the top of the gnomon at G the centre of the vertical south *dial*, describe it on the board EDC. Besides, on a circular plate IK describe an equinoctial *dial*, and by a fine cut in the XII o'clock line, from the edge to the centre, put it on the gnomon FG as far as the slit will admit. The same gnomon will shew the same hour on each of those *dials*.

To draw all the previous DIALS *on the same block or post.* 1. Let the plane ABCD (*fig. 20.*) in the proper position of the block, be supposed horizontal; and thereon describe an *horizontal dial*. See *Horizontal* DIAL.

2. Draw the right lines EM and FL parallel to DC, which, accordingly, in the proper position of the block will be parallel to the horizon: then let the plane EMMC make an angle with EM, equal to the elevation of the pole CME, and thereon describe an *upper polar dial*.

3. Let the opposite plane, ADE, make with EM an angle, DEM, equal to the elevation of the equator; and on this draw an *upper equinoctial dial*.

4. Let the plane, KLHI, make with FL an angle HLF, equal to the elevation of the equator; and on this describe a *lower equinoctial dial*.

5. Let the opposite plane, FG, make with FL an angle GFL, equal to the elevation of the pole; and here draw a *lower polar dial*.

6. Let the plane MNKL, and the opposite one, EF, be perpendicular to FL; and on that draw a *south dial*, and on this a *north one*.

7. On the plane EMLF describe a *west dial*; and on the opposite plane an *east dial*.

If, then, the block be so placed, as that the plane MNKL, looks to the south, and the plane of the meridian intersect it in the line of 12 o'clock in the *horizontal dial* ABCD, and *south dial* MNKL, all the hours of the day will be indicated by several planes at once.

DIALS, *declining*, are all those drawn on the planes of other circles, beside the horizon, prime vertical, equinoctial, and polar circles; or those which either decline, incline, recline, or direct-incline.

DIALS, *declining*, are erect or vertical *dials*, which decline from any of the cardinal points; or they are such as cut either the plane of the prime vertical, or of the horizon, at oblique angles.

The use of *declining dials* is very frequent, as the walls of houses, whereon *dials* are usually drawn, commonly deviate from the cardinal points.

Of *declining dials* there are several kinds, which are denominated from the cardinal points, which they seem most to respect, but from which they have a real declination: *decliners from the south*, and *from the north*, and even *from the zenith*.

To draw a vertical declining DIAL *trigonometrically.*

1. The declination of the plane, and the elevation of the pole of the place, being given; to find the angle formed in the centre of the *dial*, by the meridian and subtilyle.

Canon. As the whole sine is to the tangent of the complement of the height of the pole of the place GF (*fig. 21.*) so is the sine of the angle of the declination of the plane GFD, to the tangent GD, of the angle required GAD.

2. The declination of the plane being given, and the elevation of the pole of the place, to find the angle formed in the centre of a *vertical declining dial*, by the subtilyle and axis.

Canon. As the whole sine is to the sine of the complement of the elevation of the pole GF, so is the sine of the complement of the declination of the plane DGF, to the side DF, the sine of the angle DAB required.

3. The declination of the plane, and the elevation of the pole, given; to find the difference of longitudes, that is, the arch of the equator, comprehended between the meridian of the place and the meridian of the plane.

Canon. As the whole sine is to the sine of the height of the pole of the place, so is the tangent of the complement of the declination of the plane, to the tangent of the complement of the difference of longitudes.

4. The angle of the difference of longitudes, and that of the axis, with the subtilyle, being given; to find the angles formed in the centre of a *vertical declining dial*, between the subtilyle and hour-lines.

This problem admits of three cases, for the hour-lines, whose angles are sought, may be either, 1. Between the meridian and subtilyle; or, 2. Beyond the subtilyle; or, 3. On that side the meridian where the subtilyle is not. In the two first cases, the difference is to be taken between the sun's distance from the meridian first hour, and the angle of the difference of longitudes found by the last problem, and in the third case, the sum of those two angles is to be taken, and the following canon used.

Canon. As the whole sine is to the sine of the angle between the axis and subtilyle, so is the tangent of the difference of the sun's distance from the meridian, and the difference of longitudes, or of the sum of those two angles, to the tangent of the angle required.

5. The angle formed by the subtilyle, with the hour-lines, and that of the subtilyle, with the meridian, given; to find the angles formed between the meridian and hour-lines in the centre of *vertical declining dials*.

1. The angles of the hour-lines between the meridian and subtilyle are found by subtracting the angle formed by the subtilyle with the hour-line, from the angle formed by the subtilyle with the meridian.

2. The angles beyond the subtilyle, and on the side opposite

posite to that of the meridian, are found by adding those two angles.

3. Those on the other side the meridian are found by taking their difference.

To describe a vertical DIAL, *declining from the south to the east or west, geometrically.* Find the declination of the plane, as already taught, under the article DECLINATOR. Then draw upon a paper an *horizontal dial*, supposing the line of contingency of the horizontal with the equinoctial plane to be GH (*fig.* 22.) through the point E, wherein the meridian line AE cuts the same; draw a right line IK, making with GH an angle HEK, equal to the declination of the given plane. Thus, as GH represents the intersection of the prime vertical with the horizon, IK will be the intersection of the declining plane, and the horizon; whence we also conceive, that the part IE must be raised above GE, in case the given plane decline to the west, or it must be depressed below the same GE, in case it decline to the east. Draw a right line parallel to the horizon on the given plane, or wall, to answer to IK; and, assuming a point therein answering to E, set off from the right line IK on the paper the several hour-y distances E 1, E 2, E 3, &c. Then from the point E erect a perpendicular EC, equal to the distance of the centre of the *horizontal dial*, from its line of contingency. Draw lines thence to the several points of the hour-lines E 1, E 2, E 3, &c. let fall a perpendicular AD, from the centre of the *horizontal dial* A, to the line of contingency IK, and transfer the distance ED, from the point E upon the wall, then will CB be the substyle sought.

Whereunto joining AD and DC at right angles, the hypothenuse AC will be an oblique index, to be fastened on the wall in the point C, according to the angle DCA.

To construct a vertical DIAL, *declining from the south towards the east or west, by the globe.* Elevate the pole to the latitude of the place, and screw the quadrant of altitude to the zenith. If the wall declines towards the east, count the number of declination in the horizon from the east point towards the north, and bring the hours end of the quadrant to that degree of declination, or which the reckoning ends. Then bring the meridian, (e. g. the first meridian) directly under the graduated edge of the upper part of the brazen meridian, and set the hour index to XII at noon. Turn the globe eastward on its axis, the quadrant of altitude being kept to the degree of declination in the horizon, and observe the degrees cut by the first meridian in the quadrant of altitude, counted from the zenith, as the hour index comes to XI. X, IX, &c. in the forenoon; and the degrees, thus cut in the quadrant by the first meridian, are the respective distances of the forenoon hours from XII on the plane of the *dial*. For the afternoon hours, turn the quadrant of altitude round the zenith till it comes to the degree in the horizon opposite to that where it was placed before, or as far from the west point towards the south, as it was at first from the east towards the north; and turn the globe westward on its axis, till the first meridian comes to the brazen meridian, and the hour index to XII, then turning the globe westward to the afternoon hours I, II. III. &c. the first meridian will cut the quadrant of altitude in the respective number of degrees from the zenith, that each of those hours is from XII on the *dial*; and the limit of this *dial* will be determined by the hour index, when the first meridian goes off the quadrant at the horizon, both in the forenoon and afternoon. Lay down those hour distances on the *dial* plane, either by dividing a semicircle into two quadrants, beginning at the hour line of XII, or by the line of chords, as directed under *horizontal* DIAL. As the SUBSTYLE makes an angle with the meridian line in this kind of *dials*, falling among the forenoon hour-lines in an east decliner, and among those in the afternoon in a *dial* declining towards the west, its distance may be found in the former, by counting the degrees of the declination of the *dial* in the horizon from the east point towards the north, and bringing the lower end of the quadrant of altitude to that degree of declination where the reckoning ends; then turn the globe till the first meridian cuts the brazen in the like number of degrees, counted from the south point toward the east; and the quadrant and first meridian will cross one another at right angles, and the number of degrees of the quadrant intercepted between the first meridian and the zenith, is equal to the distance of the substyle line from the 12 o'clock line; and the number of degrees of the first meridian, which are intercepted between the quadrant and the north pole, is equal to the elevation of the style above the plane of the *dial*. If the *dial* declines westward from the south, count the declination from the east point of the horizon towards the south, and bring the quadrant of altitude to the degree in the horizon at which the reckoning ends; both for finding the forenoon hours, and distance of the substyle from the meridian; and for the afternoon hours bring the quadrant to the opposite degree in the horizon, as far from the west towards the north; and then proceed as above. A north *dial* declining east or west by the same number of degrees may be easily had from the former, by only extending the hour-lines, style, and substyle, quite through the centre; for thus the south-east decliner will produce the north-west decliner, and the south-west decliner the north-east decliner. Ferguson, &c. &c.

To draw a vertical DIAL, *declining from the north towards the east and west.* Take the declination of the plane, as already taught; then, as *north dials* are only *south dials* inverted, draw a *vertical dial* declining from the south, and invert it in such a manner, as that the centre C looks to the horizon, and the point E to the zenith; and the hours on the right hand fall to go towards the left, and contrariwise, omitting all hour-lines, which in such a place cannot be shewn.

For the practice, the best way is, after drawing a south declining upon paper, to prick the several points through with a pin; then applying the face of the paper to the wall, the back side thereof will shew you all the points necessary for the *north declining dial*.

DIAL, *horizontal*, are those drawn on planes not erect, but inclining, or leaning towards the south, or southern line of the horizon, in an angle [illegible] less than the equinoctial plane.

Such an inclined plane may be [illegible] one part of the plane of the equator between the zenith, and the other depressed toward the nadir; and that to revolve upon a line drawn from the east to the west points of the horizon.

DIAL, *to draw an inclined*. 1. The inclination of the plane, as DC (*fig.* 23.) being found by a declinator, as taught under DECLINATOR; if it fall between the equinoctial plane CE, and the vertical one CD, in such manner as that the angle of inclination DCA is greater than the elevation of the equator ECA, on the upper side draw a *north dial*, and on the lower a *south dial*, to an elevation of the equator, which is equal to the aggregate of the elevation of the equator of the given place, and the complement of the inclination to a quadrant.

2. If the inclined plane CF fall between the horizontal one CA, and the equinoctial CE, so as that the angle of inclination FCA, is less than the elevation of the equator ECA, describe an *horizontal dial* to an elevation of the pole, equal to the aggregate of the elevation of the pole of the given place, and the inclination of the plane. *Dials*, thus inclined, are drawn after the same manner as *primary dials*; except, that the index in the former case must be fitted under the angle ADC, and in the latter, under the angle BFC; and that the distance of the centre of the *dial* from the line of contingency, in the former case, is DC, and in the latter FC.

DIAL, *reclining*, are those drawn on planes not erect, but reclined, or leaning backwards from the zenith towards the north, in an angle greater or less than the polar plane.

A *reclined* plane may be conceived by supposing one part of the polar plane raised towards the zenith, and the other depressed towards the nadir; and thus revolving about a line drawn from east to west. To find the declination of a plane, see RECLINATORY.

DIAL, *to draw a reclining*. 1. If the *reclined* plane HC fall between the vertical plane EC, and the polar plane IC, so as that the angle of reclination HCI is less than the distance of the pole from the zenith ECI, draw as two vertical *posts* and *north dials* to an elevation of the equator, equal to the difference between the elevation of the equator of the given place, and the angle of reclination.

2. If the reclined plane, as KC, fall between the polar plane IC, and the horizontal one GC, so as that the angle of reclination BCK is greater than the distance of the pole from the zenith ICB, describe an *horizontal dial* thereon to an elevation of the pole, equal to the difference between the angle of reclination, and the elevation of the equator of the given place.

To draw inclining and reclining DIALS *respectively*. The inclination and declination of the plane, and the elevation of the pole, being known, to find the angles made in the centre of an *inclining* or *reclining dial*, by the meridian and hour-lines.

Such *dials* properly an *horizontal dial*, [illegible] to the particular elevation of the pole on [illegible] *dial*. Its angles, therefore, are found by [illegible] down for *horizontal dials*.

As to the elevation of the pole on the [illegible] thus found; the plane being inclined, [illegible] is greater than the elevation of the [illegible] place, or less, or it is equal thereto. In the two first cases, for upper *posts*, or lower *north dials*, the particular elevation of the pole on the plane is had by taking the difference between the elevation of the pole of the place, and the [illegible]

inclination of the plane; and in the latter case, the *dial* is a *polar dial*, wherein the hour-lines will be parallel, by reason that the plane being placed on the axis of the world, neither of the poles can be represented thereon.

For upper *north*, and lower *south dials*. 1. If the inclination be greater then the complement of the elevation, the complement of the inclination muſt be added to the complement of the elevation. 2. If it be leſs, the inclination muſt be added to the elevation. 3. If it be equal, the *dial* will be an *equinoctial dial*, wherein the angles at the centre will be equal to the ſun's diſtance from the meridian.

DIALS, *declining*, are thoſe which both *decline* and *incline*, or *recline*. See DECLINERS.

The uſe of *inclined*, *reclined*, and eſpecially *declined dials*, is very rare; the geometrical and trigonometrical conſtruction of theſe laſt, therefore, as being ſomewhat intricate, we here chooſe to omit, and refer ſuch as may have a fancy for ſuch a *dial*, to an univerſal mechanical method of drawing all kinds of *dials* here ſubjoined.

An eaſy method to deſcribe a DIAL *on any kind of plane, by means of an equinoctial* DIAL, *or circle.* Suppoſe, e. gr. a *dial* required on an horizontal plane: if the plane be immoveable as ABDC (*Tab.* II. *fig.* 24.) find a meridian line GF; or, if moveable, aſſume the meridian at pleaſure. Then, by means of the triangle EKF, whoſe baſe is applied on the meridian line, raiſe the equinoctial *dial* H, till the index GI becomes parallel to the axis of the world (which is had, if the angle KEF be equal to the elevation of the pole), and the 12 o'clock line on the *dial* hang over the meridian line of the plane, or the baſe of the triangle. If then, in the night-time, a lighted candle be ſucceſſively applied to the axis GI, ſo as the ſhadow of the index, or ſtyle GI, fall upon one hour-line after another; the ſame ſhadow will mark out the ſeveral hour-lines on the plane ABCD.

Noting the points, therefore, on the ſhadow, draw lines through them to G; then an index being fixed in G, according to the angle IGF, its ſhadow will point out the ſeveral hours by the light of the ſun.

If a *dial* were required on a vertical plane, having raiſed the equinoctial circle, as above directed, puſh forward the index GI, till the top thereof, I, touch the plane.

If the plane be *inclined* to the horizon, the elevation of the pole ſhould be found on the ſame; and the angle of the triangle KEF ſhould be made equal thereto.

See a new method of conſtructing *ſun-dials*, for any given latitude, without the aſſiſtance of dialling ſcales, or logarithmic calculations, by Mr. Ferguſon, in the Phil. Tranſ. vol. lvii. for 1767. art. 36. and in his Select Exerciſes, p. 95.

Note, Beſide the ſeveral ſpecies of dials above mentioned, which are ſaid to be *with centres*, there are others called *dials without centres*. See CENTER *of a Dial*.

DIALS *without centres*, are thoſe whoſe hour-lines do really converge, but ſo ſlowly, that the centre towards which they converge cannot be expreſſed on the given plane.

DIALS, *horizontal*, *without centres*, are to be made for places, the elevation of whoſe pole is either very ſmall, or very great.

DIALS, *vertical*, *without centres*, are for places, the elevation of whoſe pole is very great.

DIALS, *for the furniture of*. See FURNITURE.

DIAL, *quadrantal*. See *Horizontal* QUADRANT.

DIAL, *reflecting*. See REFLECTING *Dial*.

DIAL, *cylindric*, is repreſented in *Tab.* III. *fig.* 27. This *dial* may be delineated on paper, and then paſted round a cylinder of wood, and it will ſhew the time of the day, the ſun's place in the ecliptic, and his altitude at any time of obſervation. Draw the right line *a* AB (*fig.* 28.) parallel to the top of the paper, and with any opening of the compaſſes on the centre *a* deſcribe the quadrant AE, and graduate it. Draw the right line AC at right angles to *a* AB, and touching the quadrant AE at the point A. From the centre *a* draw right lines through as many degrees of the quadrant as are equal to the ſun's altitude at noon, on the longeſt day of the year, at the place for which the *dial* is to ſerve; which altitude at London is nearly 62 degrees; continue theſe right lines till they meet the tangent line AC; and from the points of concourſe, draw ſtraight lines across the paper, parallel to the firſt right line AB, and theſe will be the parallels of the ſun's altitude in whole degrees, from ſun-riſe to ſun-ſet, on all the days of the year. Theſe parallels of altitude muſt be drawn out to the right line BD, which muſt be parallel to AC, and as far from it as is equal to the intended circumference of the cylinder on which the paper is to be paſted. Divide the ſpace between the right lines AC and BD, at top and bottom, into twelve equal parts, for the twelve ſigns of the ecliptic; and from one mark to the oppoſite one, draw right lines parallel to AC and BD; and place the characters of the twelve ſigns in the twelve ſpaces, at the bottom, beginning with ♑ Capricorn, and ending with ♓ Piſces. Theſe ſpaces ſhould likewiſe be divided by parallel lines into halves and quarters. At the top of the *dial* make a ſcale of the months and days of the year, ſo that the days may ſtand over the ſun's place, found in an Ephemeris, for each of them in the ſigns of the ecliptic. Compute the ſun's altitude for every hour, in the latitude of your place, or take it from a table, ſuch as that ſubjoined, when he is in the beginning, middle, and end of each ſign of the ecliptic; and in the upright parallel lines, at the beginning and middle of each ſign, make marks for theſe altitudes among the horizontal parallels, reckoning downward in the order of the numeral figures at the right hand, anſwering to the like diviſions of the quadrant at the left. Through theſe marks draw the curve hour-lines, and ſet the hours to them, as in the figure, reckoning the forenoon hours downward, and the afternoon hours upward. The ſun's altitude may alſo be taken and ſaid down for the half hours and quarters. Then cut off the paper at the left hand, on which the quadrant was drawn, cloſe by the right line AC, and all the paper at the right hand cloſe by the right line BD, and cut it alſo cloſe by the top and bottom horizontal lines, and it will be fit for paſting round the cylinder. This cylinder, (*fig.* 27.) is hollow for holding the ſtyle DE, when it is not uſed. The ſtyle muſt ſtand out, perpendicular to the ſide of the cylinder, juſt over the right line AB (*fig.* 28.) where the parallels of altitude begin, and its length, or diſtance of the point *e* from the cylinder muſt be equal to the radius *a* A of the quadrant AE (*fig.* 28.) When this *dial* is uſed, the horizontal foot BC is placed on a level table, or hung by the ring F, where the ſun ſhines, and the horizontal top AD, which is made moveable, is turned till the ſtyle ſtands juſt over the day of the month. Then the cylinder is turned round, till the ſhadow of the ſtyle falls upon it, parallel to the upright lines which divide the ſigns; or till the ſhadow is parallel to a ſuppoſed axis in the middle of the cylinder's and then the point, or loweſt end of the ſhadow, will fall upon the time of the day, as it is before or after noon, among the curve hour-lines, and will ſhew the ſun's altitude at that time among the croſs parallels of altitude, encompaſſing round the cylinder; and it will alſo ſhew in what ſign of the ecliptic the ſun is at that time, and the degree may be nearly eſtimated by the eye. Ferguſon.

A TABLE ſhewing what altitude the ſun ſhall have at every hour, half, and quarter of the day, at his entrance into every one of the twelve Signs.

Calculated for the latitude of *London*, 51 deg. 32 min.

IV.	1	11												

When the sun is in the equinoctial, and has no declination, his altitude may be easily found by the following proportion. As radius is to the cosine of the latitude, so is the cosine of the hour from noon to the sine of the altitude: but if he has north or south declination, say, as radius is to the sine of the declination, so is the sine of the latitude to the sine of the sun's altitude at six o'clock. For the sun's altitude at other hours the two following proportions must be used, viz. 1. As the cosine of the hour from the meridian to radius, so is the tangent of the latitude to the tangent of a fourth arc, from which the declination is to be subtracted, when north, and to which it is to be added, when south, for a fifth arc. The supplement of the sun's declination, added to the fourth arc, must be used for this fifth arc, when they exceed a quadrant, in finding the altitudes before and after six.

2. As the sine of the fourth arc is to the cosine of the fifth arc, so is the sine of the latitude of the place to the sign of the altitude for the given hour and declination.

The altitude in the middle of a sign may either be had by taking the arithmetic mean between the next greatest and least, or by computation, in the manner above directed. Leybourn's Dialling, Tract vi. p. 23, &c.

To find the altitude by the globe, see GLOBE.

DIAL, *portable, on a card*, is represented in *fig.* 29. and may be easily constructed. Draw the occult line AB (*fig.* 30.) parallel to the top of the card, and cross it at right angles with the six o'clock line ECD; then upon C, as a centre, with the radius CA, describe the semicircle AEL, and divide it into twelve equal parts, beginning at A, as Ar, As, &c. and from these points of division draw the hour-lines *r*, *s*, *t*, *u*, *w*, and *x*, all parallel to the six o'clock line EC. If each part of the semicircle be subdivided into four equal parts, they will give the half-hour lines and quarters, as in *fig.* 30.

Draw the right line ASD, making the angle SAB equal to the latitude of the place. Upon the centre A describe the arc RST, and let off upon it the arcs SR and ST, each equal to 23½ degrees, for the sun's greatest declination, and divide them into 23½ equal parts, as in *fig.* 29. Through the intersection D of the lines ECD and ADS, draw the right line FDG at right angles to ADS. Lay a ruler to the points A and R, and draw the line ARF through 23½ degrees of south declination in the arc SR; and then laying the ruler to the points A and T, draw the line ATG through 23½ degrees of north declination in the arc ST; so shall the lines ARF and ATG cut the line FDG in the proper length for the scale of months. Upon the centre D, with the radius DF, describe the semicircle FoG, which divide into six equal parts Fm, *mn*, *no*, &c. and from these points of division draw the right lines *mb*, *ni*, *pb*, and *qi*, each parallel to *o*D. Then setting one foot of the compasses in the point F, extend the other to A, and describe the arc AzH for the tropic of ♑; with the same extent, setting one foot in G, describe the arc AEO for the tropic of ♋. Next setting one foot in the point *b*, and extending the other to A, describe the arc ACI for the beginnings of the signs ♒ and ♌; and with the same extent, setting one foot in the point *i*, describe the arc AN for the beginnings of the signs ♓ and ♍. Set one foot in the point *i*, and having extended the other to A, describe the arc AK for the beginnings of the signs ♈ and ♎; and with the same extent set one foot in *b*, and describe the arc AM for the beginnings of the signs ♉ and ♏. Then setting one foot in the point D, and extending the other to A, describe the curve AL for the beginnings of ♈ and ♑; and the signs will be finished. This done, lay a ruler from the point A over the sun's DECLINATION in the arc RST, found by a table, for every fifth day of the year; and where the ruler cuts the line FDG, make marks, and place the days of the months right against these marks, as in *fig.* 29. Lastly, draw the shadow line PQ parallel to the occult line AB; make the gnomon, and set the hours to their respective lines, as in *fig.* 29. and the dial will be finished.

The lines *ad*, *ab*, and *bc*, of the gnomon, must be cut quite through the card: and as the end *ab* of the gnomon is raised occasionally above the plane of the *dial*, it turns upon the uncut line *cd* as on a hinge. The dotted line AB must be slit quite through the card, and the thread C must be put through the slit, and have a knot tied behind, to keep it from being easily drawn out. On the other end of this thread is a small plummet D, and on the middle of it a small bead for shewing the hour of the day.

To rectify this *dial*, set the thread in the slit right against the day of the month, and stretch the thread from the day of the month over the angular point, where the curve lines meet at XII; then shift the bead to that point on the thread, and the *dial will be rectified*.

To find the hour of the day, raise the gnomon, and hold the edge of the *dial* next the gnomon towards the sun, so that the uppermost edge of the shadow of the gnomon may just cover the shadow line; and the bead then playing freely on the face of the *dial*, by the weight of the plummet, will shew the time of the day among the hour-lines, in the forenoon or afternoon.

To find the time of sun-rising and setting, move the thread among the hour-lines, until it either covers some one of them, or lies parallel betwixt any two; and then it will cut the time of sun-rising among the forenoon hours, and of sun setting among the afternoon hours for that day of the year to which the thread is set in the scale of months.

To find the sun's declination, stretch the thread from the day of the month over the angular point at XII, and it will cut the sun's declination, as it is north or south, for that day, in the proper scale.

To find on what day the sun enters the signs; when the bead, as above rectified, moves along any of the curve lines which have the signs of the zodiac marked upon them, the sun enters those signs on the days pointed out by the thread in the scale of months.

DIAL, *universal, on a plain cross*, is represented by *fig.* 31. and is moveable on a joint C, for elevating it to any given latitude on the quadrant Ca or Cb, and upon the horizontal board A. The arms of the cross form right angles to the middle part; and the top of it, from *a* to *u*, is of equal length with any of the arms *ue* or *ua*.

This *dial* is rectified, by setting the middle line *tu* to the latitude of the place on the quadrant, the board A level, and the point N northward by the needle; thus, the plane of the cross will be parallel to the plane of the equator. Then from III o'clock in the morning till VI, the upper edge *bi* of the arm *ie* will cast a shadow on the time of the day on the side of the arm *em*; from VI till IX, the lower edge *i* of the arm *ie* will cast a shadow on the hours, on the side *eq*. From IX in the morning to XII at noon, the edge *ab* of the top part *au* will cast a shadow on the hours on the arm *ne*; from XII to III in the afternoon, the edge *cd* of the top part will cast a shadow on the hours of the arm *hm*; from III to VI in the evening, the edge *gh* will cast a shadow on the hours on the part *pq*; and from VI till IX, the shadow of the edge *ef* will shew the time on the top part *ou*. The breadth of each part *ab*, *ef*, &c. must be so great, as never to let the shadow fall quite without the part or arm on which the hours are marked, when the sun is at his greatest declination from the equator.

To determine the breadth of the sides of the arms which contain the hours, so as to be in just proportion to their length; make an angle ABC (*fig.* 32.) of 23½ degrees, which is equal to the sun's greatest declination; and suppose the length of each arm, from the side of the long middle part, and also the length of the top part above the arms, to be equal to B*d*. Then, as the edges of the shadow, from each of the arms, will be parallel to B*e*, making an angle of 23½ degrees with the side B*d* of the arm, when the sun's declination is 23½°, it is plain, that if the length of the arm be B*d*, the least breadth that it can have, to keep the edge B*e* of the shadow B*egd* from going off the side of the arm *de* before it comes to the end of it *ed*, must be equal to *ed* or *d* B. But, in order to keep the shadow within the quarter divisions of the hours, when it comes near the end of the arm, the breadth of it should be still greater, so as to be almost doubled, on account of the distance between the tips of the arms.

The hours may be placed on the arms, by laying down the cross *abed* (*fig.* 33.) on a sheet of paper; and with a black-lead pencil, held close to it, drawing its shape and size on the paper. Then take the length *ae* in the compasses, and with one foot in the corner *a*, describe with the other the quadrant *ef*. Divide this arc into six equal parts, and through the points of division draw right lines *ag*, *ah*, &c. continuing three of them to the arm *ec*, which are all that can fall upon it; and they will meet the arm in those points through which the lines that divide the hours from each other, as in *fig.* 31. are to be drawn right across it. Divide each arm, and the three hours contained in it, in the same manner; and set the hours to their proper places, on the inside of the arms as they are marked in *fig.* 33. Each of the hour spaces should be divided into four equal parts, for the half hours and quarters, in the quadrant *ef*; and right lines should be drawn through these division-marks in the quadrant, to the arms of the cross, in order to determine

ermine the places thereon, where the subdivisions of the hours must be marked.

This is a very simple kind of universal *dial*; it is easily made, and has a pretty uncommon appearance in a garden. Ferguson.

DIALS, *refractive*, are such as shew the hour by means of some *refracting* transparent fluid.

If a pin or stick be set up, or any point be assigned in a concave bowl or dish for the centre of the *dial*, let an horizontal dial be applied over the same, assigning the meridian line on the edges of the bowl, and marking out the rest of the hour-lines also on the edges of the bowl; take away the horizontal *dial*, and elevate a string or thread from the end of the said pin over the meridian line, as much as is the latitude or elevation of the pole of the place: then by bringing the thread to cast a shadow on any hour-point formerly marked out on the edges of the bowl, by a candle or the like, that shade in the bowl is the true hour-line; and if the bowl be full of water, &c. when this is done, it will never shew the true hour by the shadow of the top of the pin but when it is filled again with the same liquor.

DIAL, *ring*, is a kind of *dial*, usually small and portable, consisting of a brass ring or rim, seldom exceeding two inches in diameter, and one third of an inch in breadth. In a point of this rim there is a hole, through which the sun-beams being received, make a lucid speck on the concave part of the opposite semicircle, which gives the hour of the day in the divisions marked thereon.

These divisions are made by describing a circle (*Tab.* IV. *fig.* 34.) to represent the ring, and drawing an horizontal chord EF, with this as radius describe the quadrant FD, and graduate it; and through the several degrees which mark the sun's altitude for every hour at the time of the equinox, draw lines from E to the opposite part of the circle, and there set the corresponding figures. Thus the XII o'clock line will pass through 38° 38′, the co-latitude of the place; and the XI and I line through 36° 56′; the X and II through 32° 36′; the IX and III through 26° 57′; the VIII and IV through 18° 8′; and the VII and V through 9° 17′. This may be easily calculated by the globe; or see the preceding table.

But it only holds good about the times of the equinox. To have the *dial* perform throughout the whole year, the hole is made moveable, and the signs of the zodiac, or the days of the month, are marked on the convex side of the ring, by taking, e. g. ET and Et (*fig.* 34.) on each side of E equal to double the sun's declination when he enters any particular sign, as Taurus or Pisces; and there marking the character of the said sign, or corresponding month, and so for all the others; and by means of these the *dial* is rectified for the time. It is evident, from a view of the figure, that E XII δ is = FE XII = the altitude of the sun in the equinox; but T XII E is equal to the sun's declination in Taurus, because it is an angle in the circumference standing upon an arc, which is double the declination; and therefore T XII δ is equal to the meridian altitude when the sun enters Taurus; and a ray passing through the hole at T will mark the XII o'clock hour of that day: but this *dial* will not point out the other hours exactly; because T III *d* exceeds E III *d*, the equinoctial hour by the angle of declination; and so of the rest. Some have contrived to remedy this inconvenience, by making the concave surface of the ring wider, and describing upon it seven circles, the middle one to represent the equinoctial, and the extremes the tropics; and in these circles they have marked the forenoon and afternoon hours from a table of altitudes.

To use it, put the moveable hole to the day of the month, or the degree of the zodiac the sun is in; then suspending it by the little ring, turn it towards the sun, till his rays, as before, point out the hour among the divisions on the inside.

Universal or *æquinoctial Ring*-DIAL, is a ring-*dial* which serves to find the hour of the day in any part of the earth; whereas the former is confined to a certain latitude. Its figure fee represented in *Tab.* IV. *of Dialling*, *fig.* 35.

It consists of two rings or flat circles, from two to six inches in diameter, and their breadth, &c. proportionable. The outward ring A represents the meridian of any place you are at, and contains two divisions of 90° each, diametrically opposite to one another, serving the one from the equator to the north, the other to the south pole. The inner ring represents the equator, and turns exactly within the outer, by means of two pivots in each ring at the hour XII.

Across the two circles goes a thin regret or bridge, with a cursor C, that slides along the middle of the bridge. In the cursor is a little hole for the sun to shine through. The middle of this bridge is conceived as the axis of the world, and the extremities as the poles; and on the one side are drawn the signs of the zodiac, and on the other the days of the month. On the edge of the meridian slides a piece, to which is fitted a ring to suspend the instrument by.

In this *dial*, the divisions on the axis are the tangents of the angles of the sun's declination, adapted to the semi-diameter of the equator as radius, and placed on either side of the centre: but instead of laying them down from a line of tangents, a scale of equal parts may be made, whereof 1000 should answer exactly to the length of the semi-axis, from the centre to the inside of the equinoctial ring; and then 434 of these parts may be laid down toward each end from the centre, which would limit all divisions on the axis, because 434 is the natural tangent of 23° 29′. And thus, by a nonius fixed to the sliding-piece, and taking the sun's declination from an ephemeris, and the tangent of that declination from the table of natural tangents, the slider might be always set true within two minutes of a degree. And this scale of 434 equal parts might be placed right against the 23½° of the sun's declination, on the axis, instead of the sun's place, which is there of little use. For then the slider might be set in the usual way, to the day of the month, for common use; but to the natural tangent of the declination, when great accuracy is required.

Use of the universal Ring-DIAL. Place the line *a* (on the middle of the sliding-piece) over the degree of latitude of the place (e. gr. 51½° for London); put the line which crosses the hole of the cursor to the degree of the sign, or day of the month. Open the instrument so as that the two rings be at right angles to each other, and suspend it by the ring H, that the axis of the *dial*, represented by the middle of the bridge, may be parallel to the axis of the world. Then turn the flat side of the bridge towards the sun, so that his rays striking through the little hole in the middle of the cursor, may fall exactly on a line drawn round the middle of the concave surface of the inner ring; in which case the bright spot shews the hour of the day in the said concave surface of the ring. Note, the hour of XII is not shewn by this *dial*, because the outer circle being then in the plane of the meridian, hinders the sun's rays from falling on the inner; nor will this *dial* shew the hour when the sun is in the equinoctial, because his rays then fall parallel to the plane of the inner circle.

Nocturnal, or *Night*-DIAL, is that which shews the hours of the night.

Of this there are two kinds: *lunar* and *sidereal*.

Moon-DIAL, or *Lunar*-DIAL, is that which shews the hour of the night by means of the light, or shadow, of the moon, projected thereon from an index.

To describe a Moon-DIAL. Suppose, e. gr. an horizontal *moon-dial* required: draw, first, an horizontal *sun-dial*; then erect two perpendiculars, AB and CD (*Tab.* II. *fig.* 25.) to the line of XII o'clock; and, dividing the interval GF into twelve equal parts, through the several points of division draw lines parallel thereto: now, appropriating the first line CD to the day of the new moon, and the second to the day when the moon comes an hour later to the meridian than the sun; their intersections with the hour-lines will give points, through which to draw a curve line XII XII for the meridian-line of the moon. After the like manner determine the other hour-lines I I, II II, III III, &c. which the shadow of the moon, projected from the style of the *dial*, intersects at the respective hours; then blot out the hour-lines of the *sun-dial*, together with the perpendiculars whereby the lunar hours were drawn, and divide the interval GF, by other parallel lines, into fifteen equal parts, answering to the fifteen days between new and full moon: lastly, to these lines write the several days of the moon's age.

Now, the moon's age being learnt from a calendar, the intersection of the line of the moon's age with the lunar hour-lines, will give the hour of the night.

After the same manner may any other *sun-dial* be converted into a *moon-dial*.

To draw a portable Moon-DIAL. On a plane, that may be raised according to the elevation of the equator, describe a circle AB (*fig.* 26.) and divide its circumference into 29½ equal parts: from the same centre C describe another moveable circle DE, which divide into twenty-four equal parts, or hours; in the centre C erect an index, as for an equinoctial *dial*.

This *dial* being duly placed, after the manner of an equinoctial *dial*, and the XII o'clock line brought to the day of the moon's age; the shadow of the index will give the hour.

To use a Solar as a Lunar-DIAL, i.e. *to find the hour of the night by a* sun-dial. Observe the hour which the shadow of the index points at by moon-light; find the moon's age in the calendar, and multiply the number of days by $\frac{1}{2}$, the product is the number of hours to be added to the hour shewn by the shadow, to give the hour required:

quired: the reason of which is, that the moon comes to the same horary circle later than the sun by about three quarters of an hour every day; and at the time of new moon the solar and lunar hour coincide.

DIALS, *placing of*. Having prepared the plane on which the *dial* is to rest, the hour may be found with tolerable accuracy by a large equinoctial ring-*dial*, to which a watch is to be set; and then the *dial* may be fixed by the watch at leisure. But in order to have the time more exactly, the sun's altitude should be taken by a good quadrant, and the precise time of observation noted by a clock or watch: then the time should be computed for the observed altitude, and the watch set to agree with that time. Otherwise, take two equal altitudes of the sun in the same day in summer; one between seven and ten in the morning, the other between two and five in the afternoon; mark the moments of the two observations by a clock or watch; and if the watch shews the observations to be at equal distances from noon, it agrees exactly with the sun; if not, the watch must be corrected by half the difference of the forenoon and afternoon intervals; and then the *dial* may be set true by the watch. To find a meridian line, see MERIDIAN.

It is necessary to observe, that if a *dial* be made according to the strict rules of calculation, and truly set at the instant, when the sun is in the meridian, it will be a minute too fast in the forenoon, and as much too slow in the afternoon, by the shadow of the style: because the edge of the shadow that shews the time is even with the foremost edge of the sun in the forenoon, and with his hindmost edge in the afternoon, on the *dial*, whereas the sun's centre determines the time in the (supposed) hour circles of the heaven; and as the sun is half a degree in breadth, he takes two minutes to move through a space equal to his breadth; and there will be two minutes at noon in which the shadow will have no motion at all on the *dial*. It likewise appears, that if the *dial* be set true by the sun in the forenoon, it will be two minutes too slow in the afternoon; and *vice versâ*. The way of remedying this error, is to set every hour and minute division on the *dial* one minute nearer XII than the calculation requires. Ferguson's Tables and Tracts, p. 73. &c.

DIAL-*plane*, plain superficies, upon which the hour-lines of *dials* are drawn. See DIAL.

DIAL, *diurnal*. See NOCTURNAL.

DIAL, *tide*. See TIDE-*Dial*.

DIALECT, Διαλεκτος, from διαλεγομαι, *to discourse*, the peculiar language of some province, or part, of a nation, formed by corruption of the general, or national language.

Homer could speak five different languages in one verse, i. e. five *dialects*; viz. the Attic, Ionic, Æolic, the Doric, and the common *dialect* of the Greeks.

The Attic *dialect* is more particularly used by Xenophon and Thucydides; the Ionic by Herodotus and Hippocrates; the Doric by Pindar and Theocritus; the Æolic by Sappho and Alcæa, and often by the two former writers.

The Bolognese, Bergamasque, Tuscan, &c. are the *dialects* of the Italian: the Gascon, and Picard, are *dialects* of the French.

In Great Britain, almost every county has a *dialect* of its own; all differing considerably in pronunciation, accent, and tone, though the language be the same.

The method which the Gileadites took to prove the Ephraimites, by the pronunciation of *shibboleth*, with *sibboleth* or *semath*, is well known. Judges xii. 6.

DIALECTICA, DIALECTICS, Διαλεκτικη, the art of reasoning and disputing justly.

The word comes from the Greek διαλεγομαι, *I discourse*; formed of δια, and λεγω, *dico*, *I say*.

Zeno Eleates was the first who discovered the natural series of principles and conclusions observed in reasoning, and formed an art thereof, in form of a dialogue; which, for this reason, was called *Dialectica*.

The *Dialectica* of the ancients is usually divided into several kinds: the first was the *Eleatica*, that of Zeno Eleates, which was threefold; viz. *consecutionum*, *subquationum*, and *contentionum*. The first consisting of rules for deducing, or drawing conclusions: the second, the art of dialogue; which became of such universal use in philosophy, that all reasoning was called *interrogation*: then, syllogism being laid aside, the philosophers did all by dialogue; by laying on the respondent to conclude and argue from the several concessions made. The last part of Zeno's *Dialectica*, Epicrem, was contentious; or the art of disputing, and contradicting: though some, particularly Laertius, ascribe this part to Protagoras, a disciple of Zeno.

The second is the *Dialectica Megarica*, whose author is Euclid, not the mathematician, but another, of Megara. He gave much into the method of Zeno, and Protagoras; though there are two things appropriated to him, the first, that he impugned the demonstrations of others, not by assumptions, but conclusions; continually making illations, and proceeding from consequence to consequence; the second, that he set aside all arguments drawn from comparisons, of similitude, as invalid.

He was succeeded by Eubulides, from whom the sophistic way of reasoning is said to be derived. In his time the art is described as manifold: mendens, sorites, electra, obvelata, arcevalis, cornuta, and calva. See SOPHISM.

The third is the *Dialectics* of Plato, which he proposes as a kind of analysis, to direct the human mind by dividing, defining, and bringing things to the first truth; where being arrived, and stopping there a little, it applies itself to explain sensible things; but with a view to return to the first truth, where alone it can rest. Such is the idea of Plato's analysis.

The fourth is Aristotle's *Dialectics*, containing the doctrine of simple words, delivered in his book of Praedicaments; the doctrine of propositions, in his book De Interpretatione; and that of the several kinds of syllogism, in his books of Analytics, Topics, and Elenchuses.

The fifth is the *Dialectics* of the Stoics, which they call a part of philosophy, and divide into rhetoric, and *dialectic*; to which some add the definitive, whereby things are justly defined, comprehending, likewise, the canons, or criterions, of truth.

The Stoics, before they come to treat of Dialectics, have two principal places; the one, about the signification of words; the other, about the thing signified. On occasion of the first, they consider abundance of things belonging to the grammarian's province: what, and how many letters; what is a word, diction, speech, &c. On occasion of the latter, they consider things themselves, not as without the mind, but as in it, received in it by means of the senses. Accordingly, they first teach, that *nil fit intellectu, quod non prius fuerit in sensu*; whatever is in the mind, came thither by the senses; and that, *aut tuetur sese*, as Pluto, who meets the sight; *aut similitudine*, as Cæsar, by his effigy; *aut proportione*, either by enlarging, as a giant; or by diminishing, as a pigmy; *aut transpositione*, as a Cyclops; *aut compositione*, as a Centaur; *aut contrario*, as death; *aut privatione*, as a blind man.

The sixth is Epicurus's *Dialectics*. For though he seems to have despised *dialectic*, he cultivated it with vigour: he was only averse to that of the Stoics, who, he thought, attributed too much to it; as pronouncing him alone wise, who was well versed in *dialectics*. For this reason, Epicurus, seeming to set aside the common *dialectics*, had recourse to another way; viz. to certain canons, which he substituted in their stead, the collection whereof he called Canonica: and as all questions in philosophy are either *de re*, or *de voce*, he gave separate rules for each. See EPICUREANS.

DIALECTICAL *arguments*, in *Logic*, are such as are only probable, and do not convince, or determine, the mind absolutely to either side of the question.

DIALIA, in *Antiquity*, sacrifices performed by the *flamen dialis*, or priest of Jupiter.

It was not, however, of such absolute necessity, that the *Dialia* should be performed by the *flamen dialis*; but that others might officiate. We find in Tacitus, Annal. lib. ii. cap. 58. that if he were sick, or detained by any other public employ, the pontifices took his place.

DIALIS, in *Antiquity*, a Latin term, signifying somewhat that belongs to Jupiter.

The word is formed from Δις, the genitive of Ζευς, *Jupiter*.

DIALIS, *Flamen*. See FLAMEN.

DIALITHA, from δια and λιθος, *gem*, in the *Writings of the Ancients*, a word used to express the elegant ornaments of the Greeks and Romans, composed of gold and gems. They also called these διλιθωτα, cemented stones or gems, the gold being in this case, as a cement, to hold the stones together. They wore bracelets, and other ornamental things about their habits, thus made; and their cups and table furniture for magnificence treats were of this kind. The green stones were found to succeed best of all in these things; and the emerald and greenish topaz, or, as we call it, chrysolite, are most in esteem for this purpose. This use of the stone explains what Pliny very often says of them in his description: *Nihil jucundius auram decet: nothing becomes gold better.* This he says of the green topaz or chrysolite: and this, and many other like passages, have greatly perplexed the critics who did not hit upon this explication. The Latins called these *dialithæ*, *birbecilles*, and *aurum gemmatum*; and thus Martial, where he says *miratur Scythicus virentis auri flamma Jupiter*, alludes to cups of gold, ornamented with Scythian gems, that is, emeralds.

DIALIUM, in *Botany*, a genus of the *decandria monogynia* class;

clusi; the corolla has five petals, and there is no calyx. There is only one species.

DIALLACTERII, among the Athenians. See DIETETE.

DIALLELOS, Διαλληλος, in *Rhetoric*, a figure, wherein the words and meaning of a sentence are inverted. As *doctis diserite, diserte docteri*. Voss. Rhet. lib. v. p. 405.

DIALLING, the art of drawing sun, moon, and star-dials, on any given plane, or on the surface of any given body. See DIAL.

The Greeks and Latins call this art *gnomonica*, and *sciatherica*, because it distinguishes the hours by the shadow of a gnomon. Some call it *photo-sciatherica*, because the hours are sometimes shewn by the light of the sun. Lastly, others call it *horthographia*.

Dialling is wholly founded on the first motion of the heavenly bodies, and chiefly the sun; or rather on the diurnal rotation of the earth; so that the elements of spherics, and the spherical astronomy, should be mastered, before a person advances to the doctrine of *dialling*: the doctrine, or theory, we say for, as to the practice, or the operations themselves different from the demonstrations, nothing is more easy and obvious.

The principles of *dialling* may be easily deduced from the method already illustrated, of constructing *dials* by the globe. Or, they may be further explained, by supposing the whole earth *a P e s* (*Tab. IV. Dialling, fig.* 36.) to be transparent and hollow, like a sphere of glass, and its equator to be divided into twenty-four equal parts by so many meridian semicircles *a, b, c, d, e, f, g*, &c. one of which is the geographical meridian of any given place, as London, which is supposed to be at the point *a*; and if the hour of XII were marked at the equator, both upon that meridian and the opposite one, and all the rest of the hours in order on the other meridians, those meridians would be the hour circles of London; because, as the sun appears to move round the earth, which is in the centre of the visible heavens, in twenty-four hours, he will pass from one meridian to another in an hour. Then, if the sphere had an opake axis, as P E *s*, terminating in the poles P and *s*, the shadow of the axis, which is in the same plane with the sun and with each meridian, would fall upon every particular meridian and hour, when the sun came to the plane of the opposite meridian, and would consequently shew the time at London, and at all other places on the same meridian. If this sphere was cut through the middle by a solid plane A B C D in the rational horizon of London, one half of the axis E *f* would be above the plane, and the other half below it; and if straight lines were drawn from the centre of the plane to those points where its circumference is cut by the hour circles of the sphere, those lines would be the hour lines of an horizontal dial for London; for the shadow of the axis would fall upon each particular hour line of the dial, when it fell upon the like hour circle of the sphere. If the plane which cuts the sphere be upright, as A F C G (*fig.* 37.) touching the given place, e. g. London, at F, and directly facing the meridian of London, it will then become the plane of an exact direct south dial; and if right lines be drawn from its centre E, to those points of its circumference where the hour circles of the sphere cut it, these will be the hour lines of a vertical or direct south dial for London, to which the hours are to be set in the figure, contrary to those on an horizontal dial; and the lower half E *s* of the axis will cast a shadow on the hour of the day in this dial, at the same time that it would fall upon the like hour circle of the sphere, if the said plane was not in the way. If the plane, still facing the meridian, be made to incline, or recline, any given number of degrees, the hour circles of the sphere will still cut the edge of the plane in those points to which the hour lines must be drawn straight from the centre; and the axis of the sphere will cast a shadow on their lines at the respective hours. The like will still hold, if the plane be made to decline by any given number of degrees from the meridian towards the east or west; provided the declination be less than 90 degrees, or the reclination be less than the co-latitude of the place; and the axis of the sphere will be the gnomon; otherwise, the axis will have no elevation above the plane of the dial, and cannot be a gnomon.

Thus it appears, that the plane of every dial represents the plane of some great circle on the earth, and the gnomon the earth's axis; the vertex of a right gnomon the centre of the earth or visible heavens; and the plane of the dial is just as far from the centre as from the vertex of the axis. The earth itself, compared with its distance from the sun, is considered as a point; and therefore, if a small sphere of glass be placed upon any part of the earth's surface, so that its axis be parallel to the axis of the earth, and the sphere have such lines upon it, and such planes within it, as above described; it will shew the hours of the day as truly as if it were placed at the earth's centre, and the shell of the earth were as transparent as glass. Ferguson, ubi supra.

The first professed writer on *dialling*, is Clavius; who demonstrates all, both the theory, and the operations, after the rigid manner of the ancient mathematicians; but so intricately, that probably no body ever read them at all: Dechales, Ozanam, and Schotten, give much easier in their Courses, and Wolfius in his Elements. M. Picard has given a new method of making large dials, by calculating the hour lines; and M. de la Hire, in his Dialling, printed in 1683, a geometrical method of drawing hour lines from certain points, determined by observation. Eberhardus Walpertus, in 1625, published his Dialling, wherein he has laid down a method of drawing the primary dials on a very easy foundation. The same foundation is described at length by Sebastian Munster, in his Rudiments Mathematica, published in 1551. Stirmius, in 1672, published a new edition of Walpertus's Dialling, with the addition of a whole second part, about inclining, and declining dials, &c. In 1708, the same work, with Stirmius's additions, was republished with the addition of a fourth part, containing Picard's, and De la Hire's methods of drawing large dials, which makes much the best, and fullest book on the subject. Peterson, Michael, and Hutter, have each written on *dialling*, in the German tongue; Coetius, in his Horologiographia Plana, printed in 1669; Gaspensius, in his Gnomonica Mechanica; Leybourn, in his Dialling, 8vo; and Blon, in his Use of Mathematical Instruments. We have a treatise by Mr. Desaguliers, in 1746. Mr. Ferguson has also written on this subject in his Lectures on Mechanics.

DIALLING, *Cylinder, Universal*, is represented by *fig.* 38. A B C D is a glass cylindrical tube, closed at both ends with brass plates, in the centres of which a wire or axis E F G is fixed. The tube is either fixed to an horizontal board H, so that its axis may make an angle with the board equal to that which the earth's axis makes with the horizon of any given place, and be parallel to the axis of the world; or it may be made to move on a joint, and elevated for any particular latitude. The twenty-four hour lines are drawn with a diamond on the middle of the glass, equidistant from each other and parallel to the axis. The XII next B stands for midnight, and the XII next the board H for noon. When the axis of this instrument is elevated according to the latitude, and the board set level, with the line H N in the plane of the meridian, and the end N towards the north; the axis E F G will serve as a gnomon or stile, and cast a shadow on the hour of the day among the parallel hour lines, when the sun shines on the instrument. As the plate A D at the top is parallel to the equator, and the axis E F G perpendicular to it, right lines drawn from the centre to the extremes of the parallels will be the hour lines of an equinoctial dial, and the axis will be the stile. An horizontal plate *e f* put down into the tube, with lines drawn from the centre to the several parallels entering its edge, will be an horizontal dial for the given latitude; and a vertical plate *g e*, fronting the meridian and touching the tube with its edge, with lines drawn from its centre to the parallels, will be a vertical south dial: the axis of the instrument serving in both cases for the stile of the dials: and if a plate be placed within the tube, to serve decline, incline, or recline, by any given number of degrees, and lines be drawn, as above, a declining, inclining, or reclining dial will be formed for the given latitudes. If the axis with the several plates fixed to it be drawn out of the tube, and set up in such a plane in the same position as they were in the tube, A D will be an equinoctal dial, *e f* an horizontal dial, and *g e* a vertical south dial; and the time of the day will be shewn by the axis E F G. If the cylinder were wood, instead of glass, and the parallel lines drawn upon it in the same manner, it would serve to facilitate the operation of making these several dials. The upper plate with lines drawn to the several intersections of the parallels, which appear obliquely in *fig.* 38. would be an equinoctial dial as in *fig.* 39. and the axis perpendicular to it be its stile. An horizontal dial for the latitude of the elevation of the axis might be made, by drawing out the axis and cutting the cylinder, as at *e f g*, parallel to the horizontal board H; the section would be elliptic, as in *fig.* 40. A circle might be described on the centre, and lines drawn to the divisions of the ellipse would be the hour lines; and the wire put in its place again, as E, would be the stile. If this cylinder were cut by a plane perpendicular to the horizontal board H, or to the line S H N, beginning at *g*, the plane of the section would be elliptic, as in *fig.* 41. and lines drawn to the points of intersection of the parallels on its edge would be the hour lines of a vertical direct south dial, which

might be made of any shape, either circular or square; and F the axis of the cylinder would be its stile. Thus also inclining, declining, or reclining dials might be easily constructed, for any given latitude. Ferguson, ubi supra.

DIALLING *Globe*, is an instrument made of brass, or wood, with a plane fitted to the horizon, and an index; particularly contrived to draw all sorts of dials, and to give a clear exhibition of the principles of that art.

DIALLING *Lines*, or *Scales*, are graduated lines, placed on rules, or the edges of quadrants, and other instruments, to expedite the construction of dials.

The principal of these lines are, 1. A scale of six hours, which is only a double tangent, or two lines of tangents each of 45 degrees, jointed together in the middle, and equal to the whole line of lines, with the declination set against the meridian altitudes in the latitude of London, suppose, or any place for which it is made: the radius of which line of lines is equal to the *dialling lines* of six hours. 2. A line of latitudes, which is fitted to the hour scale, and is made by this canon; as the radius is to the chord of 90 degrees; so are the tangents of each respective degree of the line of latitudes, to the tangents of other arches: and then the natural sines of those arches are the numbers, which, taken from a diagonal scale of equal parts, will graduate the divisions of the line of latitude to any radius. The line of hours and latitudes is generally for pricking down all dials with centres. For the method of constructing these scales, see SCALE.

DIALLING *Sphere*, is an instrument made of brass, with several semicircles sliding over one another, on a moving horizon, to demonstrate the nature of the doctrine of spherical triangles, and to give a true idea of the drawing of dials on all manner of planes.

DIALLING, in a *Mine*, called also *Plumbing*, is the using of a compass (which they call *dial*), and a long line, to know which way the lead, or vein of ore inclines, or where to shift an air-shaft, or bring an adit to a desired place. See MINE, and PLUMBING.

DIALOGISM, *Διαλογισμος*, in *Rhetoric*, is used for the colloquy of persons deliberating with themselves. We have an instance of it in Virgil, where Dido says,

Et quid agam? ruebusne procos irrisa priores
Experiar? &c.

In which sense, it is distinguished from dialogue. Voss. Rhet. lib. v. p. 559. See DIALOGUE.

DIALOGISM is also taken in a more extensive sense for discourse in general, whether held by a person alone, or in company.

DIALOGUE, a conversation of two or more persons, real or feigned, either by word of mouth, or in writing. The word is formed from the Latin *dialogus*, of the Greek διαλογος, which signifies the same.

Dialogue is greatly recommended by many authors, and is the most ancient form of writing; and that wherein the first authors wrote most of their pieces. The archbishop of Cambray gives a fine account of the advantages of *dialogue*, at the head of his pastoral instruction. The sacred writers, and the fathers Athanasius, Basil, Chrysostom, &c. have used this mode of instruction.

Antiquity made use of *dialogue*, not only on humorous, and comical subjects, as Lucian did, but also on the most serious and abstract: such are the *Dialogues* of Plato, and those of Cicero, which turn altogether on subjects of philosophy, or politics. Among the moderns, the principal dialogists are M. de Fenelon, archbishop of Cambray; M. Pascbal, in his Provincial Letters; F. Bouhours, in his Entretiens d'Ariste, & d'Eugene; M. Fontenelle, in his Dialogues of the Dead, and Plurality of Worlds; Addison, Hurd, and Lord Lyttelton.

A *dialogue* consists of two parts, an introduction and the body of the discourse. The introduction acquaints us with the place, time, persons, and occasion of the conversation. However, the introduction ought not to be too long and tedious. Mr. Addison complains of this fault; for though, as he says, some of the finest treatises of the most polite Latin and Greek writers are in *dialogue*, as many very valuable pieces of French, Italian, and English appear in the same dress; yet in some of them there is so much time taken up in ceremony, that before they enter on their subject, the *dialogue* is half over. Dial. II. of Med. sp. init. As to the body of the discourse, care should be taken, to keep up a softness of character in the persons that are introduced through the whole of the *dialogue*: and the characters should be so discriminated, that it may be known from the words themselves, who is the speaker. The principal speaker should appear to be a person of great sense and wisdom, and intimate acquaintance with the subject; and he should be capable of fairly answering every question that may be asked, and every objection that may be started. In the whole discourse, all wrangling, peevishness, and obstinacy should be avoided; and nothing appear but good humour and good breeding, with a readiness to submit to conviction, as evidence presses it. Cicero has given us two characters of this kind in Crassus and Antony; from whom Mr. Addison seems to have taken his Philander and Cynthio, in his Dialogues on the Usefulness of Ancient Medals. If younger persons are introduced, they should rather inquire than dispute; and neither be too long nor too frequent in the questions they propose. Sulpitius and Cotta are made to sustain this character by Cicero, and Eugenius by Mr. Addison. A person of humour may also be introduced to enliven the discourse, as Cæsar by Cicero, and Cynthio by Mr. Addison. With regard to the subject of a *dialogue*, all the arguments should at least appear probable, and nothing be advanced, which may seem weak or trivial. Short and pleasant digressions are allowed, but they should not interrupt the thread of the discourse, and break the union of the parts and constant reference to the main end, which are essential to a *dialogue*. The time allowed for a *dialogue* has been various: Cicero allows two days for his three *dialogues* concerning an orator; but Mr. Addison extends his to three days, allowing a day for each. The method of composing *dialogues* has likewise been various: sometimes a [illegible] course, by way of narrative, which [illegible] persons: such are the *dialogues* of [illegible]. Addison last mentioned: at other times [illegible] are introduced in person; Cicero's *Dialogues* of Old Age, of Friendship, and of the Parts of Oratory, are written in this manner. Plato and Lucian generally choose this method. As for the stile of a *dialogue*, the LOW STILE is the proper character, in which they should generally be written. Ward's Orat. vol. ii. p. 221, &c.

DIALOGUE, in *Music*, is a composition for at least two voices, or two instruments, which answer each other; and which frequently unthing at the close, make a trio with the thorough-bass.

Such are many of the scenes in the Italian and French operas.

DIALTHÆA, in *Pharmacy*, an unguent, thus called from its base, which is root of the *althæa*, or *marsh* MALLOW. It consists of mucilages drawn from that root, and from linseed and fenugreek seed. The other ingredients are common oil, wax, resin, and turpentine.

It is ointment proper to soften, and emolliate: althæa pains of the side, lessen calluses, and strengthen the nerves. It is applied by rubbing it on the part affected.

DIALYSIS, in *Grammar*, a character, consisting of two points placed over two vowels of a word, which would otherwise make a diphthong; but are hereby parted into two syllables; as in *Mosaïc*. See DIÆRESIS.

DIAMARGARITON, in *Pharmacy*, a medicine denominated from pearls, called, in Latin, *margaritæ*, which are a principal ingredient therein.

There are two kinds; the *hot*, and the *cold*: but both are diffused at this time.

DIAMARGARITON, *Hot*, is a powder composed of pearls, pellitory, ginger, nutmegs, cinnamon, and divers other hot ingredients. It is reputed hysterics: it strengthens the womb, promotes the menses, and assists digestion.

DIAMARGARITON, *Cold*, is a solid electuary, composed of pearls ground fine, and white sugar dissolved in rose water, or that of bugloss, and boiled to a consistence. It strengthens the stomach, moderates the too abundant acids, stops the spitting of blood, and looseness of the belly.

DIAMARGARITON, *Compound cold*, is a powder made of pearls, red roses, flowers of nenuphar, and violet, lignum aloes, red and citron sandal, tormentil root, seeds of melon, endive, &c. It is cardiac and strengthening, facilitates respiration, and corrects malignant humours.

DIAMARTYRIA, *Διαμαρτυρια*, in *Antiquity*, a protestation that the deceased person had left an heir, made to bilate the relations from entering upon the estate. Hesych. Archæol. Græc. com. lib. i. cap. 24. p. 128.

DIAMASTIGOSIS, in *Antiquity*, was a custom among the Lacedæmonians, for the children of the most distinguished families to lash and tear each other's bodies with rods before the altars of the gods; the fathers and mothers, who were present at the spectacle, animating and exciting them all the while, not to give the least sign of pain or concern. This practice they called *diamastigosis*, a Greek term, derived from διαμαστιγοω, I whip, *scourge*. The design hereof, apparently, was to inure them to harden their youth, and inspire them boldness to blows, wounds, &c. that they might despise them when they came to war.

DIAMBRÆ *species*, in the *Materia Medica*, the name of two medicines in the London Dispensatory, the one called *species diambræ sine tabernis*, the other, *species diambræ*

ambræ cum odoratis, from the ambergrise in their compoſition. The *ſpecies diambræ* without perfumes, is originally a preſcription of Meſue, and exactly tranſcribed from him into their Diſpenſatory. This is eſteemed a great cephalic and cordial, and is frequently preſcribed in nervous decays, from apoplexies, epilepſies, palſies, and old age. It ſtrengthens the ſtomach in particular, raiſes the ſpirit, and warms the blood to a very great degree; it is thereby a provoker to venery, but more as a ſtimulus than by ſupplying any freſh recruits, or augmenting the ability. Its doſe is from ten grains to half a dram. *James.*

DIAMETER, from *dia*, and *metreo*, *to meaſure*, in *Geometry*, a right line paſſing through the centre of a circle, and terminated on each ſide by the circumference thereof.

Or, *diameter* may be defined a chord paſſing through the centre of a circle. Such is the line A E (*Tab. Geometry, fig.* 24.) paſſing through the centre C. Hence the *diameter* is the greateſt of all chords.

Half a *diameter*, as CD, drawn from the center C to the circumference, is called the *ſemi-diameter*, or *radius*.

The *diameter* divides the circumference into equal parts. And hence we have a method of deſcribing a ſemicircle upon any line; aſſuming a point therein for the centre.

To find the ratio of the DIAMETER *to the circumference.* This has been greatly ſought for by the mathematicians; and no wonder; ſuitnuch as if this were juſtly given, the quadrature of the circle were atchieved.

Archimedes firſt propoſed a method of finding it, by regular polygons inſcribed in a circle, till arriving at a ſide ſubtending an exceeding ſmall arch, and then looking a ſide of a ſimilar polygon circumſcribed; each of theſe being multiplied by the number of ſides of the polygon, give the perimeter of the polygon both inſcribed, and circumſcribed. In which caſe the ratio of the *diameter* to the circumference of the circle, is greater than that of the ſame *diameter* to the perimeter of the circumſcribed polygon, but leſs than that of the *diameter* to the perimeter of the polygon inſcribed. The difference between both gives the ratio of the *diameter* to the circumference in numbers nearly true.

That celebrated author, as already obſerved, by polygons of 96 ſides, found the ratio of the *diameter* to the circumference to be as 7 to 22; viz. ſuppoſing the *diameter* 1, the perimeter of the inſcribed polygon is found 3$\frac{10}{71}$, and that of the circumſcribed 3$\frac{1}{7}$.

After his example, later authors have found out ratios yet nearer truth; Wolfius finds it as 1000000000000000 to 3141592653589793; but none ſpent ſo much time on it as Van Ceulen, who, after immenſe pains, found that ſuppoſing the *diameter* 1, the circumference is leſs than 3.14159265358979323846264338327950288419 71693993751058209749445923078164062862089986280 348253421170679.

But as ſuch prolix numbers are too unwieldy for practice, many of our preſent practical geometricians aſſume the *diameter* to be to the circumference as 100 to 314: or in greater circles as 10000 to 31415; in which proportion Ptolemy, Vieta, and Huygens, agree with Van Ceulen. Ad. Metius gives as the ratio 113 to 355, which is the moſt accurate of all thoſe expreſſed in ſmall numbers; as not erring 3 in 10000000. Thoſe in common uſe are Archimedes's, Metius's, or the proportion of 1 to 3.1415.

The DIAMETER *of a circle being given, to find the circumference, and area; and the circumference being given, to find the* diameter. The ratio of the *diameter* to the circumference being had, as in the laſt article, that of the circumference to the *diameter* is had likewiſe. Then the circumference, being multiplied into the fourth part of the *diameter*, gives the area of the circle. Thus, if the *diameter* be 100, the circumference will be 314, and the area of the circle 7850. But the ſquare of the *diameter* is 10000; therefore, as 1 to the area of the circle as 10000 to 7850, that is, as 1000 to 785 nearly.

The area of the circle being given, to find the DIAMETER. To 785, 1000, and the given area of the circle 246376, find a fourth proportional, viz. 314360, which is the ſquare of the *diameter*. Out of this extract the ſquare root, and it is the *diameter* itſelf.

DIAMETER *of a conic ſection*, is a right line, as AD (*Tab. Conics, fig.* 5.) biſecting all the ordinates MM, &c. in P &c. See CONIC.

This, when it cuts the ſaid lines at right angles, is more particularly called the *axis of the curve*, or *latus*.

DIAMETER, *Tranſverſe*, is a right line, as AB (*Tab. Conics, fig.* 6. N° 2.), which being continued each way between two curves, biſects parallel right lines between the ſame, as MM.

DIAMETER, *Conjugate*, is a right line, biſecting lines drawn parallel to the tranſverſe *diameter*. See CONJUGATE.

DIAMETER *of a ſphere*, is the *diameter* of the ſemicircle by whoſe rotation the ſphere is generated; called alſo the *axis of the ſphere*.

DIAMETER *of gravity*, is a right line paſſing through the centre of gravity.

DIAMETER, in *Aſtronomy*. The *diameters* of the heavenly bodies are either *apparent*, i. e. ſuch as they appear to the eye; or *real*, i. e. ſuch as they are in themſelves.

The *apparent diameters* meaſured with a micrometer, are found different, in different circumſtances and parts of their orbits. Theſe are the angles under which the *diameters* of the planets are ſeen from the earth; and they are equal to the real *diameters* diminiſhed by the diſtance from the earth: or, as theſe angles are very ſmall, the *diameters* may be taken for arcs of a circle deſcribed on the eye as a centre, with a radius equal to the diſtance of the planets; and they are ſaid to conſiſt of ſo many minutes and ſeconds as theſe angles conſiſt of: therefore the *apparent diameters* of a planet are in the inverſe ratio of their real diſtances. The ſun's vertical *diameter* is found by taking the height of the upper and lower edge of his diſc, when he is in or near the meridian; the height of each edge muſt be corrected by proper allowances for parallax and refraction, and the difference between the true height of the upper and lower edge is the true *diameter*. The ſun's *apparent diameter* may be determined by obſerving with a good clock the time which the ſun's diſc takes in paſſing through the plane of the meridian, or ſome other hour circle. If the ſun is in or near the equator, the following proportion may be uſed; viz. as the time between the ſun's leaving the meridian or any other hour circle and returning to it again, is to 360 degrees, ſo is the time of the ſun's tranſit to the number of minutes and ſeconds of a degree contained in his *apparent diameter*. If the ſun is in a parallel at ſome diſtance from the equator, his *diameter* meaſures a greater number of minutes and ſeconds in that parallel than it would do in a great circle, and takes up proportionally more time in paſſing over the meridian; in which caſe, as the whole line is to the coſine of the ſun's declination, ſo is the time of the ſun's paſſing the meridian reduced to minutes and ſeconds of a degree, to the arc of a great circle which meaſures the ſun's apparent horizontal *diameter*. See TRANSIT.

The ſun's *apparent diameter* may alſo be taken by the projection of his image in a dark room.

There are ſeveral ways of finding the *apparent diameters* of the planets; but the moſt certain method is that with the MICROMETER.

The great difference between Tycho and the other two astronomers, Hevelius and Huygens, is owing to this, that Tycho, in imitation of the ancients, measured the *diameter*, as they appeared to the naked eye; whereas they used telescopes, whereby a deal of spurious lustre, which others use, makes them appear bigger than they are, is taken off: nevertheless, the *diameters* of the planets measured by Huygens's method are somewhat bigger than they ought to be, because the rays of light are inflected as they pass by the edges of solid bodies, to which his method of observing was liable. On the other hand, Flamsteed's micrometer inflected the rays the contrary way, and gave their *apparent diameters* too small; and therefore Whiston chuse the mean between the measures of Huygens and Flamsteed.

The mean *diameters* of the planets as seen from the sun are as follow: viz. that of Mercury, 22″ 4‴; of Venus, 30″ 4‴; of the Earth, 17″ 1‴; of the Moon, 6″ 1‴; of Mars, 11″ 1‴; of Jupiter, 37″ 1‴; and of Saturn, 16″. See PARALLAX.

The following table shews the *apparent diameters* of the sun at different times of the year.

For the true *diameters* of the sun, and planets, and their proportion to each other, see PLANETS, and SEMIDIAMETER.

DIAMETER *of a column*, is its thickness just above the base. From this the module is taken, which measures all the other parts of the column.

DIAMETER *of the Diminution*, is that taken from the top of the shaft. See DIMINUTION.

DIAMETER *of the footing*, is that taken at the height of one third from the base.

DIAMNES, a word used by Johannes Anglicus, and some other authors, for an involuntary discharge of urine.

DIAMOND, in *Natural History*, by the ancients called *adamant*, a precious stone, the first in rank, value, hardness, and lustre, of all gems.

The goodness of *diamonds* consists in their water, or colour, lustre, and weight. The most perfect colour is the white. Their defects are veins, flaws, specks of red or black foil, and a bluish or yellowish cloth.

Some chemical writers have maintained, that *diamonds* are refractory in the fire; and even approve; nevertheless, experiments have been made, which prove that they are capable of being dissipated, not only by the collected heat of the sun, but also by the heat of a furnace. A *diamond*, by exposure to a concave speculum, the diameter of which was forty inches, was reduced to an eighth part of its weight, Phil. Trans. N° 386; and in some experiments made on precious stones, by order of the grand duke of Tuscany, with a burning lens, the diameter of which was two thirds of a Florentine ell, near the focus of which was placed another smaller lens, it appeared, that a *diamond* weighing thirty grains, exposed during thirty seconds, loft its colour, lustre, and transparency, and became of an opake white. In five minutes, bubbles appeared on its surface; foon afterwards it burst into pieces, which were dissipated; and the small fragment which remained was capable of being crushed into fine powder by the pressure of the blade of a knife. No addition of glass, stone, sulphur, metals, or salt of tartar prevented this dissipation, or occasioned any degree of fusion. Experiments were also made by order of the emperor Francis I. on precious stones, from which we find, that *diamonds* were entirely dissipated by having been exposed in crucibles to a violent fire of a furnace during twenty-four hours: and when they were exposed during two hours only at a time, they were observed first to lose their polish, then to split into thin plates, and lastly, to be totally dissipated. M. D'Arcet has found, that *diamonds* may not only be perfectly dissipated by being exposed, in porcelain crucibles close covered with perforated lids, to the long and intense heat of a porcelain furnace; but that they may be totally volatilized with a much inferior degree of heat, by exposing them in a copper tube to the muffle of an assay furnace. He observed in this experiment, that the dissipation was gradual, and that it was effected by a kind of exfoliation: M. Macquer, who repeated the experiment, farther observed,

ſerved, that, before the diſſipation began, the *diamonds* were by the fire rendered brilliant and ſhining, with a kind of phoſphoric light. In order to determine whether *diamonds* were diſſipated by evaporation or combuſtion, Meſſrs. Lavoiſier, Macquer, and Cadet, expoſed them to an intenſe heat in an earthen retort, during ſeveral hours, without any other effect than the loſs of their poliſh, and about one ſeventh diminution of their weight.

M. Mitouard put *diamonds* in a tobacco-pipe filled with pounded charcoal, and accurately cloſed with lute; and in order farther to ſecure them from the acceſs of air or flame, he placed the tobacco-pipe in a crucible to which another crucible was inverted and carefully luted: the reſult was, that the *diamonds*, thus expoſed to the moſt intenſe heat, were not altered or diminiſhed; which he aſcribes not merely to the excluſion of air, but to ſome peculiar property of the charcoal; and he was confirmed in this opinion by finding, that they were not ſo well preſerved by powder of chalk, or of calcined hartſhorn. M. Cadet expoſed *diamonds* in covered and luted crucibles to the violent heat of a forge during two hours; by which operation they loſt only one ſixteenth part of their weight; and he concludes, that the deſtruction of them by fire in open veſſels is not a true volatiliization, as M. D'Arcet imagines, but merely an exfoliation, cauſed by the fire expanding the air contained between the thin plates of which the ſtones conſiſt, and that by this exfoliation, the plates are reduced to ſo fine a powder as to eſcape obſervation. M. Lavoiſier has lately made ſome curious experiments on *diamonds* with Tchirnhauſen's great BURNING *lens*; from which he infers, that the *diamond* is a ſubſtance properly combuſtible, even in a moderate degree of heat; that, like other combuſtible bodies, it exhibits a black coaly matter at its ſurface; that when its combuſtion is prevented, through the want of air, it becomes almoſt as fixed in the fire as charcoal; but that in expoſing it to the extremeſt degree of heat, it is capable of being reduced in part into an incoercible vapour, or a kind of GAS, poſſeſſing the properties of that which is produced from effervеſcent and fermenting mixtures, and in metallic reductions. He alſo found, that when a *diamond* was expoſed to the focus of the lens *in vacuo*, its tranſparence was not diminiſhed; but that it was at length reduced into elaſtic or aerial vapours. Dict. Chem Eng. ed. 1777; and Hiſt. Acad. Sc. an. 1772. Mem. 1. and 2.

In Europe, the lapidaries examine the goodneſs of their rough *diamonds*, their water, points, &c. by day-light: in the Indies, they do it by night; in order to which, a hole is made in the wall a foot ſquare, and therein a lamp is placed, with a thick wick, by the light whereof they judge of the ſtone, holding it in their fingers.

The water called *cæleſtis* is the worſt of all, and yet is ſomewhat difficult to diſcover in a rough *diamond*. The only infallible way is to examine it in the ſhade of ſome tufted tree.

The *diamond* becomes luminous in the dark by expoſure during a certain time to the rays of the ſun, by heating it in a crucible, by plunging it in boiling water, or by rubbing it with a piece of glaſs. It alſo acquires an electrical property by friction, and attracts light bodies. Dr. Wall has applied theſe properties as *criteria* for diſtinguiſhing *diamonds* from other precious ſtones; but they are not peculiar to *diamonds*, and therefore an inſufficient teſt. Phil. Tranſ. vol. iv. part ii. p. 277. See GAS, PHOSPHORUS, TOURMALIN, &c.

The *diamond* is by ſome reckoned poiſonous; others will not admit it into the liſt of poiſons. The accounts in favour of *diamonds* are more numerous, as well as more credible, than thoſe which would make us believe them to be of a poiſonous nature.

Diamonds are found in the Eaſt Indies, principally in the kingdoms of Golconda, Viſapour, Bengal, and the iſland of Borneo. There are four mines, or rather two mines and two rivers, whence *diamonds* are drawn. The mines are, 1. That of Raolconda, in the province of Carnatica, five leagues from Golconda, and eight or nine from Viſapour. It has been diſcovered about 250 years. 2. That of Gani, or Coulour, ſeven days journey from Golconda, eaſtwardly. It was diſcovered about 170 years ago by a peaſant; who, digging in the ground, found a natural fragment of twenty-five carats. 3. That of Soumelpour, a large town in the kingdom of Bengal, near the *diamond*-mine: this is the moſt ancient of them all. It ſhould rather be called that of Goual, which is the name of the river, in the ſand whereof theſe ſtones are found. Laſtly, the fourth mine, or rather the ſecond river, is that of Succudan, in the iſland of Borneo.

DIAMOND-*mine of Raolconda.* In the neighbourhood of this mine the earth is ſandy, and full of rocks, and copſe: in theſe rocks are found ſeveral little veins, of half, and ſometimes a whole inch broad, out of which the miners, with a kind of hooked irons, draw the ſand, or earth, wherein the *diamonds* are; breaking the rocks when the vein terminates, that the track may be found again, and continued. When a ſufficient quantity of earth, or ſand, is drawn forth, they waſh it two or three times, to ſeparate the ſtones therefrom: the miners work quite naked, except for a thin linen cloth before them; and, beſides this precaution, they have likewiſe inſpectors, to prevent their concealing of ſtones: which, however, in ſpite of all their care, they frequently find means to do, by watching opportunities, when they are not obſerved, and ſwallowing them down.

DIAMOND-*mine of Gani, or Coulour.* In this mine are found a great number of ſtones from ten to forty carats, and even more; and it was there that the famous *diamond* of Aureng Zeb, the great mogul, which, before it was cut, weighed 793 carats, was found. The ſtones of this mine are not very clear; their water is uſually tinged with the quality of the ſoil; being black, where that is marſhy; red, where it partakes of reds; and ſometimes green, and yellow, if the ground happen to be of thoſe colours. Another defect, of ſome conſequence, is, a kind of greaſineſs appearing on theſe *diamonds*, when cut, which takes off part of their luſtre. There are uſually no leſs than ſixty thouſand perſons, men, women, and children, at work in this mine.

When the miners have found a place where they intend to dig, they level another, ſomewhat bigger, in the neighbourhood thereof, and incloſe it with walls about two feet high, only leaving apertures, from ſpace to ſpace, to give paſſage to the water: after a few ſuperſtitious ceremonies, and a kind of feaſt, which the maſter of the mine makes for the workmen, to encourage them, every one goes to his buſineſs, the men digging the earth in the place firſt diſcovered, and the women and children carrying it off into the other, walled round. They dig twelve or fourteen feet deep, and till ſuch time as they find water; then they ceaſe digging: and the water, thus found, ſerves to waſh the earth two or three times; after which, it is ſet out at an aperture reſerved for that purpoſe. This earth being well waſhed, and well dried, they ſift it in a kind of open ſieve, or riddle, much as we do corn in Europe; then they thraſh it, and ſift it afreſh; and, laſtly, they ſearch it well with the hands, to find the *diamonds*. They work naked here, as in the mine of Raolconda, and are watched, after the like manner, by inſpectors.

DIAMOND-*mine of Soumelpour, or river Goual.* Soumelpour is a large town built all of earth, and covered with branches of cacao-trees: the river Goual runs by the foot thereof, in its paſſing from the high mountains, towards the ſouth, to the Ganges, where it loſes its name. It is from this river that are brought all our fine *diamond*-points, or ſparks, called *natural ſparks*. They never begin to ſeek for *diamonds* in this river till after the great rains are over, that is, after the month of December; and they uſually even wait till the water is grown clear, which is not before January: the ſeaſon at hand, eight or ten thouſand perſons, of all ages, and both ſexes, come out of Soumelpour, and the neighbouring villages. The moſt experienced among them ſearch and examine the ſand of the river; going up it from Soumelpour to the very mountain whence it ſprings. A great ſign that there are *diamonds* near, is, the finding of thoſe ſtones which we Europeans call thunder-ſtones. When all the ſand of the river, which at that time is very low, has been well examined, they proceed to take up that wherein they judge *diamonds* likely to be found; which is done after the following manner: they dam the place round with ſtones, earth, and faſcines; and, lading out the water, dig about two feet deep: the ſand, thus got, is carried into a place walled round on the bank of the river. The reſt is performed after the ſame manner as at Coulour, and the workmen are watched with equal ſtrictneſs.

DIAMOND-*mine in the iſland of Borneo, or river of Succudan.* We are but little acquainted with this mine; the prince who reigns in that part of the iſland not allowing ſtrangers to have any commerce in theſe ſtones: though there are very fine ones to be bought at Batavia, brought thither by ſtealth. They were anciently imagined to be ſofter than thoſe of the other mines; but experience ſhews, they are in no reſpect inferior to them.

Beſide theſe four *diamond-mines*, there have been two others diſcovered; one of them between Coulour and Raolconda, and the other in the province of Carnatica: but they were both cloſed up almoſt as ſoon as diſcovered: that of Carnatica, becauſe the water of the *diamonds* was always either black, or yellow; and the other, on account of their cracking, and flying in pieces when cut and ground.

Diamond-mines were diſcovered about the year 1728 in

the Brafils belonging to the king of Portugal, who in the year 1740 let them to a company at Rio Janeiro, for a certain ſtipulated annual rent, which is ſaid to be 130,000 cruſades, on condition that the ſaid company employ no more than ſix hundred ſlaves in working them; ſince which time the value of *diamonds* is diminiſhed.

The *diamond*, we have already obſerved, is the hardeſt of all precious ſtones. It can only be cut, and ground, by itſelf and its own ſubſtance. To bring it to that perfection which augments its price ſo conſiderably, they begin by rubbing ſeveral againſt each other, while rough; after having firſt glued them to the ends of two wooden blocks, thick enough to be held in the hand: it is the powder thus rubbed off the ſtones, and received in a little box for the purpoſe, that ſerves to grind and poliſh the others.

Diamonds are cut and poliſhed by means of a mill, which turns a wheel of ſoft iron ſprinkled over with *diamond* duſt mixed with oil of olives: the ſame duſt, well ground, and diluted with water and vinegar, is uſed in the ſawing of *diamonds*; which is performed with an iron or braſs wire, as fine as a hair: ſometimes, in lieu of ſawing the *diamonds*, they cleave them, eſpecially if there be any viſible plates in them; but the Europeans are not uſually daring or expert enough, to run the riſque of cleaving, for fear of breaking.

DIAMOND, *Rough*, is that not yet cut, but juſt as it comes out of the mine.

A *rough diamond* muſt be choſen uniform, of a good ſhape, tranſparent, not quite white, and free of flaws and ſhivers. *Rough diamonds* are more commonly found of a ſix-pointed figure than of any other; and theſe are called *ſix-pointed rough diamonds*, the figure of which is compoſed of two ſquare pyramids, jointed at their baſes. Hence the whole figure is compoſed of eight triangular faces, or planes, four of which meet in a point above the baſe, and four below it in another point. The diſtance of theſe two points is the axis of the figure.

There are others flat, cubical, or rounded: the former are the beſt and hardeſt; the latter ſort are ſofter, and more liable to have their forms altered by attrition. *Diamonds* are ſaid to conſiſt of lamin æ or plates, and probably have ſome uniform texture; becauſe lapidaries find that they may be poliſhed much more eaſily in one than in any other direction.

Black, rugged, dirty, flawey, veiny ſtones, and all ſuch as are not fit for cutting, they uſe to pound in a ſteel mortar made for that purpoſe; and, when pulveriſed, they ſerve to ſaw, cut, and poliſh the reſt. Shivers are occaſioned, in *diamonds*, by this; that the miners, to get them more eaſily out of the vein, which winds between two rocks, are often forced to break the rocks with huge iron wedges, which ſhakes and fills the ſtone with cracks and ſhivers. The ancients had two miſtaken notions with regard to the *diamond*: the firſt, that it became ſoft, by ſteeping it in hot goat's blood; and the ſecond, that it was malleable, or bore the hammer. Experience ſhews us the contrary: there being nothing capable of mollifying the hardneſs of this ſtone; though its hardneſs be not ſuch, that it will endure being ſtruck at pleaſure with the hammer.

DIAMOND, *Brilliant*, is that cut in faces both at the top, and bottom; and whoſe table, or principal face at the top, is flat.

To make a complete *ſquare brilliant*, if the rough *diamond* be not found to be of the figure here deſcribed, it muſt be made ſo. And if the work be perfectly executed, the length of the axis will be equal to the ſide of the ſquare baſe of the pyramid. Jewellers then form the table and collet, by dividing the block or length of the axis into eighteen parts. They take $\frac{2}{18}$ from the upper part, and $\frac{1}{18}$ from the lower. This gives a plane at $\frac{2}{18}$ diſtance from the girdle for the table; and a ſmaller plane at $\frac{1}{18}$ diſtance, for the collet; the breadth of which will be $\frac{1}{2}$ of the breadth of the table. In this ſtate the ſtone is ſaid to be a *complete ſquare table diamond*.

The *brilliant* is an improvement on the table *diamond*, and was introduced within the laſt century, according to Mr. Jeffries.

To render a *brilliant* perfect, each corner of the above deſcribed table *diamond* muſt be ſhortened by $\frac{1}{18}$ of its diagonal. The corner ribs of the upper ſides muſt be flattened, or run towards the centre of the table $\frac{1}{2}$ leſs than the ſides. The lower part which terminates in the girdle, muſt be $\frac{1}{2}$ of one ſide of the girdle; and each corner-rib of the under ſides muſt be flattened at the top, ſo anſwer the above flattening at the girdle, and at bottom muſt be $\frac{1}{2}$ of each ſide of the collet.

The parts of the ſmall work which complete the *brilliant*, or the ſtar and ſtill facets, are of a triangular figure. Both of theſe partake equally of the depth of the upper ſides, from the table to the girdle, and meet in the middle of each ſide of the table and girdle, as alſo at the corners. Thus they produce regular lozenges on the four upper ſides and corners of the ſtone. The triangular facets, on the under ſides, joining to the girdle, muſt be half as deep again as the above facets to anſwer to the collet part.

The ſtone here deſcribed is ſaid to be a *full-ſubſtanced brilliant*.

If the ſtone be thicker than in the proportion here mentioned, it is ſaid to be an *over-weighted brilliant*.

If the thickneſs be leſs than in this due proportion, it is called a *ſpread brilliant*.

The beauty of *brilliants* is diminiſhed by their being either over-weighed or ſpread. The true proportion of the axis or depth of the ſtone to its ſide, is as 2 to 3.

Brilliants are diſtinguiſhed into ſquare, round, oval, and drops, from the figure of their reſpective girdles.

DIAMOND, *Roſe*, is that quite flat underneath, but its upper part cut in diverſe little faces, uſually triangles, the uppermoſt whereof terminate in a point. In *roſe diamonds*, the depth of the ſtone from the baſe to the point muſt be half the breadth of the diameter of the baſe of the ſtone. The diameter of the crown muſt be three fifths of the diameter of the baſe. The perpendicular from the baſe to the crown muſt be three fifths of the depth of the ſtone. The lozenges, which appear in all circular *roſe diamonds*, will be equally divided, by the ribs that form the crown; and the upper angles, or facets, will terminate in the extreme point of the ſtone, and the lower in the baſe or girdle.

The taſte which now prevails of converting *roſe-diamonds* into brilliants, is condemned by Mr. Jeffries unleſs the *roſe diamonds* be over-weighted. He thinks, that the diſplay of beauty in *roſe-diamonds*, is often preferable to that of brilliants. See his Treatiſe on Diamonds, p. 32, 35.

DIAMOND, *Table*, is that which has a large ſquare face at the top, encompaſſed with four leſſer.

DIAMONDS, *Complexions of*. The fineſt *diamonds* are thoſe of a complexion like that of a drop of the cleareſt rock-water: and if ſuch ſtones be of a regular form, and truly made, as alſo free from ſtains, ſouls, ſpots, ſpecks, flaws, and croſs veins, they will have the higheſt luſtre of any, and be eſteemed the moſt perfect.

If *diamonds* be tinctured yellow, blue, green, or red, in a high degree, they are next in eſteem. But if they partake of theſe colours only in a low degree, it greatly ſinks their value.

There are other complexions of *diamonds*, ſuch as the brown, and thoſe of a dark hue; the firſt ſometimes reſemble the browneſt ſugar-candy, and the latter duſky iron. A black tinge in *diamonds* is conſidered as an imperfection, though, when the *diamond* is cut, a black foil placed under it improves its beauty; for the *roſe diamonds*, the collet or ſocket in which the ſtone is ſet, is ſpecked with ivory black in little dots; and for *brilliants*, it is all over blacked. Dr. Lewis mentions a black *diamond* cut and ſet in a ring, which at a diſtance looks uniformly black, but, on cloſer examination, appears in ſome parts tranſparent, and in others charged with ſoulneſs, on which the black hue depends. Commerce of Arts, p. 637.

The *firſt water* in *diamonds* means the greateſt purity and perfection of their complexion, which ought to be that of the cleareſt drop of water.

When *diamonds* fall ſhort in this perfection, they are ſaid to be of the *ſecond* or *third water*, &c. till the ſtone may be properly called a coloured one: for it would be an impropriety to ſpeak of a *diamond* imperfectly coloured, or having other defects, as a ſtone of a *bad water* only.

DIAMONDS, *Magnitude of*. The moſt remarkable *diamonds* for ſize now known, are, that known in France under the name of *grand ſancy*, by corruption of *cent ſix*, which is one of the crown jewels, weighing 106 carats; governor Pitt's *diamond*, purchaſed by the late duke of Orleans for Louis the XV. king of France, weighing 136½ carats, and ſaid to be bought for 125000*l.* the *diamond* of the great duke of Tuſcany, which weighs 139½ carats; that of the great Mogul, weighing 279⅛ carats; and one mentioned by Mr. Jeffries, in a merchant's hands, weighing 242½ carats.

DIAMONDS, *Valuation of*. The following is a rate, or manner of eſtimating the value of *diamonds*, drawn up by a perſon well verſed in ſuch matters; and which, for its curioſity, as well as the uſe it may be of to perſons who deal in precious ſtones, we judge, will not be unacceptable.

Table

Table of DIAMONDS.

Dutch Cut.

A *Diamond* weighing 1 grain, is worth from	Lib.	Sh.		Lib.	Sh. sterl.

50 - -	2200	0	to	2300	0
60 - -	3500	0	to	4500	0

Mr. Jeffries lays down the following rule for the valuation of *diamonds* of all weights. He firſt ſuppoſes the value of a rough *diamond* to be ſettled at 2*l. per* carat, at a medium; then to find the value of *diamonds* of greater weights, multiply the ſquare of their weight by 2, and the product is the value required. E. g. To find the value of a rough *diamond* of two carats, 2×2=4, the ſquare of the weight, which multiplied by 2, gives 8*l.* the true value of a rough *diamond* of two carats. For finding the value of manufactured *diamonds*, he ſuppoſes half their weight to be loſt in the manufacturing of them; and therefore to find their value we muſt multiply the ſquare of double their weight by 2, which will give their true value in pounds: thus, to find the value of a wrought *diamond* weighing two carats; we firſt find the ſquare of double the weight, viz. 4×4=16, then 16×2=32. So that the true value of a manufactured *diamond* of two carats is 32*l.*

By this rule Mr. Jeffries has conſtructed tables of the price of *diamonds* from 1 to 100 carats.

According to Mr. Jeffries's rule, that the value of *diamonds* is in the duplicate ratio of their weights, and that a manufactured *diamond* of one carat is worth at a medium 8*l.* the great mogul's *diamond* muſt be valued at above 624962*l.* this being the value of a *diamond* of 279¼ carats.

It muſt be obſerved, however, that defects in the water, or ſhape, red or black ſpots, ſhivers, and other failings, frequently found in theſe ſtones, reduce the price by one third, and ſometimes more.

When *diamonds* are ſouled with a yellow or brown colour, it is a common practice among jewellers to put them in a fierce fire; this diveſts them of their colours, without doing them the leaſt ſenſible injury. Du-Fay, in Mem. Acad. Paris, 1735.

As to brilliant *diamonds* of very ſmall cut, the price is always leſs by one third than that of *diamonds* of a larger cut, though the weights be the ſame: the reaſon is, that the latter ſhew themſelves a great deal more when ſet in their collets, than the former.

DIAMONDS, *Specific gravity of.* Mr. Boyle has given us the obſervation of a perſon much converſant in *diamonds*, that ſome of thoſe gems in their rough ſtate were much heavier than others of the ſame bigneſs, eſpecially if they were cloudy or foul; and Mr. Boyle mentions one that weighed 8 grains and ⅛, which being carefully weighed in water, according to the rules of hydroſtatics, proved to an equal bulk of that liquor, as $2\frac{15}{16}$ to 1. So that as far as could be judged by that experiment, a *diamond* weighs not thrice ſo much as water; and yet in his table of ſpecific gravities, that of a *diamond* is ſaid to be to water as 3400 to 1000, that is, as 3½ to 1; and therefore, according to theſe two accounts, there ſhould be ſome *diamonds* whoſe ſpecific gravity differs nearly ½ from that of others. But this is a much greater difference than can be expected in two bodies of the ſame ſpecies, and indeed on an accurate trial does not prove to be the caſe in *diamonds*.

It is certain that there may be ſome difference in theſe trials, from the nature and temper of the water uſed in the experiments; ſome waters, as that of pumps or wells, being heavier than rain or diſtilled water; and the heat or coldneſs of the water may alſo make ſome variation: this, however, is much leſs than might be expected; careful experiments having proved, that the ſpecific gravity of any body will not differ above $\frac{1}{300}$ at moſt, on account of the difference of the water in quality and temper taken together; whereas the heavieſt and lighteſt of the *diamonds* in Mr. Boyle's and theſe experiments differ about one thirty-fifth part, which is about ſix times as much as $\frac{1}{300}$.

Mr. Ellicot, who made theſe experiments, has drawn out a table of their ſeveral differences, which is done with great care and accuracy, and taking in all the common varieties in *diamonds*, may ſerve as a general rule of their mean gravity and differences.

	In air. Grains	In water Grains	Specific gravity.
Water -	——	——	1000
N° 1. A Brazil *diamond* fine water, and rough coat,	92,425	66,16	3518
2. Ditto, fine water, rough coat.	88,21	63,16	3521
3. Ditto, fine bright coat,	10,625	7,170	3511
4. Ditto, fine bright coat,	9,560	6,830	3501
5. An Eaſt India *diamond*, pale blue,	26,485	18,945	3512
6. Ditto, bright yellow,	23,33	16,71	3524
7. Ditto, very fine water, bright coat, -	20,66	14,8	3525
8. Ditto, very bad water, honey-comb coat, -	20,38	14,59	3519
9. Ditto, very hard bluiſh caſt,	22,5	16,1	3515
10. Ditto, very ſoft, good water,	22,615	16,2	3525
11. Ditto, a large red ſouleſs in it, - -	25,48	18,23	3514
12. Ditto, ſoft, bad water,	29,525	21,140	3521
13. Ditto, ſoft, brown coat,	26,535	18,99	3516
14. Ditto, very deep green coat,	25,21	18,08	3521
The mean ſpecific gravity of the Brazil *diamonds* appears to be -		-	3513
The mean of the Eaſt India *diamonds*	-	-	3519
The mean of both - -	-	-	3517

Therefore, if any thing determinate is to be ſaid, as to the ſpecific gravity of the *diamond*, it is, that it is to water as 3517 to 1000. Phil. Tranſact. vol. xliii. for 1745. art. 19. p. 472.

Attempts have been made to produce artificial *diamonds*, but with no great ſucceſs.

The *falſtitious diamonds* made in France, called *temple diamonds*, on account of the temple at Paris, where the beſt of them are made, fall vaſtly ſhort of the genuine ones; accordingly they are but little valued, though the conſumption thereof is pretty conſiderable for the habits of the actors on the ſtage, &c. See PASTES.

DIAMONDS, *Cornifh*, in *Natural Hiſtory*, a name given in England to all the ſpecies of cryſtals, which are compoſed of a column, terminated at each end by a pyramid. The name takes in two genera of cryſtal, of each of which there are ſeveral ſpecies. Dr. Hill has determined this to be the true figure of perfect cryſtal, and accounts all thoſe which are affixed by one end to ſome ſolid body, and terminated at the other by a pyramid, to be mutilated or imperfect cryſtals. The ſame author, according to the length or thickneſs of the intermediate column, has divided theſe bodies into two genera, the firſt the macrotelociſtyla, the other the brachyteloſtyla. See MACROTELOSTYLA and BRACHYTELOSTYLA.

DIAMOND is an inſtrument of conſiderable uſe in the glaſs manufactory, for ſquaring the large plates, or pieces; and among glaziers for cutting their glaſs.

Theſe *diamonds* are differently fitted up. That uſed for looking-glaſſes, and other large pieces, is ſet in an iron ferril two inches long, and a quarter of an inch in diameter. The reſt of the cavity of the ferril is filled with melted lead, which keeps the *diamond* firm in its place.

The glaziers have a handle of box, or ebony, fitted into the

the ferril to hold it by. In the former there is a little piece of box croſſing the ferril, in form of a little plane, covered at bottom with a thin copper-plate.

DIAMOND, in *Heraldry*, is uſed to expreſs the black colour in the atchievements of noblemen.

Gwillim diſlikes the way of blazoning the coats of peers by precious ſtones, inſtead of metals or colour. But the Engliſh practice allows it. See COLOUR.

DIAMOND-*cutter*. See LAPIDARY.

DIAMOND-*duſt*. See GLASS.

DIAMOND-*powder* is of great uſe for grinding hard ſubſtances. And Mr. Boyle obſerves, that though it be much dearer than emery, yet it makes ſo great diſpatch, and the tools employed laſt ſo much longer, as greatly to over-balance the cheapneſs of the emery.

DIAMORUM, *Diamorum*, a compoſition in pharmacy, of which there are two kinds, *ſimple*, and *compound*.

DIAMORUM, *Simple*, is the common ſyrup of mulberries, made of the juice of that fruit, boiled up with ſugar. It is good againſt diſeaſes of the throat, and to ſtop dyſenteries.

There is alſo a ſort of *ſimple diamorum* made of mulberry juice and honey, otherwiſe called *mulberry rob*.

DIAMORUM, *Compound*, is made with mulberry juice, verjuice, myrrh, and ſaffron. It is uſed to deterge phlegm from the ſtomach and breaſt, and to eaſe reſpiration.

DIANA, in *Mythology*, the daughter of Jupiter and Latona, and twin ſiſter to Apollo. She is ſaid to have been born firſt, and to have aſſiſted her mother in the delivery of Apollo. The ſufferings of Latona on this occaſion, gave *Diana* an averſion to marriage, though not to gallantry. She is accuſed of having loved and beſtowed her favours on Endymion, Pan, and Priapus. She was the goddeſs of the woods on earth, Luna in heaven, and Hecate in hell.

The moſt known character of this goddeſs is that of her preſiding over woods, and delighting in hunting. Accordingly the *Diana venatrix*, or goddeſs of the chace, is frequently repreſented in ancient ſtatues, and deſcribed by the Roman poets, as running, with her veſt ſhortened and girt about her, and yet flying back with the wind: ſhe is tall of ſtature; and her face, though ſo very handſome, is ſomewhat manly: her legs are bare, well-ſhaped, and ſtrong: her feet are ſometimes bare, and ſometimes adorned with a ſort of buſkin: ſhe often has her quiver on her ſhoulder: and ſometimes holds a javelin, but more uſually her bow in her right hand. The ſtatues of *Diana* were frequent in the woods, where ſhe is repreſented as hunting, bathing, and reſting herſelf after fatigue. *Diana* has been ſometimes repreſented with three bodies, and hence called the triple, three-headed, and three-bodied *Diana*. Her diſtinguiſhing name, under this triple appearance, is Hecate or Trivia; under which character of the infernal *Diana* ſhe was invoked in enchantments, and repreſented as a Fury, holding inſtruments of terror in her hands, and graſping cords, ſwords, ſerpents, or flaming torches. When ſhe is repreſented as the intelligencer that preſides over the moon, ſhe appears in a car, drawn by ſtags, or by does, but more commonly by horſes of a perfectly white colour, with a lunar crown or creſcent on her forehead. Spence's Polymetis, p. 100, 102, 104.

She had many temples dedicated to her, of which that at Epheſus was the moſt celebrated, and eſteemed one of the wonders of the world. It was burned by Eroſtratus, or Eratoraſtus, to perpetuate his name by the action, on the day in which Alexander was born, A. M. 3648. Apollo and *Diana* were names for the ſun and moon, and had each of them lances given them, in alluſion to the projection of their rays.

DIANA'S *Tree*, *Arbor Dianæ*. See ARBOR.

DIANDRIA, in *Botany*, the ſecond claſs of plants, which have hermaphrodite flowers, with two ſtamina or male parts in each.

The word is formed of the Greek δυο, *twice*, and ανηρ, *male*. Of this claſs of plants, which comprehends three orders, viz. the *monogynia*, *digynia*, and *trigynia*, are the jeſſamine, phillyrea, olive, roſemary, &c. See *Tab. of Botany*, *Claſs*, 2.

DIANTHERA, in *Botany*, a genus of the *diandria monogynia* claſs. The characters are theſe: the flower hath a permanent empalement of one leaf, which is tubulous, and cut at the top into five equal parts: the flower is of the grinning kind, having one petal with a ſhort tube; the upper lip is reflexed and biſid; the lower is divided into three parts, the middle being the broadeſt: it hath two ſhort ſlender ſtamina adhering to the back of the petal, one of which has a twin ſummit, the other is a little taller. It hath an oblong germen ſupporting a ſlender ſtyle of the length of the ſtamina, crowned by an obtuſe ſtigma. The empalement afterward becomes a capſule with two cells, opening with two valves, which are alternately compreſſed at the top and bottom, and open with an elaſticity, caſting a ſingle ſeed out of each cell. This plant grows naturally in Virginia, and other parts of North America. Linnæus enumerates two ſpecies.

DIANTHON, from διος and ανθος, *flower*; in *Medicine*, an antidote deſcribed by Myrepſus, from which the *ſpecies dianthos* in the London diſpenſatory was probably taken. It is thus made:

℞ Flor. roriſm. ℥i. roſar. n. & rad. glych. ää ℥vi. caryophil. arom. ſpic. nard. nuc. moſch. rad. galangal. cort. cinnamon. rad. zedoar. lign. aloes, ſem. card. min. ſem. anethi, aniſi, & macis ää ℥iv. M.

This compoſition is recommended in the cachexy.

DIANTHUS, in *Botany*, a genus of the *decandria digynia* claſs; the clove July flower, carnation, and pink. The generical characters are theſe: the flower hath a cylindrical empalement of one leaf, ſcaly below, with five petals, whoſe tails are as long as the empalement; but their upper part is broad, plain, and ſpread open. It hath ten ſtamina; in the centre is ſituated an oval germen, which afterward becomes a cylindrical capſule with one cell, opening in four parts at the top, filled with compreſſed angular ſeeds. Linnæus enumerates eighteen and Miller twelve ſpecies. See CARNATION, PINK, &c.

DIANUCUM, in *Pharmacy*, a kind of rob, made of the juice of green walnuts, and ſugar, boiled together by a moderate fire, to the conſiſtence of honey.

The word is formed from *dia*, and *nux*, *nucis*, *nut*.

It is good to ſtrengthen the ſtomach, promote ſweat, and reſiſt poiſon.

DIAPALMA, in *Pharmacy*, a deſiccative, or drying plaſter, ſaid to be ſo denominated from the wood of the palm-tree, whereof the ſpatula is to be made, that is to ſtir it while boiling. It is compoſed of common oil, hogs fat, and litharge of gold. It is good to dry, reſolve, deterge, and cicatrize; and is the plaſter moſt uſed for wounds and ulcers.

DIAPASMA, a common name for all powders ſprinkled on the body, whether as perfumes or otherwiſe.

The word comes from the Greek διαπασσειν, *inſpergere*, *to ſprinkle*.

DIAPASON, from δια, *by*, and πας, *all*, in *Muſic*, a muſical interval, otherwiſe called *octave*: ſo called, becauſe it contains all the poſſible diverſities of ſound.

The *diapaſon* is the firſt and moſt perfect of the concords: if conſidered *ſimply*, it is but one harmonical interval; though if conſidered *diatonically*, by tones and ſemi-tones, it contains ſeven degrees, viz. three greater tones, two leſſer tones, and two greater ſemi-tones.

The interval of a *diapaſon*, that is, the proportion of its grave ſound to its acute, is as 2 to 1.

The ancients had ſeven variations, ſchemes, figures, or ſpecies of the *diapaſon*, ariſing from the various diſpoſitions of the tones and ſemi-tones in the ſcale.

The firſt ſpecies of the *diapaſon*, was from the hypate hypaton to the parameſe; or from B ♮ to b ♮ of our notation. It was called *myxolydian*.

The ſecond, called *Lydian*, from the parypate hypaton to the trite diezeugmenon, or from C to c.

The third, called *Phrygian*, from the lichanos hypaton to the paranete diezeugmenon, or from D to d.

The fourth, called *Dorian*, from the hypate meſon to the nete diezeugmenon, or from E to e.

The fifth, named *hypolydian*, from the parypate meſon to the trite hyperboleon, or from F to f.

The ſixth, called *hypophrygian*, from the lichanos meſon to the paranete hyperboleon, or from G to g.

The ſeventh, named *hypodorian*, *common*, and *Iberian*, from the meſe to the nete hyperboleon, or from the proſlambanomenos to the meſe, that is, from our a to a a, or from A to a. Euclid. Introd. Harm. p 15, ſeq. Bacchius, p. 18. edit. Meibom. See DIAGRAM.

DIAPASON *diateſſaron*. The Pythagoreans did not admit this interval as a conſonance or concord; for this reaſon, that its ratio 8 : 3 was neither multiple nor ſuperparticular. But Ptolemy contends for its being a good concord, for this reaſon, that the *diapaſon* added to any concord, produces a concord. Ariſtoxenus herein agrees with him. Vide Wallis's Append. ad Ptolem. Harm. p. 155.

DIAPASON, among *Muſical Inſtrument-Makers*, is a kind of rule, or ſcale, whereby they adjuſt the pipes of their organs, and cut the holes of their flutes, hautboys, &c. in due proportion, for performing the tones, ſemi-tones, and concords, juſtly.

A ſquare being divided into eight equal parallelograms; the points wherein a diagonal interſects all theſe parallelograms, expreſs all the uſual intervals in muſic; and on this principle it is, that the *diapaſon* is founded.

There is a particular kind of *diapaſon* for trumpets; ſerv-

ing as a standard, or measure, for the different magnitudes they must have to perform the four parts of music. There is another for trebles, and serpents, shewing how far they are to be lengthened, or shortened, to rise or fall from one tone or interval to another.

The bell-founders have likewise a *diapason*, or scale, serving to regulate the size, thickness, weight, &c. of their bells.

DIAPASON is also the name of two stops of an organ, viz. the open and stopped.

DIAPASONDIAES, in *Music*, a kind of compound concord; whereof there are two sorts: the *greater*, which is in the ratio of 10 to 3; and the *less*, in that of 16 to 5.

DIAPASONDIAPENTE, in *Music*, a compound consonance, in a triple ratio of 9 to 3.

The *diapasonsymphonie* is a symphony made when the voice proceeds from the first to the twelfth tone. The word is properly a term in the Greek music; we should now call it a *twelfth*.

DIAPASONDIATESSARON, in *Music*, a compound concord, in the ratio of 8 to 3.

The *diapasondiatessaron* is a symphony wherein the voice proceeds from the first tone to the eleventh. This the moderns would rather call an *eleventh*.

DIAPASONDITONE, in *Music*, a compound concord, in the proportion of 10 to 3, or 5 to 2.

DIAPASONSEMIDITONE, a compound concord, whose terms are in the proportion of 12 to 5.

DIAPEDESIS, διαπήδησις, in *Medicine*, an oozing of blood through the coats of the veins, or arteries; occasioned either by the blood's becoming too much dissolved, or attenuated; or by the pores of the vessels becoming too patent, and open.

The word is compounded of διὰ, *through*, and πήδησις, *a leap*. There are some physicians who deny there can be any such inanity of blood, as that it shall exude through the vessels, without any aperture made therein.

DIAPENSIA, in *Botany*, a genus of the *pentandria monogynia* class: the corolla is monopetalous and salver-shaped; the calyx has five leaves imbricated with three small ones; the stamina are laid on the tube of the corolla, and the capsule has three cells. There are two species.

DIAPENTE, in the *Ancient Music*, an interval making the second of the perfect concords; answering to what in the modern music we more usually call a *perfect fifth*.

The word is formed of δια, and πεντε, *five*.

The *diapente* is a simple concord; yet, if considered diatonically, it contains four terms, viz. two greater tones, a lesser tone, and a greater semi-tone. The *diapente* is the greater part of the diapason, or octave, harmonically divided. It is produced when the voice passes from its first tone to its *fifth*.

DIAPENTE is also used, in *Pharmacy*, for a compound of five several drugs, or ingredients.

DIAPENTE, among *Farriers*, a drink made for horses, of gentian, round birthwort, barberries, myrrh, and ivory shavings, of each a like quantity, which are to be pounded separately, and finely scarced: this powder, to the quantity of two or three spoonfuls, is mixed with a pint and a half of mulcadine, or sack, or, for want of either, with strong ale or beer, and given in fevers, the cough, glanders, farcies, inflammations, yellows, &c. It is said to purify the blood from all foulnesses, as well as to restrain the overflowing of the gall, working of the spleen, &c.

DIAPER, a sort of linen cloth wrought with flowers and other figures.

DIAPERED, in *Heraldry*. See DIAPRE.

DIAPHANOUS, in *Philosophy*, a thing transparent, or that gives passage to the rays of light; as water, air, glass, talc, fine porcelain, &c. See TRANSPARENCY.

The word is formed of διὰ, *through*, and φαινω, *I shew*.

DIAPHANEITY, in the schools, the quality of a transparent body; or that which denominates it such. See TRANSPARENCY.

DIAPHŒNIC, *Diaphœnicum*, in *Pharmacy*, a soft, purgative electuary; thus called from the dates, which make its basis; the palm-tree, whose fruit they are, being called by the Greeks φοινιξ. See DATE.

The other ingredients are, penides, almonds, turbith, ginger, white-pepper, mace, cinnamon, rice, fennel, carrot-seeds, and honey.

The *electuarium diaphœnicum* purges chiefly serosities, and excites the menses. It is also used in droplies, leucophlegmacies, apoplexies, and palsies.

DIAPHONICS, from διὰ, *through*, and φωνη, *sound*, is sometimes used for the science of refracted sound, as it passes through different mediums.

DIAPHORESIS, διαφορησις, from διαφορεω, *I dissipate*, in *Medicine*, includes all discharges through the skin; both sensible, and insensible: whence *diaphoretic*, &c. See PERSPIRATION.

DIAPHORETIC, in *Medicine*, is applied to remedies that promote the expulsion of humours by insensible perspiration.

Diaphoretic is much of the same import as *sudorific*: except that the latter promotes sensible, and the former insensible perspiration. Their only difference, therefore, is in the degree of activity.

DIAPHORETIC *antimony*, or *mineral diaphoretic*, is a preparation of antimony, the process whereof see under ANTIMONY.

DIAPHRAGM, *Diaphragma*, in *Anatomy*, a part, popularly called the *midriff*, and by anatomists, *septum transversum*. It is a nervous muscle, separating the breast, or *thorax*, from the abdomen, or lower venter; and serving as a partition between the natural, and the vital parts as they are called.

It was Plato, as Galen informs us, that first called it *diaphragm*, from the verb διαφραττω, *to separate*, or *divide in two*. Till his time it had been called φρενες, *mentes*, *supporting*; from a notion, that an inflammation of this part produced phrensy: which is not at all warranted by experience, no more than that other tradition, that a transverse section of the *diaphragm* with a sword, causes the patient to die laughing.

Its figure is round, resembling a cymbal, or thong-buckler. It is a double and digastric muscle, consisting of two circles, which are both membranous: of two arteries; and two veins, called *phrenics*; and several branches of nerves. The first, or superior circle, called the great muscle of the *diaphragm*, is fleshy in its circumference, and tendinous and aponeurotic in the middle: it arises from the sternum, and the ends of the false ribs, by radiated fibres: the second, or inferior, called the small muscle of the *diaphragm*, is thicker than the other, of less extent, and of an oblong form: it comes from the vertebræ of the loins by two tendons, called *crura*. The upper is covered at the top with a membrane derived from the *pleura*; and the lower is lined at bottom with another from the *peritonæum*.

Its situation is oblique, being extended from the *cartilago xiphoides*, by the extremes of the ribs, to the region of the loins. It is pierced in the tendinous part with a round opening for the passage of the *vena cava*, which being incapable of contraction, occasions no interruption to the circulation; and in its fleshy part for the *œsophagus*, and with another forked opening, partly fleshy and partly tendinous, for the *aorta*; and between the productions of the inferior circle pass the *azygos*, which lies in the interstice between the two *crura*, thoracic duct, and *vena azygos*. In its natural disposition it is convex on the upper side towards the breast, and concave on the lower towards the belly. Hence it has two motions; the one of contraction, the other of relaxation.

By the contraction, or swelling of the muscles, the *diaphragm* becomes flat on each side; the consequence of which is, that the cavity of the breast is enlarged, to give liberty for the lungs to receive the air in inspiration; and the cavity of the abdomen is lessened, and, consequently, the stomach and intestines prelled, for the distribution of the chyle. In its relaxation, whereby it resumes its natural situation, the cavity of the breast is diminished, and the lungs prefsed for the expulsion of the air in expiration. See RESPIRATION.

On the *diaphragm*, also, in great measure, depend the actions of coughing, sneezing, yawning, laughing, the hiccough, &c. between which motions there is some connexion caused by the communication of the nerves of different parts, which meet in the *diaphragm*.

Dr. Hooke observes, that an animal may be kept alive, without thorax, or *diaphragm*, by blowing air into the lungs with a bellows; of which he had made the experiment.

Mr. Senac has given us a new description of the structure of the *diaphragm*, with remarks on the action of this muscle. See Mem. Acad. Scienc. 1729.

DIAPHRAGM is used for the *septum cribri*. See SEPTUM.

DIAPHRAGM is also a general name, given to all partitions, or separations between two parts of a thing; as the little perforated partition in the tubes of long refle&ors.

DIAPHRAGMATIC, is applied to the arteries, veins, and nerves, distributed through the *diaphragm*.

They are also called *phrenic*, or *phrenetic*.

DIAPHTHORA, from διαφθειρω, *to corrupt*, is used by Galen and Boerhaave to denote the corruption of the humours in the stomach, and by Hippocrates for the corruption of the fœtus in the womb, and abortion.

DIAPORESIS, διαπορησις, in *Rhetoric*, is used to express the hesitation, or uncertainty of the speaker.

We have an example in Homer, where Ulysses going to relate his sufferings to Alcinous, begins thus:

Τιπρωτα, τι δ' ὑστατα, τι δ' ετ' ειπω κατακοιρανος ;
Quid primum, quid deinde, quid postremo aliis ego ?

This figure is most naturally placed in the condition or introduction to a *Mosaic*. See DOMINOE.

DIAPRE', or DIAPERED, in *Heraldry*, a dividing of a field into planes, or compartments, in the manner of fret-work; and filling it with variety of figures.

This chiefly obtains on bordures, which are scattered, or fretted over, and the field charged with things proper to bordures. See in *Vol. Herald. fig.* 18.

DIAPRUNUM, in *Pharmacy*, a soft, purgative electuary, thus called from the pulp of Damascus prunes, which make its base.

Diaprunum solutivum, fusile or *commune*.

DIARRHŒA, or *Looseness of the belly*, consists of the pulp of the aforementioned, with cassia, tamarinds, sharlock, red roses, violet seeds, laudanum wood, bole red and white, scrapings of ivory, balaustine juice, and the four cold seeds. It is good to prepare and soften the humours.

DIARRHŒA, *Universal*, or *solutive*, is only the simple, with the addition of half an ounce of manna to every pound of the electuary, to render it more purgative.

DIARRHODON, *Compound*, in *Pharmacy*, a name given to divers compositions wherein roses are a principal ingredient.

The word is formed of *dia*, and *rhodon*, *rose*.

DIARTHRODIAL *Muscle*, is a muscle proper to demonstrated from the above who invented it. It consists of red roses, red and white sanders, lignum aloes, cinnamon, sharpstones, fishmaw, ivory, lactuhum, lithium, mastich, pearls, ambergris, musk, &c. It is said to strengthen the heart, stomach, and liver, to assist in digestion, and to prevent vomiting.

There are also *Lenitive Diarrhodons*, compounded of red roses, syrups of ivory, the four cold seeds, mastich, saffron, amaranth, and pale myrobs. They are good to fortify the heart, stomach, and liver, and to help dysenteries, and other diseases of the belly.

DIARRHODONS, *Pulvis*, are composed of aloes, rose-buds *diarrhodon*, wormwood leaves, mastich, and rock salt.

They purge, strengthen the stomach, promote digestion, and prevent a stinking breath. But all these commendations are out of use at present.

DIARRHŒA, *Sanguis*, in *Medicine*, a bloody, or flux of the belly; or a profuse evacuation of liquid excrements by stool.

The word is formed of the Greek *dia*, *through*, and *rheo*, *to flow*.

The name, in general, is used for any kind of flux of the belly; but properly for that wherein the humours, or excrements, flow out either pure, or mixed, with or without pain, in a fluid state.

The *diarrhœa*, *looseness*, or purging of the bowels, as it is usually called in us, is properly an increased peristaltic motion of the guts, by means of which nature attempts to throw off a humour or bilious matter lodged in too great a quantity in the prime *viæ*, and disturbing her regular operations.

Diarrhœa are of divers kinds, distinguished by the diversity of the excrements; some being bilious, some serous, some purulent, and some pituitous.

The purulent diarrhœa arises from some ulcers bred in the bodies, the refuse of which, poured into the intestines, and expelling the juices out of the adjacent parts, occasions a laxity of the intestinal fibres; or an extraordinary fermentation in the blood, whereby it throws off its excrementitious portions.

If this disorder is attended with pain, it is sometimes called a colic. When the excrements are fluid, but very sharp, they are called *cataracta*. When the whole is carried through the bowels, and evacuated in an unpalatable state, it is called *lienteria*, and when an over-fullness regorges the portions.

If this disorder is attended with pain, it is sometimes called a colic. When the excrements are fluid, but very sharp, they are called *cataracta*. When the whole is carried through the bowels, and evacuated in an unpalatable state, it is called *lienteria*, and when an over-fullness regorges the portions.

DIARRHŒA, *Signs of*. The signs which precede a diarrhœa of any kind are usually a rending pain and rumbling, and noise in the abdomen, and frequent acute pains, particularly about the region of the navel. The appetite is usually very bad in the beginning of a *diarrhœa*, and joins hands in the strength fails; and the longer it continues, the more frequent it grows on a sudden to the common complaint, and the food is wasted and either is turned, and, finally, an internal heat is felt, which dries up the tongue, and threatens mischief to various kinds.

DIARRHŒA, *Purging*, *Symptoms of*. The simple diarrhœa, in which the stomach and first intestines is enabled to perform their functions, is accompanied with pleasant health, with little or no generally watery. When the kind of diarrhœa called the cœliac appears, there is a sign of a languor in the stomach in the person. The bilious diarrhœa are most frequent with persons of choleric habits, and the crudal diarrhœa in persons usually troubled with phlegm. Persons of tender and delicate constitutions, in their walk about a room when not well, are usually affected afterwards with a simple *diarrhœa*.

DIARRHŒA, *Cause of*. The immediate cause is irritation in the intestines. Among the principal causes of this preternatural irritation, may be reckoned the sudden impression of fevers in a morning, while the person is in bed; it is a standing observation, that such as perspire but little, are ever subject to a *diarrhœa*; and on the contrary, people who perspire much are commonly costive.

Crude foods, and such as are difficult of digestion, often throw people into diarrhœas, as also over-fat meats, especially if persons drink much after them; and nothing so frequently as the free eating of summer-fruits, especially if the person chances to swallow a quantity of any thing liquid soon after them.

Resolvent or fermenting liquors will also do it, and sometimes the drinking cold liquors in a large quantity, or even the external cold; but in this case the tender habit of the patient is as much to be accused as any thing.

The cause of a lienteric *diarrhœa* is principally the debilitating of the bowels after their erosion in a dysentery, in which the villous coat have been also injured. The cœliac *diarrhœa* is usually laid upon a fault in the stomach; but it is as often owing to an obstruction of the biliary ducts, or to a weakness of that organ. The choleric diarrhœa is usually occasioned by an effusion of a larger portion than usual of bile into the intestines, and this often occasioned by a violent fit of passion in the person. Hoffman's Comm. Med.

A great variation *diarrhœa* is of one small great cause of a great, as likewise of innumerable lesser; without which a great would, in these cases, be prevented.

DIARRHŒA, *Prognostics in*. All diarrhœas are diseases of the greatest consequence when improperly treated, or rashly and suddenly stopped by opiates and astringents. On the contrary, the whole course of a simple *diarrhœa*, if nature be left to herself, is attended with no danger. When the cause simple, and, in itself, innocent *diarrhœa* is treated in that manner, the consequences are violent and dangerous pains in the abdomen; and, in old people especially, a translation of the matter which nature would have carried off by that safe way, to the head and breast; whence vertigoes and suffocative catarrhs are often brought on, and the patient sits suddenly, and as it is supposed of apoplexies. The danger of stopping a bilious *diarrhœa* is still greater, for the frequent consequence of this is a cardiac or other violent fever of that kind; but the greatest danger of all attends the stopping of a critical *diarrhœa*. The symptomatic *diarrhœas* in the small-pox, measles, and purple fevers, are often of fatal consequence. Periodic *diarrhœas*, if nature be left to herself, are always salutary. The simple lienteric and coeliac *diarrhœas* usually give very little to reflections; and the choleric are of no dangerous consequence, unless they are attended with a fever. Finally, let it be observed, that any profuse continuing an immoderate time, wholly deprives of the strength, and throw the patient into a low fever and an atrophy.

DIARRHŒA, *Method of curing*. In a simple *diarrhœa*, the first intention is to calm and attenuate the mucous matter; and then to enlarge it by digestive, cordial, and corroborating medicines. Such are the bitters and aromatics, with some of the acrid kind, as the roots of pennyroyal, orris, and zedoary together with ginger, galangale, and the aromatic seeds. These may be assisted by the opening and carminative virtues of the cortex and aromatic gums, with the final aids of astringents, and the like. To these may be added occasionally the digestive and attenuating gums, as ammoniacum, and the like; and in some cases it is proper to administer the viscous mucilaginous gums as demulcents. Time is to be done by the astringents, as cortexes, and the like. When there is a quantity of a bilious matter mixed with this, the administry of small doses of nitre with the other medicines is of great effect; and when the peccant matter is by this means prepared for evacuation, cathartics are to be administered, or attempt to throw it off by this proper passage, by small doses of gently laxative medicines, such as rhubarb, and the like. After this, if the tension of the bowels does not abate and come to its usual standard on part being thus eased of their load, their functions are to be taken off by gentle astringents. For though these complaints were no way to be impeded, when nature exerts itself for the throwing off what offends her, and were salutary in that state; yet when they become afterwards evil to others, they are to be considered as a disease. The medicines proper on this occasion are dried quinces, the absorbent powders, such as red coral, and the like, gentle opiates, and the astringent syrups of cinnamon, and the like; and finally, the

cure

cure is to be completed by restoring the bowels to their due tone by gentle chalybeates.

Putrid *diarrhœas*, which often occur in the last stage of malignant fevers, have been checked, and in some cases removed, by injecting clysters of *fresh* air every two or three hours, and by supplying the patient plentifully with water impregnated with this air. Priestly on Air, Appendix, containing Observations of Dr. Percival, p. 9, &c.

The lienteric and coeliac *diarrhœas* require the same method of treatment with the simple, except that in the lienteric vomit in the beginning is usually very proper; but in the coeliac, when there is an obstruction of the biliary vessels, a vomit has no use; but the resolvent, aperient, and laxative alone, are to be depended upon.

Periodic *diarrhœas* are to be treated in this manner like the simple ones, and nature is to be assisted, not attacked in her operations in curing. In these cases a medicine which, joined with absorbents, gentle sudorifics, and bland bitters, is a very valuable medicine. When worms are suspected to be in the case, as they very frequently are, the usual anthelmintics are to be joined to the medicines hence described.

The critical and symptomatic, as well as symptomatic *diarrhœas* in fevers, are to be treated as directed under the fevers to which they belong; and the ichorous *diarrhœa*, in which the blood are white amidst the stools, is to be treated as the jaundice. See FEVER, INFANT, WORMS, &c.

In the cure of *diarrhœas*, from whatever cause they arise, the stomach must be corroborated, and substances are to be mixed with all vomits. The patient is to drink sparingly. Hartshorn drink may be the white decoction, or camomile tea, and the diet preparations of rice. Quince and wine boiled with aromatics is good. Wainwright observes, that a flannel shirt contributes much to the cure of a habitual *diarrhœa*.

DIARTHROSIS, in *Anatomy*, a kind of articulation, or juncture of the bones, which being pretty lax, admits them to a manifest motion. See ARTICULATION.

The word comes from *dia*, and *arthron*, *juncture*, *articulus*.

It is opposed to synarthrosis, wherein the articulation is so close, that there is no sensible motion at all.

In the *diarthrosis*, or moveable articulations of the bones, the pieces are really separated, and the parts in which they touch are each of them covered by a smooth cartilage, by means of which they easily slide over one another; whereas in the synarthrosis, or immoveable articulation, the pieces are joined together in such a manner, that the parts in which they touch have nothing particular in their surface, and cannot slide upon one another.

The *diarthrosis* is either manifest with large motion, or obscure with small motion. The former kind of *diarthrosis* is of three kinds. 1. When the head of the bone is big, and long, and the cavity that receives it, deep; it is called *enarthrosis*, or orbicular *diarthrosis*; such is that of the thigh, with the hip. 2. When the head of the bone is flat, and the cavity that receives it, superficial; it is called *arthrodia*, and plasiform *diarthrosis*; such is that of the jaws, with the bones of the temples. 3. When two bones receive each other reciprocally, and are moveable in each other; it is called *ginglymus*, and alternative or reciprocal *diarthrosis*; thus the cubitus receives the radius, at the same time that the radius receives the cubitus.

DIARTHROSIS *synarthrodialis*, called also *amphiarthrosis*, is a kind of neutral, or dubious articulation; being neither absolutely *synarthrosis*, as not having a manifest motion; nor absolutely *diarthrosis*, as not being quite immoveable.

Thus the articulations of the ribs with the *vertebræ*, and those of the *ossa coxæ*, and *sacrum*, among each other, are *synarthrodialis diarthrosis*.

DIARY, a term sometimes used for a journal, or day-book, containing an account of every day's proceedings.

Thus we say *diaries* of the weather, &c.

DIARY *fever*, is a fever of one day. See EPHEMERA.

DIASCHISM, *Diaschisma*, in *Music*, the difference between the comma and enharmonic shisma. This is expressed by the ratio 128:125.

Mr. Keller has taken this term in the sense here mentioned. Others call it the lesser comma. The octave contains five *diaschisms* nearly. Trotam. Nov. Theor. Music. p. 107 & 110. See COMMA.

DIASCORDIUM, in *Pharmacy*, a kind of electary, first described by Fracastorius, and denominated from *scordium*, which is a chief ingredient therein. It is also called *confectio Fracastorii*.

The other ingredients are red roses, bole, florax, cinnamon, cassia lignea, dictany, tormentil roots, bistort, gentian, galbanum, amber, terra sigillata, opium, long pepper, ginger, red centaury, and Malmsey wine.

It is an astringent, and is used against malignant fevers, the plague, worms, the colic, and to procure sleep, and resist putrefaction.

DIASEBESTEN, in *Pharmacy*, a soft, purgative electary, whereof sebestens are the basis.

The other ingredients are prunes, tamarinds, juices of fig, anguine, and mercurialis, penides, simple diapruna, rob of sloes, the four cold seeds, and diagrydium. It is good in intermitting and continued fevers, appeases thirst, promotes sleep, and expels the morbid humours by urine.

DIASENNA, in *Pharmacy*, a soft, purgative electary, thus called from *senna*, which is its base.

The other ingredients are ingle-candy, cinnamon, lapis lazuli, nik. clarues, galanga minor, black pepper, radix indica, zedoary, fruit of ballotus, flowers of cloves, cubebs, mosses, citron, ginger, cubeby, celestine berries, long pepper, lapis Armenus, and barley.

Diasenna eases and comforts the melancholic and splenetic; and is good against all diseases arising from an atrabilis.

DIASIA, *Diasia*, in *Antiquity*, a festival at Athens in honour of Jupiter, surnamed *Maimactes*, i. e. *the propitious*. Port. Archæol. lib. ii. cap. 20.

DIASTASIS, from *diastemi*, *I set apart*, a word used by the writers in medicine in many different senses. It is frequently used as a name for that separation of the bones, when they naturally recede from one another. Sometimes it is used as the term for an interval, as that between the *ilion* and *radius*, or between the *ilion* and *femur*. Sometimes it is put for a distention of the muscles in convulsions; and, when applied to the stomach, it is made to signify an inclination to vomit.

DIASTEM, *Diastema*, in *Music*, a name the ancients gave to a simple interval, in contradistinction to a compound interval, which they called a *system*.

Aristoxenus enumerates many differences of intervals; such as greater, or less, conformal, or dissimilar; compounded, or uncompounded; related to one genus, or to another; lastly, rational or irrational. *Aristox. apud Wallis. Append. ad Ptolem. Harmon.* p. 154.

Musicians divide intervals into two kinds: one of these called *system*, which is to contain at least two intervals in any kind of mode whatever; but many commonly more.

The other, called *diastem*, is a more, or simple interval; the proper signification of the Greek *διαστημα*, being *interval*.

DIASTOLE, in *Anatomy*, expresses that motion of the heart, and arteries, whereby their parts dilate, or distend themselves: the other opposite motion being called the *systole* of the heart, and arteries; wherein they contract themselves. See ARTERY, and HEART.

The word is Greek, formed from the verb *διαστελλω*, *to separate, open, dilate*.

The *diastole* of the heart is properly the recess of the parietes of the two ventricles from each other; or the enlargement of their cavities, and diminution of their lengths, and their approximation to a spherical form.

The *diastole*, or dilatation of the heart, arises from the blood being brought, by the veins, into its ventricles; and that of the arteries, from the blood being thrown into their cavities by the contraction of the heart. So that the *diastole* of the heart, and arteries, is not effected at the same times; the *diastole* of the heart happening when the arteries are contracted, and that of the arteries when the heart is contracted.

When we call the beating of the pulse in any the *diastole* of the arteries.

The lungs and breast have also their *systole* and *diastole*, as has the brain.

The true cause of the *diastole* of the heart was not well accounted for before Dr. Drake; that the heart is a muscle, is made evident beyond all doubt by Dr. Lower; and that the motion of all muscles consist in contraction, is not to be doubted. By such means the systole is easily accounted for.

But inasmuch as the heart has no antagonist muscle, the *diastole* has puzzled men of the greatest genius. Dr. Lower unhappily attributes it to a motion of restitution. *A nulla cunctatione aberat, ubi restitutum quæ erat natura, & ab irritante compulsum, dilatatur, erat hic ubi ab actione secedit.* De Corde, p. 205.

Mr. Cowper accounts for the *diastole* from the analogy the heart of an animal bears to the pendulums of those artificial automata, clocks and watches: its motion, he says, is performed like that of other muscles, the blood doing the office of a pendus or weight.

Both these notions Dr. Drake refutes; and with great reason and probability maintains the weight of the atmosphere to be the pendus, or counterpoise to the contrac-

tractile force of the heart. He has found that respiration has an effect upon the heart in this sense which had not been understood before. The systole being the proper motion of the heart, a state of contraction by means of that systole must needs be its natural state, and consequently no motion of reflusion natural, and without external violence it could have no *diastole* at all.

This will appear more plain, if we consider the circumstances of the heart, and its motion as a muscle, with respect to other muscles. That contraction is the proper action and natural state of all muscles, is evident from experience as well as from reason: for if any muscle be freed from the power of its antagonist, it is immediately contracted; and in fact, by any action of the will or spirits, to be reduced to a state of dilatation: thus, if the *muscles flexors* of any joint be divided, the *extensors* of that joint, the opposite muscles to the *flexors*, being freed from the contrary action of their antagonists, will exert themselves; the joint will be extended without the concurs of the will, and it will continue in that posture: and, on the other hand, if the extensors are divided, the contrary will of themselves exert their force, and the limb will be contracted without the concurs of the will, and it will continue in that posture. It is very evident from all this, that the muscles of the human body have no reflusionary power of their own, but that all power of this kind in them is derived from the action of their antagonists, by which they are balanced: thus likewise the sphincters of the *anus*, and *vesica*, having no proper antagonists, are always in a state of contraction, and suffer nothing to pass through them, but what is forced on by the action of other stronger muscles; which, though not properly antagonists to these, yet, on all necessary occasions, perform the office of such.

The heart is a solitary muscle: it has no antagonist, and is not under the direction of the will: as it performs also no voluntary motions, from all things approaches more to the nature of the sphincter muscles, than to any other boundary but, in its constant actions of contraction and dilatation, it differs exceedingly from all the muscles of the body. This reciprocal motion of the heart has given the learned abundance of trouble, who finding nothing peculiar in the structure which should occasion it, nor any antagonist whose relation should produce it, have been extremely perplexed to find out the cause of it.

Lower having proved the heart a muscle, and established the manner of its muscular motion, takes notice of no further usefulness that it receives for the performing this, than what it has from the brain, by means of the eighth pair of nerves. Borelli, in his Animal Oeconomy, computes the motive power of the heart to be equal to, at least, that of a weight of three thousand pounds. The obstacles to the egress of the blood, through the arteries, he affirms equivalent to one hundred and eighty thousand pounds, which is sixty times as much as he rates the force of the heart at; even deducting forty-five thousand pounds, for the advantageous help of the muscular coat of the arteries: so that there remains a surplus of one hundred and thirty-five thousand pounds force, with the heart, to overcome the resistance of a hundred and thirty-five thousand pounds more in it, with ease, to remove forty-five. This supposed effect, he satisfies himself with assuming as the energy of percussion; but, had he proceeded in his calculation to the veins, which he allows to contain one-fourth a quantity of blood quadruple to the contents of the arteries, and to which this energy of percussion does not either reach at all, or but very languidly, he might probably have seen a necessity of some other expedient, to relieve so insuperable a difficulty.

But not to insist regularly on the exactness of this computation, we may allow a much greater deduction than would be sufficient, without lessening the difficulty. Dr. Lower, notwithstanding the care and sagacity with which he examined this subject, seems to have overlooked something of very great moment, in the explication of the action of the heart: for, though it should be granted, that the muscular fibres of the heart, acted by the nerves, are the immediate instruments of its systole or contraction, yet it must not be denied that the intercostal muscles and diaphragm are of great service, to aid and facilitate this contraction, by opening a passage for the blood through the lungs, which denied, would be an insuperable obstacle: neither do the lungs promote the motion of the heart in that way only, but the manner in which they assist the heart in its contractions, will appear manifestly, if we consider the different postures, situations, and capacity of the blood-vessels of the lungs in the several times of elevation and depression of the *costæ*.

The pulmonary artery rises from the right ventricle of the heart, and runs in one trunk, till it comes to the *aspera arteria*, where it is divided, and sends a branch along with each division of the *aspera arteria*; according to all the minuteſt subdivisions of which, it is also subdivided, accompanying all the *bronchi* in their passage through the lungs.

The pulmonary vein, which empties itself into the left ventricle of the heart, spreads itself on the *aspera arteria* and *bronchi*, and continues its progress in the same manner in which the artery does. The necessary consequence of this disposition is, that this artery and vein, being co-extended with, and fastened to the *bronchi*, must needs suffer such alteration of superficial circumference, as the *bronchi* do in the elevation and depression of the *costæ*, while the ribs are in a state of depression, whether before commencing with the external air, as after the muscular cartilages of the *sternum* sink into one another, and by that means their dimensions are exceedingly contracted; in conformity to this condition of the *bronchi*, the pulmonary artery and vein must likewise either by means of their muscular coats, contract themselves to the same dimensions, or lie in folds or corrugations, which is much less probable.

On the other hand, when the ribs are elevated, and the diaphragm bears downward, the air rushing into the lungs, throws out the cartilaginous rings, and dilatates the branches of the *trachea*, and by them extends and dilatates the several dividions of the pulmonary artery and veins, and thereby lengthens and enlarges their capacities. This enlargement of their cavities is very considerable, not only upon the score of the volume which they receive in length thereby, but also on account of their diminution; for whereas, when the ribs are depressed, and the lungs subside, the blood-vessels are not only contracted, but their branches, which are exceeding numerous, approach one another, and lie in juxtaposition, by which their cavities are very much compressed and straitened: when the ribs are elevated, and the lungs turgid with air, not only the force, by which their coats in the opposite state were contracted, are extended, but their innumerable reliefs, which lying before in their almoſt contiguous to one another, compressed each other, making an acute angle at their junctures, are dilatated and separated from each other, and make an obtuſe one, whereby their channels are widened.

Thus a passage is opened for the blood from the right ventricle of the heart to the left, through the lungs, to which it could not otherwise pass; and the opposition, which the blood contained in that ventricle must otherwise have had made to its contraction, is taken off, and the systole thereby facilitated a-new in this act, for the *diastole* being caused, as is certainly and demonstrably the case, by the force of the blood rushing into the ventricles, this anticipation and extension of the pulmonary artery is a part of that in contemplation to it, and presents an endeavour towards two contrary effects at once, which would necessarily ſruſtrate both: for the heart being a ſpring, and compressible body, whose proper action, which is contraction, depends upon the force of expansion fluids upon its ſolids and ſubſtance, and containing beside a fluid in its ventricles, as just exprest, in one of which is the power of this artery, the action of this vessel must in a great measure resemble that of a ſpring, whose extremity is fastened in water: the endeavour or expansion of the channels of the artery, answering to the bearing of the cylinder, as the contractile motion of the muſcle of the heart, does to the preſſure of the atmoſphere on the ſurface of the water, the one pushing way for the blood, and the other forcing it to flow where the reſiſtance is leaſt. In this caſe we may allow a lost of attraction to the pulmonary artery, depending wholly upon the action of the intercoſtal muſcles, and diaphragm, which we shall therefore conſider to be very conſiderable and inſtrumental in promoting the ſyſtole of the heart. Phil. Trans. N° 281. p. 1272. See HEART.

It has long been known, that the *thora water* has a ſyſtole and *diaſtole*, exactly correſponding to those of the heart. But no cauſe was yet to well known. Dr. Ridley, in the Philoſoph. Tranſact. Abr. vol. v. p. 160, &c. having bored a hole in the upper part of the *thorax* of a dog, firſt perceived the alternate vibrations of the *thora water*; then, continuing the hole to the brain, he found both by his eyes, and even afterwards by touch, very ſenſible, that there was a like brisk ſyſtole and *diaſtole* of the brain. M. De la Mure, in 1734, made ſeveral experiments with dogs, both living and dead, in order to inveſtigate the cauſe of this motion of the brain; from which he proves, that the true cauſe is the reflux of the blood towards the brain, and that this reflux is owing to the preſſure of the lungs on the veins of the *thorax*, in reſpiration. Encycl. See BRAIN, and DURA *mater*.

DIASTOLE, in *Grammar*, a figure whereby a ſyllable naturally short is made long.

Thus it is that Virgil begins a verse with the word *Italus*, the firſt ſyllable whereof is naturally ſhort.

DIASTYLE, from *δια*, and *στυλος*, *a pillar*, in the *Ancient Architecture*, an edifice, where the columns ſtand at ſuch a diſtance from one another, that three diameters, or ſix modules, are allowed for the intercolumniation. See *Tab. Archit. fig.* 40. D. in the plan of the Baſilic.

DIASTROPHUS, *Διαστροφος*, from *δια* and *στρεφω*, *I draw*, in *Rhetoric*, a figure whereby we ſlightly anſwer, or rather evade, a thing which it would be tedious to reply to in form.

E. gr. *What matters it to reply to an argument foreign to the purpoſe?*

DIATESSARON, in *Pharmacy*, a ſort of theriaca, thus called, becauſe it conſiſted of four ingredients, which are roots of ariſtolochia and gentian, bay-berries and myrrh.

The word is Greek, compounded of *δια*, and *τεσσαρες*, *four*, q. d. *a compoſition of four drugs*.

It is alſo called *theriaca pauperum*, becauſe made at a very eaſy expence, and in a ſhort time. It is good againſt ſtingings of venomous beaſts, epilepſies, convulſions, colics, to ſtrengthen the ſtomach, and promote the menſes.

DIATESSARON, in the *Ancient Muſic*, a concord, or harmonical interval, compoſed of one greater tone, one leſſer, and one greater ſemi-tone; its proportion being as 4 to 3.

In the modern muſic, it is called a *perfect fourth*.

Many muſical writers have rejected the *diateſſaron* from the claſs of conſonances. Others have retained it as a ſecondary or imperfect concord; urging that it is only a concord when the harmony conſiſts of two parts, but not by itſelf; and that if it were a perfect conſonance, the replicate of it would be a conſonance likewiſe; whereas the ear can hardly endure it. Thus they ſay, whenever a ſound is a perfect conſonance with its uniſon, the replicate of that ſound will alſo be a conſonance, as is the caſe with the diapente and diapaſon, whoſe replicates, viz. the 15th and the 12th, which are the diapaſon and diapente compounded, are not leſs grateful to the ear than the radical ſounds themſelves: but the diapaſon and diateſſaron compounded in the 11th, do not make a conſonance. See Hawkins's Hiſt. Muſ. vol. ii. p. 192. and vol. iii. p. 134.

DIATHESIS, from *διατιθημι*, *I diſpoſe*, a term uſed by ſome writers in the ſame ſenſe with conſtitution; and by others for a diſpoſition of the blood to a faulty ſtate.

DIATONIC, from *δια* and *τονος*, *tone*, an epithet given to the common muſic, as it proceeds by tones, or degrees, both aſcending and deſcending.

Authors divide the genera or kinds of muſic into *diatonic*, *chromatic*, and *enharmonic*.

The *diatonic* genus was by the ancients divided into two ſpecies; the *molle*, and the *intenſum*. The laſt is in daily practice. It is commonly ſaid to conſiſt of two tones and a ſemi-tone: but, to ſpeak exactly, it conſiſts of a ſemi-tone major, a tone minor, and a tone major.

We find it accurately defined by Didymus, in Ptolemy's Harmonics, publiſhed by Dr. Wallis. Vide Wallis, Oper. vol. iii. p. 92. The numbers by which Didymus expreſſes its intervals, are, $\frac{9}{8} \times \frac{16}{15} \times \frac{10}{9} = \frac{4}{3}$. Ptolemy, indeed, makes the *diatonicum intenſum* to be expreſſed by $\frac{16}{15} \times \frac{9}{8} \times \frac{10}{9} = \frac{4}{3}$; but it is plain, this is only tranſpoſing the tones major and minor, which makes no eſſential difference, nor is it ſufficient to conſtitute a new ſpecies. But the firſt of the before mentioned ſpecies, the *diatonicum molle*, has not, till lately, been accurately defined by any author. Its component intervals, according to Dr. Pepuſch, are, the ſemi-tone major, an interval compoſed of two ſemi-tones minor, and the complement of theſe two to the fourth; which complement is equal to a tone major, and an enharmonic dieſis.

Beſides the two ſpecies of the *diatonic* mentioned by Ariſtoxenus and Euclid, Ptolemy, and other ancient muſicians, have left us ſeveral different *diatonic* diviſions of the tetrachord; ſuch are the *diatonic* of Archytas, of Eratoſthenes, and of Didymus, which laſt agrees perfectly with the truth of muſical proportions. Ptolemy himſelf gives us no leſs than five different *diatonics* by the names of *molle*, *tonicum*, *ditonicum*, *intenſum*, *æquabile*. See GENUS.

But, except one (the *intenſum*), they are all inconſiſtent with the true theory of muſic; which admits of no numbers, or proportions, but 2, 3, and 5, and ſuch as ariſe from theſe primes. Indeed, Ptolemy's tetrachords are ſo miſ-tuned, that Salinas has charged him with having had no ear. Vide Phil. Tranſ. N° 481.

Diatonic muſic only allows of three degrees; the greater and leſſer tone, and the greater ſemi-tone.

Hence *diatonic* muſic appears the moſt natural, and of conſequence is the moſt ancient.

In the *diatonic* muſic there is a tone between every two notes, except between *mi* and *fa*, and *fa* and *ut*, where there is only a greater ſemi-tone.

DIATONUM, *Διατονον*, in the *Ancient Muſic*, is uſed for the diatonic genus. See DIATONIC.

DIATRÆTA, a word uſed by Pliny, and other of the ancient Romans, to expreſs a ſort of cups and veſſels, which were of great value, and only ſeen at the tables of the great. They were peliucid and colourleſs, and cut into various forms, and were often engraven upon with figures expreſſive of the deeds of honour of the family who poſſeſſed them. The firſt *diatratæ* were made of pure cryſtal of the rock, and the working of theſe rendered them very expenſive; but afterwards they were made of common white glaſs, and ſunk greatly in their price and value. The ancients were very nice in their diſtinctions of the ſeveral kinds of cryſtal. They termed the pureſt and fineſt of all *accetatum*, and the others, which were ſubject to blemiſhes and ſoulneſſes of ſeveral kinds, they called by names expreſſive of them. There was nothing they ſo much feared in the pieces they ſelected for this work, as what they called an over-hardneſs, that is, a brittleneſs, which made the veſſel often fly under the engraver's tool, after it had been formed into ſhape at a great expence: for this reaſon they were cautious of uſing the very brighteſt and cleareſt maſſes; for they often found thoſe ſucceed beſt, which had ſome of thoſe flaws which we call *hairs* in them. Theſe they thought the tougheſt pieces of cryſtal, and theſe flaws they eaſily concealed among the ſtrokes of their work. See NUBES and SAL.

DIATRAGACANTH, in *Pharmacy*, is a name applied to certain powders, whereof gum tragacanth is the baſe. There are two kinds, *cold* and *hot*.

Powder of *cold diatragacanth* is compoſed of the gums tragacanth and Arabic, liquorice, ſtarch, white poppy-ſeed, and the four great cold ſeeds. It is good to thicken and ſoften the too ſharp, and ſubtile ſerous humours falling on the breaſt, to aſſuage coughs, and to promote ſpitting.

Powder of *hot diatragacanth* is compoſed of gum tragacanth, cinnamon, hyſſop, almonds, linſeed, fenugreek, liquorice, and ginger. It is good againſt aſthmas, to promote expectoration, ſtrengthen the ſtomach, and aſſiſt digeſtion.

DIATRIBE, from *διατριβω*, *I delay*, denotes a continued diſcourſe.

DIATYPOSIS, *Διατυπωσις*, in *Rhetoric*, the lively deſcription of a thing, ſetting it, as it were, before the eyes of the audience. Thus Cicero, vii. in Ver. *Viſo ſpiculatorem, ſortiri, & furere, in forum venit; acclamat audit; intra ea crudelitas eminebat, &c.*

DIAUGOPHRAGMIA, in *Natural Hiſtory*, a genus of *ſpatæ*, whoſe ſepta are of ſpar, with an admixture of cryſtal, which being ſometimes alſo mixed among the matter of the tali, renders the whole more bright and gloſſy. See SPETARIA.

Of this genus we have the following ſpecies: 1. The ſerrugineous red *diaugophragmium*, with brownith yellow partitions. 2. The brownith yellow *diaugophragmium*, with whitiſh partitions. 3. The bluiſh white *diaugophragmium*, with ſtraw-coloured partitions. Vide Hill, Hiſt. Foſſ. p. 522.

DIAULION, from *δια*, and *αυλος*, *a flute*, in *Antiquity*, a deſignation given to a performance on the ancient ſtage with the flute alone.

DIAULODROMI, *Διαυλοδρομοι*, from *δρομος*, and *δρεμω*, *courſe*, in *Antiquity*, thoſe racers who turned round the meta, or goal, and finiſhed their courſe at the career, or place of ſtarting. The *diaulodromi* always took a ſhort breathing or reſt, when they arrived at the meta, before they ſet out again for the career.

DIAULOS, from *δις*, *twice*, and *αυλος*, *ſtation*, in *Antiquity*, the name of a particular kind of race, wherein the racers always returned to the place from whence they ſtarted, and were called DIAULODROMI.

DIAULOS is alſo uſed to ſignify a diſtance of two ſtadia.

DIAZEUCTIC, from *διαζευγνυμι*, *I diſjoin*, or *ſeparate*, one, in the *Ancient Greek Muſic*, was that which diſjoined two fourths, one on each ſide of it, and which, being joined to either, made a fifth.

Thus in their muſic was from *meſe* to *parameſe*; that is, in ours, from A to B: ſuppoſing *mi* to ſtand in B *fa# mi*. They allowed to this *diazeuctic* tone, which is our tone major or *la, mi*, the proportion of 9 to 8, as being the unalterable difference of diapente and diateſſaron.

DIBBLE, from *dibſel*, Du. *a ſharp point*, among *Gardeners*, the name of the ſetting-ſtick, or tool, wherewith they ſet plants; ordinarily made of the handle of an old ſpade.

DICA, in *Law*, a tally for accounts, by the number of tallies, cuts, or notches.

DICE, among *Gamesters*, certain cubical pieces of bone or ivory, marked with dots on each of their faces, from one to six, according to the number of their sides.

Sharpers have several ways of falsifying *dice*: 1. by sticking a hog's bristle into them, so as to make them run high or low as they please: 2. by drilling and loading them with quicksilver; which trick is discovered by holding them gently between two diagonal corners; when, if false, the heavy side will turn always downwards: 3. by filling and rounding them. But all these methods fall far short of the arts of the *dice*-makers, some of whom are so dextrous, that sharping gamesters will give any money for such *dice*.

Dice pay a large STAMP-duty and are prohibited to be imported.

DICE-*marle*, in *Husbandry*, see MARLE.

DICERATION, in the *Writers of Medicine*, a name given to a collyrium mentioned by Celsus, and thus named from δικερως, *a horn*, burnt hartthorn being a principal ingredient in it.

DICHORÆUS, in *Poetry*, the foot of a Latin verse consisting of four syllables; of which the first is long, the next short, the third long, and the last short. It is a double *choreus*, as *cămpĭthĕātri*.

DICHOTOMY, *bisection*, a term used by astronomers for that phasis, or appearance of the moon, wherein she is bisected, or shews just half her disk, or circle; or when she is in the beginning of her first and last quarter.

The word is Greek, formed of διχοτομεω, *I bisect*, or *cut into two*; of δις, *twice*, and τεμνω, *I cut*.

The time of the moon's *dichotomy* is of considerable use in fixing the sun's distance from the earth. But it is very difficult to fix the precise moment when the moon is bisected, or in her true *dichotomy*. Observation informs us, that when she is thirty minutes distant from the quadratures, she appears bisected; but she appears so too in the quadratures themselves, and some time afterwards, as Riccioli acknowledges in his Almagest. So that she appears *dichotomized* at least for the space of a whole hour: in which time any moment may be taken for the true point of the *dichotomy*, as well as any other. But the infinite number of moments of time give an infinite diversity of distances. The moment in which the true *dichotomy* happens being thus uncertain; but it being granted withal, that it happens before the quadrature; Riccioli takes the middle point between the quadrature, and the time when it is first dubious, whether the moon be *dichotomized*, or not, for the true *dichotomy*. Keil.

DICHOTOMY, in *Botany*, a term used to express that division of the branches which we see in mistletoe, and in the greater part of the sea-fucuses, in which each branch is divided into two.

DICHOTOPHYLLUM, in *Botany*, the name by which Dillenius, and several others, call the *hybrocotophyllum* of Vaillant, and some other writers; a genus of plants charactered by Linnæus in his Genera Plantarum under the name of CERATOPHYLLUM.

DICKER, or DICRE, *Dicra*, in our *Old Writers*, a quantity of leather consisting of ten hides.

Some derive the word from the Greek δεκα, *ten*.

We find the word *dicra* applied to other things besides leather; thus, *Cicilias Glouc. Trin reddebat* XXXVI. dicras *ferri*; which is interpreted thirty-six *dickers* of iron, ten bars to the *dicre*. Gales's Hist. Brit. 766. ap. Blount.

DICROTUS, in *Natural History*, a word used by the ancients to express the deer or stag when in its third year's growth. It was called *nebus* by the ancient Greeks in the first year, *puttoles* in the second, *dicrata* in the third, and in the fourth and all its life afterwards *eeroftes*.

DICROTUS, from δις, *twice*, and κρουω, *I strike*, in the *Medicinal Writings of the Ancients*, the epithet given to a peculiar sort of pulse, which Dr. Nihill calls very properly in English the rebounding pulse. In this kind of pulse the artery beats as it were double; and is esteemed a certain sign of a future critical hæmorrhage by the nose. When the rebounding pulse is perceived at about every thirtieth pulsation, the hæmorrhage usually follows in about four days after; when it recurs at every fifteenth pulsation the hæmorrhage generally follows in three days; when at every eighth pulsation, it is to be expected in two days and a half; and, finally, when it recurs at every fourth, third, or second pulsation, or is continual in every one, the hæmorrhage is to be expected within four and twenty hours. Sometimes nature runs regularly through all the before mentioned progressions of this critical pulse from its first appearance at every thirtieth stroke, to the single pulsation; and in this case the hæmorrhage is seen gradually approaching, and happens regularly as expected; but sometimes the hastens or delays it; and then the pulse shifting in its indications, it cannot be judged of with any certainty. When the artery rebounds upon the finger with great celerity, and very briskly follows the first stroke, the hæmorrhage is just at hand, and will appear on the patient's blowing his nose.

The quantity of the hæmorrhage may be guessed from the strength of the rebound in the pulse, and as the blood discharges itself, this symptom in the pulse gradually goes off: and if after the hæmorrhage it should be perceived again, it is a sign of another crisis of the same kind. Finally, when the rebounding of the artery is more evident in one wrist than in the other, the blood usually flows in the greatest violence from that side of the nose, or that nostril which is on the same side with the hand in the artery of which the rebounding has been most violent.

DICTAMNUS, in *Botany*. See DITTANY.

DICTATE, *Dictamen*, in the *Schools*, a suggestion, motion, or sentiment of a man's CONSCIENCE. A good action becomes evil, if done contrary to the *dictates* of one's own conscience.

DICTATE, *Dictata*, is likewise used in the *Schools* for a lesson, or exercise, wherein the master reading, or speaking something, the scholars take it down in writing after him. Here the act of the master is likewise called *dictating*.

DICTATOR, a Roman magistrate, created by the senate, or people, on some extraordinary and eminent occasion, to command, with sovereign authority, for a certain time, ordinarily limited to six months though the office was sometimes continued to twelve.

Recourse was never had to such an officer but in dangerous and difficult times; as in sudden wars, popular factions, &c. He had absolute and monarchic power while his dictature lasted: and some will even have it, his power went beyond that of the kings. He was arbiter of peace and war, and had command of life and death, without any appeals lying to the people. Twenty-four axes were borne before him, whereas only twelve before the consuls.

The origin of this office was unknown even in Livy's time: though some ancient authors speak of T. Largius Flavus as the first *dictator*, who was appointed in the year of Rome 259. *Sed nec anno, nec quibus auspiciis— nec quis primus dictator creatus sit, satis constat: apud veterrimas tamen auctores, T. Lartium* dictatorem *primum, Sp. Cassium magistrum equitum creatos invenio. Consulere legem.* Liv. lib. ii.

Sylla was the first perpetual *dictator*, and Cæsar the next. After Cæsar, there were no more *dictators*. The first *dictator* chosen from among the people was Marcus Rutilius, in 398.

Dionysius Halicarnassæus derives the word *ab edicendo*, because they ordained or appointed what they pleased. But Varro will have the word taken hence, that the consul named him, which the Latins call *dicere*, lib. iv. De Lingua Latina. Dictator *quod a consule dictebatur, cujus dicto audientes omnes essent.*

DICTION, the phrase, elocution, or style of a writer, or speaker.

The *diction* or language of an orator should be pure, proper to the subject, rich without affectation, strong and stole without dryness, and suitable to the person, time, place, and audience.

The *diction* of tragedy is accounted the fourth of the essential parts thereof: it is of the least importance of any; yet must peculiar care be taken herein to make every passion speak its proper language.

DICTIONARY, a collection, or catalogue of all the words of a language, or art, with their significations: ranged in the order of the alphabet.

What the Latins, and we after them, call *dictionary*, the Greeks call *lexicon*.

For the proper character, nature, office, &c. of a *dictionary*, see the preface to this work. See also VOCABULARY.

The most ancient *dictionaries* for the Latin tongue, are, that called Papias, compiled by Solomon, abbot of St. Gall, bishop of Constance, who lived about the year 1409; another made in 1469, called Gemma Vocabulorum; a third in 1502, called Gemma Gemmarum; and a fourth by Dionysius Nestor, a Cordelier.

The most celebrated old Latin *dictionary* is that of Ambrose Calepine, a hermit of St. Augustine at Bergamo, and son of the count of Calepin. Conrad Gesner is said to have augmented this with four thousand words. Paulus Manutius increased it still more; and Passerat after him: and yet Matthias Martinius made two volumes of their omissions.

There is another noted Latin *dictionary* of Crispinus: to say nothing of Cowper, Holyoake, Gouldman, Littleton, Cole, Ainsworth, and many others of less consideration.

For the Greek, we have those of Henry Stevens and

Scapula, Schrevelius, and Hedericus: for the Spaniſh, thoſe of Covarruvias, and Delphino: for the Italian, thoſe of the Academy della Cruſca, Veneroni, and Baretti: for the French, thoſe of Nicod, Fa. Monet, Fa. Gaudin, Furetiere, Richelet, Trevoux, that of the French Academy, Boyer, and Chambaud: for the Engliſh, we had ſcarce any worth the mentioning (unleſs, perhaps thoſe of Lloyd, Philips, Kerſey, and Bailey) before the publication of that very complete and accurate one by Johnſon.

Junius has a *dictionary*, or alphabet, of the Gothic, Runic, and Anglo-Saxon. There is another in the Malayan, which is a dead language, famous throughout the Eaſt Indies, where it ſtands inſtead of the Latin among us.

There are alſo hiſtorical and geographical *dictionaries*: as that of Charles Stephens, which is tranſlated into French, and augmented by Moreri: another of Hofmann, printed at Baſil in 1677, in two volumes folio; which were followed by a continuation of as many volumes, in 1683: another of Mr. Bayle, under the title of Hiſtorical and Critical *Dictionary*, firſt printed at Rotterdam in 1697, in two large volumes, now making five in Engliſh: a Philoſophical *dictionary*, by Mr. Chauvin of Berlin: beſides ſeveral law *dictionaries*, as Jacob's; phyſical *dictionaries*, as James's; family *dictionaries*; *dictionaries* of arts, as the Encyclopædie, &c. of *commerce*, as Savary's by Fofliethwaite, &c.

DICTORES, in our *Old Writers*, is uſed for an arbitrator.

DICTUM, in our *Old Writers*, is uſed for an arbitrament or award.

DICTUM *de Kenelworth*, an edict or award between king Henry III. and thoſe barons who had been in arms againſt him. It was ſo called becauſe made at Kenelworth caſtle in Warwickſhire, anno 51 Hen. III. It contained a compoſition of five years rent for the lands of thoſe who had forfeited them in that rebellion.

DICTYMNIA, or DICTYNNIA, in *Mythology*, were feaſts celebrated at Lacedæmon and in Crete, in honour of Diana *Dictynnia* or *Dictynna*, or of a nymph taken for her, who, having plunged herſelf into the ſea, to eſcape the paſſion of Minos, was caught in a fiſherman's net or *ſuccus*, whence the name.

DIDACTIC, in the *Schools*, ſignifies the manner of ſpeaking, or writing, adapted to teach or explain the nature of things.

The word is formed from the Greek διδασκω, *doceo*, *I teach*.

There are many words that are only uſed in the *didactic*, and dogmatic way: and there are many works, ancient and modern, both in proſe and verſe, written after this method: ſuch are the Georgics of Virgil, Lucretius's poem De Rerum Natura, and Pope's Eſſays on Criticiſm and on Man, &c. &c.

DIDAPPER, in *Ornithology*. See DOP-*chick*.

DIDAR, among the Arabian authors, the name of the elm.

DIDELPHIS, the name by which Linnæus calls the animal called philander by other writers. This creature, in that author's ſyſtem of zoology, is alſo a diſtinct genus of animals, of the order of *feræ*, and claſs of *mammalia*; the characters of which are, that they have ten upper fore-teeth, and eight lower, with the two intermediate very ſhort; the lamiarii are long, and the molares denticulated: they have alſo a ſmall bag or pouch under the belly. See OPOSSUM.

DIDRACHM, from δις, *double*, and δραχμα. See DRACHM.

DIDYMI, Δίδυμοι, the ſame with *gemelli*, or *twins*.

DIDYNAMIA, in *Botany*, the fourteenth claſs of plants, whoſe flowers have two of their male parts or ſtamina of greater efficacy in the action of impregnation of the ſeeds than the other two: they are known by the efficacious ſtamina being always much longer than the others. See *Table of Botany*, *Claſs* 14.

The word is formed of the Greek δις, *twice*, and δυναμις, *power* or *efficacy*. Of this claſs of plants are baum, thyme, lavender, baſil, &c.

Linnæus divides this claſs of plants into two orders: the firſt the *gymnoſpermia*, and the ſecond the *angioſpermia*. The firſt of theſe comprehends the labiated plants of Tournefort, and the verticillate plants of Mr. Ray's method; and the other, the perſonated plants of Tournefort.

The *gymnoſpermia*, or verticillate plants, are diſtinguiſhed from the reſt by having the ſeeds four in number, excepting phryma, which is monoſpermous; and ſtanding naked in the cup: and the ſtigma divided into two ſegments, the lower of which is crooked. This order contains thirty-four genera, diſtinguiſhed into ſuch as have the calyx quinquifid and nearly equal, of which there are twenty; and ſuch as have the calyx bilabiate, of which there are fourteen.

The ANGIOSPERMIA, or perſonated plants, are diſtinguiſhed from the others, by always having a ſeed-veſſel of ſome form, though very various; and by the ſtigma being obtuſe and various.

Of the firſt kind, or gymnoſpermia, are the galeopſis and ballota, with the like; and of the ſecond kind, or angioſpermia, are the antirrhinum, &c.

DIE. See DYE.

DIEBEL, in *Ichthyology*, a name given by Kentman and others to the chub or capito. It is properly a ſpecies of the cyprinus. See CAPITO and CYPRINUS.

DIECYSTINDA, among the *Ancients*, a kind of exerciſe performed by boys, who being divided into two parties or ſides, each endeavoured to draw the other over to their ſide, and the party which prevailed gained the victory.

DIEM *cluſit extremum*, a writ iſſued out of chancery to the eſcheator of the county, upon the death of any of the king's tenants *in capite*, to enquire by a jury of what lands he died ſeiſed, and of what value, and who was the next heir to him.

DIEMERIS, in the *Ancient Muſic*, a word uſed ſometimes alone, and ſometimes joined with the word *phorbeæ*. It expreſſed a ſort of bandage, uſed by the ancients, to tie up the lower lip in playing on the pipe. The other kind of *phorbeia* conſiſted only of one perpendicular piece, which went down the cheek, and one tranſverſe one which covered the whole mouth, but had a hole cut into it to admit the mouth-piece of the pipe. See PHORBEA.

DIER. See DYER.

DIERVILLA, in *Botany*. Its characters are theſe: the flower is of one leaf, cut into five parts at the top; it hath five ſtamina, which are equal with the petal; at the bottom of the flower is ſituated an oval germen, which afterward becomes a pyramidal berry divided into four cells, which contain ſmall round ſeeds. There is but one known ſpecies, which is a native of the northern parts of America.

This, in the Linnæan ſyſtem, is a ſpecies of the LONICERA.

DIES. See DAY.

DIES, in *Common Law*. There are two kinds of *dayes*: *juridici*, *& non juridici*.

DIES *juridici*, or *feſti*, are all days wherein juſtice is adminiſtered in court.

DIES *non juridici*, or *nefaſti*, are all Sundays in the year: and in Eaſter term, the feaſt of the Aſcenſion of our Lord: in Trinity term, the Nativity of St. John the Baptiſt: in Michaelmas term, the feaſt of All Saints, and All Souls: and in Hilary term, the Purification of the Bleſſed Virgin.

The ſame diſtinction holds not only as to legal proceedings in court, &c. but alſo as to contracts.

DIES, in ſome *Ancient Authors*, is alſo uſed for daily proviſion. *Et reddebat dimidium diem nobis*, q. d. *as much money as ſerved the king's family half a day.*

DIES *datus*, is a day, or time of reſpite given to the tenant, or defendant, by the court.

DIES *Marchiæ*, was a day of congreſs, or meeting of the Engliſh and Scotch, appointed annually to be held on the *marches* or borders, to adjuſt all differences between them, and preſerve the articles of peace.

DIESIS, from διημι, *I divide*, in *Muſic*, a diviſion of a tone, leſſer than a ſemi-tone; or an interval conſiſting of a leſſer, or imperfect ſemi-tone.

The *dieſis* is the ſmalleſt, and ſofteſt change, or inflexion, of the voice imaginable. It is alſo called a *feint*, and is expreſſed by a St. Andrew's croſs, or ſaltier.

Ariſtotle calls *dieſes* the elements of voice, as letters are thoſe of diſcourſe. Indeed Ariſtotle's *dieſes* were apparently different from ours: and we find Vitruvius expreſsly making the *dieſis* a fourth part of the tone. But the Pythagoreans, who are held the inventors of the name *dieſis*, did not make it ſo ſmall: they only divided the tone into two unequal parts, and called the leſſer, *dieſis*, or *limma*, expreſſing the interval $\frac{243}{256}$, which we call the leſſer ſemi-tone; and the greater, which we call the greater ſemi-tone, they called *apotome*.

But in after-times, when the tone came to be divided into three and four parts, the name *dieſis* was retained to them all. And hence thoſe different accounts, which we meet with in authors, of the quantity of the *dieſis*.

DIESIS, *Enharmonical*, is the difference between a greater and leſſer ſemi-tone. See TONE, GENUS, DEGREE, SCALE, &c.

Dieſes are divided into three kinds: the *leſſer enharmonical dieſis*, or *ſimple dieſis*, denoted by a ſingle croſs, raiſes the note following to two commas, or about $\frac{1}{5}$ of a tone. The logarithm or meaſure of the octave $\frac{1}{2}$ being 1,000,000, the meaſure of the *dieſis* $\frac{243}{256}$ will be 0,034215. Hence 29 *dieſes* will be nearly equal to the octave. See INTERVAL.

The *chromatic*, or *double dieſis*, denoted by a double croſs, raiſes

raiſes the following note by a leſſer ſemi-tone, or about four commas; which is the common *dieſis*. The ratio of this *dieſis* is $\frac{24}{25}$.

The *greater enharmonical dieſis*, denoted by a triple croſs, raiſes the note by ſix or ſeven commas, or about $\frac{1}{4}$ of a tone. None but the *double dieſis* is uſed in muſic. A flat is frequently uſed to take away the *dieſis*, and a *dieſis* to take away a flat.

When ſemi-tones are placed where regular tones ſhould be, or a tone where there ſhould be a ſemi-tone: it is called a *dieſis* or *feint*.

DIESIS, among the *Modern Muſicians*, denotes thoſe ſigns or characters which are uſed to expreſs the ſeveral degrees whereby a ſound may be elevated above, or depreſſed below its natural ſituation: and it either affects the note before which it is placed, or the whole KEY. See SHARP.

DIESPITER, in *Antiquity*, a name given to Jupiter.

Some authors will have it the ſame with *Dies Pater*, *Jupiter father*; Jupiter being called in Greek Ζευς or Δευς, whence the oblique caſe Διος, &c. Others hold *Dieſpiter* to ſignify *Dies pater*, *father of the day*. St. Auguſtin derives the name from *dies*, *day*, and *partus*, *production*, *bringing forth*; it being Jupiter that brings forth the day. Of which ſentiment were Servius and Macrobius; the former adding, that in the language of the Oſci they called him *Lucentius*, as *Dieſpiter* in Latin.

Struvius, Antiq. Rom. Synt. C. I. ſeems to intimate, that *Dieſpiter* ſignified *Pluto:* but, if that be his meaning, he is apparently miſtaken. For both in Cicero, and in the inſcription he quotes from Gruter, xxi. 8. we have only *Dis pater*, and not *Dieſpiter*.

DIET, *Diæta*, in *Medicine*, *&c.* a regimen, or courſe of living, proper in regard to health.

The word *diet*, in this ſenſe, comes from *diæta*, which ſignified anciently a *banqueting-room*; and at length an *aſſembly of the ſtates*, becauſe the Germans held moſt of their councils at table.

The word is formed from the Greek διαιτα, which ſignifies *regimen*, or *rule of life*, preſcribed by phyſicians. And as the phyſicians uſually order a ſpare, ſcanty proportion, leſs than is uſually taken, *diet* has with many paſſed into a name for this retrenchment, or diminution of the ordinary quantity of food, whether it be by advice of a phyſician, or by a perſon's own choice; provided it be to remove, or prevent, ſome diſorder.

Judge Blackſtone obſerves, that, as to exceſs in *diet*, there remains one ancient ſtatute unrepealed, viz. 10 Edw. III. ſtat. 3. which ordains that no man ſhall be ſerved, at dinner or ſupper, with more than two courſes, except upon ſome great holidays there ſpecified, in which he may be ſerved with three. Comm. vol. iv. p. 171.

A *ſpare diet* is a ſovereign remedy againſt all diſeaſes ariſing from repletion.

It is founded on this, that nature ought not to be buſied and diſtracted in the concocting of food, but left wholly to her work of digeſting and expelling the morbific matter.

For the advantages of a *ſpare ſimple diet*, ſee ABSTINENCE.

As no ſubſtance is abſolutely and of its own nature, either ſalutary or noxious, but derives either the one or the other quality from its particular relation to the human body; ſo it is certain, that the effects of the non-naturals muſt bear a direct proportion to the different conſtitutions of thoſe who uſe them: ſince in theſe, their conſequences muſt vary, and prove either of the ſalutary or noxious kind, according to the different cauſes which concur to produce them.

Hence it is obvious, that the phyſician acts a prepoſterous and unaccountable part, who to every one preſcribes the ſame method of living; or thinks that what contributes to the health of one, will without diſtinction or reſerve prove ſalutary to all. For we are ſufficiently taught by daily experience, that all ſubſtances are not equally adapted to all patients; and that what one may bear without being ſenſible of any bad effects, may to another prove prejudicial, and even fatal. Time itſelf has a conſiderable influence in determining the ſalutary or noxious effects of aliments; ſince ſome ſubſtances may ſafely, and without any bad conſequence, be uſed at one ſeaſon, which at another may contribute not a little to the deſtruction of health.

At different ſeaſons of the year different regimens are to be uſed, becauſe a change in the ſtate of the atmoſphere induces a proportionable alteration in animal bodies.

In the winter, the fibres in conſequence of the increaſed elaſticity of the air, are ſtronger, and better qualified for performing their ſeveral motions, and aſſiſting the concoction of the aliments; for which reaſon we can far better bear aliments of difficult digeſtion in that ſeaſon, than in any other. As during winter tranſpiration is in ſome meaſure obſtructed, the cutaneous ducts being braced up by the cold air, the uſe of rich wines, and ſtrong ales, becomes highly proper. It is alſo expedient to make frequent uſe of warm broths and infuſions; and care is always to be taken, that the perſpiration bear a proportion to the quantity of aliment uſed.

In the ſpring, ſomething is to be retrenched from the quantity of our aliments, and the liquor we uſually drink is ſomewhat to be enlarged.

In the autumn the ſame phenomena are to be obſerved as in the ſpring; becauſe the inclemency of the air is the ſame, and the changes of the weather equally ſudden and frequent; by which means perſpiration, which is abſolutely neceſſary for health, is eaſily obſtructed; and becauſe at this ſeaſon the equinoctial happens, diſeaſes are to be prevented by what we call preſervative cures.

During the ſummer, health is moſt effectually preſerved by vegetables, and draughts of diluting liquors; but we are to abſtain from ſuch aliments as are heavy, and of difficult digeſtion, from wine and brandy.

The *diet* ſhould alſo be adapted to different conſtitutions. Perſons, whoſe ſolids are weak and relaxed, ſhould avoid all viſcid food, or ſuch things as are hard of digeſtion. Their *diet*, however, ought to be ſolid, and they ſhould uſe much exerciſe in the open air. Thoſe who abound with blood ſhould uſe ſparingly every thing that is highly nouriſhing, as fat meat, rich wines, ſtrong ale, &c. Their food ſhould conſiſt moſtly of bread, and other vegetables, and their drink ought to be water, whey, or ſmall-beer. Fat people ſhould abſtain from oily, nouriſhing *diet*; and they ought frequently to uſe raddiſh, garlic, and ſpices, in order to promote perſpiration and urine. Their drink ſhould be water, coffee, tea, and the like; and they ought to take much exerciſe, and little ſleep. The courſe of the lean ſhould be oppoſite to this. Thoſe who are troubled with acidities ſhould live much on fleſh meats; and thoſe who are afflicted with hot alkaline eructations ſhould chiefly uſe acid vegetables. Thoſe who are ſubject to the gout, low ſpirits, hypochondriac, or hyſteric diſorders, ſhould avoid all flatulent food, every thing viſcid, and hard of digeſtion, all ſalted or ſmoke-dried proviſions, and whatever is apt to turn ſour on their ſtomachs. Their food ſhould be light, ſpare, cool, and of an opening nature.

The *diet* ſhould alſo be adapted to the manner of life, and age, as well as to the ſeaſon and conſtitution; thoſe whoſe buſineſs and profeſſion lead them to a ſedentary life, ſhould be more ſparing as to the quantity, and more attentive to the quality of their *diet*, than thoſe that are accuſtomed to much exerciſe; they ought to be particularly cautious in the uſe of every thing that is ſour, windy, rancid, and hard of digeſtion. Particular diſeaſes ſhould likewiſe make us avoid any thing that has a tendency to increaſe them. Gouty perſons ſhould not uſe rich wines, ſtrong ſoups, nor acids. Perſons ſubject to the gravel ſhould ſhun all auſtere and aſtringent aliments, and the ſcorbutic ſhould not indulge too much in animal food. The food in early life ſhould be light, but nouriſhing, and frequently uſed; food that is ſolid, with a ſufficient degree of tenacity, is moſt proper for the ſtate of manhood; and the *diet* of the later period of life, ſhould reſemble that of the firſt. At every period of life, gluttony and faſting ſhould be equally avoided; both the one and the other deſtroys the powers of digeſtion; and the frequent repetition of aliments is not only neceſſary for repairing the continual waſte of our bodies, but likewiſe to keep the humours ſound and ſweet. It ſhould be remarked, however, by way of caution, that one meal of freſh meat in the twenty-four hours, is ſufficient. The quantity of animal food conſumed by the Engliſh is generally pernicious, becauſe it produces but little of that air which is antiſeptic: hence they are ſubject to the ſcurvy, and its numerous train of conſequences, indigeſtion, low ſpirits, hypochondriaciſm, &c. whereas if vegetables and milk, whoſe antiſeptic quality, ariſing from the *gas* or air which they plentifully afford, is now generally allowed, were more uſed in *diet*, we ſhould have leſs ſcurvy, and likewiſe fewer putrid and inflammatory fevers. See PUTREFACTION and SCURVY.

Different ſexes alſo require a different *diet* and regimen. Women are weaker than men, and for that reaſon require a *diet* and regimen peculiar to themſelves; they are of a ſpungy and lax habit, and for the moſt part addicted to indolence and pleaſure, drink little, have bodies of a highly delicate and ſenſible nature, much inclined to ſpaſms, and convulſive motions, and diſpoſed to generate a redundance of blood. Beſide, at certain ſtated times, they have a regular evacuation by the veins of the uterus; and in conſequence of theſe circumſtances it is neceſſary that women, rather than men, ſhould obſerve a regimen and method of living, peculiarly and accurately adapted to their habit and conſtitution.

Pregnant women are alſo to have a regimen peculiar to them-

themſelves directed for them, leſt the mother herſelf or the *fœtus* ſhould ſuſtain any injury; for the infant included in the *uterus* is as it were a part of the mother's body. James, from Hoffman; and Buchan's Domeſtic Medicine, chap. iii.

Dr. Cheyne thews, how one may ſupply the place of medicines by *diet*: any one, ſays he, may in effect loſe a pound of blood, take a purge, or a ſweat, by dropping the great meal, or abſtaining from animal food, and ſtrong liquors, for four or five days, in chronical caſes, as effectually as by opening a vein, ſwallowing a doſe of pills, or taking a ſudoriſic bolus. He adviſes, therefore, all gentlemen of a ſedentary life, and of learned profeſſions, to uſe as much abſtinence as poſſibly they can, conſiſtently with the preſervation of their ſtrength, and the freedom of ſpirits. This they ought to have recourſe to, as ſoon as they find any heavineſs, inquietudes, reſtleſs nights, or averſion to application; either by leſſening one half their uſual quantity of animal food, and ſtrong liquors, till ſuch time as they regain their wonted freedom; or by living a due time wholly on vegetable *diets*, as ſago, rice, pudding, and the like; and drinking only wine and water. See DISEASE.

One great reaſon why leproſies, hot ſcurvies, dyſenteries, plagues, peſtilential fevers, and the like diſtempers, formerly ſo frequent in London, are now ſo rare, is the change that has been made in the diet of the inhabitants. Hopped beer, wine, and ſpirituous liquors coming into general uſe, have been a great means of ſuppreſſing putrid diſeaſes; greens and fruit are likewiſe more univerſally eat, and ſalted meats make a much leſs part of *diet* than formerly: to which may be added the more general conſumption of tea and ſugar.

A vegetable *diet* is moſt proper for ſcorbutic and hectical perſons, and does very well with people who have not much exerciſe; but in other circumſtances, a mixed *diet* of vegetable and animal ſubſtances, ſuch as is commonly uſed, ſeems beſt calculated to nouriſh and preſerve the body from decay.

Irregularities in *diet* are commonly, though unjuſtly, ſuppoſed to have the greateſt ſhare in producing military diſeaſes. Were this the caſe, the changes in the weather and ſeaſons would not ſo remarkably affect their health; the ſobereſt and moſt regular corps would not be ſo ſickly; different nations in the ſame camp, living variouſly, would not be afflicted with the ſame diſtempers; nor would there be ſuch an inequality in the numbers of the ſick in different years, were the greateſt part of diſeaſes owing ſolely to *diet*.

Againſt excels, the moſt common error in *diet*, the ſmallneſs of a ſoldier's pay is a ſufficient ſecurity; in regard to them, therefore, the danger lies on the other hand; for, when all are not obliged to eat in meſſes, ſome will be apt to lay out their pay upon ſtrong liquors, and to ſquander away in one day what is but barely a maintenance for a week; but, on the ſuppoſition that every man contributes his ſhare to a meſs, we may be aſſured there can be no errors in *diet* of any conſequence, whilſt almoſt the whole pay is ſpent upon common food.

As to the abuſe of ſpirits and fruit, ſoldiers are generally blamed without any foundation; ſpirits being rather beneficial than hurtful to them, ſo often expoſed to the extremes of heat and cold, to moiſt and bad air, long marches, wet cloaths, and ſcanty proviſions; and as to fruit, a few diſorderly men may rob orchards, which is the only way they can come at fruit, but the camp diſeaſes are incident to the moſt regular equally with them.

A fundamental rule in regard to the *diet* of ſoldiers, is to oblige them to eat in meſſes, by which means their pay will be laid out upon wholeſome food. The greateſt impediment to meſſing are the wives and children, who muſt often be maintained on the ſoldier's pay; in which circumſtances it is not improper food, but the want of it, that may endanger a ſoldier's health.

The meſſing being eſtabliſhed, there remains only to ſee that the men be well ſupplied with bread, and that the markets be ſo regulated that the traders may have encouragement to come to the camp, and the meſſes have good proviſions at a moderate price; and particularly vegetables, which, during the hot weather, ought to make a great part of the *diet*. In eſtabliſhing the meſſes, ſome regulations might be made with regard to an allowance of ſpirits, either by ſtoppages on the pay or otherwiſe. This is already practiſed in the navy, and probably for the ſame reaſons that make ſpirits neceſſary for ſoldiers; ſince in ſhips men are liable to diſtempers from moiſt and corrupted air.

As to the *diet* of officers, their chief rule, in ſickly times, is to eat moderately, avoiding all ſurfeits and indigeſtion, and uſing wine in moderation. Pringle's Obſ. on the Diſeaſes of the Army. See FOOD.

DIET-*drinks*, a form of phyſic, including all the medicated wines, whey's, and ales, uſed in chronic caſes. They require a courſe or continuance to anſwer any intention of moment. In acute caſes they are of no uſe; but where the diſorder of a conſtitution is gradually to be gained upon, much help may be had from them.

DIET, or DYET, is alſo uſed for an aſſembly of the ſtates, or circles of the empire, or Poland, to deliberate and concert meaſures for the public good.

The general *diet* of the empire is ordinarily held at Ratiſbon. It conſiſts of the emperor in perſon, or by his repreſentative or commiſſary; the nine ELECTORS, three of whom are eccleſiaſtic, and the other ſix ſecular, forming the electoral college; the eccleſiaſtical princes, viz. archbiſhops, biſhops, abbots, and abbeſſes, and the ſecular princes, forming the ſecond college; and the repreſentatives of the imperial cities, who conſtitute the third college, and are divided into two benches, viz. that of Suabia and of the Rhine. This *diet* has been uſually ſummoned by the emperor, but there are ſome caſes in which the electors have ſummoned it without his conſent, or requeſted him to ſummon it. In the abſence of the emperor, the right of convocation belongs to the king of the Romans. The *diet* makes laws, raiſes taxes, determines differences between the ſeveral princes and ſtates, and relieves the ſubjects from the oppreſſions of their ſovereigns. The *diets* of the empire were originally the ſame with the aſſemblies of March and May, held by the kings of France: they met, at leaſt, once a year; and every freeman had a right to be preſent. Theſe were aſſemblies, in which the monarch deliberated with his ſubjects, concerning their common intereſt: but when the princes, dignified eccleſiaſtics, and barons, acquired territorial and independent juriſdiction, the *diet* became an aſſembly of the ſeparate ſtates, which formed the confederacy of which the emperor was the head. Robertſon's Hiſt. Charles V. vol. i. p. 462.

The term *diet* is alſo applied to the aſſembly of electors for the choice of an emperor or king of the Romans: this is uſually held at Frankfort on the Main.

The general *diet* of Poland is by the laws only to be held every two years; but preſſing occaſions convene them every year: the laws alſo confine their ſitting to fifteen days, but they frequently protract it to ſix weeks. The uſual place is at Warſaw, the capital of the kingdom: though it has been often held at other places: in effect, as by the laws every third *diet* is to be convened at Grodno, in Lithuania; whenever, for particular reaſons, it is judged meet to change the order, and hold it elſewhere, the nobility of the grand-duchy muſt conſent to it. It is the king who fixes the time, and ſummons it by circular letters ſent to all the palatines. In an interregnum, the archbiſhop of Gneſna calls the *diet*.

The ſeveral particular *diets*, which are held ſix weeks before the general one, ſend three deputies each, choſen out of the members thereof.

In Poland there are likewiſe *diets* on horſeback, held in the champagne, or country: ſuch are thoſe wherein they chooſe their king. They are called *poſpolites*.

There are likewiſe *diets* held in Switzerland; *diets* of the proteſtant cantons; *diets* of the catholic cantons; and general *diets*. The firſt aſſemble at Araw, and are convoked by the canton of Zurich; the ſecond at Lucern, convoked by the canton of that name; the third, compoſed of the deputies of all the cantons, both proteſtant and catholic, is held twice a year, at the end of June, and the beginning of December, and meets at Baden. It is the canton of Zurich which has the right of convening it.

DIETA, in *our Old Law Books*, denotes a day's journey. *Omnis rationabilis* dieta *conſtat ex viginti milliaribus*. Fleta.

DIETETIC, *Dietetica*, that part of phyſic which conſiders the way of living, with relation to food, ſuitable to particular caſes. See DIET.

DIEU *& mon droit*, q. d. *God and my right*, the motto of the arms of England, firſt given by king Richard I. to intimate, that he held not his empire in vaſſalage of any mortal.

It was afterwards taken up by Edward III. when he firſt claimed the crown of France; and was continued, without interruption, to the time of king William III. who uſed the motto *Je maintiendray*; though he commanded the former to be retained on the great ſeal. The ſame is to be underſtood of the late queen Anne, who uſed the motto, *Semper eadem*; which had been before uſed by queen Elizabeth.

DIEU *ſon act*, in *Law*, are words often uſed in our old law: and it is a maxim in law, that the act of God ſhall prejudice no man. Therefore if a houſe be blown down by a tempeſt, thunder, or lightning, the leſſee or tenant for life or years, ſhall be excuſed in waſte. Likewiſe he hath by the law a ſpecial intereſt to take timber to build the houſe again for his habitation. 4 Rep. 63 11

Rep. 82. So when the condition of a bond conſiſts of two parts in the diſjunctive, and both are poſſible at the time of the obligation made, and afterward one of them becomes impoſſible by the act of God, the obligor is not bound to perform the other part. 5 Rep. 22. And where a perſon is bound to appear in court at a certain day, if before the day he dieth, the obligation is ſaved, &c. See BOND.

DIEXAHÆDRIA, in *Natural Hiſtory*, the name of a genus of ſpars. The word is derived from the Greek δις, *twice*, εξ, *ſix*, and εδρα, *ſide*. The bodies of this genus are ſpars, compoſed of twice ſix planes, being formed of two hexædral pyramids, joined baſe to baſe, without any intermediate column. Of this genus there are only two known ſpecies: 1. One with long, narrow, and ſharp-pointed pyramids, found in Lamb's-cave, on Mendip-hills: and, 2. One with long, broad, and obtuſe pyramids: this is found in the mine of Goſſelar in Saxony, and in many of the mines of the Hartz Foreſt. Hill's Hiſt. of Foſſils, p. 213.

DIEXODUS, *Antiquity*, in *Rhetoric*, is uſed for digreſſion.

DIFF, is the name of an inſtrument of muſic among the Arabs, ſerving chiefly to beat time to the voice: it is a hoop, ſometimes with pieces of braſs fixed to it to make a jingling, over which a piece of parchment is diſtended. It is beat with the fingers, and is the true *tympanum* of the ancients. Ruſſell's Hiſt. of Aleppo, p. 94.

DIFFAMATORY. See DEFAMATORY.

DIFFARREATION, among the Romans, a ceremony whereby the divorce of their prieſts was ſolemnized.

The word comes from the preposition *dis*; which is uſed, in compoſition, for *diviſion*, or *ſeparation*; and *farreatio*, *a ceremony with wheat*, of *far*, wheat.

Diffarreation was properly the diſſolving of marriages contracted by confarreation: which were thoſe of the pontifices, or prieſts. Feſtus ſays, it was performed with a wheaten cake. Vigenere will have confarreation and *diffarreation* to be the ſame thing.

DIFFERENCE, in *Logic*, an eſſential attribute belonging to ſome ſpecies, and not found in the genus; being the idea that defines the ſpecies.

Thus, body and ſpirit are the two ſpecies of ſubſtance, which in their ideas include ſomething more than is included in the idea of ſubſtance. In body, for inſtance, is found impenetrability, and extenſion; in ſpirit, a power of thinking, and reaſoning: ſo that the *difference* of body is impenetrable extenſion, and the *difference* of ſpirit is cogitation.

DIFFERENCE, in *Mathematics*, the exceſs of one quantity above another.

When a leſs quantity is ſubtracted from a greater, what remains is called the *difference*.

It was a fundamental principle among the ancient geometers, that the *difference* of any two unequal quantities, by which the greater exceeds the leſſer, may be added to itſelf, till it ſhall exceed any propoſed finite quantity of the ſame kind. This principle ſeems inconſiſtent with the ſuppoſition of an infinitely ſmall quantity or *difference*, which added to itſelf any number of times, is never to be ſuppoſed to become equal to any given quantity whatſoever; which is the foundation of the modern method of infiniteſimals. However, this laſt may, with proper caution, be made uſeful and accurate.

DIFFERENCE *of longitude* of two places, is an arch of the equator intercepted between the meridians of the places.

DIFFERENCE, *Aſcenſional*, in *Aſtronomy*. See ASCENSIONAL.

DIFFERENCES, in *Heraldry*, certain additaments to coat-armours; whereby ſomething is altered, or added, to diſtinguiſh the younger families from the elder, or to ſhew how far they are removed from the principal houſe. They are called, in Latin, *diminutiones*, and *deſcenſicula armorum*; and, by the French, *briſures*.

Of theſe *differences* Sylv. Morgan gives us nine, which obtain principally among us: viz. the *label*, which denotes the firſt and eldeſt ſon: the *creſcent*, the ſecond; the *mullet*, the third; the *martlet*, the fourth; the *annulet*, the fifth: the *fleur de lis*, the ſixth; the *roſe*, the ſeventh; the *croſs-moline*, the eighth; and the *eight-foil*, the ninth. See each under its proper article.

Again, as the firſt *differences* are ſingle for the ſons of the firſt houſe, or deſcent; the ſons of the younger houſes are differed by combining, or putting the ſaid *differences* upon each other. As the firſt *difference* are, the *label*, *creſcent*, &c. for the firſt houſe; the *difference* for the ſecond houſe is the *label* on a *creſcent*, for the firſt of that houſe, during his father's life only; for the ſecond, a *creſcent* charged with a *creſcent*; for the third brother of the ſecond houſe, a *mullet* on a *creſcent*, &c.

Siſters, except of the blood-royal, have no other mark of *difference* in their coats of arms beſides the form of the eſcutcheon. See LOZENGE.

The original of *difference* is controverted. Camden will have them to have begun about the time of king Richard I. Paradin aſſigns *differences* worn as early as the year 870. The preſident Fauchet obſerves *differences* to have been hereditary in the French families before the time of Louis le Gros, who came to the crown in the year 1110. Moreau refers them to the time of St. Louis; and Lallonette, Belleforeſt, &c. to that of Philip Auguſtus. The occaſion of their riſe is well accounted for by Colombiere.

All nations, ſaya he, preſer the eldeſt brothers to the younger; whence thoſe, in a direct line, ſucceeding to their fathers, and becoming maſters of their lands, took on them their coat-armour, without any change, or alteration; and tranſmitted the ſame again to their eldeſt ſons; the younger brothers, or baſtards, not being allowed to bear the ſame arms, without ſome additional mark, to diſtinguiſh them from the elder. Hence ſome heralds, he goes on, have endeavoured to confine them to certain fixed and determinate figures, for diſtinguiſhing the ſecond from the firſt, the third from the ſecond, and ſo on to the fifth; aſſigning the ſecond a *label*, the third a *bordure*, the fourth an *orle*, the fifth a *baſtoon*, and the ſixth a *bend* or *cottice*.

And the deſcendents of theſe to bear double *differences*, or *differences* charged on one another; viz. the eldeſt ſon of the ſecond ſon to retain his paternal coat, with the *difference* of the *label* of three points; the ſecond, the *label* of four points; the third, ſuch a *label* on a chief; the fourth, a *label* charged with certain figures, as *eaglets*, *lioncels*, *martlets*, *creſcents*, *roſes*, &c. And, for the ſame reaſon, the ſecond ſon of the third ſon ſhall bear a *bordure* engrailed: the third, a *bordure* charged with *bezants*, or *tourteaux*, &c.

But the ſame author judges the fixing of any certain invariable *differences* at all an abuſe; becauſe they may happen not to be agreeable to the paternal coat, but very much deface and blemiſh it. He adds, that many other figures, beſides thoſe above mentioned, may be uſed as *differences*; as ſhells, bezants, cinquefoils, and a thouſand more. Some younger families have made the *difference* in their arms by only diminiſhing the ordinaries, or changing the poſture; and others, by only changing the metal, or colour.

It muſt be added, that the *difference* may be of metal on metal, or colour on colour; which, in other caſes, is falſe heraldry.

DIFFERENCES, *Ancient*. See BORDURES.

DIFFERENTIAL, *Differentiale*, in the *Higher Geometry*, an infinitely ſmall quantity, or a particle of quantity ſo ſmall as to be leſs than any aſſignable one.

It is called a *differential*, or *differential quantity*, becauſe frequently conſidered as the difference of two quantities; and, as ſuch, it is the foundation of the *differential calculus*. Sir Iſaac Newton, and the Engliſh, call it a moment, as being conſidered as the momentary increaſe of quantity.

Mr. Leibnitz, and others, call it alſo an *infiniteſimal*. See INFINITESIMAL.

DIFFERENTIAL, *of the firſt, ſecond, &c. degree*. See DIFFERENTIO-DIFFERENTIAL.

DIFFERENTIAL *calculus*, or *method*, is a method of differencing quantities; that is, of finding a *differential*, or infinitely ſmall quantity, which, taken an infinite number of times, is equal to a given quantity. See CALCULUS, and FLUXIONS.

DIFFERENTIO-DIFFERENTIAL *Calculus*, is a method of differencing *differential* quantities.

As the ſign of a *differential* is the letter *d*; that of a *differential of dx* is *ddx*, and the *differential* of *ddx*, *dddx*, or d^3x, d^4x, &c. or *x*, *ẋ*, &c.

Thus we have powers, or degrees, of *differentials*.

The *differential* of an ordinary quantity, is called a *differential of the firſt power*, or *degree*; as *dx*.

DIFFERENTIAL *of the ſecond power*, or *degree*, is an infiniteſimal of a *differential* quantity of the firſt degree; as *ddx*, or dx^2, or dx^3, $dxdy$, &c.

DIFFERENTIAL *of the third degree*, is an infiniteſimal of a *differential* quantity of the ſecond degree; as $dddx$, dx^3, $dxdydz$, and ſo on.

The *powers of differentials*, as dx^2, are differenced after the ſame manner, as the powers of ordinary quantities: and, again, as compound *differentials* either multiply, or divide, each other, or are powers of *differentials* of the firſt degree; *differentials* are differenced after the ſame manner as ordinary quantities; and, therefore, the *differentio-differential calculus* is the ſame, in effect, with the *differential*.

DIFFERENTIAL, in the *Doctrine of Logarithms*. Kepler calls the logarithms of tangents, *differentiales*; which we uſually call *artificial tangents*. See LOGARITHM, MESO-LOGARITHM, and TANGENT.

DIFFERENTIAL *equation* is uſed by ſome mathematicians for

for an equation involving infinitesimal differences, or fluxions. Thus the equation $3x^2\,dx - 2ax\,dx + ay\,dx - 3y^2\,dy + ax\,dy = 0$ in the foreign notation, or $3xxx - 2axx + ayx - 3yy\dot{y} + axy = 0$ in the English notation, is called a *differential equation*. But these equations should, consistently with the English, or Sir Isaac Newton's notation, be rather called fluxional equations. Hence some of our mathematicians have applied the term *differential equation* in another sense, to certain equations defining the nature of serieses. See SERIES.

DIFFERENTIAL *method*, in *Mathematics*, an appellation given to a method of describing a curve of the parabolic kind through any given number of points.

This method is given by Sir Isaac Newton in the fifth lemma of the third book of his Principles. He distinguishes two cases of this problem; the first, when the ordinates drawn from the given points to any line given in position, are at equal distances from each other; and the second, when these ordinates are not at equal distances. He has given a solution of both cases, but without demonstration in that place, which has since been supplied by himself and others. See his Methodus Differentialis, published with other tracts of the same author, by Mr. Jones, London, 1711; and Stirling's explanation of the Newtonian *differential method*, in the Phil. Trans. No. 362. Cotes, De Methodo Differentiali Newtoniana, in his works published by Dr. Smith; Herman. Phoronomia; and Le Seur and Jacquier, in their Comment on Sir Isaac's Principles.

Where it is to be observed, that the methods there demonstrated by some of these authors extend to the description of any algebraic curve through a given number of points, which Sir Isaac, writing to Mr. Leibnitz, mentions as a problem of the greatest use.

By this method, some terms of a series being given, and supposed to be placed at given intervals, any intermediate term may be found nearly; and this therefore gives a method for interpolations. Newton. Method. Differ. prop. 5.

Any curvilinear figure may also be squared nearly, of which some ordinates may be found. Newt. ibid. prop. 6.

And this method may be extended to the construction of mathematical tables by interpolation. Ibid. in Schol. p. 100.

The successive differences of the ordinates of parabolic curves, becoming ultimately equal, and the intermediate ordinate required being determined according to Sir Isaac's rules, by these differences of the ordinates, is the reason of this method being called the *differential method*. To be a little more particular.

The first case of Sir Isaac's problem amounts to this: a series of numbers, placed at equal intervals being given, to find any intermediate number of that series when its interval from the first term of the series is given.

Subtract every term of the series from the next following, and let the remainders be called first differences; then subtract each difference from the next following, and let these remainders be called second differences; again, let each second difference be subtracted from the next following, and let these remainders be called third differences, and so on: then if A be the first term of the series, a' the first of the first differences, a'' the first of the second differences, a''' the first of the third differences, &c. and if x be the interval between the first term of the series and any term sought, E, that is, let the number of terms from A to E, both inclusive, be $= x+1$, then will the term sought,

$$E = A + \frac{x}{1}a' + \frac{x\cdot x-1}{1\cdot 2}a'' + \frac{x\cdot x-1\cdot x-2}{1\cdot 2\cdot 3}a''' + \frac{x\cdot x-1}{1}$$

$$\frac{x-2\cdot x-3}{2\cdot 3\cdot 4}a'''' +, \text{ \&c. which series differs from the}$$

Newtonian in this, that the quantities $\frac{a''}{1\cdot 2}$, $\frac{a'''}{1\cdot 2\cdot 3}$, $\frac{a''''}{1\cdot 2\cdot 3\cdot 4}$ here used, signify the same with a'', a''', a'''' used by Sir Isaac.

Hence, if the differences of any order become equal, that is, if any of the quantities a', a'', a''', become $= 0$, we shall have a finite expression for E, the term sought; it being evident, that the series must terminate when any of the differences a', a'', &c. become $= 0$.

It is also evident that the coefficients $\frac{x}{1}, \frac{x\cdot x-1}{1\cdot 2}$, &c. of the differences, are the uncia of the binomial theorem.

A method may be deduced from the foregoing expression, of finding the sums of the terms of such a series. For if we imagine a new series, whereof the first term shall be $= 0$, the second $= A$, the third $= A + B$, the fourth $= A + B + C$, the fifth $= A + B + C + D$, and so on, it is plain that the assigning one term of this series is finding the sum of all the terms A, B, C, D, &c. Now since those terms are the differences of the sums 0, A, A + B, A + B + C, A + B + C + D, and that, by the supposition, some of the differences of A, B, C, D, &c. are $= 0$; it follows that some of the differences of the sums will also be $= 0$: and that whereas in the series $A + x\dot{a} + \frac{x\cdot x-1}{1\cdot 2}\ddot{a}$, &c. whereby a term was assigned, A represented the first term, $\dot{a}$ the first of the first differences, and that x represented the interval between the first term, and the last, we are to write 0 instead of A, A instead of $\dot{a}$, $\dot{a}$ instead of $\ddot{a}$, $\ddot{a}$ instead of $\dddot{a}$, &c. and $x+1$ instead of x; which being done, the series expressing the sums will be $0 + x + 1 \times A + \frac{x+1\cdot x}{1\cdot 2}\dot{a} + \frac{x+1\cdot x\cdot x-1}{1\cdot 2\cdot 3}\ddot{a} +$, &c. or $x+1 \times A + \frac{x}{2}\dot{a} + \frac{x\cdot x-1}{2\cdot 3}\ddot{a} + \frac{x\cdot x-1\cdot x-2}{2\cdot 3\cdot 4}\dddot{a}$, &c.

Or again, if the real number of terms of the lines be called z, that is, if $z = x+1$ or $z-1 = x$, we shall have the sum of the series $= z \times A + \frac{z-1}{2}\dot{a} + \frac{z-1\cdot z-2}{2\cdot 3}\ddot{a} + \frac{z-1\cdot z-2\cdot z-3}{2\cdot 3\cdot 4}\dddot{a} +$, &c. See De Moivre, Doct. of Chances, p. 59, 60. Mis. Analyt. p 153.

For instance, let it be required to find the sum of a series of the squares of the natural numbers $1+4+9+16+25+36$. Then, $A = 1$

$$\begin{array}{rll} 4 & 3 & \dddot{a} \\ & 2 & \\ 9 & 5 & 0 \\ 16 & 7 & 0 \\ 25 & 9 & 2\,0 \\ 36 & 11 & 2\,0 \end{array}$$

The sum consequently will be,

$$= z \times 1 + \frac{z-1}{2} \times 3 + \frac{z-1\cdot z-2}{2\cdot 3} \times 2$$

$$= z \times 1 + \frac{3z-3}{2} + \frac{zz-3z+2}{3}$$

$$= z \times \frac{6-9+9z+2zz-6z+4}{6}$$

$$= z \times \frac{1+3z+2zz}{6} = \frac{z.1+z.1+2z}{6} = \frac{6.7.13}{6} = 91.$$

This easy example will be sufficient to shew the applications of this rule. Those who are desirous of seeing its use in questions of chance, may consult M. De Moivre's Doctrine of Chances, p. 59. seq. Various other instances of the use of this rule in finding sums of progressions of figurate members, &c. may be seen in Misc. Analyt. p. 154, seq.

As to the *differential method*, it is to be observed, that though Sir Isaac and others have treated it as a method of describing an algebraic curve, at least of the parabolic kind, through any number of given points; yet the consideration of curves is not at all essential, though it may help the imagination. The description of a parabolic curve through given points, is the same problem as the assigning of quantities from their given differences, which may always be done by algebra, and by the resolution of simple equations. See Mr. Stirling's Methodus Differentialis, p. 97. This ingenious author has treated fully of the *differential method*, and shewn its use in the solution of some very difficult problems. See SERIES.

DIFFERENTIAL *scale*, in *Algebra*, is used for the scale of relation subtracted from unity. See *Recurring* SERIES.

DIFFORM, *Difformis*, from *forma*, *shape*, is a word used in opposition to *uniform*; and signifies, that there is no regularity in the form, or appearance, of a thing.

The botanists use it as a distinction of the flowers of several species of plants.

DIFFRACTION, in *Optics*, a term first used by Grimaldi the Jesuit, to denote that property of the rays of light, which others have called INFLECTION; the discovery of which some attribute to Grimaldi, and others to Dr. Hooke.

DIFFUSE, DIFFUSIVE, is chiefly used for a prolix manner of writing, &c.

A dictionary cannot well be too *diffusive*: for a man is never too much informed of the word he wanted; and he is not obliged to read that part of the explication which does not concern him.

A *diffusive* style is proper for discourses in the demonstrative

ſtrative kind. Demoſthenes is cloſe, and conciſe; Cicero, on the contrary, is *diffuſive*.

DIFFUSION, from *diffundo*, *I pour out*, *I dilate*, the act whereby a body is ſpread, or ſtretched out, ſo as to take up more ſpace.

The ſchoolmen make three kinds of *diffuſion*: the firſt, that whereby a pure quality is *diffuſed*; as cold, force, &c. This they diſtinguiſh into *equal*, whereby equal portions, or degrees, of the quality are diſtributed upon equal parts of the medium; thus, when a direct motion is impreſſed on a moveable, all the parts of the moveable receive an equal impetus; and *unequal*, when unequal degrees of the quality are diſtributed on different parts of the ſubject: thus it is, that force is impreſſed on a lever, and cold propagated through a medium.

The ſecond kind of *diffuſion* is that performed by the motion of bodies; ſuch is the *diffuſion* of light, ſound, ſmell, magnetic, electric virtues, &c.

The third is performed partly by the motion of corpuſcles, and partly by the *diffuſion* of a quality; and thus they hold fire to be *diffuſed*.

But the modern philoſophers reject the notion of qualities, and their *diffuſion*. According to them, there is no other *diffuſion*, but that of corporeal ſubſtance, emitted in minute effluvia, or particles, into a kind of atmoſphere all around the body; which *diffuſion* of corpuſcles ſome call *atmoſpherical*, as being ſuppoſed to be terminated by a circle, whereof the *diffuſing* body is the centre. Every body, it is now proved, has its ſphere of activity, or *diffuſion*, within which the particles, or corpuſcles, torn from it, and flying away, have a ſenſible effect; as we ſee in odorous, ſonorous, &c. bodies. See QUALITY; where the phyſical law of the *diffuſion* of qualities is laid down.

DIGAMMA. See F.

DIGAMY, the ſame with BIGAMY.

DIGASTRICUS, in *Anatomy*, a muſcle of the lower-jaw, thus called, as having a double belly. See *Tab. Anat. (Muſcl.) fig.* 2. No. 2.

The word is formed from *δις*, *twice*, and *γαστηρ*, *belly*. See BIVENTER.

The *digaſtric* muſcles, according to Mr. Monro, do not ſolely pull the lower-jaw down, but ſerve to draw up the os hyoides, and parts annexed to it, in deglutition. We have an account of the ſituation and uſes of theſe muſcles by this learned profeſſor, in the Med. Eſſ. Edinb. vol. i. art 11.

DIGEST, DIGESTUM, a collection of the Roman laws, ranged and *digeſted* under proper titles, by order of the emperor Juſtinian.

That prince gave his chancellor Tribonianus a commiſſion for this purpoſe; who, in conſequence thereof, choſe fifteen juriſconſulti, or lawyers, to work upon the ſame. Theſe, accordingly, took out the beſt and fineſt deciſions from the two thouſand volumes of the ancient juriſconſulti, and reduced them all into one body; which was publiſhed in the year 533, under the name of the *Digeſt*. To this the emperor gave the force of a law, by a letter at the head of the work, which ſerves it as a preface.

The *Digeſt* makes the firſt part of the Roman law, and the firſt volume of the corpus, or body, of the CIVIL *law*, contained in fifty books.

It was tranſlated into Greek under the ſame emperor, and called Pandecta. See PANDECTS.

Cujas ſays, that *Digeſt* is a common name for all books diſpoſed in a good order and œconomy; and hence it is, that Tertullian calls the Goſpel of St. Luke, a *Digeſt*.

Hence alſo abridgments of the common law are denominated *digeſts* of the numerous caſes, arguments, readings, pleadings, &c. diſperſed in the Year-books, and other reports and books of law, reduced under proper heads, or common places. The firſt was that of Statham, which comes as low as Henry VI. That of Fitzherbert was publiſhed in 1516; Brook's in 1573, of which Hughes's, publiſhed in 1663, is a ſequel. Rolls, Danvers, and Nelſon, have alſo publiſhed *Digeſts* or abridgements of this kind, including the caſes of later days; to which may be added the New Abridgement, and Viner's Abridgment.

DIGESTION, in *Medicine*, that change of the food, taken in at the mouth, which it undergoes in the ſtomach, in order to afford fit matter to compoſe, or increaſe, an animal, till it arrives at its deſtined bulk; and to repair the loſs of thoſe particles which the body, in its natural ſtate, neceſſarily undergoes.

The operation of *digeſtion* ſucceeds to maſtication, and deglutition.

It includes chylification, and is ſucceeded by ſanguification, and nutrition.

The cauſe, manner, and means of *digeſtion*, have been infinitely controverted: it would be tedious to enter into all the ſyſtems, and hypotheſes that have been framed by philoſophers and phyſicians, to account for this important operation. Some contend, that it is done by a kind of elixation, or boiling, of the ſolid and groſſer parts of the food in the liquid, by the heat of the ſtomach, and of the adjacent parts, the liver, ſpleen, &c. Others will have it done by attrition; as if the ſtomach by thoſe repeated motions, which are the effects of reſpiration, rubbed or ground off the minuter particles from the groſſer matters; and agitating, and driving the reſt againſt each other, attenuated, and diſſolved them. Others think, the bilious juice; others the ſpirits, &c. chiefly concerned in the affair.

Others will have the food diſſolved by a menſtruum, or diſſolvent: but theſe are greatly divided as to the nature and origin of this menſtruum; ſome ſuppoſing it an acid, furniſhed by the glands of the ſtomach; others a nitro-aereous ſpirit, which, by penetrating the maſs of food, breaks the connexion of the moſt ſolid parts; and others, a ſaline juice, which divides and volatilizes the parts of the food.

Others, again, ſuppoſe *digeſtion* to be performed by means of a ferment, or leaven; which, mixing with the aliment, excites an inteſtine motion in the parts thereof, by whoſe mutual colliſions, the parts are attenuated and diſſolved.

But theſe, too, differ in their opinions of this ferment; ſome taking it to be the remains of the food laſt *digeſted*, which, by its continuance in the ſtomach, has contracted an acid quality, which renders it a ferment: others take the ferment, or principle of fermentation, to be contained in the aliment itſelf; which, when incloſed in the ſtomach, and heated thereby, being put in motion, enters on its office of fermentation: but theſe, too, are divided; ſome taking it to be the ſpirituous part; and ſome the air in foods.

Others ſuppoſe the matter of this ferment ſupplied by the glands of the ſtomach: and laſtly, others contend for the ſaliva, and make that the ferment ſerving principally for the *digeſtion* of the food.

All theſe ſyſtems are now reduced to three principal ones; which we ſhall find explained, and defended in the ſeveral later writings on that ſubject: the firſt holding *digeſtion* to be performed by fermentation; the ſecond by trituration; and the third by fermentation and trituration together.

The firſt opinion was for a long time the only one. The retainers of it hold, that the food, after it is received into the ſtomach, *is* there impregnated with certain menſtruous juices, which being aſſiſted by the natural heat of the ſtomach, raiſe a fermentation in the foods, which diſſolves, attenuates, and converts them into chyle, which is a liquor in a ſtate of actual fermentation.

This was, originally, the ſyſtem of the ancients; who, though they only expreſs themſelves in general terms, as diſſolving, ſoftening, ſubduing, concreting qualities, &c. yet ſeem to have the notion of what we call *fermentation*. Thus Empedocles and Hippocrates teach, that *digeſtion* is performed by a putrefaction of the foods, after the like manner as the ſame Empedocles holds water to be converted by putrefaction into wine. Hippocrates and Ariſtotle uſed the term *concoction*, which we likewiſe find in Erotian, Plutarch, and Actuarius, to expreſs the manner of fruits ripening, the moſt changing into wine, and paſte riſing. Hippocrates expreſly names *efferveſcence* and *fermentation*, De Veteri Medicina, cap. 5. and Galen likewiſe, L. de Conſuetudine, cap. 2. And in another place he aſſerts, that a certain ſerous juice of the ſtomach concurs with the bile and ſpirits to effect *digeſtion*. To ſay nothing of Cicero, who, according to the prevailing opinion of his time, attributes *digeſtion* to the heat of the ſtomach. Lib. ii. De Nat. Deor.

Van Helmont, in his Treatiſe De Flatibus, has applied the doctrine of *fixed air*, now more generally underſtood, to the explication of the phenomena of *digeſtion*; and Hoffman alſo, in his chapter De Alimentorum Solutione & Salivæ Uſu; and the three ſucceeding ones, inſiſts much on the complete change which the aliment undergoes in the firſt paſſages, and makes *digeſtion* a mere fermentatory proceſs.

The juices, or ferments in the ſtomach, to whoſe action *digeſtion* is ſuppoſed owing, are, the ſaliva, bile, and pancreatic juice. This is ſo true, that in certain voracious animals, which eat, and *digeſt* faſt, particularly wolves, oſtriches, and porcupines, the bile diſcharges itſelf immediately into the cavity of the ſtomach; and we have obſerved a diſpoſition analogous thereto in a man that had been a great eater.

There are only three marks to know the fermentation of dough and muſt by: firſt, in that the dough riſes and ſwells; and the muſt bubbles and rarefies; ſecondly, in that the bread and wine made by theſe fermentations have different taſtes and qualities from thoſe the flour

and muſt had before; thirdly, in that the bread and wine, by diſtillation, yield principles that differ in many reſpects from thoſe drawn from flour and muſt. Now, all theſe characters are found in the change made in the food by *digeſtion*.

Sir John Pringle made ſeveral curious experiments, in order to aſcertain the fermentative quality of animal and vegetable ſubſtances. Bread and water remained for ſeveral days in a heated furnace, without any fermentation; but two drams of freſh meat being added to double the former quantity of bread, and water in proportion, the mixture began to ferment in a few hours, and continued to do ſo about two days. The fermentation was generally ſo ſtrong that if the cakes had not frequently given way, the phials muſt have burſt. The bread and fleſh, which at firſt lay at the bottom, ſoon roſe to the top, and conſtantly, as the air eſcaped, let fall ſome particles, that had been buoyed up by the fluid; thus a ſediment was formed reſembling lees, whilſt the lighteſt part, or flowers, remained on the ſurface; but the fermentation continuing, theſe alſo ſubſided; and the acid taſte and ſmell of the liquors, after the action ceaſed, was a farther proof of the preceding fermentation. This change was the more extraordinary, becauſe, when the motion began, the mixture was tending to corruption, and in a few hours afterwards became actually offenſive; but the next day the putrid ſmell abated and went off, before the fermentation ceaſed. From this and ſeveral other experiments of the ſame kind, Sir John infers, that moſt animal ſubſtances tending to putrefaction are endowed with a power of cauſing a fermentation in the *farinacea*, and even of renewing that action in ſuch as have undergone it before. It appears alſo plain by his experiments, that there is ſomewhat generated, or ſet free, during the firſt ſtage of the fermentation of animal and vegetable mixture, which hath a power of correcting putrefaction. The effect of fermentation is evidently to change putrid ſubſtances into a ſtate of acidity, which they not only retain, but become ſtill more and more acid. It is obſerved, indeed, that the acid ariſing from fermentation has ſomething of an auſtere and ſaltiſh taſte, but without any offenſive ſmell. Now, conſidering how much air is generated by fermentation, it may ſeem ſtrange that the ſame materials, uſed as food, ſhould make ſo little diſturbance in the body; and the difficulty would be the greater, did the SALIVA, as ſome ſuppoſe, promote both fermentation and putrefaction.

From this theory of fermentation, the doctor accounts for the acidity of the ſtomach; a diſorder to which many people are ſubject; ſince not only a ſtrong, but an auſtere acid, may be produced from the food of thoſe who live on fleſh, bread, and water only, as often as the ſtomach is relaxed, or in any way diſabled from conveying the whole aliment into the inteſtines; for what is left, having time to undergo a complete fermentation, is thereby changed into a harſh ſort of vinegar. See HEART-*burn*.

It is farther obſerved, that ſpirits, wines, acids, bitters, aromatics, and the better antiſcorbutic plants, retard alimentary fermentation, by their power of correcting putrefaction. However they may have their ſeveral uſes; ſome for checking immoderate fermentation, when, by reaſon of a putrid effluvia, or defect of it, the aliment may ferment too violently; and others, again, for bracing the ſtomach, and ſitting it for expelling its contents in due time. All theſe facts correſpond with *digeſtion*; for the moſt nouriſhing and digeſtible food to people in health, conſiſts in a due mixture of animal and vegetable ſubſtances with water. Scorbutic or putrid habits require acids, wine, or other antiſeptics. And acids abounding in the ſtomach are corrected by abſorbents; and, in a want of a natural heat, and a debility of the ſtomach, wines, bitters, and warm and acid ſubſtances, become neceſſary. Obſ. on Diſeaſes of the Army. Appendix.

Fermentations have been uſually ſuppoſed to generate great heat, and effervescence has been uſed as a ſynonymous term, by which to expreſs it. Neverthleſs many of the moſt violent of them are attended with a very conſiderable cold inſtead of heat. Thus water poured into ſpirit of wine produces heat, in proportion to the water; but the eſſential vegetable oil, which is particularly diſpoſed to take fire, mixed with ſpirit of wine, produces cold; and water has no effect with theſe oils. Mem. Acad. Par. 1725.

Several of Sir John Pringle's experiments have been repeated by Dr. Macbride, to which he has added others of the ſame kind. The following mixtures were prepared, viz. bread and water, about four ounces; bread and boiled mutton, beat up thin, with the requiſite quantity of water, in all about four ounces; this was called the ſimple fermentative mixture: four ounces of this mixture, with two drams of freſh lemon juice; four ounces of the ſame beat up with an ounce of ſpinage; the ſame quantity of the mixture with an ounce of green water-creſſes; and four ounces, with two drams of a very fœtid liquor, that lay about putrid mutton: theſe ſeveral mixtures were placed in a moderate degree of heat, on the top of a ſand furnace, which required a continual fire for three or four days. The bread and water diſcovered no fermentation for fifty-four hours; but at the end of four days it became perceptibly acid. In the other five mixtures, an inteſtine motion was evident in three or four hours; the ſolid part ſoon roſe to the top; bubbles of air, and a thick ſcum, formed on the ſurface; a vapour, with ſome degree of pungency, and which extinguiſhed fire, now began to diſcharge itſelf; and when the motion became very brisk, little pieces of the ſolid matter fell every moment to the bottom of the phials; and when it ceaſed, as it did in the four laſt, in fifty-four hours, and in the firſt in four days, the mixtures were clear and perfectly ſweet.

From theſe and many other experiments, both of a ſimilar nature, and on the great quantity of fixed air which is ſeparated from animal ſubſtances, during their putrefaction, Dr. Macbride was led to conclude, that on the preſence of an elaſtic fluid, or fixed air, in fleſh, depend its cohesion and ſoundneſs; that in proportion as the fixed air is ſeparated from it by fermentation, its texture is deſtroyed, its conſtituent parts become diſunited, and ſeparate to reunite in a different manner, and to form new combinations different from the former. See PUTREFACTION.

Having likewiſe found, that all the alimentary mixtures, which we commonly uſe, are ſuſceptible of fermentation in a ſhort time; that animal and vegetable ſubſtances, when mixed, have a greater aptitude to ferment than either of theſe ſubſtances poſſeſs ſeparately; and that from all the alimentary mixtures, which he has tried, he always ſeparated a conſiderable quantity of fixed air; he applied theſe different diſcoveries to explain the phenomena, and to eſtabliſh the moſt plauſible and rational theory of *digeſtion*. See the cloſe of the article, and CHYLE. See alſo *Fixed* AIR, and SCURVY.

Haller denies that any kind of fermentation takes place in the ſtomach, in order to *digeſtion*; and ſeems to attribute the greateſt effects, in order to the diſſolution of our aliment, to the ſeparation of the air therein contained, and the action of the bile.

The ſecond ſyſtem was invented, or at leaſt renewed, in the preſent age; and has been maintained with much zeal and vivacity, as is commonly the caſe in any thing that has the appearance of novelty. Thoſe who eſpouſe this opinion, contend, that it is a mere continual attrition, or grinding, that breaks, attenuates, and reduces the food, and with the addition of a proper fluid, forms it into that whitiſh ſubſtance, called *chyle*; much as corn is ground between the ſtones of a mill. Which opinion ſeems to be confirmed by ſomething obſerved in birds; their gizzard, or craw, is compoſed of two ſtrong, ſolid, compact muſcles, which rubbing againſt each other, and being aſſiſted by little angular ſtones, or grains of ſand, ſwallowed by the birds, break and grind the dry food thoſe animals live on; and when the ſand is grown ſmooth, they caſt them off with the other excrements, and ſwallow freſh grains.

The experiments of the Florentine academy, repeated by Redi and Borelli, favour the ſame opinion. Hollow particles of glaſs, which they gave to chickens, ducks, and turkeys, were found reduced to a fine powder.

This ſentiment is thus explained by an able aſſertor thereof, M. Hecquet, in his treatiſe of *digeſtion*. Every thing in the body is vaſcular; conſequently, every thing therein is hollow: every thing therein lives after its manner; conſequently, every thing is in motion: animal life being nothing but motion, and conſequently, all the veſſels are in motion. Now the parts of a body, that are to move, will move moſt readily towards thoſe ſides where they find the leaſt reſiſt once. But the place of the leaſt reſiſtance in tubes is the cavity; conſequently, the motion of the parts of veſſels is towards their axes. The parts of veſſels that are to move, are the parieties or ſides, becauſe flexible and elaſtic; and this motion can only be effected by an approximation of thoſe parts; conſequently, the motion of the veſſels conſiſts in an approximation of their parieties; it is, therefore, a ſort of contraction, preſſion, or coarctation. Hence, as all the parts of the body are only veſſels, they all undergo a ſyſtole, preſſion, or contraction.

Farther, all theſe veſſels contain juices in their cavities; and, therefore, all the juices, or liquids in the body, are continually compreſſed. This preſſion is the action of an elaſtic force; conſequently, the preſſion will be ſuch

ca is the force, and, therefore, alternative: consequently, it is a pulse, or palpitation; and therefore the juices are continually beaten. Now, these juices are exceedingly divisible; and consequently they are continually attenuated and divided; and a division effected by a pulsation, or beating, is a trituration; and consequently, the juices in the body are continually triturated, or ground. The reason why the compreſſive force ſhould be alternative, is, that the membranes, which compoſe the veſſels, conſiſt of two plans, or ſeries of fibres; the one longitudinal, the other circular, cutting the longitudinal at right angles: the longitudinal are tendinous, and elaſtic; the circular are muſcular, or motive, like ſphincters, which compreſs: the circular are over the longitudinal, and embrace, or gird them round; the former, we have already obſerved, are elaſtic; and their elaſticity oppoſes the compreſſion of the latter. From this oppoſition, or reſiſtance, ariſes a reciprocal action, and re-action, which is the alternative grinding force required.

To ſuch as account for *digeſtion* from a ferment, theſe philoſophers object, that *digeſtion* is a diſſolution; that to prepare the matters for this diſſolution, they muſt be ſoftened; that the proper effect of acid ferments, is to gnaw, or tear the hardeſt matters, and to harden the ſofter, to thicken the fluid, fix the fat, and coagulate the milky; conſequently, that an acid ferment ſhould rather impede, than promote, *digeſtion*. Add, that, beſide the force to grind the juices, and the veſſels to compreſs them, there are likewiſe liquors to dilute and temper them; viz. the ſaliva, and ſtomach-liquor; and mineral matters, which the ſtomach liquor cannot diſſolve, are found to be worn and poliſhed, after having ſtayed ſome time in the ſtomach. Now, poliſhing is the effect of triture, or grinding, not of corroſion; accordingly we find pebbles, or balls of hair, or threads, in the ſtomachs of cattle, very ſmooth and ſhining, and far from having any marks of corroſion.

The authors who are for the trituration, require three things for *digeſtion* to proceed: a liquor to wet and dilute the food, which they find in the ſaliva and ſtomach-liquor; a veſſel, which is the ſtomach; and a moving power to grind, which they imagine to have found in the muſcles of the ſtomach, diaphragm, and abdomen. The moving force in the muſcles of the ſtomach they maintain to be equivalent to the weight of 248235 pounds; and the force of the ſtomach, alone, to a weight of 12951 pound; a power more than equal to that of one of the heavieſt mill-ſtones. See Traité de la Digeſtion, par M. Hecquet.

Borelli, on the footing of the equilibrium of fluids, has demonſtrated, that the force of the flexor of the laſt articulation of the thumb is equal to 3720 pounds; whence Pitcairn deduces, that the force of the fibres of the ſtomach is equal to 11951, and that of the diaphragm, and muſcles of the lower venter, to 248235 pounds. His way of eſtimating is this: the flexor only weighs 122 grains, and yet may ſuſtain 3720 pounds; conſequently, the fibres of the ſtomach, weighing 8 ounces, and the diaphragm, with the muſcles of the lower venter, weighing together 8223 grains, have the force above mentioned. But this argumentation ſeems founded on a miſtake; for it is not in virtue of its weight of 122 grains, that the flexor muſcle is equivalent to 3720 pounds; beſides that it would follow hence, that the heavier the muſcles of the ſtomach, diaphragm, and abdomen, are, the more force they would have; and, conſequently, the more eaſy and expedite would the *digeſtion* be, which is falſe.

The patrons of this ſyſtem compare the brain to the arbor, or ſcrew, of a preſs; the heart to a piſton; the lungs, to bellows; the mouth, to a mill-ſtone, or a peſtle; the ſtomach, to a preſs; and the inteſtines, to a receiver, or vat. They contend, that Caſtellus, a phyſician of Meſſina, was the firſt of the moderns who expreſly eſpouſed the ſyſtem of ferments; and that he was followed by Van Helmont and Willis.

But even the partiſans of trituration are not perfectly agreed among themſelves: Pitcairn will have it performed by a total contraction of the ſtomach; and M. Hecquet by a ſucceſſive periſtaltic, or vermicular, contraction.

Aſtruc, in his treatiſe De la Cauſe de la Digeſtion, refutes this ſyſtem of trituration at large. He makes a ſtrong oppoſition to the calculus which raiſes the moving force of the ſtomach, &c. ſo very high; the contraction of the fibres of the ſtomach, to compreſs the food, he ſhews, cannot exceed three ounces; and it is even *granti* that he allows ſo much; that of the diaphragm, and abdomen, he computes at about four pounds. He obſerves, that Pitcairn, ſurpriſed, in all probability, with what he had aſſerted of this force, durſt not purſue the proportion whereon his calculus was founded; and according to which, one of the forces would have been found equivalent to 117083 pounds, and the other to 280734; which, together, make 397822 pounds.

The diaphragm, in its motion, has two powers; the one direct, which is that whereby its muſcles draw from the centre towards the circumference; the other lateral, whereby it reſts, or preſſes, on the ſtomach; the latter is very ſmall, in compariſon of the former. Now what ſeems to have deceived Pitcairn and Hecquet, is, their taking the direct for the lateral force; the contraction of the fibres, for their preſſure on the ſtomach; and the ſame overſight they are guilty of in the muſcles of the abdomen, whoſe preſſure againſt the abdomen is only lateral. Add, that there are voracious animals without any diaphragm at all; as fiſhes, which reſpire through their gills; and others, that have only a ſingle membrane; as birds, in whom the muſcles of the lower venter are very ſmall and feeble, and in a ſituation that incapacitates them from acting at all on the ſtomach.

The membranes of the ſtomach being very ſoft, and having only a ſlender motion, ſeem very unfit for the office of a mill-ſtone. It is true, in certain ſowls the ſtomach conſiſts of a cloſe, compact, fleſhy muſcle, exceeding ſtrong, ſo as to break little ſtones, and bits of glaſs; but to this it is urged, that it is no *digeſtion*, which in theſe animals is effected in the inteſtines; and the ſtructure of our ſtomach, compared with the gizzard, or crop, of granivorous birds, does, on the contrary, furniſh a very cogent argument againſt trituration. The gizzard is provided, on the outſide, with four fleſhy muſcles, the tendons whereof meet in two oppoſite joints; the inſide is lined with a hard, thick, cartilaginous membrane, eſpecially in the places where the tendons meet; by this mechaniſm, nature plainly intimates the office of the gizzard to be the grinding of the grain by the friction of its parieties, or ſides: whereas the membrane in the ſtomach of a man is exceedingly thin and fine, furniſhed with few fleſhy fibres, covered with a tender, ſenſible, kind of villi, and the ſtomach itſelf is of a great capacity: and the ſtomach in rapacious birds, who devour large pieces of raw fleſh without chewing, is ſtill a finer membrane. Laſtly, on the foot of the ſyſtem of trituration there ſeems no accounting for hunger, naufea, indigeſtions, crudities, &c.

In the ſyſtem of trituration it ſeems impoſſible to explain why certain things eaſy to grind; e. gr. cabbage-leaves cannot be *digeſted* in certain ſtomachs; which yet find no difficulty in *digeſting* more hard and ſolid meats, as beef and mutton; whereas the difference of diſſolvents gives a natural and eaſy ſolution. Hydropic people continue to *digeſt*, notwithſtanding the fibres of the ſtomach, as well as the reſt of the body, are extremely relaxed, through the redundance of moiſture; and the total, prompt change of nature induced in foods, can be the effect of nothing elſe but fermentation; which even diſcovers itſelf by belches, &c. while it goes on. The iron, needles, pins, &c. ſometimes found undiſſolved in the ſtomach, are no objection to the ſyſtem of fermentation; it being notorious, that no diſſolvent diſſolves all bodies. In birds, which feed on grain, the fermentation is manifeſt; firſt in the crop, where the grain is prepared for *digeſtion*, by being macerated in a liquor like the ſaliva; and afterwards in the gizzard, where the *digeſtion* is perfected by a diſſolvent poured into it by a conglomerate gland. But the thing is ſtill more apparent in ruminating animals, which are provided with four ſtomachs; the two firſt whereof, though formed of a nervous membrane, make but little alteration in the aliment, for want of a ferment, or menſtruum; ſo that it requires to be chewed again, and only becomes well *digeſted* in the fourth ſtomach, whither a diſſolvent is poured from a conglomerate gland.

The partiſans of the third opinion allow it inconteſtable, that there are acids in the ſtomach which mix with the foods, and act on them; and they hold, likewiſe, that their action is aided and promoted by the motion of the ſyſtole and diaſtole in the viſcera: they add, that the acids produce a fermentation, and the oſcillatory motion of the viſcera a trituration; and that this *digeſtion* is the effect of fermentation and trituration at the ſame time. The doctrine of trituration was firſt propoſed in the time of Hippocrates. An opinion was entertained by ſome phyſicians, of thoſe times, that the ſtomach was only the receptacle of the ſolid or dry food; that theſe, after having been diluted, and broken in the mouth, were again broken more perfectly in the ſtomach; and that, by this means alone, they were converted into chile; but that the drink, by reaſon of its liquidity, not being ſubject to be broken, went to the lungs, and not to the ſtomach, where, on account of its abundance, it would rather have prejudiced the *digeſtion* than have aided it. Hippocrates, we read, in the fourth book of diſeaſes, vigorouſly oppoſed an opinion ſo contrary both

to reason and experience; and he was the more zealous in his oppoſition, becauſe, as he informs us, the opinion had gained many partiſans. However, it ſoon gave way to the reaſoning of Hippocrates, and the ſyſtem of trituration ſunk with it. But Eraſiſtratus revived it; and the doctrine, after having been ſupported for ſome time, fell into oblivion. Within the laſt century ſeveral have again endeavoured to recover it.

Dr. Pitcairn, M. de Reaumur, and many others, have eſpouſed it. M. de Reaumur made many experiments both on granivorous and carnivorous birds, from which it appeared that the former digeſt their food by trituration, and the latter by ſolution in a proper fluid. Thoſe that have gizzards were made to ſwallow ſhort tubes of glaſs and tin; and when the fowls were killed, the tubes of glaſs were found ſplit aſunder lengthwiſe, and thoſe of tin, either grooved from end to end, or flatted, or unrolled. But in order to ſhew that this was done by the operation of grinding, without the aid of a diſſolvent, M. Reaumur caſt leaden tubes in moulds, whoſe ſhape could not be altered, and into theſe, left open at both ends, he introduced grains of barley, and bits of beef; and theſe, after remaining ſeveral hours, at different times, in the gizzards of fowls, were taken out, without any ſenſible alteration. In order to determine the mode of *digeſtion* in the ſtomachs of carnivorous birds, which are membranous, he caught a young buzzard, and made him ſwallow a tin tube, which might have been ſqueezed together by the preſſure of a finger and thumb; but after twenty-four hours he threw it up, without any the leaſt apparent mark of friction; whence he concluded, that the bird's ſtomach had little, if any, force of trituration. Having filled the tube with fleſh, and fixed a proper quantity to each end, the buzzard was made to ſwallow it, and in twenty-four hours diſgorged it, without the leaſt injury to the thread meſhes at the ends; but the meat was covered with a kind of paſte, and reduced to an eighth part of the original quantity. Other experiments were renewed with meat and bones; ſome of which were wholly diſſolved, and others conſiderably reduced in quantity. Grain was tried in the ſame manner, without any viſible change; the proper food of carnivorous birds being fleſh.

Mr. John Hunter has lately made ſeveral experiments on the *digeſtion* of the ſtomach after death. Having obſerved that animals, or parts of animals, poſſeſſed of the living principle, when taken into the ſtomach, are not in the leaſt affected by the powers of that viſcus, whilſt the living principle remains; he ſhews, that the ſtomach when deprived of the living principle, is itſelf capable of being digeſted either by the digeſtive powers of other ſtomachs, or by the remains of that power which it had of digeſting other things. And hence it happens, that the ſtomachs of dead bodies are found diſſolved at their greater extremity, from their own natural digeſtive powers, and not in conſequence of any diſeaſe; appearances of this kind being moſt frequent in thoſe who have died violent deaths. This digeſtive power of the ſtomach was farther evinced in fiſh, which ſwallow their food whole, and ſwallow fiſh much larger than the digeſting part of the ſtomach can contain; the part lodged in the ſtomach was found more or leſs diſſolved, whilſt the part left in the œſophagus remained perfectly ſound; and the digeſting part of the ſtomach was itſelf, in many caſes, actually diſſolved.

From ſeveral facts of this kind, Mr. Hunter inferred, that the ſtomach, being dead, was no longer capable of reſiſting the power of that menſtruum, which itſelf had formed for the *digeſtion* of its contents; and that *digeſtion* is performed not by any mechanical power, nor contractions of the ſtomach nor heart, but by ſomething ſecreted in the coats of the ſtomach, which is thrown into its cavity, and there aſſimilates the food, or aſſimilates it to the nature of the blood. Mr. Hunter has found in the ſtomachs of all animals, to which his obſervations or experiments have extended, an acid, but not a ſtrong one, in the juices contained in that viſcus in a natural ſtate. Phil. Tranſ. vol. lxii. art. 32. p. 447, &c.

Some ſuppoſe *digeſtion* owing to gentle heat and motion; by which the texture of the alimentary ſubſtance is changed in the bodies of animals; and then the conſtituent ſolid parts are endued with peculiar attractive powers of certain magnitudes, by which they draw out of the fluids moving through them, like parts in certain quantities, and thereby preſerve their forms and juſt magnitudes. See Dr. Bryan Robinſon of the Animal Oeconomy.

Be it as it will with each of the three ſyſtems, thus much we may venture to lay down from them all, as the real proceſs of *digeſtion*; the end of this operation being to prepare the foods, ſo as that they may ſerve for nutrition, thoſe foods muſt be conſidered from the time the man takes them in; till, being converted into chyle, they mix with the blood, which conveys them into all parts of the body: the *foods*, then, we take, are either crude, as oyſters, fruits, certain pulſe, &c. or dreſſed, as fleſh and fiſh, which are roaſted, boiled, fried, &c. and ſeaſoned a thouſand divers ways with ſalt, pepper, and other ſpices, vinegar, wine, &c. This is done to heighten and enrich the taſte, as much as to aſſiſt *digeſtion*.

Farther, there are ſome foods we ſwallow without chewing, as liquids; and others, which we break and comminute by chewing, as bread, fleſh, &c. It is of theſe laſt we ſhall here ſpeak, as undergoing more preparations, and more changes to fit them for nutrition, than the others.

The food, then, is firſt broke and divided by the teeth, and, at the ſame time, moiſtened with a liquid ſupplied by the ſalival glands, and thus is formed into a kind of paſte.

Thus prepared, it is paſſed through the œſophagus into the ſtomach, there to ferment. This fermentation is cauſed, 1. By the ſalival and gaſtric juice, which is a ferment, and has the ſame effect on the aliments, that leaven, or yeaſt, has on paſte. 2. By the heat of the ſtomach, viſcera of the abdomen, and even excrements; which here have nearly the ſame effect on foods, as a dunghill has on matters laid by the chemiſts to *digeſt* therein. 3. By the remains of foods left adhering in the rugæ, or folds of the ſtomach, and there turned ſour and acrimonious. 4. By the agitation ariſing from the periſtaltic motion, the compreſſion of the muſcles of the abdomen and diaphragm, and the continual pulſation of the neighbouring blood-veſſels. 5. By the liquor which the repeated compreſſion of thoſe muſcles occaſions to drip from the glands of the ſtomach. And, 6. According to the ſentiments of ſome modern phyſicians, by the air itſelf; which, being mixed, and embarraſſed in the aliments, dilates by the heat of the ſtomach, and ſeparates the parts of the foods. This air, which once adhered to the ſubſtances compoſing our food, in a fixed ſtate, does, in the moment of extrication, reſume its elaſticity, and thus deſtroys the union of their minute particles. This elaſtic air is probably abſorbed again by the alimentary mixtures, and reduced to a fixed or non-elaſtic ſtate, before the chyle enters the lacteals; though Dr. Black maintains, that the alimentary ſubſtances carry their fixed air into the blood, without throwing it off into an elaſtic ſtate, during *digeſtion*; and he is ſo far from believing that the aliment naturally ferments in the ſtomach, that he looks on ſuch fermentation, when it does happen, to be the cauſe of many, and very dangerous diſeaſes. Theſe cauſes all contribute to attenuate and divide the food, ſo as to convert it into a cineritious matter, called CHYLE.

From the ſtomach the chyle deſcends into the duodenum, and through the long tract of the ſmaller inteſtines, where it is farther perfected by the pancreatic juices, and the bile, which thin it, precipitate its groſſer parts, and render it more fluid; and chiefly by the fermenting motion which ſtill continues; the chyle, thus perfected and attenuated, enters the lacteal veins, fully charged with the ſubtle, active, antiſeptic ſpirit, called *fixed* AIR, which convey it into the receptaculum chyli, where it is farther diluted by the lympha, which is brought hither in abundance; hence it ariſes into the thoracic duct, and enters the ſubclavian vein; where, being taken up by the aſcending cava, it is poured into the right ventricle of the heart. The chyle, thus mixing with the blood, communicates its inteſtine motion to it, and thus prevents the natural tendency of the fluids to putrefaction; and the blood, by its volatile and exalted parts, together with the ſaline and nitrous parts of the air, ſubtilizes, and gives it its laſt perfection. Then the *digeſtion* is finiſhed; and the foods being, by ſo many changes, rendered the immediate matter of nutrition, are carried by the blood into all parts of the body, to repair and fill the vacancies of ſuch as are continually diſſipating and exhaling, or even to add new ones.

As to the groſſer parts of the foods, ſeparated from the chyle by the bile and pancreatic juice, they aſſume the colour of excrements, from the bile; and their rank ſmell they derive from the coarſer ſulphur thereof, and from the ſour and putrid ferments, that are lodged in the cœcum, which, in a very ſhort time, convert the alimentary remains into their own nature. Theſe ſulphurs, and ſalts of the excrements, together with their putreſcent quality, ſerve, after they have paſſed through the inteſtines, and are arrived at the laſt, which is the rectum, to vellicate the muſcles thereof, and diſpoſe them to relax, and thus to apprize nature of a neceſſity to diſcharge.

In particular caſes, however, as in thoſe of weak and relaxed habits, of pregnant women, whoſe ſtomachs, and

great part of the smaller inteſtines, are thrown out of their natural ſituation, and of perſons who lead ſedentary lives, the food is often detained ſo long in the firſt paſſages, as to paſs on to the ſecond or acetous ſtage of alimentary fermentation; and then it produces a very ſulfure acid, which, not being admitted by the lacteals, accumulates, and occaſions ſour eructations, heart-burning, vomiting, griping, or looſeneſs, according to its quantity, degree of ſtrength, and place where lodged. The ſour acrimony precipitates the alimentary mixture through the firſt ſtage of fermentation to the ſecond, and prevents the food from yielding a nutritious chyle, which appears from a paleneſs and languid diſpoſition of thoſe who are much afflicted with ſourneſs in the ſtomach. This circumſtance ſuggeſts one reaſon, why exerciſe, which agitates the viſcera, and prevents the too long ſtay of the aliment in the firſt paſſages, and the aromatic gums and bitters, together with chalybeates, whoſe qualities are ſtrengthening and ſtimulating, prove ſo very ſerviceable in all theſe caſes. But if the aliment, either from its own very putreſcent nature, or from its too long ſtay within the confines of the ſmaller inteſtines, ſhould proceed to the third, or putreſcitive ſtage of fermentation, it will become ſo offenſive, as to occaſion immediate efforts for throwing it off, or end in dangerous diſeaſes, and even death. Machride's Eſſays, p. 20, &c.

The ſeparation of the urine from the blood may be eſteemed a part of perfect *digeſtion*; the deſign of ſuch ſeparation being to render the blood more pure and balſamic; and, of conſequence, more fit for nutrition; which the ſalts, with which the urine abounds, greatly prevented. This ſeparation is thus performed: the branches of the emulgent arteries, which terminate in the glands, whereof the ſubſtance of the kidneys is compoſed, carry the blood thither; where a ſerofity is ſeparated from the blood, by means of the pores in the glands of the kidneys; thoſe pores repreſenting the holes in a ſieve, which only let paſs ſuch things as are of a leſs diameter than themſelves. This ſerofity, called urine, is diſcharged hence into ſeveral little tubes, which joining in a kind of pyramids, yield their humour into the pelvis, whence it runs through the ureters into the bladder.

DIGESTION, in *Chemiſtry*, is a preparation of plants, minerals, metals, or other bodies, by putting them, with ſome proper fluid, in a veſſel, and heating them gradually over a gentle fire, like the heat of an animal body. *Digeſtion* is ordinarily confounded with maceration; but the two things differ, in that there is heat required to *digeſtion*; whereas maceration is done in the cold.

Digeſtion is uſually performed with the addition of ſome menſtruum ſuitable to the matter: thus roſes and poppies heads are put to digeſt in oil, or water, to make unguents, or ſyrups; calcined lead, and ceruſs, are digeſted in diſtilled vinegar, to make the magiſtery thereof, or the ſal Saturni. Hence Dr. Freind defines *digeſtion* to be the ſolution of bodies, made by menſtruums, with the aſſiſtance of fire.

The uſe of *digeſtion* in pharmacy, is to extract the more volatile particles, and mix them intimately with the menſtruum. To this end a gentle fire is commonly uſed, that the corpuſcles, which are moſt volatile, may ſeparate, as it were, of their own accord; for a fierce fire forces out the faeces, as well as the finer particles; and if it does not abate the ſtrength of the liquor, as is often the caſe, it will not fail of ſpoiling its clearneſs.

In ſome caſes *digeſtion* is uſed to produce a change in a ſingle body, as in merc. precip. perſe; in others to promote ſolutions, or other combinations; as of well-calcined, dry fixed alkali, with rectified ſpirit of wine, which digeſted together in a matraſs, with a gentle ſand-bath heat, becomes an alkaline tincture of a yellow red-diſh colour, called tincture of ſalt of tartar. CIRCULATION is a mode of *digeſtion*. The veſſels generally uſed for this purpoſe are matraſſes, or Florence flaſks, either of which may be eaſily converted into circulatory veſſels. The operation is generally performed in a ſand-bath, by which the degrees of heat may be regulated according to the intention of the operator. This heat ſhould never riſe ſo as to make the matter boil. *Digeſtion* is uſed for making tinctures, wines, elixirs, &c.

The chemiſts of late years have too much given into the more elaborate and forced proceſſes, and neglected the more natural and eaſy ones. Among theſe latter is *digeſtion*; a proceſs ſo eaſy, that it requires ſcarce any quality in the operator but patience, and yet will do ſuch things as all the elaborate proceſſes of that art can never arrive at without it. There is ſcarce a proceſs that has more puzzled the chemiſts of an age or two ago, than the volatilizing ſalt of tartar; yet Langelot aſſures us, that after oft-repeated attempts, and the cautions in the common proceſſes that an earneſt deſire of ſucceſs could inſpire him with, he failed in them all; till trying the effect of a long *digeſtion*, he ſucceeded ſo well in the firſt attempt, that he converted almoſt the whole ſalt into a pure white volatile ſubſtance, leaving only a few inſipid earthy faeces behind. Another great uſe of *digeſtion* is the duly preparing of the eſſences of mineral ſulphurs; the ſtony ſea-plants, which greatly reſemble the nature of foſſils, are alſo better treated by this proceſs than by any other. Tartariſed ſpirit of wine, receives a very high tincture from red coral, after a long *digeſtion*, in any diſtilled vegetable oil, though it will not in the common way be at all coloured by it. Phil. Tranſ. N° 87. See CORAL.

DIGESTION, in *Surgery*, expreſſes a diſpoſition in abſceſſes to ripen, and come to ſuppuration.

Tumors, ariſing on the parotides of children, are of eaſy *digeſtion*: they ripen in a little time. Dionis.

DIGESTION is alſo uſed for maturation, or that ſtate of a diſeaſe wherein the morbific matter is ſo changed in bulk, figure, coheſion, mobility, &c. by the uſe of proper medicines, or even by the force of nature, as to be leſs noxious and hurtful, and, conſequently, to abate the violence of the diſtemper.

The Greeks call it πεψις. The matter of the diſeaſe ſo far *digeſted*, as to become next a-kin to ſalubrious, or healthy matter, is ſaid to be *reſolved*.

DIGESTIVE *faculty*. The ancient philoſophers admitted a *digeſtive faculty*, or *quality*, in the human body; as not knowing how otherwiſe to account for the act of *digeſtion*.

DIGESTIVE is alſo uſed, in *Medicine*, for ſuch remedies as ſtrengthen and increaſe the tone of the ſtomach, and aſſiſt in the *digeſtion* of foods. To this claſs belong all ſtomachics and ſtrengtheners, or corroborants.

DIGESTIVE, in *Surgery*, denotes a ſort of unguent, plaiſter, or the like, that ripens and prepares the matter of wounds, &c. for ſuppuration.

The common *digeſtive* is compoſed of turpentine, yolk of eggs, oil of St. John's wort, unguentum baſilicum, and tincture of aloes.

The wound muſt be dreſſed the firſt day with a *digeſtive*, to bring it to ſuppuration.

DIGESTOR, or DIGESTER, an artificial means, or inſtrument, ſerving to *digeſt*, or diſſolve meats out of the ſtomach, by a way analogous to that of animal digeſtion. Mr. Leigh, in the Philoſophical Tranſactions, gives us an artificial *digeſtor*, to illuſtrate the natural one; it is prepared from ſpirit of ſulphur, ſpirit of hartſhorn, the chyle of a dog, and its ſaliva. A piece of veal, mutton, beef, or the like, of the bigneſs of a nut, being put in a dram of this preparation, and ſet on a *digeſting* furnace two hours, it drew from the fleſh a juice, that had the colour and taſte of chyle, and left the meat light, dry, and inſipid.

Dr. Havers prepares a *digeſtor* of oil of turpentine mixed with oil of vitriol; in which, raw fleſh, and crumbs of bread being put, and the whole committed for four hours to *digeſt* in balneo Mariæ, the meat is found diſſolved, and the whole together forms a thickiſh pulp: hence, thoſe authors, each of them, conclude the food in the ſtomach to be *digeſted* by ſome ſuch menſtruums.

But the moſt celebrated *digeſter*, is an inſtrument of that name, invented by Papin, the effect whereof bears a more near reſemblance to the operation of the ſtomach. It is a ſort of veſſel, wherein meat being put, together with ſo much water as ſerves exactly to fill it, a lid is ſcrewed cloſe on, ſo as to admit of no external air. Then, by the application of two or three lighted charcoals, or even a ſingle ſmall lamp-flame, the meat is in a few minutes (ſix or eight) reduced into a perfect pulp, or rather liquor. By a little increaſe of the fire, or the addition of a few minutes in time, the hardeſt bones themſelves are brought into a pulp or jelly. The effect is accounted for from the ſtrict cloſure of the engine, which excluding the intruſion, or eſcape, of air, the ſucceſſions occaſioned by the expanſions and oſcillations of the air included in the fleſh, are equable and ſtrong, and ſo reſolve the whole into one ſeemingly homogeneous body, and mix the aqueous, ſaline, oleous, and other particles, ſo ſtrongly together, as ſcarce to ſeparate, but while hot, to appear one liquor, and when cold, jelly of a ſtrength proportionate to the quantity of fleſh, or bones, diſſolved in the water.

This experiment ſeems to hold a cloſe analogy with the operation of the ſtomach. For though the ſtomach doth not ordinarily diſſolve, either ſo ſtrongly, or ſo quick; yet in proportion to its heat and conſtruction, Dr. Drake takes it to do the ſame thing; thereby breaking, and reſolving into ſmall, the bodies which it included, ſo mixed, *inter minima*, with its humours. Theſe, thus reduced into a fluor, and intimately mixed with the liquids of the drink, and juices of the ſtomach, compoſe that lacteſcent liquor, called *chyle*, or *chyme*. See CHYLE.

DIGGING,

DIGGING, in *Mineralogy*, a term appropriated by the miners to expreſs that penetrating into the earth, where they have the ore before them, and every ſtroke of the tools turns to account.

They appropriated the word to this ſenſe, expreſſing the random openings, which they make in ſearch of mines, by the word *batching*, or *eſſay-batching*. See the article TRAINING *of mines*.

When the eſſay-hatches have been opened ſo long, that the orifice of the mine or load is found, the opening which has led to it, loſes its name of eſſay-hatch, and is called a ſhaft or metal-hatch; this is to be ſunk down about a fathom, and then they leave a ſquare ſpace, called a *ſhamble*, and ſo continue ſinking from caſt to caſt; that is, as high as a man can conveniently throw up the ore with a ſhovel, till the load is found to grow ſmall, or elſe to degenerate into ſome unprofitable ſubſtance, or weed, as they metaphorically expreſs it. The degeneracy of the ore is ſoon perceived, by the finding of mundic or marcaſite growing more plentifully among it. This is a ſulphureous mineral, of a yellow, whitiſh, or greeniſh colour, and is very troubleſome to the Corniſh miners. The other unprofitable ſubſtances found in the place of the ore, or mixed in large quantities with it, where it degenerates, are daze, which is white, black, or yellowiſh; *iron-mould*, which is black or ruſty; *caul*, which is red; *gliſter*, which is blood-red, or black, is alſo another degeneracy of the ore. Theſe are the common names given by the miners to various foſſils, and theſe are the marks by which they know the vein is almoſt exhauſted in that part, and will not long be worth *digging*.

In this caſe, they begin to drive either caſt or weſt, as the goodneſs of the land, or the convenience of the hill, unite. The drift or opening, on this occaſion, is three feet over, and ſeven feet high, ſo that a man may conveniently ſtand and work; but in caſe the land is not broad enough of itſelf, as ſome are ſcarce half a foot, then they break down the deads firſt on the north ſide of the land, for the greater conveniency of the right arm in working, and then they begin to rip the load itſelf. By the term deads, they mean that part of the ſhelf, which contains no metal, but encloſes the load or vein as a wall between two rocks.

The inſtruments commonly uſed in mines with us, and that ſerve for ripping the lands, are the *berle*, or, as it is called in Cornwall, the *tubber*. This is an inſtrument of eight or ten pounds weight, well ſteeled and ſharpened at each end, ending in a point each way, and having a hole in the middle; this will laſt half a year, but muſt be new ſharpened every fortnight. The ſecond inſtrument is a *ſledge*; this is uſually made from ten to twenty pounds weight; and will laſt ſeven years, if new ordered once in three or four months. Beſide theſe, they have *gadds* or wedges; theſe are of about two pounds weight; they are made four-ſquare, and well ſteeled at the point, and they muſt have ladders and wheel-barrows to carry the deads and the ore out of the adits to the ſhambles. The general proportion of the workmen in Cornwall, is this: two ſhovel-men and three beele-men in a drift; theſe are as many as the drift will contain without ſtanding in one another's way. The beele-men rip the deads and the ore, and the ſhovel-men carry it off and land it, by caſting it up from one of the ſhambles to another all the way up. In ſome places they ſave the trouble of this caſting it to the ſhambles by a winder and two buckets: theſe are ſo contrived, that one goes up as the other comes down, and they are filled and emptied with great eaſe. Phil. Tranſ. N° 69.

DIGIT, DIGITUS, in *Anatomy*. See FINGER.

DIGIT, in *Aſtronomy*, is the meaſure whereby we eſtimate eclipſes: amounting to the twelfth part of the diameter of the luminary eclipſed.

The diameter of the body, or diſk, of the ſun or moon, is divided into twelve parts, called *digits*; and an eclipſe is ſaid to be of ten *digits*, when ten of thoſe parts are hid.

Theſe *digits*, Wolfius, and ſome others, call *digiti eclipticî*.

DIGIT, in *Arithmetic*, ſignifies an integer, or number, under ten; as 1, 2, 3, 4, 5, 6, 7, 8, 9.

DIGIT is alſo a meaſure taken from the breadth of the finger. A *digit* is properly three-fourths of an inch, and equivalent to four grains of barley, laid breadth-wiſe, ſo as to touch each other.

DIGITALIS, in *Botany*. See FOX-*Glove*.

DIGITATED *Leaf*, among *Botaniſts*. See LEAF.

DIGITUS *Veneris*, *Venus's finger*, in *Botany*, a name by which ſome authors have called the nymphæa, or water-lily.

DIGLYPH, from *δις*, *twice*, and *γλυφω*, *I engrave*, a kind of imperfect triglyph, conſole, or the like, with only two channels, or engravings, inſtead of three. See TRIGLYPH.

DIGNITARY, in the *Canon Law*, a perſon who holds a *dignity*, that is a benefice, which gives him ſome pre-eminence in the choir, above mere prieſts and canons. Such is a dean, and archdeacon; though the word is now abuſively applied to a mere prebendary, or canon.

Dignities are ſometimes ſimple, ſometimes with cure of ſouls, and ſometimes with juriſdiction and adminiſtration of ſacred things. The canoniſts even define *dignity*, *adminiſtratio cum juriſdictione & poteſtate conjuncta*. If the *dignity* have no contentious, or exterior juriſdiction, it is a ſimple perſonage, and only gives pre-eminence. See BENEFICE, PARSONAGE, &c.

Of *dignities*, including prebends, Camden reckons in England, 544 in number.

DIGNITY, a quality that denotes a man *(dignus) worthy*.

DIGNITY, in its moſt uſual acceptation, ſignifies honour and authority, reputation, &c. and *dignity* may be divided into ſuperior and inferior; as the titles of duke, earl, baron, &c. are the higheſt names of *dignity*; and thoſe of baronet, knight, ſerjeant at law, &c. the loweſt Nobility only can give ſo high a name of *dignity*, as to ſupply the want of a ſurname in legal proceedings; and as the omiſſion of a name of *dignity* may be pleaded in abatement of a *writ*, &c. ſo it may be where a peer who has more than one name of *dignity*, is not named by the moſt noble. 2 Hawk. P. C. 185. 23. No temporal *dignity* of any foreign nation can give a man a higher title than that of eſquire. 2 Inſt. 667.

DIGNITY, in *Oratory*, is one of the three parts of general ELOCUTION; and conſiſts in the right uſe of TROPES and FIGURES. See COMPOSITION and ELEGANCE.

DIGRESSION, in *Oratory*, is defined by Quintilian, agreeably to the etymology of the word, to be, a going off from the ſubject we are upon to ſome different thing, which, however, may be of ſervice to it. Inſt. Or. lib. iv. cap. 3.

Digreſſion is not a neceſſary part of a diſcourſe, though it may ſometimes be convenient on ſeveral accounts; as where a ſubject is of itſelf flat and dry, and requires cloſe attention; in this caſe it is of uſe to relieve the mind by ſomething agreeable and entertaining. But as it ſhould never be introduced without ſufficient reaſon, it ſhould never be too frequent, nor too long. Ward's Or. vol. i. p. 283, &c.

DIGYNIA, in the Linnæan ſyſtem of *Botany*, an order of plants, or a ſubdiviſion in moſt of the claſſes eſtabliſhed by Linnæus, denoting that the plants have two ſtyles. The term is derived from *δις*, *double*, and *γυνη*, *wife*. See FRUCTIFICATION, and SEXUAL *Syſtem*. See *Tab.* II. *of Botany*.

DIHELIOS, from *δια*, *through*, and *ἡλιος*, *ſun*, in the *Elliptical Aſtronomy*, a name which Kepler gives to that ordinate of the ellipſis, which paſſes through the focus, wherein the ſun is ſuppoſed to be placed.

DII *Patrii*, among the Romans, were the three ſupreme deities, Jupiter, Juno, and Minerva. They were firſt received over all the Eaſt, and afterwards, ſucceſſively, in Greece and Italy. They are deſcribed as *indigetes* by Virgil, Georg. i. ver 499. and as *noſtri* by Juvenal, Sat. iii. ver 145.

DIJAMBUS, in *Poetry*, the foot of a Latin verſe of four ſyllables; it is compounded of two *iambics*, as *ſecerâtis*.

DIPOLIA, *Διπολεια*, in *Antiquity*, an Athenian feſtival, celebrated in honour of Jupiter Polieus, or protector of the city. For the ceremonies obſerved at this ſolemnity, ſee Potter's Archæol. Græc. lib. ii. c. 20. tom. i. p. 381.

DIKE, a *ditch*, or *drain*, made for the paſſage of waters.

The word ſeems formed from the verb. *to dig*; though others chooſe to derive it from the Dutch, *dïk*, a *dam*, *ſea-bank*, or *wall*.

DIKE, or DYKE, alſo denotes a work of ſtone, timber, or faſcines, raiſed to oppoſe the entrance, or paſſage of the waters of the ſea, a river, lake, or the like.

The word comes from the Flemiſh *dyk*, or *dïk*, a heap of earth to bound, or ſtem the water. Junius and Menage take the Flemiſh to have borrowed their word from the Greek *τειχος*, *wall*. Guichard derives it from the Hebrew *daghab*.

Theſe *dikes* are uſually elevations of earth, with hurdles or ſtakes, ſtones, and other matters.

The *dike* of Rochelle is made with veſſels faſtened to the bottom. The *dikes* of Holland are frequently broke through, and large tracts of land are then drowned.

DILAPIDATION, a waſteful deſtroying, or letting buildings, eſpecially parſonage houſes, run to ruin and decay, for want of neceſſary reparation.

An action lies for *dilapidations*, either in the ſpiritual court by the canon law, or in the courts of common law; and it may be brought by the ſucceſſor againſt the predeceſſor, if living, or, if dead, againſt his executors.

The money recovered for *dilapidation*, by 14 Eliz. it. muſt be employed in the repair of the ſame houſes, within two years, on penalty of forfeiting double the value to the crown.

DILATATION, in *Phyſics*, a motion of the parts of a body, whereby it expands or opens itſelf ſo as to occupy a greater ſpace.

The generality of authors confound *dilatation* with rarefaction; but the more accurate, eſpecially foreigners, diſtinguiſh between them; defining *dilatation* to be the expanſion of a body, into a greater bulk, by its own elaſtic power; and rarefaction, the like expanſion produced by means of heat.

The moderns have obſerved, that bodies, which, after being compreſſed, and again left at liberty, reſtore themſelves perfectly, do endeavour to *dilate* themſelves with the ſame force whereby they are compreſſed; and accordingly they ſuſtain a force, and raiſe a weight equal to that whereby they are compreſſed.

Again, bodies, in *dilating* by their elaſtic power, exert a greater force at the beginning of their *dilatation*, than towards the end; as being at firſt more compreſſed; and the greater the compreſſion the greater the elaſtic power, and endeavour to *dilate*. So that theſe three, the compreſſing power, the compreſſion, and the elaſtic power, are always equal.

Again, the motion, whereby compreſſed bodies reſtore themſelves, is uſually accelerated: thus, when compreſſed air begins to reſtore itſelf, and *dilate* into a greater ſpace, it is ſtill compreſſed; and, conſequently, a new impetus is impreſſed thereon, from the *dilatative* cauſe; and the former remaining, with the increaſe of the cauſe, the effect, that is, the motion and velocity, muſt be increaſed likewiſe: thus an arrow ſhot from a bow does not quit the ſtring, till after that be perfectly reſtored to its natural ſtate; nor does the arrow move a whit ſwifter than the ſtring; and if the ſtring, before it have perfectly reſtored itſelf to its right line, be ſtopped, the arrow will not go its full length; which is a proof, that it is continually acquiring a new impetus from the ſtring. And ſince projectiles, at the beginning of their motion, are little or nothing retarded, but rather accelerated, it is evident, that the motion of a ſtring reſtoring itſelf, is likewiſe accelerated. Indeed, it may happen, that where the compreſſion is only partial, the motion of *dilatation* ſhall not be accelerated, but retarded; as is evident in the compreſſion of a ſponge, ſoft bread, gawſe, &c.

DILATATION, in *Medicine*, &c. denotes the laying open any orifice, or the lips of a wound, wider; or the extenſion of any veſſel, or the like.

This is done by an inſtrument called a *dilatatorium*.

DILATATOR *poſticus urethræ*, in *Anatomy*, a name given by Heiſter and ſome others, to what is ſuppoſed to be a peculiar muſcle by many, and called alſo *levator ſextus ani*, and by ſome other names, though it is really only a proceſs of the ſphincter ani running into the perinæum. See SPHINCTER.

DILATATORES *alæ naſi*, in *Anatomy*, a pair of muſcles common to the *alæ naſi*, and upper lip.

They ariſe thin, broad, and fleſhy, from the cheek-bones under the orbits of the eyes, and deſcend obliquely with a two-fold order of fleſhy fibres in each muſcle; which partly terminate in the upper lip, and partly in the *alæ naſi*. They draw the *alæ* from each other, and widen the external openings of the noſtrils.

DILATORY *pleas*, in *Law*, are ſuch as are put in merely for delay; and there may be a demurrer to a *dilatory plea*, or the defendant ſhall be ordered to plead better, &c. 6 Mod. The truth of *dilatory pleas* is to be made out by affidavit of the fact, &c. by ſtat. 4 and 5 Anne. See PLEAS.

DILE, in *Botany*, a name by which ſome authors have called the ſtatis or woad. Ger. Emac. Ind. 2.

DILEMMA, Διλημμα, in *Logic*, an argument conſiſting of two, or more propoſitions, ſo diſpoſed, that grant which you will of them, you will be preſſed by the concluſion.

The word is formed from the Greek δις, *bis*, *twice*, and λημμα, *ſumpio*.

A *dilemma* is an argument conſiſting of two contrary parts, or ſides, either of which catches the adverſary. And hence it is alſo called *ſyllogiſmus cornutus*, a *horned ſyllogiſm*, its horns being ſo diſpoſed, that if you avoid the one, you run upon the other.

It is alſo called *crocodilinus*, by reaſon that as the crocodile leads ſuch as follow it, into the water, and purſues ſuch as fly it, to deſtroy them; ſo, whatever the adverſary either affirms, or denies, in this kind of ſyllogiſm, is turned to his diſadvantage.

For an example: A philoſopher once diſſuaded a man from marrying, by this argument: Either the woman you marry will be handſome, or ugly; if handſome, the will give you jealouſy; if ugly, diſpleaſure.

Cicero uſes this fine *dilemma*, to prove, that all pain is to be borne with patience: *omnis dolor aut eſt vehiemens, aut levis; ſi levis, facile feretur; ſi vehemens, certe brevis futurus eſt.*

The ſame orator, by another *dilemma*, proves that no meſſengers ſhall be ſent to Anthony: *ingatos deterritis; ſi ut deprecentur, contemnet: ſi ut imperatis, non audiet.*

Nor muſt we here omit that beautiful *dilemma* of Tertullian whereby he clears the Chriſtians, and accuſes Trajan, who had forbid the ſeeking them out, and yet ordered them to be puniſhed when found: *O ſententiam neceſſitate confuſam! negat inquirendos, ut innocentes; & mandat puniendos, ut nocentes: parcit & ſævit, diſſimulat & animadvertit! quid temetipſum cenſura circumvenis? ſi damnas, cur non & inquiris? ſi non inquiris, cur non & abſolvis?*

For a *dilemma* to be legitimate, there are two things required: 1. A full enumeration of parts; thus that of Ariſtippus above mentioned, whereby he diſſuades from marriage, is invalid, as being defective in the enumeration; there being a middle degree, or form, between *handſome* and *ugly*.

2. That the *dilemma* preſs the adverſary alone, and that the perſon who makes it be not liable to have it retorted upon him. This was the caſe in that celebrated *dilemma* of the ſophiſt Protagoras, which the areopagites, with all their wiſdom, were not able to reſolve.

A youth named Evathlus, engaged with Protagoras, to learn dialectics, upon condition, that he ſhould pay him a large ſum of money, the firſt cauſe he pleaded, in caſe he gained the ſame. Evathlus, when fully inſtructed, refuſing to pay the condition, Protagoras brings his action, arguing thus: You muſt pay the money, however the cauſe go; for if I gain, you muſt pay in conſequence of the ſentence, as being caſt in the cauſe; and if you gain it, you muſt pay it in purſuance of our covenant. Nay, retorts Evathlus, which way ſoever the cauſe go, you will have nothing: for if I prevail, the ſentence gives it, that nothing is due to you; and if I loſe, then there is nothing due by the covenant.

After the like manner, an ancient prieſteſs diſſuading her ſon from haranguing the people, by this *dilemma*, *nam ſi injuſta ſuaſeris*, ſays ſhe, *habebis Deos iratos: ſin vero juſta, iratos habebis homines*: the youth thus returned the *dilemma* on his mother: *imo*, ſays he, *expedit ad populum verba facere, nam ſi juſta dicero, Deos amabunt; ſi injuſta, homines.*

DILICTUM, a term uſed by Agricola, to expreſs a brine, made by pouring water upon ſand, ſtones, earth, &c. that had been before ſtrongly impregnated with ſea-ſalt: from this brine, a ſalt, for the uſe of the table, was made by evaporation in his time, and is ſtill ſo in many parts of the world. At Junthall, in Germany, they have a ſalt work of this kind, where they make at the rate of eight hundred loaves of ſalt in a week, each loaf weighing four hundred weight.

DILIGENZA, in the *Italian Muſic*, is uſed for a ſoft or ſweet manner of ſinging or playing.

DILL, *Anethum*, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe: it is an umbelliferous plant, with many umbels, which are uniform; the flowers have five ſpear-ſhaped petals; under the flower is ſituated the germen, which afterward becomes two compreſſed ſeeds, having borders. We have but one ſpecies of this plant, which is the common *dill*.

This plant both in root, ſtalk, and leaf, very much reſembles common fennel, excepting that it ſeldom grows ſo tall, or is ſo much branched; the whole plant is of a very ſtrong ſcent, leſs pleaſant than fennel. It flowers and ſeeds in July and Auguſt; the leaves and ſeeds are uſed. The officinal preparations of this plant, are, a water, oil, and aſhes; for which, ſee ANETHUM.

DILLENIA, in *Botany*, the name of a genus of plants, of the *polyandria polygynia* claſs; the characters of which are theſe: the perianthium is compoſed of five leaves, which are large, roundiſh, hollow, and of a coriaceous texture, and remain when the flower is fallen; the flower is compoſed of five roundiſh hollow petals; theſe alſo are large, and of a coriaceous texture. The ſtamina are numerous filaments forming a ſort of globe, the antheræ are oblong and erect. The germina are about twenty in number; they are of an oval oblong figure, and pointed; they are ſomewhat compreſſed, and adhering together by their inner ſurfaces; there are no ſtyles. The ſtigmata are large and pointed, and are diſpoſed in form of a ſtar; the fruit is roundiſh, and is covered with a number of capſules, divided by ſo many furrows. The ſeeds are numerous and ſmall.

DILLOUGHING. See TIN.

DILUTE. To *dilute* a body, is to render it liquid; or, if it were liquid before, to render it more ſo, by the addition of a thinner thereto.

Thoſe things thus added, are called *diluents*, or *dilutors*; ſuch are common whey, piſſans, and juleps, which in reſpect

reſpect of the blood in a ſtate of viſcidity are thinner, and therefore are ſaid to thin, or *dilute* it. Flour muſt be well *diluted*, to make it into paſte. Ochre is *diluted* with oil, to paint beams, doors, &c.

DIMACHÆ, from δις, *double*, and μαχομαι, *I fight*, in *Antiquity*, a kind of horſemen, firſt inſtituted by Alexander. Their armour was lighter than that of the infantry, and at the ſame time heavier than that uſed by horſemen, ſo that they could act as horſe or foot as occaſion required.

DIMACHÆRUS, Διμαχαιρος, from δις, and μαχαιρα, *ſword*, in *Antiquity*, a gladiator who fought with two ſwords.

DIMETER. See IAMBIC.

DIMENSION, the extenſion of a body, conſidered as meaſurable.

Hence, as we conceive a body extended, and meaſurable in length; breadth, and depth, we conceive a *trine dimenſion*, viz. length, breadth, and thickneſs. The firſt called a *line*, the ſecond a *ſurface*, the third a *ſolid*.

DIMENSION is particularly uſed with regard to the powers of the roots, or values of the unknown quantities of equations, which are called the *dimenſions* of thoſe roots. See EQUATION and ROOT.

Thus in a ſimple equation, the unknown quantity is only of one *dimenſion*, as $x = a + b$. In a quadratic equation it is of two *dimenſions*, as $x^2 = a^2 + b^2$. In a cubic, of three, as $x^3 = a^3 - b^3$, &c.

DIMETIENT, in *Geometry*, is ſometimes uſed for *diameter*.

DIMINISHED *interval*. See INTERVAL.

DIMINISHED *ſecond* is a ſemitone major, leſſened by a ſemitone minor. See INTERVAL and SECOND.

DIMINISHED *third*, by ſome called *defective third*, is properly a *third* minor leſſened by a ſemitone minor. But among practical muſicians, it commonly ſignifies an interval equal to two ſemitones major. And this they confound with the former; but there is a difference between them, equal to the difference between a tone-major and minor, that is, a comma. The firſt mentioned of theſe *diminiſhed thirds* will be expreſſed by $\frac{15}{14} = \frac{5}{4} : \frac{28}{25}$, and is equal to the tone-major and enharmonic dieſis; for $\frac{125}{112} = \frac{5}{4} \times \frac{25}{28}$. The ſecond *diminiſhed third* will be expreſſed by $\frac{125}{112} = \frac{25}{21} \times \frac{15}{16}$, which is a comma leſs than the former. See the table in the article INTERVAL.

DIMINISHED *fourths*. See the table in the article INTERVAL.

The *diminiſhed fourth* often occurs in practice, as from C to G ♮ deſcending; and ſometimes, though more rarely, from G ♮ to C aſcending.

DIMINISHED *fifth*, in *Muſic*, is leſs than the true *fifth* by a ſemitone minor, and is therefore equal to two leſſer *thirds*.

Practitioners often confound the *diminiſhed fifth* with the ſemi-diapente, or falſe *fifth*, which is a comma leſs. See INTERVAL.

DIMINISHED *ſixth*. This interval, according to Ozanam, contains two tones and three ſemitones major; or a *fourth* and *diminiſhed third*; or a *diminiſhed fourth* and *third* minor. Thus from C ♮ to A b is a *diminiſhed ſixth*.

But as there are two *diminiſhed thirds*, ſo there may be as many *diminiſhed ſixths*; theſe being the complements of the former to the octave. One of theſe *diminiſhed ſixths* will be expreſſed by $\frac{28}{15} = \frac{4}{3} \times \frac{7}{5}$, and this is a ſemitone major more than the ſemi-diapente; the other *diminiſhed ſixth* will be $\frac{25}{14} = \frac{4}{3} \times \frac{25}{21}$, which is a ſemitone minor leſs than the flat *ſixth*. Practitioners confound theſe two; and, in effect, in temperate ſcales they coincide, as do all other intervals differing only by a comma. See TEMPERAMENT.

DIMINISHED *ſeventh* is of two kinds, differing by a comma. See the table in the article INTERVAL.

That *diminiſhed ſeventh*, which is the complement of the ſuperfluous ſecond to the octave, is the only one in uſe. It is a ſemitone major more than the ſixth minor, as from C ♮ to B b.

DIMINISHED *octave*, is a ſemi-tone minor, leſs than the *octave*, as from C to *c* b. It occurs ſometimes in the baſſes of inſtrumental pieces of muſic. See INTERVAL.

DIMINUTION, in *Architecture*, a contraction of the upper part of a column, whereby its diameter is made leſs than that of the lower part. See *Tab. Archit. fig.* 36.

To attain thoſe two important points in architecture, ſtrength, and the appearance of ſtrength, all architects have made their columns leſſer above than below, which is called their *diminution*. Some have likewiſe made them a little bigger towards the middle than at the bottom, which is called their ſwelling. The Gothic architects, indeed, obſerve neither *diminution* nor ſwelling; their columns are perfectly cylindrical; for which reaſon they are properly called pillars, in contradiſtinction to columns.

The *diminution* generally commences from one third of the height of the column. Some make it begin from the very baſis, and hold tapering to the capital; but that has not ſo good an effect. Vitruvius would have the *diminution* of columns differ according to their height, and not according to their diameter: thus, a column of fifteen feet high, he diminiſhes a ſixth part of its diameter; and another of fifty feet only an eighth part; but we do not find this rule obſerved in the antique. The difference of orders, M. Perrault obſerves, does not inter a difference of *diminution*, there being ſmall and great *diminutions* in different works of the ſame order; excepting, however, the Tuſcan, which Vitruvius diminiſhes by a fourth part, though Vignola only makes it a fifth, and the Trajan column a ninth. The *diminutions* are very differently adjuſted in the different antique buildings, as well as by the different modern authors. For the method of diminiſhing a column, ſee COLUMN.

DIMINUTION, in *Heraldry*, a term uſed by Latin writers for what we more uſually call *differences*, and the French *briſures*. See DIFFERENCE.

DIMINUTION, in *Law*, is where the plaintiff or defendant in a writ of error alleges to the court, that part of the record remains in the inferior court not certified, and therefore prays that it may be certified by certiorari. *Diminution* cannot be alleged of what is fully certified, but of ſomething that is wanting, as the want of an original, or a warrant of attorney.

DIMINUTION, in *Muſic*, is when there are a number of words which are to make tones, and ſeveral haſty motions in the ſpace of a cadence; ſeveral quavers, and ſemiquavers, correſponding to a crotchet, or minim.

DIMINUTION, in *Rhetoric*, the augmenting and exaggerating what you have to ſay, by an expreſſion that ſeems to weaken and diminiſh it.

As for inſtance, when a man ſays, with a certain tone, This woman is not ugly; meaning, ſhe is very handſome.

Some authors take *diminution* in a ſtricter ſenſe, viz. for ſaying leſs than a man really means; as, You are not, indeed, to be commended; where a greater reproach is ſecretly meant.

DIMINUTIVE, in *Grammar*, a word formed from ſome other, to ſoften or diminiſh the force and effect thereof; or to ſignify a thing that is little in its kind.

Thus cellule is a diminutive of cell; globule, of globe; hillock, of hill, &c.

The Italians abound in *diminutives*, every author being at liberty to make as many as he pleaſes. The French are a good deal more reſerved in that reſpect, though their old authors were every whit as licentious as the Italians, witneſs Belleau, &c.

In Engliſh we have very few; not that, as ſome have ſaid of the French, our language is hard, and incapable of the ſofteſt expreſſions, but becauſe we lay all our tenderneſs in our ſentiments; or rather, our language is tender, like a perſon of diſcretion, who always ſpeaks ſenſe, even in ſpeaking of his paſſion.

In Latin, Italian, Engliſh, and moſt other tongues, *diminutives* are formed from primitives, by the addition of a few letters, or ſyllables: in French, the caſe is frequently otherwiſe, the *diminutive* being ſometimes ſhorter than the primitive, ſometimes of the ſame length.

They have a pleaſing effect in that celebrated addreſs of Adrian to his departing ſoul, which begins,

Animula, vagula, blandula
Hoſpes comeſque corporis, &c.

Some grammarians call *at leaſt* a *diminutive* conjunction, as ſerving to leſſen or diminiſh the force of what went before.

DIMISSORY *Letters*, *Literæ Dimiſſoriæ*, in the *Canon Law*, a letter given by a biſhop to a candidate for holy orders, having a title in his dioceſe, directed to ſome other biſhop, and giving leave for the bearer to be ordained by him.

When a perſon produces letters of ordination, or tonſure, conferred by any other than his own dioceſan, he muſt at the ſame time produce the letters *dimiſſory*, given by his own biſhop, on pain of nullity.

Letters dimiſſory cannot be given by the chapter, *ſede vacante*; this being deemed an act of voluntary juriſdiction, which ought to be reſerved to the ſucceſſor.

DIMNESS *of ſight*, in *Farriery*, a diſorder in horſes, proceeding from blood-ſhotten eyes. If the ball of the eye be found, the cure is effected by keeping the horſe warm, with a hood of linen cloth fitted to his head, and anointing the eye-lids twice a day with a compoſition of ſugar-candy, honey, and white roſe water. In two or three days the eyes will be well, after which the creature ſhould be blooded.

In this diſorder the bladders on any part of the eye ought by

by no means to be clipped, or meddled with. See SIGHT.

DIMŒRITÆ, a name given to the Apollinariſts, who at firſt held, that the word only aſſumed a human body, without taking a reaſonable ſoul like ours; but being at length convinced by formal texts of Scripture, they allowed, that he did aſſume a ſoul, but without underſtanding; the word ſupplying the want of that faculty. From this way of ſeparating the underſtanding from the ſoul, they became denominated *dimœritæ*, q. d. *dividers, ſeparaters*, of δὶς and μοιρεω, *I divide*.

DIMORPHOTHECA, in *Botany*, a name given by Vaillant to a genus of plants, which Linnæus makes the ſame with the calendula. See MARYGOLD.

DING, in *Commerce*, a name which the Siameſe give in general to all ſorts of weights.

DINNAGE. See DUNNAGE.

DINNER, the great meal, or that taken about the middle of the day.

The word is formed from the French *diſner*, which Du-Cange derives from the barbarous Latin *diſnare*. Henry Stephens derives it from the Greek δεῖπνον; and will have it wrote *diſpner*. Menage deduces it from the Italian *deſinare*, *to dine*; and that from the Latin *deſine e*, *to leave off work*.

The grand Tartar, emperor of China, after he has *dined*, makes publication by his heralds, that he gives leave for all the other kings and potentates of the earth, to go to *dinner*; as if they waited for his leave.

In the general, it is agreed to be the moſt ſalutary to make a ſpare ſupper, and to eat the more plentifully at *dinner*, eſpecially for tender, valetudinary people. This is the ſentiment of the Schola Salernitana.

Ex magna cœna ſtomachus fit maxima pœna:
Ut ſis nocte levis, ſa tibi cœna brevis.

Yet Bernardinus Paternus, an eminent Italian phyſician, maintains the contrary, in a treatiſe expreſly on the ſubject.

The Romans, we are aſſured, never minded *dinner*; but deferred their good cheer to the evening, which they made their grand meal.

DINUS, in *Medicine*, according to ſome, is the name of a diſeaſe, called more uſually VERTIGO.

DIOCALLIA, in *Botany*, a name by which Apuleius and ſome other authors have called the common ſweet chamomile.

DIOCESE, or DIOCESS, the circuit or extent of the juriſdiction of a biſhop. See BISHOP.

The word is formed from the Greek διοικησις, *government, adminiſtration*, formed of διοικεω, which the ancient gloſſaries render *adminiſtro, moderor, regno*: hence διοικησις της πολεως, *the adminiſtration, or government of a city*.

DIOCESE is alſo uſed, in *Ancient Authors*, &c. for the province of a metropolitan. See PROVINCE, and METROPOLIS.

Diœceſis, διοικησις, was originally a civil government, or prefecture, compoſed of divers provinces.

The firſt diviſion of the empire into *diœceſes* is ordinarily aſcribed to Conſtantine, who diſtributed the whole Roman ſtate into four, viz. the *diœceſe* of Italy, the *diœceſe* of Illyria, that of the Eaſt, and that of Africa. And yet, long time before Conſtantine, Strabo, who wrote under Tiberius, takes notice, lib. xiii. p. 432, that the Romans had divided Aſia into *diœceſes*, and complains of the confuſion ſuch a diviſion occaſioned in geography; Aſia being no longer divided by people, but by *diœceſes*, each whereof had a tribunal, or court, where juſtice was adminiſtered. Conſtantine, then, was only the inſtitutor of thoſe large *diœceſes*, which comprehended ſeveral metropoles and governments; the former *diœceſes* only comprehending one juriſdiction, or diſtrict, or the country that had reſort to one judge, as appears from this paſſage in Strabo, and, before Strabo, from Cicero himſelf, lib. iii. Epiſt. ad Famil. Ep. 9. and lib. xiii. Ep. 67. Thus, at firſt, a province included divers *diœceſes*, and afterwards a *diœceſe* came to comprize divers provinces. In after-times the Roman empire became divided into thirteen *diœceſes*, or prefectures; though, including Rome, and the ſub-urbicary regions, there were fourteen. Theſe fourteen *diœceſes* comprehended a hundred and twenty provinces; each province had a pro-conſul, who reſided in the capital, or metropolis; and each *diœceſe* of the empire had a conſul, who reſided in the principal city of the diſtrict.

On this civil conſtitution, the eccleſiaſtical one was afterwards regulated; each *diœceſe* had an eccleſiaſtical vicar, or primate, who judged finally of all the concerns of the church within his territory.

At preſent there is ſome farther alteration; for *diœceſe* does not now ſignify an aſſemblage of divers provinces, but is limited to a ſingle province, under a metropolitan, or even to the ſingle juriſdiction of a biſhop.

England, with regard to its eccleſiaſtical ſtate, is divided into two provinces, viz. Canterbury and York; the former province contains twenty-one *diœceſes*, and the latter three, beſides the biſhoprick of the iſle of Man, which was annexed to the province of York by Henry VIII. Every *diœceſe* is divided into archdeaconries, of which there are ſixty in all; and each archdeaconry into rural deaneries, and every deanry into pariſhes.

Gul. Brito affirms *diœceſe* to be properly the territory and extent of a baptiſmal, or parochial church: whence divers authors uſe the word to ſignify a ſimple pariſh.

DIOCLEIA, Διοκλεια, in *Antiquity*, a ſolemnity kept in the ſpring at Megara, in memory of the Athenian hero Dioeles, who died in the defence of the youth he loved. Pott. Archæol. Græc. lib. ii. cap. 20.

DIOCLESIAN *Epocha*. See EPOCHA.

DIOCTAHÆDRIA, in *Natural Hiſtory*, the name of a genus of ſpars. The word is derived from the Greek δις, *twice*, οκτω, *eight*, and εδρα, *a ſide*. The bodies of this genus are ſpars compoſed of twice eight planes, or two octangular pyramids joined baſe to baſe, without any intermediate column. Hill's Hiſt. of Foſſ. p. 211.

DIODIA, in *Botany*, the name of a genus of plants, of the *tetrandria monogynia* claſs; the characters of which are theſe: the perianthium conſiſts of two leaves, of an oval figure, equal in ſize, and placed upon the germen: theſe remain when the flower is fallen. The flower is of the one-leaved labiated kind: its tube is ſlender and longer than the cup, its upper lip is erect and biſid, and the lower lip is expanded, and divided into two pointed ſegments. The ſtamina are four filaments of the thickneſs of a briſtle; and two of theſe, which are oppoſite to one another, are ſomewhat ſhorter than the others; the antheræ are oblong, and verſatile; the germen of the piſtil is roundiſh, but in ſome degree four-cornered; this ſtands under the cup of the flower; the ſtyle is capillary, and of the length of the ſtamina, and the ſtigma is biſid; the fruit is a capſule, of an oval figure, with four corners, ſo as to appear ſquare, and is crowned with the cup grown larger; this is compoſed of two valves, and contains two cells; the ſeeds are double, of an oval oblong figure, and convex on one ſide, and plain on the other. There is one ſpecies.

DIOECESIS, Διοικησις, among the Romans, a prefecture of ſeveral provinces joined together, under the ſame governor. called *præfectus*. See PREFECT and DIOCESE.

DIOECIA, in *Botany*, a claſs of plants which have the male and female plants, not in the ſame, but in different flowers, and thoſe not on the ſame individual, but on different plants of the ſame ſpecies; either of which, though they are called the male and female plants, from their thus carrying the ſeparate male and female flowers, might have ariſen from the ſame ſeed. This claſs comprehends fourteen orders. See *Tab. of Botany*.

The word is formed of the Greek δις, *twice*, and οικος, *habitation*.

Among the plants of this claſs are the willow, miſſetoe, hemp, ſpinach, &c.

It is a curious obſervation, that there are no ſeparate male and female plants in the claſſes of the aſperifoliate or ſtellate plants, nor in the umbelliferous claſs, or that of the didynamia, tetradynamia, monadelphia, diadelphia, or ſyngeneſia. The reaſon of which appears very evidently, from an obſervation of the conduct of the fructification in thoſe claſſes. Linnæi Gen. Plant. p. 470.

DIOMEDIA, in *Ornithology*, a genus of *anſeres*, in the Linnæan ſyſtem, with a ſtraight bill, the upper mandible hooked at the end, and the lower truncated; including the albatroſs and Magellanic gooſe.

DIOMEDIS *Aves*, in *Ornithology*, the name of a bird of the web-footed kind, with a ſlender beak, hooked at the end, and with its hinder toe not connected by the membrane that joins the reſt. It is of the ſize of a common hen, but its neck and legs are much longer; its colour is a dulky, and ſomewhat greyiſh brown, and under the belly there is more or leſs white; its beak is of a fine red, or in ſome of a yelloviſh colour, with a black end. It is found in the inſula Diomedea, now called Tremiti, in the Adriatic Sea, and is ſaid to be peculiar to that place.

DIONE, in *Mythology*, a ſea nymph, the daughter of Ocean and Thetis, and the mother of Venus by Jupiter.

DIONYSIA, or DIONYSIACA, ſolemn feaſts, held among the ancients, in honour of Bacchus.

The word is formed from the Greek, Διονυσος, of Διονυσος, *Bacchus*; and that of Διος, the genitive of Ζευς, *Jupiter*, and *Nyſa*, a city in Egypt, on the frontiers of Arabia, where Bacchus is ſaid to have been educated by the nymphs.

The *Dionyſia* are the ſame with what are otherwiſe called *Orgia*, and by the Romans BACCHANALIA and LIBERALIA.

There were divers feſtivals under the denomination of *Διονυσια*, *Dionyſia*; but the chief were two, viz. 1. The ancient, *αρχαιοτερα*, probably the ſame with *μεγαλα*, or the greater *Dionyſia*, ſometimes alſo called, by way of eminence, *Διονυσια*, without any other addition, as being the moſt celebrated of all Bacchus's feſtivals at Athens, where it was held in the month of Elaphebolion. 2. The new, *Νεωτερα*, probably the ſame with *μικρα*, or the leſſer *Dionyſia*, held in autumn, as a ſort of preparation to the greater. Some will have this the ſame with *Διονυσια ληναια*, ſo called from *ληνος*, a *wine-preſs*, and plac'd in the month Lenæon.

DIONYSIACA, in *Antiquity*, was a deſignation given to plays and all manner of ſports acted on the ſtage; becauſe play-houſes were dedicated to Dionyſius, i. e. Bacchus and Venus, as being the deities of ſports and pleaſure. Potter, Archæol. Græc. lib. i. cap. viii. tom. i. p. 41.

DIONYSIAN, or *Victorian Period*. See PERIOD.

DIONYSIAS *Lapis*, in *Natural Hiſtory*, the name of a ſtone deſcribed by Pliny, and ſome other of the ancients, as a black ſtone, variegated with red ſpots. It is not now known what ſtone was intended by it. Plin. lib. xxxvii. cap. 10.

DIOPHANTINE *Problems*, in *Mathematics*, certain queſtions relating to ſquare and cube numbers, and right-angled triangles, &c. the nature of which was determined by Diophantus, a mathematician of Alexandria, who is believed to have lived about the third century. We have his works, which were publiſhed with notes at Paris, in 1621, by Bachet de Meziriac; and another edition in 1670, with obſervations on every queſtion, by M. Fermat.

In theſe queſtions it is endeavoured to find commenſurable numbers to anſwer indeterminate problems; which bring out an infinite number of incommenſurable quantities. For example, it is propoſed to find a right angled triangle, whoſe ſides x, y, z, are expreſſed by commenſurable numbers; it is known that $x^2+y^2=z^2$, z being the ſuppoſed hypothenuſe. But it is poſſible to aſſume x and y ſo, that z will be incommenſurable; for if $x=1$, and $y=2$, $z=\sqrt{5}$.

The art of reſolving ſuch problems conſiſts in managing the unknown quantity or quantities in ſuch a manner, that the ſquare or higher power may vaniſh out of the equation, and then by means of the unknown quantity in its firſt dimenſion, the equation may be reſolved without having recourſe to incommenſurables; e. gr. let it be ſuppoſed to find x, y, z, the ſides of a right-angled triangle, ſuch as will give $x^2+y^2=z^2$. Suppoſe $z=x+u$, then $x^2+y^2=x^2+2xu+u^2$; out of which equation x^2 vaniſhes, and $x=\frac{y^2-u^2}{2u}$; then aſſuming y and u equal to any numbers at pleaſure, the ſides of the triangle will be y, $\frac{y^2-u^2}{2u}$, and the hypothenuſe $x+u=\frac{y^2+u^2}{2u}$; if $y=3$, and $u=1$, then $\frac{y^2-u^2}{2u}=4$, and $x+u=5$. It is evident that this problem admits of an infinite number of ſolution.

For the reſolutions of ſuch kind of problems, ſee Saunderſon's Algebra, vol. ii. book 6.

DIOPTER, or DIOPTRA, in *Writers of Aſtronomy*, is frequently uſed for the hole, or index, pierced in the pinnula, or ſight of an alhidade. See SIGHTS.

DIOPTRA, among the *Ancients*, an inſtrument invented by Hipparchus, which ſerved for ſeveral uſes, as to level water, to take the height of towers, or places at a diſtance; to determine the places, magnitudes, and diſtances of the ſtars.

DIOPTRA, among *Surgeons*, denotes an inſtrument whereby to dilate the matrix, or anus, and inſpect any ulcers therein; called alſo SPECULUM *matricis* and *dilatatorium*.

DIOPTRICS, the doctrine of refracted viſion, called alſo *anaclaſtics*.

The word is originally Greek, formed of *δια*, *per*, *through*, and *οπτομαι*, *I ſee*.

Dioptrics is properly the third branch of optics, its office being to conſider, and to explain the effects of light refracted by paſſing through different mediums, as air, water, glaſs, &c. and eſpecially lenſes.

The laws of *dioptrics* ſee delivered under the articles REFRACTION, LENS, &c. and the application thereof, in the conſtruction of teleſcopes, microſcopes, and other *dioptrical* inſtruments, under the articles TELESCOPE, and MICROSCOPE.

DIORTHOSIS, *Διορθωσις*, in *Surgery*, an operation, by which crooked or diſtorted members are made even, and reſtored to their primitive and regular ſhape.

DIOSCOREA, in *Botany*, a genus of the *dioecia hexandria* claſs. Its characters are theſe; it hath male and female flowers in different plants; the male flowers have a perianthium cut into ſix parts, and have no petals, but have ſix ſhort hairy ſtamina; the female flowers have the ſame perianthium, have no petals, but have a three-cornered germen. The perianthium becomes afterward a triangular capſule with three cells, opening with three valves, containing two compreſſed bordered ſeeds in each. There are five ſpecies, natives of warm climates; which will not thrive here, but in the bark ſtove. The YAM, or *yammes*, is one ſpecies of this plant. Linnæus enumerates eight ſpecies.

DIOSCURIA, *Διοσκουρια*, from *Δις*, *Jupiter*, and *κουρος*, *infant*, in *Antiquity*, a feſtival in honour of the *Διοσκουροι*, or Caſtor and Pollux, who were reputed to be the ſons of Jupiter. It was obſerved by the Cyrenæans, but more eſpecially by the Spartans, whoſe country was honoured by the birth of theſe heroes. The ſolemnity was full of mirth, being a time wherein they ſhared plentifully of the gifts of Bacchus, and diverted themſelves with ſports, of which wreſtling matches always made a part. Potter, Archæol. Græc. lib. ii. cap. 20. tom. i. p. 384.

DIOSMA, in *Botany*, *African Spiræa*, a genus of the *pentandria monogynia* claſs. The characters are theſe: the flower hath a permanent empalement, which is divided into four acute ſegments, which are plain at the baſe; it hath five obtuſe petals, which ſpread open, and are as long as the empalement; it hath five ſtamina, terminated by oval, erect ſummits, and a five-pointed hollow nectarium, ſitting on the germen, from which ariſes a ſingle ſtyle, crowned by an obſolete ſtigma; the germen afterward becomes a fruit compoſed of five compreſſed capſules, which open lengthways, each incloſing one ſmooth oblong ſeed. The ſeveral ſpecies of theſe plants grow naturally at the Cape of Good Hope.

DIOSPOROS, in *Botany*, a name given by ſome of the ancients to the lithoſpermum or gromwell. Some chooſe to write it *dioſpyros*, but this ſeems erroneous; the plain derivation of the word being from the Greek *Διος σπορος*, *the ſeed of Jupiter*. It ſeems to have obtained this name from its beauty and hardneſs. Pliny, lib. xxvi.

DIOSPYROS, in *Botany*, the name by which Linnæus calls the guiacana of Tournefort and others. See *Indian Date* PLUM.

DIOTA, among *Chemiſts*, a term uſed for a circulating or DOUBLE *veſſel*.

DIOXIA, *Διοξια*, in *Muſic*, a name ſometimes given by the ancients to the DIAPENTE.

DIP *of the horizon*. See DEPRESSION.

DIPHRIS, a ſtone mentioned by the ancient writers; and ſaid, by Pliny, to be of two kinds, the one black, the other white; and that theſe carried each of them the mark of one of the ſexes, deſcribed by a line of the oppoſite colours; they were therefore called the male and female; the white was called the male, and had the character of the male ſex figured in a black line; the other the female, and had the marks of that ſex deſcribed by a white one. We know no ſuch ſtones at this time.

DIPHRYGES, or DIPHRYX, in the *Ancient Pharmacy*, the ſcoria or calx of melted copper gathered in the furnace, when the metal was run out.

The word is formed from the Greek *δις*, *twice*, and *φρυγω*, *to roaſt*.

Dioſcorides diſtinguiſhes three very different kinds of *diphryges*; one made of a kind of clay, or bole, dried in the ſun; another made of marcaſite, or pyrites, burnt; and a third that of the faces of copper.

The beſt *diphryges* is what taſtes of copper, is aruginous, aſtringent, and vehemently drying upon the tongue; qualities of which burnt ochre, though ſold for *diphryges*, is deſtitute.

It is an aſtringent, a potent cleanſer, abſterſive, and drier, repreſſes excreſcences of fleſh, induces malignant and ſpreading ulcers to cicatrize; and mixed with turpentine or cerate, diſcuſſes an abſceſs. Dioſcorides, lib. v. cap. 120.

DIPHTHERA, *Διφθερα*, among the *Ancients*, a garment made of ſkins, and worn only by ſhepherds and country-labourers.

DIPHTHONG, *Διφθογγος*, in *Grammar*, a double vowel, or the union, or mixture, of two vowels pronounced together, ſo as only to make one ſyllable; as (1) the Latin *ae*, or *æ*; *oe*, or *œ*; (2) the Greek *αι*, *ει*; (3) the Engliſh *ai*, *au*, &c. See VOWEL, and SYLLABLE.

The word is Greek, and is compounded of *δις*, *twice*, and *φθογγος*, *ſound*.

Æ anſwers to *ai*, the proper; and *æ*, the improper *diphthong* of the Greeks; e. g. *Aineas*, *Æneas*; *αφαιρα*, *ſphera*, &c. And, on the contrary, the Romans, when they had occaſion to divide their *ae*, changed it into the Greek, *αι*; e. g. *aulai*, for *aulæ*, &c.

Ai, by ſome is made a Latin *diphthong*, as in *aio*, *Caius*, &c. But in *ais*, and *ait*, *i* manifeſtly belongs to

the latter syllable; and the Greeks write not γαι ος, but γαι ιος; whence it seems plain that *ai*, in the Latin tongue, is not a *diphthong* as in the Greek.

The Latins pronounced the two vowels in their *diphthongs* much as we do, with this exception, that the two were not heard equally, but the one was somewhat weaker than the other; though the division was made with all the delicacy imaginable; among us moſt of the Latin *diphthongs* are loſt in the pronunciation; their *æ* and *œ* are only ſpoken as *e's*; ſo alſo the Engliſh *ea*, *oo*, &c. though wrote with two characters, are pronounced as ſimple ſounds.

In Engliſh, French, and divers other languages, one may diſtinguiſh *diphthongs* with regard to the eye, from *diphthongs* with regard to the ear.

A *diphthong* with regard to the eye, is formed of two vowels, meeting in the ſame ſyllable, whether the particular ſound of each of them be heard in the pronunciation, or whether the ſound of one of them be drowned; or, laſtly, whether a new ſound, different from either of them, reſult from both. In the two latter caſes, it is with ſome impropriety that we call them *diphthongs*: the firſt, only, are real *diphthongs*, as being ſuch both to the eye and ear.

Diphthongs, with regard to the ear, are either formed of two vowels, meeting in the ſame ſyllable, whoſe ſounds are ſeverally heard; or of three vowels in the ſame ſyllable, which only afford two ſounds in the pronunciation.

On this laſt occaſion, *diphthongs*, with regard to the ear, are triphthongs with regard to the eye.

Engliſh *diphthongs*, with regard both to the eye and ear, called *proper diphthongs*, are *ai*, as in *fair*; *au*, in *laud*; *ee*, in *bleed*; *oi*, in *void*; *oo*, in *food*; and *ou*, in *houſe*.

Engliſh *improper diphthongs*, or *diphthongs* with regard to the eye, are *aa*, pronounced only like *a*, as in *Aaron*; *ea*, like *a*, as in *ſwear*, *bear*; or like *e*, as *already*; or like *ee*, as *veal*; *eo*, like *e*, in *feoffee*; or like *o*, as in *George*; *eu*, or *ew*, like *u*, as *Deuteronomy*; *ie*, like *e*, as *cieling*, *field*; *ei*, like *a*, in *feign*; or like *e*, in *deceit*; *oa*, as in *cloak*, *boat*; *oe*, as in *doe*, *oeconomy*; *ui*, as in *gueſs*; and *ui*, as in *guile*, *recruit*.

DIPHYES, from δις, and φυειν, *to generate*, in *Natural Hiſtory*, a name given by ſome authors to a kind of ſtone, which repreſents both the male and female parts of generation of the human ſpecies; and owes its figures merely to the accidental conformation of the hinge and protuberances of a ſhell, in which it has been formed.

We have a ſpecies of chama, whoſe external form at the mouth repreſents the female pudenda; but the figure of this ſtone is owing to the internal ſhape of the ſhell in which it has been caſt. This is an unknown ſpecies of concha anomia, which has ſuch ridges in one ſhell, and ſuch cavities in the other, that the ſtone caſt or moulded in it, has on one ſide the figure of the female pudenda, and on the other the male; it is uſually of a duſky brown colour, and of a ferruginous ſubſtance. As the ſame ſhell may, however, have received in different places different ſubſtances into its cavity, all which would neceſſarily be of this form, we hear, among authors, of ſome black, and ſome white ſtones of this kind. Authors have treated of this ſtone in a very idle and fabulous manner; but this is its true hiſtory.

DIPLASIASMUS, from διπλασιαζω, of διπλοος, *double*, in *Medicine*, a reduplication of diſeaſes.

DIPLASIASMUS is alſo uſed for two muſcles in the arm, which ſerve to turn it about.

DIPLOE, from διπλοος, *double*, in *Anatomy*, a ſpongy, medullary ſubſtance, ſeparating the two tables of the cranium, and together with them conſtituting the ſkull.

The ſubſtance of the *diploe* being ſpongious, eaſily imbibes the blood; and is found ſeparated into an infinite number of little cells, of different magnitudes, which receive little branches of arteries from the brain, and give paſſage to the little veins that proceed to the ſinuſes of the dura mater.

DIPLOIS, διπλοις, in *Antiquity*, a double *pallium*, or cloak worn chiefly by the Cynics.

DIPLOMA, from διπλοος, *double*, an inſtrument given by ſome colleges and ſocieties, on taking a degree, on paſſing examination, as a proof or qualification for any advancement to title, or pre-eminence, or introduction to the exerciſe of a profeſſion.

DIPLOMA, in *Chemiſtry*, denotes a double veſſel. Thus when one veſſel is put into another, the ingredients in the firſt, and the fire under the laſt, the chemiſts call it boiling *in diplomate*.

DIPONDIUS, in the *Scripture Language*, is uſed by St. Luke, to ſignify a certain coin, which was of very little value. Our tranſlation of the paſſage is, *Are not two ſparrows ſold for two farthings?* In St. Matthew, who relates the ſame thing, we read, *Are not two ſparrows ſold for a farthing?* The Greek reads *aſſarion* inſtead of *as*. Now *aſſarion*, as ſome ſay, was worth half an *as*, that is to ſay, four French deniers and ½; and, according to others, two deniers and ½. *Dipondius* ſeems rather to ſignify half an *as*. Calmet Diction. Bibl. Luke xii. 6. Matt. x. 29.

Dr. Arbuthnot differs in opinion from the author laſt quoted. He ſays, that this coin was at firſt *libralis*, or a pound weight; and even when diminiſhed, it retained the name of *libella*. So that *dipondius* denotes two aſſes.

DIPPING, in *Mineralogy*, a term uſed to expreſs the deviation of the veins of ore, from that regular and ſtraight line in which they uſually run. A great deal of the ſkill of the miners conſiſts in the underſtanding of this *dipping* of the veins, and knowing how to manage it. In Cornwall they have this general rule to guide them in this reſpect: moſt of their tin-loads, which run from eaſt to weſt, conſtantly dip toward the north. Sometimes they underlie; that is, they ſlope down towards the north three foot in eight, perpendicular. This muſt carefully be obſerved by the miners, that they may exactly know where to make their air-ſhafts when occaſion requires; yet, in the higher mountains of Dartmoor, there are ſome conſiderable loads which run north and ſouth; theſe always underlie toward the eaſt.

Four or five loads may run nearly parallel to each other in the ſame hill; and yet, which is rare, they may meet all together in one hatch, as it were a knot, which well tins the place, and ſo ſeparate again, and keep their former diſtances. Phil. Tranſ. N° 69.

DIPPING-*Needle*, or *Inclinatory Needle*, a magnetical needle, ſo hung, as that, inſtead of playing horizontally, and pointing out north and ſouth, one end *dips*, or inclines to the horizon, and the other points to a certain degree of elevation above it.

Or a *dipping-needle* may be defined, with Mr. Whiſton, to be a long ſtraight piece of ſteel, repreſented *Tab. Navigation. fig.* 7. every way equally poiſed on its centre, and afterwards touched with a load-ſtone; but ſo contrived, as not to play on the point of a pin, as does the common horizontal-needle, but to ſwing in a vertical plane, about an axis parallel to the horizon; and this in order to diſcover the exact tendency of the power of magnetiſm.

Mr. Nairne, an ingenious inſtrument-maker in London, made a *dipping-needle* in 1772 for the board of longitude, which was uſed in the voyage towards the north-pole. This is repreſented *Tab. Navigation, fig.* 8. The needle AA is twelve inches long, and its axis, the ends BB of which are made of gold, alloyed with copper, reſts on friction wheels CCCC, of four inches diameter, each end on two friction wheels; which wheels are balanced with great care. The ends of the axes of the friction wheels, are likewiſe of gold alloyed with copper, and moved in ſmall holes made in bell-metal; and oppoſite to the ends of the axes of the needle, and the friction wheels, are flat agates, ſet in at DDD, finely poliſhed. The magnetic needle vibrates within a circle of bell-metal, EEE, divided into degrees and half degrees; and a line, paſſing through the middle of the needle to the ends, points to the diviſions. The needle of this inſtrument was balanced before it was made magnetical; but by means of a croſs, the ends of which are FFFF (contrived by the reverend Mr. Mitchell), fixed on the axis of the needle, on the arms of which are cut very fine ſcrews to receive ſmall buttons, that may be ſcrewed nearer or farther from the axis, the needle may be adjuſted both ways to a great nicety, after being made magnetical, by reverſing the poles, and changing the ſides of the needle. GG are two levels, by which the line of o degrees of the inſtrument is ſet horizontal; by means of the four adjuſting ſcrews LLLL; H is the perpendicular axis, by which the inſtrument may be turned, that the divided face of the circle may front the eaſt or weſt; to this axis is fixed an index I, which points to an oppoſite line on the horizontal plate K, when the inſtrument is turned half round; MMMM are ſcrews which hold the glaſs cover to keep the needle from being diſturbed by the wind. When this needle is conſtructed for ſea, it is ſuſpended by an univerſal joint on a triangular ſtand, and adjuſted vertically by a plumb-line and button above the divided circle and the dove-tail work at the upper 90; and the diviſions on the circle are adjuſted ſo as to be perpendicular to the horizon by the ſame plumb-line, and an adjoining ſcrew; and when it is adjuſted, a pointer annexed to a ſcrew, which ſerves to move the divided circle, is fixed at the loweſt 90. Whenever the inſtrument is uſed to find the *dip*, it muſt be ſo placed that the needle may vibrate exactly in the magnetic meridian. Phil. Tranſ. vol. lxii. art. 35. Phipps's Voyage, &c. Appendix, p. 119. See alſo the deſcription

of

of a new *dipping-needle*, by Mr. Lorimer of Penſacola, in the Phil. Tranſ. vol. lxv. part i. p. 82.

The inventor of the *dipping-needle*, Mr. Whiſton obſerves, was, without all queſtion, an Engliſhman, Robert Norman by name, a compaſs-maker at Wapping, about the year 1576; this is not only teſtified by his own account, in his New Attractive, but was allowed by Dr. Gilbert, and other writers of that time. The occaſion of the diſcovery he himſelf relates, viz. that it being his cuſtom to finiſh, and hang the needles of his compaſſes, before he touched them, he always found that, immediately after the touch, the north-point would bend, or decline downward, under the horizon; inſomuch that, to balance the needle again, he was always forced to put a piece of wax on the ſouth-end, as a counter-poiſe.

The conſtancy of this effect led him, at length, to obſerve the preciſe quantity of the *dip*, or to meaſure the greateſt angle which the needle would make with the horizon.

This, in the year 1576, he found at London to be 71° 50′. It is not abſolutely certain whether the *dip* varies, as well as the horizontal direction, in the ſame place. Mr. Graham made a great number of experiments with the *dipping-needle* in 1723, and found the *dip* to be between 74 and 75 degrees. Mr. Nairne, in 1772, found it to be ſomewhat above 72°. The trifling difference between the firſt obſervations of Mr. Norman, and the laſt of Mr. Nairne, would lead us to imagine that the *dip* was unalterable; but Mr. Graham, who was a very accurate obſerver, makes the difference more conſiderable. Phil. Tranſ. abr. vol. vii. p. 280. and Phil. Tranſ. vol. lxii. art. 35.

It is certain, however, from a great number of experiments and obſervations, that the *dip* is variable in different latitudes, and that it increaſes in going northward. It appears from a table of obſervations made with the marine *dipping-needle*, already deſcribed, in a voyage towards the north-pole, in 1773, that in lat 60° 18′, the *dip* was 75°: in lat. 70° 45′, it was 77° 52′; in lat. 80° 12′, it was 81° 52′; and in lat. 80° 27′, 82° 34′. Phipps's Voyage, &c. p. 122. See alſo the obſervations of Mr. Hutchins, made in Hudſon's Bay and Straits. Phil. Tranſ. vol. lxv. part i. art 14.

Burrows, Gilbert, Ridley, Bond, &c. endeavoured to apply this diſcovery of the *dip* to the finding of the latitude; and the laſt author, going farther, likewiſe propoſed the finding of the longitude thereby; but for want of obſervations and experiments, he could go no length. Mr. Whiſton, being furniſhed with the farther obſervations of colonel Windham, Dr. Halley, Mr. Pound, Mr. Cunningham, Pere Noel, Pere Feuille, and his own, has improved very much on the doctrine and uſe of the *dipping-needle*; brought it to more certain rules; and endeavoured, in good earneſt, to find the longitude thereby. In order to this, he obſerves, 1ſt, That the true tendency of the north or ſouth end of every magnetic needle, is not to that point of the horizon, to which the horizontal needle points, but towards another, directly under it, in the ſame vertical, and in different degrees under it, in different ages, and at different places.

2dly, That the power by which an horizontal needle is governed, and all our navigation ordinarily directed, is proved to be but one quarter of the power by which the *dipping-needle* is moved; which ſhould render the latter far the more effectual and accurate inſtrument.

3dly, That a *dipping-needle*, a foot long, will plainly ſhew an alteration of the angle of inclination, in theſe parts of the world, in half a quarter of a degree, or 7½ geographical miles; i. e. ſuppoſing that diſtance taken along, or near a meridian; and a needle of four feet, in two or three miles.

4thly, A *dipping-needle*, four feet long, in theſe parts of the world, will ſhew an equal alteration along a parallel; as one of a foot long will ſhew along a meridian; i. e. this will, with equal exactneſs, ſhew the longitude, as that the latitude.

This depends on the poſition of the lines of equal *dip*, in theſe parts of the world, which are found to lie about fourteen or fifteen degrees from the parallels.

Hence he argues, that as we can have needles of five, ſix, ſeven, eight, or more feet long, which will move with ſtrength ſufficient for exact obſervation; and ſince microſcopes may be applied to the viewing the ſmalleſt diviſions of degrees on the limb of the inſtrument, it is evident, the longitude at land may be found thereby to leſs than four miles.

And as there have been many obſervations made at ſea, with the ſame inſtrument, by Noel, Feuille, &c. which have determined the *dip* uſually within a degree, ſometimes within ½ or ¼ of a degree, and this with ſmall needles, of five or ſix, or at the moſt nine inches long; it is evident, the longitude may be found, even at ſea, to leſs than half a quarter of a degree. Thus much preſumiſed the obſervation itſelf follows.

To find the longitude, or latitude, by the DIPPING-*needle*. If the lines of equal *dip*, below the horizon, be drawn on maps, or ſea-charts, from good obſervations, it will be eaſy, from the longitude known, to find the latitude; and from the latitude known, to find the longitude, either at ſea or land.

Suppoſe, e. gr. you were travelling, or ſailing along the meridian of London, and found the angle of *dip*, with a needle of one foot, to be 75°, the chart will ſhew, that this meridian, and the line of *dip*, meet, in the latitude of 53° 11′; which, therefore, is the latitude ſought. See LATITUDE.

Or, ſuppoſe you were travelling, or ſailing along the parallel of London, i. e. in 51° 32′ north latitude, and you find the angle of *dip* to be 74°. This parallel, and the line of this *dip*, will meet in the map in 1° 46′ of eaſt longitude, from London; which is, therefore, the longitude ſought.

DIPSACUS, in *Botany*. See TEASEL.

DIPSACUS, in *Medicine*, according to ſome, is the ſame with a DIABETES.

DIPSAS, a ſort of ſerpent, the biting whereof produces ſuch a thirſt as proves mortal; whence it is called *dipſas*, which in Greek ſignifies *thirſty*. In Latin it is called *ſitula*, a *pail*. Moſes ſpeaks of it in Deut. viii. 15. The Hebrew word *tzimaon* anſwers very well to the Greek *dipſas*, and expreſſes the thirſt occaſioned by the biting of this ſerpent. Some by the Hebrew *tzimaon* underſtand a deſart or dry place.

DIPTERA, from *δις*, and *πτερον*, *wing*, in *Zoology*, an order of inſects, which have only two wings, and under each wing a ſtyle or oblong body, terminated by a protuberance or head, and called a balancer.

DIPTERE, or DIPTERON, in the *Ancient Architecture*, a temple ſurrounded with a double row of columns, which form a ſort of porticos, called wings, or iſles.

The word is Greek, formed from *δις*, *twice*; and *πτερον*, *ala*, *wing*.

DIPTOTES, from *δις*, and *πτωσις*, of *πιπτω*, *cado*, in *Grammar*, a kind of irregular nouns, having only two caſes; as *fors*, *forte*.

DIPTYCHA, in *Antiquity*, a public regiſter, wherein were written the names of the conſuls, and other magiſtrates, among the heathens; and of biſhops, and defunct as well as ſurviving brethen, among the Chriſtians.

The word *diptycha* is formed from the Greek *διπτυχος*, or *διπτυχα*, and that from *πτυσσω*, a maſculine noun derived from *φυτευω*, *I fold*, or *plait*. From its future *πτυξω* is formed *πτυξ*, a *fold*, or *plait*, to which adding *δις*, *twice*, we have *διπτυξ*, in the genitive *διπτυχος*, whence the nominative neuter, *διπτυχον*, q. d. *a book folded in two leaves*; though there were ſome in three, and others in four or five leaves. An ingenious author imagines this name to have been firſt given them to diſtinguiſh them from the books that were rolled, called *volumina*. See VOLUME and BOOK.

It is certain there were profane *diptycha* in the Greek empire, as well as ſacred ones in the Greek church. The former were the matricula, or regiſter, wherein the names of the magiſtrates were entered; in which ſenſe *diptycha* is a term in the Greek chancery.

DIPTYCHA, *ſacred*. The word is plural; *diptycha* being a double catalogue, in one whereof were written the names of the living, and in the other thoſe of the dead, which were to be rehearſed during the office. We meet with ſomething not unlike the *ſacred diptycha* of the Greeks, in the canon of the maſs, according to the Latin uſage; where the people are enjoined to pray once for the living, and once for the dead; ſeveral ſaints are invoked in different times, &c.

In theſe *diptycha* were entered the names of biſhops, who had governed their flocks aright; and theſe were never expunged out of the ſame, unleſs they were convicted of hereſy, or ſome other groſs crime. In the *diptycha* were likewiſe entered the names of ſuch as had done any ſignal ſervice to the church, whether they were living or dead, and mention was made of them in the celebration of the liturgy.

Caſaubon, in his obſervations on Athenæus, lib. vi. cap. 14. ſuppoſes the Chriſtians to have borrowed the cuſtom of writing names in a book, and rehearſing them at maſs, from the heathens, who entered the names of perſons they would do any ſignal honour to, in the verſes of the Salii; as was done to Germanicus and Verus, ſons of the emperor Marcus Aurelius, and long time before, during the age of the republic, to Mamurcus Veturius, and Lucia Volumnia, as we are told by Tacitus, lib. ii. Spartian, Ovid, Feſtus, Plutarch, &c. But Fa. Roſweyd does not approve this notion of Caſaubon. The pretended St. Dionyſius, a very ancient author,

author, says the contrary, and asserts the first establishment of this usage to have been founded on scripture, 2 Tim. ii. 19. Psalm cxvi. 15. Rosweyd adds Ecclesiastic. xliv. 1. and takes these to have been the passages the ancient church had a view to, rather than the Salian verses.

The *profane diptycha* were frequently sent as presents to princes, &c. on which occasion they were finely gilt, and embellished; as appears from Symmachus, lib. ii. ep. 81. Those presented were usually of ivory. The first law, De Expens. Ludor. C. Theod. forbids all magistrates below consuls to make presents of *diptycha* of ivory in the public ceremonies.

DIPYRENON, from δις and πυρην, a *berry*, in *Surgery*, the name of a probe, with a double bottom at the end, resembling two small berries growing together.

DIRÆ, in *Mythology*. See FURIES.

DIRCA, in *Botany*, a genus of the *octandria monogynia* class. Its characters are these: the flower is tubulous, and has no empalement: it has eight stamina, which are longer than the tube; the flower is succeeded by a berry with one cell, including a single seed. There is but one sort of this genus, called by the French *bois de plomb, lead-wood*; and by the English in America leather-wood, from its lightness. It is a low shrub in this country, seldom rising above four or five feet high; and is very nearly allied to the mezereon.

DIRECT, in *Arithmetic*. The *Rule of Three* DIRECT is that opposite to the inverse. See RULE *of proportion*.

DIRECT, in *Astronomy*. We consider the planets in three states; viz. *direct*, *stationary*, and *retrograde*. See PLANET.

They are said to be *direct*, when they appear to move forward, according to the succession of the signs; and *retrograde*, when they go the contrary way.

DIRECT, in *Matters of Genealogy*, is understood of the principal line, or the line of ascendants and descendants; in contradistinction to the collateral lines.

Thus the house of Bourbon is said to descend in a *direct* line from St. Louis. The heirs in a *direct* line always precede those in the collateral line.

A very good historian uses the phrase DIRECT *speech*, or *harangue*, when he introduces any one speaking, or haranguing of himself: when the historian speaks, and only rehearses the chief points of what was delivered by the speaker, it is called an *indirect speech*.

DIRECT { *East* / *West* } *dials*, are those whose planes lie directly open to the east, or west points of the heavens, or parallel to the meridian of the place. See DIAL.

DIRECT *south*, or *north* { *Inclining* / *Reclining* } *dials*. See DIAL.

DIRECT, in *Music*, is a mark set at the end of a staff, especially at the foot of a page upon that line or space where the first note of the next staff is set.

DIRECT, in *Optics*. *Direct vision* is that performed by *direct* rays; in contradistinction to vision by refracted, or reflected rays.

Direct vision is the subject of optics, which prescribes the laws and rules thereof. See VISION.

DIRECT *rays* are those which pass in right lines from the luminary to the eye, without being turned out of their rectilinear direction by any intermediate body, either opaque or pellucid. See RAY.

DIRECT *sphere*. See RIGHT *sphere*.

DIRECTION, in *Astronomy*, the motion, and other phenomena, of a planet, when *direct*. See PLANET.

DIRECTION, in *Astrology*, is a kind of calculus, whereby they pretend to find the time wherein any notable accident shall befal the person whose horoscope is drawn.

For instance, having established the sun, moon, or ascendant, as masters, or significators of life; and Mars, or Saturn, as promisers, or portenders, of death; the *direction* is a calculation of the time wherein the significator shall meet the portender.

The significator they likewise call *apheta*, or giver of life; and the promiser, *anareta*, *promissor*, or giver of death.

They work the *directions* of all the principal points of the heavens, and stars, as the ascendant, mid-heaven, sun, moon, and part of fortune. The like is done for the planets, and fixed stars; but all differently, according to the different authors.

DIRECTION, *line of*, in *Gunnery*, was formerly marked on guns with a slit or cavity at the breech, and a button at the muzzle, so that they were directed in the same manner as fowling-pieces are; but as the platforms on which the cart carriages rest are never laid so exactly level, but that one wheel is always higher than another, this line of *direction* must be false, and has, therefore, in modern practice, been laid aside; and the centre-line of a piece is found every time it is fired, by a plummet, or instrument, which Mr. Muller complains of as a tedious and uncertain method; and he recommends returning the line of *direction*, as more expeditious, and more certain than the common practice. System of Math. vol. v. p. 90, and 230.

DIRECTION, or *Line of* DIRECTION, in *Mechanics*, is particularly used for a line passing from the centre of the earth through the centre of gravity of a body, and the support or fulcrum that bears it.

A man must necessarily fall down as soon as the centre of his gravity is out of the *line of direction*.

DIRECTION, *line of*, in *Mechanics*, also denotes that wherein a body moves, or endeavours to proceed.

DIRECTION, *angle of*, in *Mechanics*, is that comprehended between the lines of *direction* of two conspiring powers.

DIRECTION, *quantity of*, in *Mechanics*, is used for the product of the velocity of the common centre of gravity in a system of bodies, by the sum of their masses.

In the collision of bodies, the quantity of direction is the same before, and after the impulse. Bernoulli, Discours sur le Movement. Oper. tom. iii. p. 32, and 56.

DIRECTON *chamber*, in *Commerce*. See CHAMBER.

DIRECTION *of the load-stone*, that property whereby the magnet, or a needle touched by it, always presents one of its ends towards one of the poles of the world, and the opposite end to the other pole.

The attractive property of the magnet was known long before its *directive*; and the *directive* long before the inclinatory.

DIRECTION, *magnetical*, is also used in the general for the tendency, or turning of our earth, and all magnetical bodies, to certain points.

The *direction* of a load-stone denotes its POLARITY.

The situation of the earth, we know, is such, that its axis is in the axis of the universe; and therefore its poles, and cardinal points, exactly correspond to those thereof. This situation some account for hence, that it is the most commodious with regard to the aspects and influences of the heavenly bodies, and renders it the fittest habitation for man. Others hold this position of the earth an effect of a magnetic virtue; and suppose a celestial pole, endued with a like magnetic virtue; which, extending as far as our earth, draws the correspondent part thereof, the pole, towards itself.

DIRECTION, *number of*, in *Chronology*. See NUMBER.

DIRECTLY. In *Geometry*, we say, two lines lie *directly* against each other, when they are parts of the same right line.

In *Mechanics*, a body is said to strike, or impinge *directly* against another, if it strike in a right line perpendicular to the point of contact.

A sphere, particularly, strikes *directly* against another when the line of *direction* passes through both their centres. See PERCUSSION.

DIRECTOR, in *Commercial Polity*, a person who has the management of the affairs of a trading company: thus we say, the *directors* of the India COMPANY, South-sea COMPANY, &c. See BANK.

DIRECTORS *of Creditors*, in the *Commercial Policy of France*, are persons of ability and property, chosen by votes of the creditors, to inspect and examine the debtor's affairs, and to procure as far as possible by common methods of justice, the payment of each person's debt. See ASSIGNEES.

DIRECTORS-*general* of the five great farms of the GABELS and AIDS, &c. in France, are chief commissioners, who have the direction of these farms, each in the districts appointed by the general farmers.

DIRECTOR, in *Surgery*, a grooved probe, to direct the edge of the knife or scissars in opening sinuses or fistulas, that, by this means, the subjacent vessels, nerves, and tendons, may remain unhurt. Sometimes one end is made in form of a spoon, to contain powders to sprinkle upon wounds or ulcers. Sometimes also it is forked at the end to divide the frænum of the tongue. See *Tab. Anat. (Splanch.) fig.* 15. *lit. e e.*

DIRECTORY *of public worship*, was drawn up by the assembly of divines at Westminster, pursuant to an ordinance which passed the house of lords in 1644, repealing the statutes of Edward VI. and of Elizabeth, for uniformity in the common prayer. This *directory* set aside the use of the Liturgy, and allowed of no church-music besides that of singing the psalms.

DIRECTRIX, in *Geometry*. See DIRIGENT.

DIRECTRIX *of the parabola*. See CONIC *Sections*.

DIRIBITORES, among the Romans, officers appointed to distribute tablets to the people at the COMITIA.

DIRIGENT, a term in *Geometry*, expressing the line of motion, along which a describent line, or surface, is carried in the genesis of any plane, or solid figure.

Thus, if the line A B (*Tab.* II. *Geometry*, *fig.* 33.) move parallel to itſelf, and along the line A C, ſo that the point A always keeps in the line A C, a parallelogram, as A B C D, will be formed, of which the ſide A B is the deſcribent, and the line A C the *dirigent*. So alſo, if the ſurface A B C D be ſuppoſed to be carried along the line C E, in a poſition always parallel to itſelf in its firſt ſituation, the ſolid A D E H will be formed, where the ſurface A D is the deſcribent, and the line C E is the *dirigent*.

DIRITTA, in the *Italian Muſic*, a term intimating that the piece is to be played or ſung in conſonant degrees. Thus, *contrapunto alla diritta*, according to Angelo Berardi, is when one is obliged to raiſe or fall the voice by the ſame degrees, i. e. by an equal number aſcending or deſcending, without making a leap, even of the interval of a third. Broſs. Dict. Muſ. in voc.

DIS, an inſeparable particle prefixed to divers words; the effect whereof is, either to give them a ſignification contrary to what the ſimple words had: as in *diſgrace*, *diſparity*, *diſproportion*, &c. or to intimate a ſeparation, detachment, diſtribution, &c. as in *diſcerning*, *diſcourſing*, *diſtracting*, *diſpoſing*, &c.

DISABILITY, in *Law*, is when a man is made incapable to inherit lands, or take any benefit, which otherwiſe he might do; which may happen four ways; viz. by the act of the anceſtor; by the act of the party; by the act of law; and by the act of God.

DISABILITY *by the act of the anceſtor*, is where a man is attainted of treaſon, or felony; by which attainder his blood is corrupted, and thereby himſelf and his children are *diſabled* to inherit.

DISABILITY *by the act of the party himſelf*, is where a man binds himſelf by obligation, that, upon a ſurrender of a leaſe, he will grant a new eſtate to the leſſee; and afterwards he grants the reverſion to another, which puts it out of his power to perform it.

DISABILITY *by the act of the law*, is when a man, by the ſole act of law, without any thing by him done, is rendered incapable of the benefit of the law: as, an alien born; ſo that if a man born out of the king's liegeance, will ſue an action, the tenant, or defendant, may ſay, he was born in ſuch a country out of the king's liegeance, and demand judgment, if he ſhall be anſwered; for the law is our birth-right, to which an alien is a ſtranger, and therefore *diſabled* from taking any benefit thereby.

DISABILITY *by the act of God*, is when the party is *non compos mentis*, or *non ſanæ memoriæ*, which ſo *diſables* him, that in all caſes, where he gives, or paſſes any thing, or eſtate from him, after his death it may be annulled, and voided.

There are alſo other *diſabilities* by the common law, as of idiocy, infancy, and coverture, for making of grants, &c. and by ſtatute, as papiſts are *diſabled* for making any preſentation to a church, &c. and officers not taking the oaths for holding offices.

DISABLED, in *Sea Language*, is applied to a ſhip, when by the loſs of her maſts, yards, or rigging, or other damage, ſhe is rendered incapable of proſecuting her voyage, without great difficulty and danger.

DISAFFORESTED. See DEAFFORESTED.

DISARM, in the *Manege*. To *diſarm* the lips of a horſe, is to keep them ſubject, and out from above the bars, when they are ſo large as to cover them, and prevent the true preſſure or *appui* of the mouth, by bearing up the bit, and ſo rendering the horſe to feel the effects of it upon the bars.

DISARMING, the act of depriving a perſon of the uſe or poſſeſſion of arms. See ARMS.

On the concluſion of a peace, it is uſual for both ſides to *diſarm*. We have divers laws for *diſarming* papiſts, and all recuſants. Under king George I. a law was made for *diſarming* the Highlanders; none of whom, except peers, or gentlemen of 400*l. per ann.* are to wear any arms in the field, on the road, or at market. 1 Geo. I. ſtat. 2. cap. 54.

The game law has, in effect, diſarmed all the common people of England, having under 100*l.* a year in landed eſtate, except the ſervants of lords of manors. Yet, by the ancient policy of England, the whole nation was obliged to bear arms.

DISBOSCATION, *Diſboſcatio*, a turning wood-ground into arable or paſture, an aſſarting. See ASSART.

DISBURDENING *of trees*, in *Gardening*, the taking off leaves and fruits when too numerous, that thoſe left may grow the larger.

DISC, or DISK, DISCUS, in *Antiquity*, a kind of round quoit, or a piece of ſtone, or metal, about a foot over, uſed by the ancients in their exerciſes.

The *diſcus* of the ancients was flat and round, reſembling the apparent figure of the ſun.

The exerciſe of *the diſcus* was one of thoſe practiſed in the ſolemnities of their public games: it conſiſted in pitching, or throwing a *diſcus* either upward, or ſtraight forward; and he who threw it higheſt, or fartheſt, bore away the prize.

Thoſe who practiſed at this game were called *diſcoboli*, i. e. *throwers of the diſcus*.

The poets tell us, that Hyacinth, a favourite of Apollo, playing at the *diſcus* with that god, was killed by a blow of Apollo's *diſcus*, which his rival Zephyrus diverted from its courſe, and caſt on the boy's head.

The *diſcus* was thrown by means of a little cord made of hair, as appears from Claudian, lib. ii. in Eutrop. carm. 20. ver. 359, & ſeq. Ovid deſcribes this ſport, Metam. lib. x. ver. 175. The Romans learnt the game of the *diſcus* of the Greeks, and practiſed it among themſelves. Dempſter, Paraleip. in Roſin. Antiq. Rom. lib. v. cap. 1. and Pet. Faber, Agoniſticon, lib. ii. cap. 1. treat of the diverſion of the *diſcus*.

DISC, or DISK, in *Aſtronomy*, the body or face of the ſun, or moon; ſuch as it appears to us. For, though they are really ſpherical bodies, they are apparently circular planes.

The *diſc* is conceived to be divided into twelve equal parts, called *digits*; by means whereof it is, that the magnitude of an eclipſe is meaſured, or eſtimated. Such an eclipſe was ſo many digits, or parts of the ſun, or moon's *diſc*.

In a total eclipſe of either of thoſe luminaries, the whole *diſc* is obſcured, or darkened; in a partial eclipſe only part of them. See ECLIPSE.

DISC, *illuminated*, *of the earth*. See CIRCLE *of illumination*.

DISC, DISCUS, in *Botany*, is applied to the central, or middle part of radiated flowers; as being round, and plain like a quoit.

This is ſometimes alſo called the *pelvis*, or *baſon*. The *diſc* is compoſed of ſeveral floſculi perpendicularly placed.

DISC, in *Optics*, the magnitude of a teleſcope glaſs; or the width of its aperture, whatever its figure be, whether a plain, convex, meniſcus, or the like.

DISC, in the Greek *Liturgy*, is nearly the ſame thing with the *patena* in the Latin. See PATENA.

In the Greek church the conſecrated bread is laid on a *diſcus*, as in the Latin church it is on a *patena*. The *diſcus* only differs from the *patena*, in that it is bigger and deeper, as reſembling a plate, which was the proper ſignification of the word *diſcus* among the ancients.

DISCEIT, in our *Old Writers*. See DECEIT and DECEPTIONE.

DISCENT. See DESCENT.

DISCERNING, an act of the mind, whereby it diſtinguiſhes between ideas.

On this faculty of *diſcerning* depends the evidence and certainty of ſeveral, even general propoſitions, which paſs for innate truths; and which in reality flow from this clear *diſcerning* faculty of the mind, whereby it perceives two ideas to be the ſame, or to be different.

In being able nicely to diſtinguiſh one thing from another, where there is the leaſt difference, conſiſts in great meaſure that exactneſs of judgment, and clearneſs of reaſon, which is to be obſerved in one man above another: which is quite oppoſite to wit: this conſiſts moſt in the aſſemblage of ideas, and putting thoſe together with quickneſs and variety, which have the leaſt reſemblance to form agreeable viſions; whereas judgment ſeparates carefully thoſe ideas, wherein can be found the leaſt difference, to prevent error and deluſion. To the well diſtinguiſhing of our ideas, it chiefly contributes, that they be clear and determinate; and when they are ſo, there will not ariſe any confuſion, or miſtake, about them, though the ſenſes ſhould convey them from the ſame object differently on different occaſions. See JUDGMENT.

DISCEUS, or DISCIFORMIS *Cometa*. See DISCUS.

DISCHARGE, in *Electricity*, See CHARGE.

DISCHARGE, in *Law*. See CHARGE, in *Law*.

DISCHARGE, in *Military Language*, is the diſmiſſion of a ſoldier from the troop or company to which he belonged, either by his own requeſt, or when after long and faithful ſervice, he is entitled to his maſter's bounty.

To DISCHARGE, in *Sea Language*, ſignifies to unload a ſhip, or take out her ſtores, ammunition, artillery, &c. When applied to the crew, it implies to diſband them from immediate ſervice.

DISCHARGER, or DISCHARGING *Rod*, in *Electricity*, conſiſts of a handle of glaſs or baked wood. A (*Tab. Electricity*, *fig.* 3.) and two bent metal rods B B, terminating in points, and capable of being ſcrewed into the knobs D D, which move by a joint C, fixed to the handle A. Thus it may be uſed either with the points or balls, as occaſion requires; and by being made moveable

on a joint, it may be applied to larger or ſmaller jars at pleaſure. By bringing one of theſe knobs or points to one coated ſide of a charged electric, and the other to the other ſide, or to any conductor connected with it, the communication is completed between the two ſides, and the electric is *diſcharged*.

DISCHARGER, *the univerſal*, contrived by Mr. Henly, conſiſts of a flat board A (*Tab.* II. *Electricity, fig.* 14.) fifteen inches long, four broad, and about one inch thick, and two glaſs pillars B, B, cemented in two holes upon the board A, and furniſhed at their tops with braſs caps; each of which has a turning joint, and ſupports a ſpring tube, through which the wire DC ſlides. Each of theſe caps is compoſed of three pieces of braſs, connected in ſuch a manner that the wire DC not only ſlides through the ſocket, but may be moved both vertically and horizontally. Each of the wires D C, D C is furniſhed with an open ring at one end, and at the other end with a braſs ball D, which, by a ſhort ſpring ſocket, may be ſlipt on its pointed extremity, or removed from it at pleaſure. E repreſents a ſtrong circular piece of wood, five inches in diameter, in the ſurface of which a ſlip of ivory is inlaid; it reſts on a cylindrical foot, fitting the cavity of the ſocket F, which is faſtened in the middle of the board A, and by means of a ſcrew G, the circular board may be fixed at any required height. To this inſtrument belongs a ſmall preſs H, compoſed of two oblong pieces of board, which may be preſſed againſt each other by two ſcrews *a*, *a*; the lower of theſe boards has a cylindrical foot of the ſame ſize with that of the circular board E; and thus the preſs may be fixed in the ſocket F, in the room of E. Cavallo's Electr. p. 164, &c.

This inſtrument may be uſed in a variety of electrical experiments. Thus, glaſs may be ſtained with metals, by putting a ſmall ſlip of gold, ſilver, or braſs-leaf, between two ſlips of common window-glaſs, about three inches long, and half an inch wide, and preſſing them between the boards of the preſs H; then, if a ſhock be made to paſs through this metallic leaf, a ſmall part of which projects beyond the ſlips of glaſs at each end, the force of the exploſion will ſo fix the metal to the glaſs, that it cannot be wiped off, or even be affected by any of the common menſtrua, which would otherwiſe diſſolve it. If a ſmooth piece of metal, or ſemi-metal, be fixed on each of the wires, that bear the knobs D, D, and their ſurfaces be brought near each other, ſo that the battery may be *diſcharged* through them, by connecting one wire of the *diſcharger* with the outſide of the battery, and the other wire with the inſide of it, each ſurface will be marked with a central ſpot, and concentric circles, which are more or leſs diſtinct, and more or leſs in number, as the metal upon which they are marked requires a greater or leſs degree of heat to melt it, and as a greater or leſs force is employed. If a plain piece of metal be fixed on one of the wires, and a ſharp-pointed needle on the other, directed to the ſurface of the metal, the exploſion of a battery repeatedly paſſed from one to the other, will gradually mark the ſurface of the metal, oppoſite to the point, with circles conſiſting of all the priſmatic colours; the coloured rings will appear ſooner, and be cloſer to one another, as the point is nearer to the ſurface of the metal; and the number of rings depends on the acuteneſs of the point. See CIRCULAR *Spots*, COLOURS, and FAIRY *Circles*.

DISCIPLE, from *diſco*, *I learn*, one who learns any thing from another. Thus the followers of any teacher, philoſopher, &c. are called *diſciples*. In the Chriſtian ſenſe, they were the followers of Jeſus Chriſt, in general; but in a more reſtrained ſenſe, the *diſciples* denote thoſe alone who were the immediate followers and attendants on his perſon; of which there were ſeventy, or ſeventy-two. The names *diſciple* and apoſtle are often ſynonymouſly uſed in the goſpel hiſtory; but ſometimes the apoſtles are diſtinguiſhed from *diſciples*, as perſons ſelected from them, to be the principal miniſters of his religion; of theſe there were only twelve. The Latins keep the feſtival of the ſeventy, or ſeventy-two *diſciples*, on July 15; and the Greeks on January 4.

DISCIPLINE primarily ſignifies inſtruction and government; but the word is figuratively applied to a ſtated method of living, according to the rules of ſome profeſſion.

We ſay the *military diſcipline*, the *eccleſiaſtic* or *church diſcipline*, the *regular* or *monaſtic diſcipline*, &c.

We do not ſay *civil diſcipline*, but inſtead thereof policy.

DISCIPLINE is alſo uſed in a peculiar ſenſe for the chaſtiſement, or bodily puniſhment, inflicted on a religious, who has been caught delinquent; or even for that which the religious voluntarily undergo, or inflict on themſelves, by way of mortification.

Among all the auſterities practiſed by the ancient monks and ſolitaries, Dupin obſerves, there is no mention made of *diſcipline*: in effect, it does not appear to have been in uſe in antiquity, unleſs to puniſh the monks who had been taken tripping.

It is commonly ſaid to be St. Dominic, and Peter Damian, who firſt introduced the uſe of *diſcipline*; but F. Mabillon notes, that Guy, abbot of Pompoſa, and others, had practiſed it before them. It is pretty certain, the practice was firſt eſtabliſhed in the eleventh century, with deſign to redeem the penances the canons impoſed on divers offences; and at length they came not only to redeem for themſelves, but alſo for others. See F. Mabillon.

DISCIPLINE is alſo frequently uſed for the inſtrument wherewith a monk chaſtiſes, or mortifies himſelf; which is uſually made of ropes, knotted hair, or twiſted parchment; ſometimes of broken rods. St. Jerom is painted with *diſciplines* of iron chains, armed with ſpur-rowels, &c. See FLAGELLATION.

DISCIPLINE, *Book of*, in the *Hiſtory of the Church of Scotland*, is a common order, drawn up by the aſſembly of miniſters in 1650, for the reformation and uniformity to be obſerved in the *diſcipline* and policy of the church. In this book the government of the church by prelates is ſet aſide, church-ſeſſions are eſtabliſhed, the ſuperſtitious obſervation of faſt-days and feaſts days is condemned, and other regulations for the government of the church are determined. This book was approved by the privy-council, and is called the firſt book of *diſcipline*.

DISCIPLINE, *military*, denotes the exerciſe of thoſe laws that are eſtabliſhed for regulating the conduct of military men.

DISCIPLINE, *marine*, ſignifies the training up ſoldiers for ſea-ſervice, in ſuch exerciſes and manœuvres as can be performed on board ſhips of war at ſea.

DISCLAIMER, in *Law*, a plea, containing an expreſs denial, renouncing, or *diſclaiming*, of a thing alleged.

As if the tenant ſue a replevin upon a diſtreſs taken by the lord, and the lord ſhow the taking, ſaying, that he holds of him as his lord, and that he diſtrained for rent not paid, or ſervice not performed; then the tenant denying to hold of ſuch lord, is ſaid to *diſclaim*; and the lord proving the tenant to hold of him, the tenant loſes his land.

Alſo a man, denying himſelf to be of the blood, or kindred of another, in his plea, is ſaid to *diſclaim* in blood. If a man arraigned of felony, *diſclaims* goods, being cleared, he loſes them.

Thus likewiſe in chancery, if a defendant by his anſwer renounces having any intereſt in the thing in queſtion, this is a *diſclaimer*: to which may be added, a *diſclaimer* by renouncing an executorſhip of a will, or the right to an adminiſtration.

DISCLOSED, a term uſed for chickens or hawks newly hatched; alſo for buds or flowers juſt blown.

DISCOBOLI, Δισκοβολοι, from Δισκος and βαλλω, *I throw*, among the *Ancients*, an appellation given to thoſe who gained the victory at the *diſcus*. See DISCUS.

DISCOIDES *fibula*, in *Natural Hiſtory*, the name of a genus of the echinodermata, or ſea hedge-hogs; the periphery of the baſe of theſe is exactly round, and the body of a convexo-concave figure. The principal ſpecies of this genus is the ſubuculus, which has ſometimes a roſaceous top, the lines being very neat and elegant, ſometimes a plain and ſmooth top; ſometimes it is all over covered with extremely minute and fine ſtriæ, and ſometimes it is much ſtatter than at others. Klein's Echinoderm.

DISCONTINUANCE, an interruption, intermiſſion, or ceſſation, of the courſe of a thing: as, *diſcontinuance* of poſſeſſion, of a plea, proceſs, &c.

The effect of a *diſcontinuance of poſſeſſion* is, that a man may not enter on his own land, or tenement alienated, whatever his right be to it, of himſelf, or by his own authority; but muſt bring his writ, and ſeek to recover poſſeſſion by law. As if a man alien the lands he holdeth in right of his wife; or a tenant in tail make any feoffment, or leaſe for life not warranted by the ſtat. 32 Hen. VIII. by fine, or livery of ſeiſin; ſuch alienations are called *diſcontinuances*.

The effect of *diſcontinuance of proceſs*, is, that the opportunity of proſecution is loſt, and not recoverable, but by beginning a new ſuit. For to be *diſcontinued*, and to be put off without a day, are the ſame thing; and nothing leſs than to be finally diſmiſſed the court.

Diſcontinuance of proceſs, at *Common Law*, is helped by appearance; and by ſtatute 32 Hen. VIII. cap. 30. all *diſcontinuances*, miſcontinuances, and negligences therein, of plaintiff or defendant, are cured after verdict.

DISCONTINUANCE *of plea*, is when divers things ſhould be pleaded to in a ſuit or action, and ſome are omitted. If

a de-

a defendant's plea anſwers to part only, it is a *diſcontinuance*: and the plaintiff may take judgment by *nil dicit*, for that which is not anſwered; but if the plaintiff plead over, the whole action is *diſcontinued*.

If a juſtice-ſeat be *diſcontinued* by the not coming of the juſtices, the king commonly renews the ſame by his writ, &c.

DISCORD, in *Muſic*, the relation of two ſounds, which are always, and of themſelves, diſagreeable, whether applied in ſucceſſion or conſonance.

If two ſimple ſounds be in ſuch a relation of tune, that is, have ſuch a difference of tune, as that, being ſounded together, they make a mixture, or compound ſound, which the ear receives with diſpleaſure, it is called a *diſcord*; as, on the contrary, if it receive it with pleaſure, it is called a *concord*; and whatever two ſounds make an agreeable, or diſagreeable compound, they will have the ſame effects reſpectively, if they be applied in ſucceſſion.

As concords are denominated harmonical intervals, ſo may *diſcords* be denominated unharmonical intervals.

Diſcords are diſtinguiſhed into *concinnous*, and *inconcinnous* intervals.

DISCORDS, *concinnous*, by the ancients called *emeli*, are ſuch as are apt, or fit for muſic, next to, and in combination with concords. Theſe are relations, which in themſelves are neither very agreeable, nor very diſagreeable; and have only a good effect in muſic by their oppoſition, as they heighten and illuſtrate the more natural and eſſential principles of the pleaſure we ſeek for; or, as by their mixture, and combination with them, they produce a variety neceſſary to our being better pleaſed.

Notwithſtanding this, they are ſtill called *diſcords*; as the bitterneſs of ſome things may help to ſet off the ſweetneſs of others, and yet they may ſtill be bitter.

DISCORDS, *inconcinnous*, by the ancients called *ecmeli*, are ſuch as are never choſen in muſic; as having too great a harſhneſs in them, though even the greateſt *diſcord* is not without its uſe.

The eſſential principles of harmony, harmonical intervals, or concords, are but *ſeven*, in number only eight; the indefinite number of other ratios are all *diſcords*. Hence Mrs. Malcolm ſhews the neceſſity of taking ſome of the leſs untoward of theſe *diſcords* into the ſyſtem of muſic. In order to this ſhe conſiders the effect of having none but harmonical intervals in the ſyſtem of muſic.

1. With reſpect to a ſingle voice: if that ſhould move always from one degree of tune to another, ſo as every note, or ſound to the next, were in the ratio of ſome concord; the variety, which is the life of muſic, would ſoon be exhauſted. For to move by no other than harmonical intervals, would not only want variety, and ſo weary us with a tedious repetition of the ſame things, but the very perfection of ſuch relations of ſounds would cloy the ear, in the ſame manner as ſweet and luſcious things do the taſte; which, for that reaſon, are artfully ſeaſoned with the mixture of ſour and bitter.

2. With reſpect to muſic in parts, i. e. when two or more voices join in conſonance, the general rule is, that the ſucceſſive ſounds of each be ſo ordered, that the ſeveral voices ſhall be all concords. Now there ought to be a variety in the choice of theſe ſucceſſive concords, and alſo in the method of their ſucceſſions; all which depends on the movement of the ſingle parts. So that, if theſe could only move in an agreeable manner by harmonical diſtances, there are but a few different ways wherein they could move from concord to concord; and hereby we ſhould loſe much of the raviſhment of ſounds in conſonance. As to this part then, the thing demanded is a variety of ways, whereby each ſingle voice, or more in conſonance, may move agreeably in the ſucceſſive ſounds, ſo as to paſs from concord to concord, and meet at every note in the ſame, or a different concord, from what they ſtood in at the laſt note.

In what caſes, and for what reaſons, *diſcords* are allowed, the rules of compoſition muſt teach; but only joining theſe two conſiderations, &c. we ſee how imperfect muſic would be without any other intervals than concords.

Beſide the *concinnous diſcords*, uſed eſſentially in muſic, there are ſeveral other *diſcord* relations, which happen unavoidably, in a kind of accidental and indirect manner. Thus, in the ſucceſſion of ſeveral notes, there are to be conſidered not only the relations of thoſe which ſucceed others immediately, but alſo of thoſe betwixt which other notes intervene. Now the immediate ſucceſſion may be conducted ſo as to produce good melody; yet among the diſtant notes there may be very groſs *diſcords*, that would not be tolerable in immediate ſucceſſion, and far leſs in conſonance. And ſuch *diſcords* are actually contained in the ſcale of muſic. Thus, taking any one ſpecies, e. gr. that with the greater third, and marking the degrees betwixt each term and the next; though the progreſſion be melodious, as the terms refer to one common fundamental, yet there are ſeveral *diſcords* among the mutual relations of the terms; e. gr. from 4th to 7th *g*, is 32 : 45; and from 2d *g* to 6th *g*, is 27 : 40; and from 2d *g* to 4th, is 27 : 32; all *diſcords*.

The ſpecies of counterpoint, wherein there is a mixture of *diſcords*, is called *figurative counterpoint*; of which there are two kinds; that wherein the *diſcords* are introduced occaſionally, to ſerve as tranſitions from concord to concord; and that wherein the *diſcord* bears a chief part in the harmony.

Diſcords may tranſiently paſs upon the unaccented parts of the meaſure, without any offence to the ear: this is called *ſuppoſition*, becauſe the tranſient *diſcord* ſuppoſes a concord immediately following.

The harmony of *diſcords* is that wherein the *diſcords* are made uſe of as a ſolid and ſubſtantial part of the harmony. For, by a proper interpoſition of a *diſcord*, the ſucceeding concords receive an additional luſtre. Thus the *diſcords* are in muſic what the ſtrong ſhades are in painting.

The diſcords are the 5th when joined with the 6th; the 4th joined with the 5th; the 9th is of its own nature a *diſcord*; ſo is the 7th.

Theſe *diſcords* are always to be introduced into the harmony with due preparation, and muſt be ſucceeded by concords; which is commonly called the *reſolution of the diſcord*. The *diſcord* is prepared by ſubſtituting firſt in the harmony in quality of a concord, that is, the ſame note, which becomes the *diſcord*, is firſt a concord to the baſs-note immediately preceding that to which it is a *diſcord*.

The *diſcord* is reſolved by being immediately ſucceeded by a concord deſcending from it by the diſtance only of greater 2d, or leſſer 2d.

DISCORD, *apple of*, *pomum diſcordiæ*, a phraſe uſed to ſignify the ſubject, or occaſion of ſome miſunderſtanding in a ſociety. It is borrowed from the heathen mythology: the poets feign, that at the marriage of Thetis and Peleus, the goddeſs of *diſcord* threw a golden apple, whereon were written theſe words, *To the faireſt*; which immediately ſtirred up a diſſenſion between Juno, Pallas, and Venus, each pretending a title to the apple.

DISCOVERT, in *Law*, denotes an unmarried woman.

DISCOVERY, in *Law*, the act of revealing or diſcloſing any matter by the defendant, in his anſwer to a bill filed againſt him in a court of equity.

DISCOVERY *of accomplices* is provided for in the caſes of robbery, burglary, houſe-breaking, and larceny, to the value of five ſhillings, from ſhops, ware-houſes, ſtables, and coach-houſes, by 4 and 5 W. and M. cap. 8. 10 and 11 W. III. cap. 23. and 5 Anne, cap. 31. which enact, that if any ſuch felon, being out of priſon, ſhall diſcover two or more perſons who have committed the like felonies, ſo that they may be convicted, he ſhall in moſt caſes receive a reward of 40*l.* and in general be entitled to a pardon of all capital offences, excepting only murder and treaſon. And if any ſuch perſon having feloniouſly ſtolen any lead, iron, or other metals, ſhall *diſcover* and convict two offenders of having illegally bought or received the ſame, he ſhall by ſtat. 29 Geo. II. cap. 30. be pardoned for all ſuch felonies committed before ſuch *diſcovery*.

DISCOVERY *by bankrupts*. See CERTIFICATE *of Bankrupt*. and PETITION *of Bankruptcy*.

DISCOVERY, in *Dramatic Poetry*, a manner of unravelling a plot or fable, very frequent in tragedies, comedies, and romances; wherein, by ſome unforeſeen accident, a *diſcovery* is made of the name, fortune, quality, and other circumſtances, of a principal perſon, which were before unknown.

A *diſcovery* ſhould never be in vain, by leaving thoſe who thus diſcovered one another in the ſame ſituation and ſentiments they were in before: in effect, thoſe *diſcoveries*, which are immediately followed by a peripetia, or change of fortune of ſome principal character, whereon the unravelling depends, are always the moſt beautiful.

One of the fineſt *diſcoveries* ever brought upon the ſtage, is that of Oedipus in Sophocles; for the minute he finds himſelf the ſon of that Jocaſta, who was then his wife, he becomes of the moſt happy, the moſt miſerable of all men.

There are three ſorts of *diſcoveries*: the firſt by certain marks in the body, either natural, or accidental: ſuch is that of Ulyſſes, who having received a wound in the thigh by a boar, before the Troſan war, is diſcovered by the old nurſe, upon waſhing his legs after his return home incognito.

The ſecond by tokens: as the caſket of things, which the prieſts found with Ion when he was expoſed, diſcovers Creuſa, whom he was going to kill, to be his mother.

The

The third is made by remembrance: that is, when the sight or hearing of any thing occasions us to recollect our misfortunes. Thus, when Ulysses heard Demodocus sing his actions at Troy, the memory of them struck him, and drew tears from his eyes, which discovered him to Alcinous.

But the finest sort is, that which arises from the subject, or incidents of the fable; as that of Oedipus from his excessive curiosity, and the letter that Iphigenia sent by Pylades.

DISCOUNT, in *Commerce*, a sum deducted, or retained in hand, upon paying a greater. See DEDUCTION.

The term is much used among mechanics, and manufacturers, who keep workmen, journeymen, labourers, &c. for the sums advanced them before-hand, which are discounted when the payments are made in course.

DISCOUNT is more particularly used for an allowance made on a bill of exchange, or any other debt not yet become due; to induce the acceptor, or debtor, to advance the money.

In the usual mode of calculating this *discount*, it is supposed that the whole interest which might be made of the debt till it becomes payable, should be *discounted*: but this is not just; for though it be true, that from this time to the time when the debt becomes due, such interest might be made of it, yet it is not true, that by paying the whole debt without *discount*, the debtor loses so much at this time as that interest; because he cannot be said to have lost it, till the time comes when he should receive it; and therefore he cannot be said to lose any more at this time than such a sum, as being laid out at interest from this time till the time of payment of the debt would amount to the interest of the debt for the same time: in order to obtain this sum, find the amount of 1*l.* for the given time, which at the rate r and for the time t, will be $1+rt$. See INTEREST. And rpt is the interest of the principal p for the same time; therefore $1+rt : 1 :: rpt : \frac{rpt}{1+rt}$, which is the *discount* required. Or, otherwise, find a principal, which, being laid out at a certain rate of interest for the given time of *discount*, will amount to the debt: this principal is its present worth, and the difference between this and the debt is the true *discount*. Thus $1+rt : 1 :: p : \frac{p}{1+rt}$: and $p - \frac{p}{1+rt} = \frac{prt}{1+rt}$ the true *discount* as before. Hence we have the following rule: divide the continual product of the debt, rate and time by the sum of 1, and the product of the rate and time. To find the annual *discount* at 3 *per cent.* divide .03 by 1.03; at $3\frac{1}{2}$ *per cent.* .035 by 1.035; at 4 *per cent.* .04 by 1.04, &c. and the several quotients will be the *discounts* required. Thus,

At 3 *per cent.* the *discount* is				.0291,7621,3592.
$3\frac{1}{2}$	-	-	-	.0338,1642,5121.
4	-	-	-	.0384,6153,8462.
$4\frac{1}{2}$	-	-	-	.0430,6220,0957.
5	-	-	-	.0476,1904,7619.
6	-	-	-	.0566,0377,3585.
8	-	-	-	.0740,7407,4074.
10	-	-	-	.0909,0909,0900.

The *discount* of 1*l.* for one year multiplied by any principal will give the annual *discount* of that principal: e. g. the *discount* of 100*l.* for a year at 5 *per cent.* is 4.7619*l.* &c. or 4*l.* 15*s.* 2*d.* $\frac{1}{2}$: and 95*l.* 4*s.* 4*d.* $\frac{1}{2}$ will amount to 100*l.* in a year at this interest: whereas it is the common practice to allow 5*l.*

The *discount* on any debt for one year being found equal to $\frac{pr}{1+r}$ as $t=1$, Dr. Harris in his Lexicon directs to find the *discount* of the same debt for any part of one year, by taking the proportional part answering to the time, as the 365th part of the whole *discount* for that of a day, &c. But it is easy to perceive the erroneousness of this rule, as well as of the tables which he has given founded upon it. By his rule $1 : \frac{pr}{1+r} :: t : \frac{prt}{1+r}$ instead of $\frac{prt}{1+rt}$ the *discount* required: the former quantity is evidently less than the latter, if t be a fraction, but greater when t is a whole or mixt number. The following rule, by which Mr. Smart has constructed his tables, which are the most accurate of this kind, will give a similar result with the theorem already propoſed. Find the interest of 1*l.* for any day or number of days, at any given rate; then divide unit by the sum of 1*l.* and its interest; and the arithmetical complement of the quotient will be the required *discount*. Example at 5 *per cent.*

1*l.* with its interest for 1 day is 1.0001,3699
2 - 1.0002,7397, &c.

Then divide unit by	The quotients are,	And arithmetical complements,	Discounts of 1*l.* for
1.0001,3699	.9998,6303	.0001,3697	1 day
1.0002,7397	.9997,2610	.0002,7390	2
1.0004,1096	.9995,8921	.0004,1079	3
1.0005,4795	.9994,5235	.0005,4765	4
1.0006,8493	.9993,1554	.0006,8446	5
1.0008,2192	.9991,7876	.0008,2124	6
1.0009,5890	.9990,4202	.0009,5798	7
1.0010,9589	.9989,0531	.0010,9469	8
1.0012,3288	.9987,6864	.0012,3136	9
1.0013,6986	.9986,3201	.0013,6799	10
1.0136,9863	.9864,8649	.0135,1351	100
1.0273,9726	.9733,3333	.0266,6667	230

Thus a table of *discount* may be formed for any number of days. See such a table at twelve several rates in Smart's Tables, 4to edit. See also on this subject Malcolm's Arithm. book vi. chap. 10.

Discounts are also frequently given for the payment of dubious, or bad debts.

DISCOUNT is also used among merchants when they buy commodities on trust, with a condition, that the seller shall *discount* so much with him *per cent.* for each payment made before the time expired. See PROMPT *payment*.

The Sieur de la Porte distinguishes between these two kinds of *discount*: the first, or that upon bills of exchange, is reckoned like the exchange, at the rate of so much *per cent.* E. gr. At 2 *per cent. discount* on a hundred pounds, there is only ninety-eight pounds to pay: whereas that on commodities, is not only laid on the hundred pounds, but on the hundred and *discount* added together. So that *discounting* for goods at 10 *per cent.* there is only eight abated on a hundred and eight, and not on the hundred. This last, he says, is the true *discount*.

DISCOUNT is also used with less propriety for the tare, or waste of any commodity, sum, &c.

DISCOURSE, in *Logic*, from *discurro*, *I run over*, an operation of the human mind, whereby it passes or proceeds from one thing to another, that is, from a known thing to an unknown.

The schoolmen define it an act of cognition, whereby the mind deduces one thing from another: this is then, when, in consequence of an assent given to one proposition, it yields assent to another: so that *discourse* consists in a dependency of assents; and supposes such an order between the acts, that that belonging to the consequent arises from that belonging to the antecedent. So that the intellect is then said, *discurrere*, to *discourse*; when, from an assent to one or more propositions, it infers or draws an assent to another.

The object of *discourse*, therefore, or that about which the intellect is employed in *discoursing*, is the connexion of extremes considered with regard to some third, or medium: thus, when it judges, that every reasonable animal is visible, affirming, that there is a connexion between visibility, and rationality; and then finds, there is likewise a connexion betwixt man and reasonable animal; and afterwards gathering from the connexion found between visible and man, with rational, that man and visible have likewise a connexion, as both are connected with rational; it is said to *discourse*.

Hence it appears, that *discourse*, whereon men used to value themselves, does really betray the infirmity of the human understanding; as it denotes a chain or scale of several successive acts of cognition necessary to arrive at a truth. So that there is no *discourse* in God, who understands all things originally and truly. See READINESS.

DISCOURSE, in *Rhetoric*, is used in the same sense with ORATION.

DISCOUS *Flower*. Botanists reckon two classes of plants with a *discous flower*. 1. Such as have the flower compounded, and the seed pappous, but the leaves and stalks not milky when broken. 2. The corymbiferous plants, whose flowers are compounded into a *discous* figure, but their seeds not pappous. Of the former kind are the sea-banes, ragweeds, groundsels, &c. and of the latter are daisies, camomile, tansy, wormwood, &c. These are distinctions founded by Mr. Ray, but not regarded by the later botanists.

DISCRETE, or DISJUNCT, *Proportion*, is when the ratio between two or more pairs of numbers, or quantities, is the same, and yet there is not the same proportion between all the four numbers.

Thus, if the numbers 6 : 8 : : 3 : 4 be considered; the ratio between the first pair, 6 and 8, is the same as that between 3 and 4, and therefore these numbers are proportional: but it is only *disretely*, or *disjunctly*; for 6 is not to 8, as 8 to 3; that is, the proportion is broken off between

between 8 and 3, and is not continued all along, as it is in theſe following, which are called *continual proportionals*, viz. 3 : 6 :: 12 : 24.

DISCRETE *Quantity*, is ſuch as is not continued and joined together.

Such is a number, whoſe parts, being diſtinct units, cannot be united into one *continuum*; for in a *continuum* there are no actual determinate parts before diviſion, but they are potentially infinite; wherefore it is uſually and truly ſaid, that continued quantity is diviſible *in infinitum*. See CONTINUITY.

DISCRETION, in *Law*, the faculty of diſcerning between right and wrong; and therefore whoever hath power to act at *diſcretion*, is bound by the rule of reaſon and law. 2 Inſt. 56. 298. Infants, &c. under the age of *diſcretion*, are not puniſhable for crimes; and want of *diſcretion* is a good exception againſt a witneſs. 2 Hawk. 434. See AGE, and INFANCY.

DISCRETIONE, in the *Italian Muſic*, is uſed to direct the finger or player to execute his part with care diligently.

DISCRETIVE *Propoſitions*, are thoſe where various judgments are made, and denoted, by the particles *but*, *notwithſtanding*, or by words of the like nature, either expreſſed or underſtood. Thus, fortune may deprive me of my wealth, *but* not of my virtue; they, who croſs the ſeas, change their climate, *but* not their diſpoſition; are called *diſcretive propoſitions*.

DISCUS, among the *Ancients*, a name given to a round ſhield, conſecrated to the memory of ſome famous hero, and hung up in the temples of their gods, as a trophy of ſome great action.

From the figure of this *diſcus*, or rather of that which the Greeks and Romans uſed to divert themſelves with, eſpecially at their public games, and which was a round quoit of braſs, comes the word ſo much in uſe among aſtronomers, viz. the *diſc* of the ſun, or moon. See DISC.

DISCUS, DISCEUS, or DISCIFORMIS *Cometa*, a comet or fiery meteor reſembling a round diſh or platter. The chief of this kind is called a ſolar comet, from the likeneſs of its rays to thoſe of the ſun; it is called alſo *roſa* and *chryſeus*, from its bright ſilver colour mixed with a golden or amber one.

DISCUSSION, in matters of literature, ſignifies a clear treating or handling of any point, or problem. The word imports a ſhaking off, or diſpelling the difficulties and obſcurities with which a thing was embarraſſed. We ſay, ſuch a point was well *diſcuſſed*, when it was well treated of, and cleared up.

DISCUSSION is alſo uſed, in a medicinal ſenſe, for a diſperſing the matter of any tumor, or ſwelling, through the pores of the body; or an evacuation of ſome thin matter gathered in any part, by inſenſible perſpiration.

DISCUSSORIA, *Diſcutientia*, διαφορητικα, *diſcutients*. See DISCUTIENTS.

DISCUTIENTS, in *Medicine*, either repellers or remedies proper to open the pores, and evacuate the redundant or peccant humours of the body by inſenſible perſpiration or otherwiſe.

Diſcutients are in this laſt ſenſe the ſame with what we otherwiſe call *diaphoretics*.

DISDIAPASON, in *Muſic*, a compound concord, in the quadruple ratio of 4 to 1, or of 8 to 2.

The *diſdiapaſon* is produced when the voice goes from the firſt tone to the fifteenth, and may be called a *ſyſtereib*.

The voice ordinarily does not go farther than from its firſt tone to the *diſdiapaſon*; i. e. it does not go beyond the compaſs of a double octave; for the *diſdiapaſon* is an octave doubled. It may ſometimes riſe ſeveral tones above a *diſdiapaſon*, but the effort or ſtruggle diſfigures it, and makes it falſe. In reality, the ancient ſcale, or diagramma, only extended to a *diſdiapaſon*.

DISDIAPASON-*Diapente*, in *Muſic*, a concord in a ſextuple ratio of 1 to 6.

DISDIAPASON-*Diateſſaron*, a compound concord in the proportion of 16 to 3.

DISDIAPASON-*Ditone*, a compound conſonance in the proportion of 10 to 2.

DISDIAPASON-*Semiditone*, a compound concord in the proportion of 24 to 25.

DISEASE, in *Medicine*, that ſtate of a living body, wherein it is prevented the exerciſe of any of its functions, whether vital, natural, or animal. See *Acute* and *Chronic* DISEASE.

Or, *diſeaſe* is an indiſpoſition contrary to nature, whereby the action of ſome part is immediately injured.

Or, *diſeaſe* is a depraved and diſorderly ſtate of the ſolid, and fluid parts; whereby all, or ſome of the functions, either of the body, or mind, or both, are either abolliſhed, or impaired.

An ingenious author of a late Latin treatiſe, De Purgatione, holds the eſſence of a *diſeaſe* to conſiſt in a want of that equilibrium between the ſolid and fluid parts, which is neceſſary to the maintenance of health: others add, that all *diſeaſes* ariſe either from too lax, or too ſtrict a tenſion of the fibres.

Of all animals, man is ſubject to the moſt *diſeaſes*; and of men, the ſtudious and ſpeculative are moſt expoſed thereto. Other animals have their *diſeaſes*; but they are in ſmall number: nor are plants without them; though their maladies ſcarce exceed half a ſcore. The ancients deified their *diſeaſes*. Voſſius De Idolol. lib. viii. cap. 5. Some *diſeaſes* only impair the uſe of the part immediately affected; as the ophthalmia, gout, &c. Others deſtroy it entirely; as the *gutta ſerena*, palſy, &c. Some affect the whole body; as the fever, apoplexy, epilepſy, &c. Others only impair a part; as the aſthma, colic, dropſy, &c. Some only affect the body; as the gout: others diſturb the mind; as melancholy, deliriums, &c. Laſtly, others affect both the body and mind; as the mania, phrenſy, &c.

The colder the country, in general, the fewer and the leſs violent are the *diſeaſes*. Scheffer tells us, that the Laplanders know no ſuch thing as the plague or fevers of the burning kind, nor are ſubject to half the diſtempers we are. They are robuſt and ſtrong, and live to eighty, ninety, and many of them to more than a hundred years; and at this great age, they are not feeble and decrepid, as with us, but a man of ninety is able to work, or travel, as well as a man of ſixty with us. They are ſubject, however, to ſome *diſeaſes* more than other nations: thus they have often diſtempers of the eyes, which is owing to their living in ſmoke, or being blinded by the ſnow. Pleuriſies and inflammations of the lungs are alſo very frequent among them: and the ſmall-pox often rages with great violence. They have one general remedy againſt theſe, and all other internal *diſeaſes*: this is the root of that ſort of moſs, as Scheffer expreſſes it, which they call *yerth*. They make a decoction of this root in the whey of rein-deer milk, and drink very large doſes of it warm to keep up a breathing ſweat; if they cannot get this, they uſe the ſtalks of angelica boiled in the ſame manner: they have not ſo great an opinion of this as of the other remedy; but the keeping in a ſweat, and drinking plentifully of diluting liquors, muſt go a great way in the cure of their *diſeaſes*, whether either the one, or the other of the drugs, have any virtue or not. They cure pleuriſies, by this method, in a very few days; and get ſo well through the ſmall pox with it, that very few die of it.

It has been always obſerved, that people of particular places were peculiarly ſubject to particular *diſeaſes*, which are owing to their manner of living, or to the air, and effluvia of the earth and waters. Hoffman has made ſome curious obſervations on *diſeaſes* of this kind. He obſerves, that ſwellings of the throat have always been common to the inhabitants of mountainous countries: and the old Roman authors ſay, Who wonders at a ſwelled throat in the Alps? The people of Switzerland, Carynthia, Styria, the Hartz foreſt, Tranſylvania, and the inhabitants of Conſtadt, he obſerves, are all ſubject to this *diſeaſe* from the ſame cauſe. See BRONCHOCELE.

The French are peculiarly troubled with fevers, with worms, and with hydrocoeles and ſarcocoeles; and all theſe diſorders ſeem to be owing originally to their eating very large quantities of cheſnuts. The people of our own nation are peculiarly afflicted with hoarſeneſſes, catarrhs, coughs, dyſenteries, conſumptions, and the ſcurvy: and the women with the *fluor albus*, or whites: and children, with a *diſeaſe* ſcarce known *elſewhere*, which we call the rickets. In different parts of Italy, different *diſeaſes* reign. At Naples, the venereal *diſeaſe* is more common than in any other part of the world. At Venice, people are peculiarly ſubject to the bleeding piles. At Rome, tertian agues, and lethargic diſtempers are moſt common. In Tuſcany, the epilepſy, or falling ſickneſs. And in Apulia they are moſt ſubject to burning fevers, pleuriſies, and to that ſort of madneſs which is attributed to the bite of the TARANTULA, and which, it is ſaid, is only to be cured by muſic.

In Spain, apoplexies are common, as alſo melancholy, hypochondrical complaints, and bleeding piles. The Dutch are peculiarly ſubject to the ſcurvy, and to the ſtone in the kidneys. Denmark, Norway, Sweden, Pomerania, and Livonia, are all terribly afflicted with the ſcurvy: and it is remarkable, that in Denmark, Sweden, and Norway, fevers are very common; but in Iceland, Lapland, and Finland, there is ſcarce ever ſuch a *diſeaſe* met with; though peripneumonies are very common in theſe places, as alſo *diſeaſes* of the eyes and violent pains of the head. The Ruſſians and Tartars are afflicted with ulcers, made by the cold, of the nature of what

we call chilblains, but greatly worſe; and in Poland and Lithuania there reigns a peculiar *diſeaſe*, called the *plica Polonica*, ſo terribly painful and offenſive, that ſcarce any thing can be thought of worſe.

The people of Hungary are very ſubject to the gout and rheumatiſm: they are alſo more infeſted with lice and fleas than any other people in the world, and they have a peculiar *diſeaſe* which they call *cremor*.

The Germans, in different parts of the empire, are ſubject to different reigning *diſeaſes*. In Weſtphalia, they are peculiarly troubled with peripneumonies and the itch. In Silefia, Francouia, Auſtria, and other places thereabout, they are very liable to fevers of the burning kind, to bleedings at the noſe, and other hæmorrhages; and to the gout, inflammations, and conſumptions. In Miſnia they have purple fevers; and the children are peculiarly infeſted with worms. In Greece, Macedonia, and Thrace, there are very few *diſeaſes*; but what they have, are principally burning fevers and phrenſies. At Conſtantinople the plague always rages; and in the Weſt Indian iſlands, malignant fevers, and the moſt terrible colics. Theſe *diſeaſes* are called *endemic*.

As the actions, or conditions of the body, ſo alſo the *diſeaſes*, or defects thereof, may be reduced to three general heads; viz. 1. *Diſeaſes* of the ſolid parts. 2. Thoſe of the fluid parts. And, 3. *Diſeaſes* compounded of both.

A popular ſyllabus of *diſeaſes* may be given, as follows; the ſolid parts, i. e. the bones and fleſh may be diſtordered five ways; viz. they may be rendered turgid by tumors; eat with wounds, corroded by ulcers, or cariefies; removed out of their place, as in hernias, prolapſoſes, and diſlocations; or diſcontinued by fractures, and contuſions.

Diſeaſes of the fluids are either in the maſs of the blood, or the ſpirits; thoſe of the blood are reducible to two kinds; thoſe that thicken and inſpiſſate, or, which amounts to the ſame, retard its motion; and thoſe which attenuate, and diſſolve, and of conſequence accelerate it. To this latter kind belong fevers, and feverifh affections alone: all the other diſeaſes of the blood belong to the former.

In too thick a ſtate of the blood, its principles are too crafs, and its molecules too big; whence a lentor, lazy motion, and even ſtoppage, particularly in the ſinous paſſages of the glands; and hence obſtructions, inflammations, ſcirrhuſes, ſarcomas, verrucæ, puſtules, œdemata, impetigines, and other tumors, and congeſtions, both in the viſcera and habit of the body: and hence, again, drowſineſs, melancholy, hypochondriacal affections, &c. If this thick blood be too much replete with ſharp acid ſalts, it will deſtroy the texture of the parts, and break out in ulcers; as in phthiſical, ſcrophulous, ſcorbutic, and venereal *diſeaſes*, gangrenes, carboes, cancers, and other erofive tumors, according to the quality and degree of ſaltneſs and acrimony; and from the ſame ſource arife cephalalgias, cardialgias, colics, gouts, rheumatiſms, pleuriſies, &c. which by abrading the ſolid ſubſtance, frequently emaciate the body.

The *diſeaſes* of the animal ſpirits arife either, 1. From an intermiſſion, or retardation of their motion; or a diminution of their quantity; or, 2. From a diſorder in their crafis, or quality.

To the firſt claſs are reduced the catalepſis, apoplexy, coma, carus, palſy, ſtupor, tremor, &c. To the ſecond belong the mania, phrenſy, delirium, fooliſhneſs, melancholy, vertigo, ſpaſms, epilepſy, hyſteric affections, horror, &c. Add, that as all *diſeaſes* of the blood arife from external cauſes, viz. ſome one, or more, of the non-naturals, as food, air, evacuation, &c. ſo thoſe of the ſpirits generally proceed from diſorders of the blood. Laſtly, the *diſeaſes* of the fluids, whether thoſe in the blood, or ſpirits, are ſeldom confined long thereto; but they preſently come to diſturb and impede ſome of the functions of the ſolid parts; and, at laſt, corrupt the ſubſtance of the ſolids themſelves. Hence compound, or complicated *diſeaſes*, which are infinitely various.

The learned Boerhaave furniſhes us with a much more accurate and ſcientifical diviſion of *diſeaſes*, into thoſe of the ſolids and fluids.

DISEASES *of the ſolids* he conſiders, either as of the ſimple and ſimilar parts, or of the organical.

DISEASES, *Similar*, are, 1. Thoſe of the laſt and ſmalleſt fibres; which are reducible to too great tenſion, and laxneſs, too great ſtrength, or weakneſs, and a ſolution of their continuity.

2. Thoſe of the membranes, which, being only aſſemblages of the fibres juſt mentioned, are ſubject to the ſame diſorders.

3. Thoſe of the laſt and ſmalleſt canals, which are formed of ſuch membranes.

4. Of the membranes compoſed of ſuch canals.

5. Of canals, compoſed of ſuch membranes, which are all the greater veſſels of the body.

6. Of the ſolid parts, which are compoſed of canals, compreſſed and grown together, ſo as to be void of humour to diſtend them; or canals growing into one conſiſtent part, the humour hardening together with the veſſel that contained it.

Laſtly, Suppoſing theſe parts all ſound, *diſeaſes* may befal them with reſpect to their ſtructure, from a vice, or vicious application, of the matter of nutrition.

DISEASES, *Organical*. An organical part, conſiſting of the ſeveral ſimple parts above mentioned, and fitted to perform any office, by means of ſome humour contained in it, may be conſidered, either in itſelf, as a ſolid part, or with reſpect to the humour it contains. In the firſt view, *organical diſeaſes* are reducible to four claſſes.

1. *Diſorders* in the figure, and the circumſtances thereof, as roughneſs, ſolidity, cavity, &c. To this belong the *ανεκφυσεις*, when one veſſel opens into another; the *διαβρωσεις*, when a rupture is made; *διαιρεσεις*, when a breach is occaſioned by corroſion; the *συμφυσεις*, which is a total obſtruction of the cavity, by a viſcous grumous matter; the *συνοχαι*, or narrowneſs of the paſſage; the *θλασεις*, or compreſſion of the ſides of the cavity; *συμφυσεις*, when the ſides are quite joined; and *ενφυσεις*, when the veſſel is ſo emptied, that the ſides falling together, the cavity is loſt. See DIAPEDESIS, DIARRHŒA, &c.

2. In the number, where it is either deficient or redundant: but the parts ſeldom err in this reſpect, ſo as to occaſion a *diſeaſe*.

3. In magnitude, to which belong nodes, exoſtoſes, and calluſes.

4. In the ſituation, and connexion; as, when the ligaments are too long, or too ſhort, when broken, or depraved: alſo diſtortions, luxations, ſubluxations, hernia, or ruptures in the groin, ſcrotum, bladder, procidentiæ of the womb, bladder, and rectum: *diſorders* of the tendon, and muſcles, particularly their ſlying out of their places; the relaxation, or rupture of the membranous ligament that ſhould retain them.

Laſtly, There is a *diſeaſe*, common both to ſimilar and organical parts, called ſolution of continuity.

DISEASES *of the fluids*, conſidering thoſe fluids ſimply, and in themſelves, may be reduced to *diſorders* in reſpect of quantity and quality: but conſidering them as contained in ſolids, they may err too, in place and proportion.

As to the firſt, ſuch an abundance of the humours as diſturbs the animal functions, is called a plethora: or to *diſeaſes* from the defect of humours, we ſcarce know of any.

As to the ſecond, ſuch quality of the humours as diſturbs the animal functions, is called cacochymia. Now, this is either in the fluids, conſidered in themſelves, their own parts, and compoſition; or conſidered as they concur towards conſtituting ſome part of the body.

If the morbid quality be conſidered in the particles of the humour, it muſt either conſiſt in an augmentation of bulk, whence the emphraxis, atrophy, lymphoſis, and ſynizeſis; or in the diminution thereof, as in the diapnœ, and enecangeia; or an increaſe of ſolidity, whence too great an attenuation; or a decay thereof, whence a lentor, ſtagnation, and coheſion; or in the figure, as when of ſpherical, it becomes angular, and conſequently, with reſpect to the part it is applied to, ſharp; whence acrimonies, both acid, alkaline, muriatic, ammoniac, ſaponaceous, vitriolic, &c. and oleoſities; or in rigidity, and flexibility; or in elaſticity; or in coheſion, and diviſibility. See ATROPHY, &c.

Again, all the juices being conſidered together, the principal diſorders they are ſubject to, are, too great fluidity, or tenacity; or too much velocity in their veſſels, or too little.

Laſtly, conſidering the fluids as contained in the ſolids, there ariſe divers *diſeaſes*, merely from their changing of place: theſe may be reduced to two claſſes, viz. the groſſer humours, intruding themſelves into the finer canals; and the humours, extravaſating, or getting out among the ſolid parts; whence inflammations, aneuryſms, varices, enchymoſes, œdemas, puſtules, dropſy, ſpongious ſwellings of the head, breaſt, abdomen, and uterus; and emphyſemas.

Add, that the humours collected, and ſtagnating among the parts, grow putrid, purulent, ichorous, eroſive, and ſharp; and thus deſtroy the tender ſtamina of ſolids; whence ſinuſes, fiſtulæ, ulcers, gangrenes, ſphacelus's, cancers, and the like.

Theſe are the prime differences of the *diſeaſes* of the body; and from theſe ariſe moſt of the reſt; ſo that they may be regarded, not only as *diſeaſes*, but as the cauſes of *diſeaſes*. See each further explained under its reſpective article in this work. See alſo NOSOLOGY.

There

There is alſo another diviſion of *diſeaſes*, in uſe among phyſicians, taken from certain external accidents, which are common to a great many different *diſeaſes*; which diſtinction, too, has its uſe, though they generally run it too far. *Diſeaſes* are by this diſtinguiſhed, 1. With reſpect to their cauſe, into idiopathy, ſympathy, protopathy, deuteropathy, hereditary, connate, and acquired. 2. With reſpect to their ſubject, into *diſeaſes* of old age, children, adults, men, women, maids, pregnant parturient, and into endemical, epidemical, &c. 3. With reſpect to ſeaſons, into vernal, autumnal, continued, and intermitting. 4. With reſpect to their effects, into benign, malignant, curable, incurable, mortal, and contagious. 5. With reſpect to their ſtate, into beginning, progreſs, ſtate, declenſion, and end. And laſtly, With reſpect to duration, into moſt *acute*, which terminate in four days; *acute*, in twenty; and chronical, which are all thoſe of longer continuance.

DISEASE, *Acute*, is that which terminates, or comes to its period, in a few days; or, as the phyſicians expreſs it, *citò & cum periculo terminatur*.

In this ſenſe the word ſtands oppoſed to *chronical*. All *diſeaſes* which hold above forty days, are reputed chronical.

Dr. Quincy thinks an *acute diſeaſe* may be defined, that which is attended with an increaſed velocity of blood.

Acute diſeaſes are the more dangerous, in that beſide the violence of the ſymptoms, if there be not time to empty the *primæ viæ*, it is very difficult to ſtop their progreſs, and ſave the patient.

Acute diſeaſes are uſually divided into thoſe ſimply called *acute*; and thoſe which, by reaſon of the vehemence of the ſymptoms, are called *moſt acute*.

DISEASES, *Chronic*, ſtand in oppoſition to acute *diſeaſes*, which are ſpeedy, and haſten to a criſis; as fevers, ſmall-pox, &c.

Chronic diſeaſes are uſually owing either to ſome natural defect in the conſtitution, or to an irregular manner of living; and evacuation of one kind or another, is nine parts in ten of their remedy, according to Dr. Cheyne.

The ſources of chronical diſtempers, ſays the ſame author, are, 1. Viſcidity in the juices, or the over largeneſs of their conſtituent particles; which not being ſufficiently broken by the concoctive powers, ſtop, or retard the circulation. Or, 2. Too great abundance of ſharp acrimonious ſalts; whereby the juices themſelves are rendered ſo corroſive, as to burſt or wear out the ſolids. Or, 3. A relaxation, or want of due force and ſpringineſs of the ſolids themſelves.

An exceſs in the quantity of our meat and drinks begets the firſt; the bad condition of the ſame foods, the ſecond; and both together, with want of due exerciſe, the third.

Several authors have given us very compendious theories of *diſeaſes*; reducing them all to ſome one general diſaffection. Bontekoe deduces all the *diſeaſes* of the human frame from the ſcorbutus; Muſgrave, from the arthritis; Dr. Woodward, from the bile. Others imagine all *diſeaſes* the effects of a virus, which has lurked in the ſeed ever ſince the ſin of Adam: Helmont, and Sereeus the Dane, take them to depend on ſome extraneous ferment, formed in or out of us. Laſtly, it appearing from the obſervations of Pliny, Kercher, Langius, and Bonomo, that there are little worms in ſeveriſh blood, puſtules, carboes, and the like, divers phyſicians have taken occaſion to ſuſpect, that all *diſeaſes* ariſe from inſects.

DISEASES *of ſoldiers*. See DIET, and SOLDIERS.

DISEASES, *Feigned*. The cheat of feigning *diſeaſes*, for idleneſs, or profit ſake, or for other occaſional purpoſes, has been too common in all ages, and is too difficult to be diſcovered in all caſes; though, in many, there are ways of coming at the truth. We have had a very late inſtance of a young lady, who puzzled ſeveral of our beſt phyſicians, to account for the nature of a *diſeaſe*, which ſhowed itſelf in a ſingular kind of excoriations; and the ſecret perhaps had never been diſcovered, had not a bottle of *aqua fortis* been accidentally found in her chamber; the touching the arms, &c. with which, had occaſioned all the appearances, which ſome ſtrange fault in the juices had been before accuſed of.

Diſſimulation in regard to *diſeaſes*, may be reduced to three kinds. In the firſt, the ſickneſs is pretended by words only, and really is not: of this nature are the pretended head-ach, colic, and the like; which as the patient can only know, the phyſician may always be deceived. In the ſecond, there are not only words for teſtimonies of the ſickneſs, but there appear ſigns and marks of it on the body, which yet are only counterfeited to ſerve certain purpoſes. Scabbineſs, leproſy, and even the exulceration of the lungs may be thus counterfeited; the laſt by a pretended ſpitting of blood. Gravidation is often pretended alſo. Our beggars often contrive the means of theſe to excite compaſſion. In the third kind of diſſimulation of *diſeaſes*, we are to include the concealing a *diſeaſe*, which really exiſts, inſtead of the owning of one which does not.

In the diſcovery of theſe deceits, on which the credit of the phyſician often depends, it is not mere medical knowledge that will ſucceed, but there muſt be added to it a ſagacity in exploring all circumſtances and outward accidents and eſpecially thoſe things which relate to the genius, temper, and ſtate of the perſon ſuſpected. The DEMONIACS of former ages, exorciſed by prieſts who wanted to propagate the credit of their religion, or their own ſanctity, have generally been cheats of this kind, and might have been diſcovered by any who had talents and opportunities for the proper examinations. Sylvaticus, an Italian author, has given an excellent ſet of rules for the diſcovery of theſe frauds, and all others of pretended ſickneſſes, to which we refer the curious reader.

DISEASES *of infants*. See INFANTS.

DISEASES, *Peſtilential* or *epidemic*. Many think that the cauſe of all theſe is in the air, and is exhaled in vapours through the pores of the earth.

It is generally obſerved, that *peſtilential diſeaſes* ſeize firſt the cattle; which is not wonderful, ſince they naturally carry their noſes near the ground, and ſuck in the vapours as they riſe, or feed on the herbage that is infected by them. It often happens, that the vapours do not riſe ſo high as to affect men at all; but though in this caſe the plague would be naturally confined to the cattle alone, yet it gets among men by means of the food eaten by them, and before tainted with the contagion. There is no doubt but that the fleſh of animals that die of *diſeaſes*, partakes ſomewhat of the nature of theſe *diſeaſes*; and when they are peſtilential, may ſpread a peſtilence among us, which, perhaps, would otherwiſe never have reached us.

The plague once begun, frequently joins itſelf with ſuch other *diſeaſes* as the people it attacks are moſt ſubject to; hence, in the northern nations, where the ſcurvy is frequent, it is often ſeen that the plague and ſcurvy appear mixed. Theſe two *diſeaſes*, in their nature ſomewhat agreeing, make each other the worſe and more violent; but on the contrary, there are other *diſeaſes* depending on ſuch contrary cauſes, that the plague, if the patient ſurvives, proves a cure to them.

Dr. Hodges inſtances the conſumption, and the king's evil, as two diſeaſes of this kind; which, though in themſelves of the moſt terrible kind, and when in an advanced ſtage uſually baffling all remedies, yet he ſaw perſons in the plague that laſt raged in London, cured of both by the plague; the ſymptoms of the diſeaſe appearing more mild in theſe than in other caſes, and the patients at once recovering of both complaints.

He alſo tells us of ſome people terribly afflicted with the gout for many years, who being at that time affected by the contagion, had the plague with leſs violent ſymptoms than others; and were, on its going off, cured of the gout alſo.

A fever is uſually a concomitant ſymptom of the plague, but it is not an inſeparable ſign of it. A palpitation of the heart is another of the uſual, but not conſtant ſymptoms; where this comes on, it is uſually very violent, and often is ſo loud, that it may be heard at a conſiderable diſtance.

The plague is leſs contagious than is uſually ſuppoſed, and thoſe who eſcape the terror of it, often eſcape it wholly. Hodges gives us an inſtance of a poor woman who had the plague ſoon after her delivery, and ſuckled her young child as ſhe lay ill of it. She had a carbuncle on her breaſt, near the nipple which the child ſucked at; and yet the mother recovered, and the child never caught the infection at all; though this ſeemed a circumſtance under which there could be no eſcaping.

Hodges, treating of the prognoſtics of an imminent plague, tells us, that one very remarkable one is the change of chronic diſtempers in general into acute ones, and thoſe attended with very violent ſymptoms; and a murrain among the cattle happening at the ſame time, ſeem together a prognoſtic not eaſily to be got over, without the terrible ſequel of a general peſtilence.

If the plague is very terrible at its firſt appearance, it never is of long duration; and on the contrary, when it comes, from a ſcarce perceptible beginning, more and more violent, it is generally of a long continuance. What time it takes from the beginning to the height, the ſame it takes from the height to the final period.

The moſt fatal ſymptoms in the laſt plague in London, and which uſually preſaged death very near, were hemorrhages from the noſe or ears, fluxes of the menſtrua in women, diarrhœas, dyſenteries, and greenneſs and blackneſs of the excrements.

The

The firſt ſweats coming on without giving eaſe, and long naufeouſneſs continuing afterwards, are alſo terrible ſymptoms. The pulſe and urine, which are the two great things to judge by in moſt illneſſes, in theſe preſage nothing at all. The pulſe is fallacious in the higheſt degree; and the urine often appears as well in the height of the plague, as while the perſon was in health.

Among the ſeveral preſervatives for particular places, the two beſt are the burning ſweet-ſcented woods in the time, and ſome of the reſins, ſuch as frankincenſe and the like: the other is the firing a number of cannon every morning and evening. Hodges de Peſt. See EPIDEMIC, and PLAGUE.

DISEASES *of Plants.* M. Tournefort, in an expreſs diſſertation on this ſubject, in the Memoirs de l'Academie des Sciences, refers all the *diſeaſes* of plants to the following cauſes:

1. The too great abundance of the nutritious juice. 2. The defect, or want of this juice. 3. Some ill qualities it acquires. 4. Its unequal diſtribution in different parts of the plant. And, 5. External accidents.

The *diſeaſes*, principally obſerved by our gardeners, are, 1. Barrenneſs, when the tree, though ſeeming freſh and healthy, bears no bloſſoms; or, if it does, they ſoon fall; or, if they ſet, the fruit drops before it comes to maturity.

2. Blaſting of the buds, occaſioned by a froſt happening when the leaves and bloſſoms are wet; by this means the pores are ſhut, and the vital juices ſuffocated; when if the ſun break out on a ſudden, they turn yellow, with round fiery ſpecks growing on them; whence frequently proceed tumors, like warts, which, rotting, grow full of maggots. Mr. Mortimer adds, that the want of rain in bloſſoming-time often occaſions the dropping off of the bloſſoms, for want of ſap; he, therefore, recommends the watering of them.

3. Conſumption, proceeding from a want of ſuſtenance, through the failure of the nouriſhing juices, or from obſtructions of the veins and roots; or ill digeſtion, and ſecretion of humours, &c.

4. The moſs; an account of which ſee under the article MOSS.

5. The jaundice, which, though it does not hinder the tree from appearing ſound, yet, when it begins to ſprout, the leaves become of a whitiſh green, and as they grow bigger, turn yellow: this frequently ariſes from external cauſes, as the mildew; but, chiefly, from a ſtony or chalky ſoil, impregnated with an acid ſalt.

6. Mildew, a kind of epidemical *diſeaſe*, moſt frequent and fatal in the ſpring ſeaſon: it is properly a corroſive and nipping dew, proceeding from pent up vapours now exhaled, and returned back on the tender opening buds, which infects them by its acrimony, and obſtructs the circulation of the nutritive juices; by which means the leaves begin to fade and wither, and both the bloſſoms and fruit are much prejudiced.

7. A thick fog, or too abundant dew, Agricola aſſures us, occaſions the ſame *diſeaſes* as the mildew, only in a leſs degree.

8. Falling of the leaves; which happens when the trees, ſprouting too ſoon, are either ſurpriſed by exceſſive heat, or violent cold.

9. Uredo, or ſcorching: of which there are two kinds: the firſt happening from the fall of a ſubtile dew, or ſmall rain, immediately followed by the piercing beams of the ſun, which ſuddenly cloſes the pores, before dilated, and burns up the leaves: the ſecond happening from the like ſervour in the internal parts of the tree, viz. in the pith, occaſioned by ſome inward failing: Agricola imputes it to the fault of the gardeners, who, in tranſplanting trees, frequently cut off the leſſer filaments and roots, as alſo the greater roots, without covering the wounds with wax, or the like.

10. Scurf, or leproſy; a *diſeaſe* chiefly of the bark, cauſed by a too great dilatation of the pores, whereby too much perſpirable matter tranſuding, it hangs and hardens on the bark, which by this means, chaps and cracks; and thus a ſort of lepra is formed, perſpiration is obſtructed, &c. Add, that this ſcurfy ſkin proves a harbour for vermin, which live both on the bark and tree.

11. The worm, a little animal, generated in the corrupted ſubſtance of the bark, bloſſoms, fruit-leaves, pith, and roots. M. Gentle mentions another kind, called cockchaffers, which ſtick to the roots of young tender trees, and bark, and kill them. There is a third ſort, called breezes, or gad-flies, which gnaw the bark. The worm is a very frequent *diſeaſe*, whereby young hopeful trees are, all of a ſudden, brought to languiſh and decay.

12. Rotten roots, occaſioned chiefly by their being planted too deep. This *diſeaſe* is incurable.

13. Blights; a particular account whereof, ſee under the article BLIGHT.

Some diſorders ariſe in the tree itſelf, and others in the ſoil and other things about it. Of the laſt kind are weeds, which are of the utmoſt ill conſequence to all ſorts of trees while young, and ſhould be pulled up by hand after rain: if they are too ſtrong rooted for this, they muſt be dug up; and this will have a double advantage, as the ſtirring the earth about their roots will do the trees very great good. When the trees are grown to any tolerable height, they require no care about weeds, for they kill them with their own droppings. Suckers are another diſtemperature of trees ariſing from the tree itſelf; they muſt be pulled off, or cut up cloſe to the place where they come out, opening the earth to come at them there. Over-much wet often is a very great prejudice to trees, and eſpecially to thoſe kinds which naturally love a dry ſoil. This is to be remedied by cutting drains: and if a drip fret the body of the tree by the head (which will certainly decay it), the place muſt be firſt cut ſmooth, and then ſome loam or clay mixed well with horſe-dung, is to be applied to the place, which will defend it from miſchief till a new bark is formed over it. All wounds made in trees in winter are much harder to cure than thoſe made in ſummer; and for theſe it is proper to add ſome tallow to the mixture of loam and dung.

When trees are bark-bound, which is eaſily ſeen by the unnatural tightneſs and ſtraining of the bark over them, it is to be remedied by cutting through the bark with a knife from the top to the bottom of the tree. This may ſeem a dangerous remedy to thoſe who have not experienced it, but it never was found to do any injury to trees. It is to be done in February or March; and if the wound gape very much it may be filled up with cow-dung, which will defend the tree from injury till it heals. The digging about the root of the tree is a very good practice alſo on this occaſion, and the cutting off of the dead or withered branches.

The grubs of beetles called teredines and coſſi, which get between the bark and the tree, do great miſchief: if the places can be found out where they lie, it is proper to pierce into the bark with a pointed inſtrument upon them, and then to open a ſmall hole below to let out whatever moiſture may be there. When trees of the fruit kind are burnt up and bliſtered on the bark with hot and dry ſeaſons, and this is followed by a vaſt number of the pucerons or tree-lice, which feed on the juices, ſome recommend the boring of a large hole in the ſtock or root, and pouring in ſome brandy, then ſtopping up the hole with a pin of the ſame wood. The tree ſuffers nothing by this, but the juices are ſo much altered for the preſent by it, that theſe animals do not like them, and conſequently quit their habitation. See PUCERON.

If a tree is by any accident barked or ſtripped all round, ſo that it cannot grow any longer, the proper method is to cut it off juſt above ſome principal branch; the ſtump muſt be cut off ſlanting and covered with clay, and the branch will ſoon become the body of a tree in the place of the other: the place where the ſtump is cut off being covered with a bark in the manner of a tree that is grafted.

Deer and hare, as alſo rabbits, are apt to bark trees, and do them great miſchief. The defences againſt deer are by paling them round, or painting the lower part of the tree, but the firſt is much the better method. The hares and rabbits may be kept off by tying bands of ſtraw round the foot of every tree as far as they can reach. Evelyn recommends the rubbing them over with human dung made into a ſoft paſte with urine, ſo that it may be laid on with a bruſh; but this is attended with great trouble, as it muſt be renewed after every hard rain. Some uſe tar and lime mixed together, but this always damages the tree more than theſe creatures would have done; and in general ſtraw-bands, where any thing is neceſſary, do beſt.

DISEMBARK, ſignifies to land goods from on ſhip-board.

DISEMBOGUE. When a ſhip paſſes out of the mouth of ſome great gulf or bay, they call it *diſemboguing*. They ſay, alſo, of a river, that at ſuch a place, or after it has run ſo many leagues, it *diſembogues* itſelf into the ſea.

DIS-ERGOT, in the *Manege*. See ERGOT.

DISFIGURING, in *Law*. See MAYHEM.

DISFRANCHISING, the taking away one's freedom, or privilege. See FRANCHISE.

DISGORGE, in the *Manege*, is uſed for diſcuſſing or diſperſing an inflammation or ſwelling: thus, if a horſe's legs are gorged or ſwelled, we ſay he muſt be walked out to *diſgorge* them.

DISGUISE. Perſons doing unlawful acts in *diſguiſe*, are by our ſtatutes ſometimes ſubjected to great penalties, and even declared felons. Thus perſons convicted of hunting in *diſguiſe* in foreſts, parks, or warrens, or of unlawful hunting in the night, are to ſuffer as felons.

But

But the principal act of parliament in this respect is that commonly called the BLACK *act*.

DISH, in *Mining*, is a trough made of wood, about twenty-eight inches long, four inches deep, and six inches wide; by which all miners measure their ore. It any be taken selling their ore, not first measuring it by the barmaster's *dish*, and paying the king's duties, the seller forfeits his ore, and the buyer forfeits for every such offence forty shillings to the lord of the field, or farmer.

DISHERISON, an old word, of the same import as disinheriting. Our lord the king, considering his own damage, and *disherison* of the crown, &c. Stat. 8 Richard II. Henry IV.

DISHERITOR, a person who disherits, or puts another out of his inheritance. The sheriff shall, forthwith, be punished as a *disheritor* of our lord the king, and his crown. Stat. 3 Edw. I.

DISJUNCT *Proportion*. See DISCRETE *Proportion*.

DISJUNCTIVE, something that separates, or disjoins.

Thus, *or*, *neither*, &c. are called *disjunctive* CONJUNCTIONS; which, in connecting a discourse, do yet separate the parts thereof. E. g. *Aut Cæsar, aut nullus*; *either Cæsar, or nothing*. He *neither* advanced, *nor* gave back. *Disjunctive* conjunctions may also be called *partitive*, *distributive*, and *alternative*.

DISJUNCTIVE *propositions*, in *Logic*, are compound propositions, consisting of two members, or parts, connected by a *disjunctive* conjunction.

The first proposition of a dilemma is usually a *disjunctive* proposition.

You must either obey the king, or be a rebel.
But you must not be a rebel.
Therefore you must obey the king.

DISK. See DISC, and DISCUS.

DISLOCATION, the putting a bone out of joint, by some violence, usually called by the physicians, *luxation*. See LUXATION.

We have an instrument of Mr. Freke's invention for the reduction of *dislocated* shoulders, described in the Philosophical Transactions, N° 470.

DISMASTED, in *Sea Language*, denotes the state of a ship, when she has lost her masts by engagement or bad weather.

DISMEMBERED, in *Heraldry*, is applied to birds that have neither feet nor legs; as also to lions and other animals, whose members are separated. See MEMBERED.

DISMES, *Decimæ*, in our *Law Books*, tithes. See TITHE.

DISMISSION *of a bill*, in *Chancery*. If the plaintiff does not attend on the day fixed for the hearing, his bill is *dismissed* with costs. It may be also *dismissed* for want of prosecution, which is in the nature of a NON-SUIT at law, if he suffers three terms to elapse without moving forward in the cause.

DISMOUNTING, in the *Military Art*, the act of unhorsing. Thus, to *dismount* the cavalry, the dragoons, or the like, is to make them alight.

To DISMOUNT *the cannon*, is to break their carriages, wheels, and axle-trees, so as to render them unfit for service.

Horses are also *dismounted* when they are rendered unfit for service.

DISORDERLY *Houses*. See NUISANCE.

DISORDERLY *Persons*. See VAGABONDS.

DISORIENTATED, from *dis*, and *oriens*, *east*, a term applied to a thing that is turned, or removed from the east, to which it was originally directed.

But the word is most frequently used in a figurative sense, for the disconcerting, or putting a man out of his way or element. Speak of law to a physician, or of physic to a lawyer, and they will both be *disorientated*.

Andrew Marvel uses the word *discoedentated*, instead of *disorientated*: Geneva had *discoedentated* our geographer.

DISPARAGEMENT, in *Law*, is used for the matching an heir, &c. in marriage, below his or her degree or condition; or against the rules of decency.

The word is a compound of the privative particle *dis*, and *par*, *equal*.

DISPART, in *Gunnery*, is used for setting a mark on the muzzle-ring of a piece of ordnance; so that a sight-line taken upon the top of the base ring against the touch-hole, by the mark set on or near the muzzle, may be parallel to the axis of the concave cylinder. The common way of doing which, is, to take the two diameters of the base ring, and of the place where the *dispart* is to stand, and divide the difference between them into two equal parts, one of which will be the length of the *dispart*, which is set on the gun with wax or pitch, or fastened there with a piece of twine or marlin; but an instrument may be made to do it to all possible nicety. See *Line of* DIRECTION.

DISPART *Frontlet*. See FRONTLET.

DISPATCH, a letter on some affair of state, or other business of importance, sent with care and expedition, by a courier expreſs.

The business of *dispatches* lies on the secretaries of state, and their clerks. The king gives directions to his ministers abroad by *dispatches*.

The word is also used for the packet, or mail, containing such letters.

The French, during the reign of Lewis XIV. had a *conseil des dépêches*, *council of dispatches*, held in the king's presence, at which the dauphin, the duke of Orleans, the chancellor, and four secretaries of state, assisted.

DISPAUPER. When any person, by reason of his poverty, is admitted to sue in FORMA *pauperis*; if afterwards, before the suit be ended, the same party have any land or personal estate fall to him, or that the court, wherein his suit is depending, think fit for that, or some other reason, to take away the privilege from him, he is then said to be *dispaupered*.

DISPENSARY, or DISPENSATORY, a name given to divers collections of recipes for compound medicines, wherein are specified the ingredients, proportions, and circumstances, of the preparation and mixture; the same with what we otherwise call a *pharmacopœia*, or *antidotary*. Such are the *Dispensaries* of Mesue, Cordus, that of the College of Physicians at London, and Edinburgh, Quincy, &c.

The apothecaries, in and about London, are obliged to make up their compound medicines according to the formulas prescribed in the College *Dispensary*, and are enjoined to keep always ready in their shops, all the medicines therein enumerated.

DISPENSARY is likewise used for a magazine or office of medicines, kept ready to be *dispensed* at the prime cost of the ingredients, for the benefit of the sick poor.

Of which kind we have had two or three in London, maintained by the college of physicians; one at the college itself, first begun in the year 1696; another in St. Peter's alley, Cornhill; and a third near Covent-garden: where the best medicines were sold for their intrinsic value, and patients were advised every day, but Sunday, at one of the three places. There are at this time several supported by voluntary contribution.

DISPENSATION, in *Law*, &c. a permission to do something contrary to the standing laws; or a relaxation, or suspension of a law, on some just occasion.

Some confound *dispensation* with equity; but they are very different things; for equity is only the correction, or modification, of a law which is too general; but a *dispensation* suspends the obligation of the law itself, and can, therefore, be only given by the legislative power.

The king of France grants *dispensations* of age to some officers, to be admitted before the legal age: but the greatest dealer in *dispensations* is the pope, who claims the office, *jure divino*, and extends it to every thing: indeed, the more sober of the Romanists themselves deny, that he can give a *dispensation* for a thing contrary either to the divine law, or the law of nature, and confine him to what is contrary to positive laws, as to things relating to fasts, marriages, holding several benefices, &c. And even in these things they set bounds: thus, say they, a *dispensation* in the first degree of affinity, as that of father and daughter, brother and sister, would be abusive and null. But it is certain the papal fee does not apprehend itself under any such severe restrictions.

The right of giving *dispensations* they thus prove. It is certain the church has power to make laws: a power which the apostles themselves exercised, and which their successors have continued to exercise after them. Whoever can make a law, can annul it; and much more, can he dispense with it in certain cases: the church, then, may dispense with the laws itself has made, and we find it to have done accordingly in all ages. See PREMUNIRE.

The archbishop of Canterbury has a power, by stat. 25 Henry VIII. c. 21. of *dispensing* in any case, within the realm, wherein *dispensations*, not contrary to the law of God, were formerly granted by the see of Rome, as well to the king as to his subjects: but in extraordinary matters, or in a case that is new, the king and council are to be consulted; and the *dispensation* must be confirmed under the broad seal: and during the vacancy of the archbishop's see, the guardian of the spiritualities may grant *dispensations*. Every bishop, of common right, has the power of *dispensing* in common cases.

DISPENSATIONS *for pluralities*. See CHAPLAIN and PLURALITY.

DISPENSATION *of the king*, makes a thing prohibited lawful to be done by the person that has it, though a thing evil in itself will not admit of a *dispensation*. When an offence wrongs none but the king, or if the suit is only the king's for the breach of a penal law, that is not to the damage

of a third perſon, the king may *diſpenſe*: but in caſe the ſuit is the king's, for the benefit of another, he cannot. It was formerly held that the king might in many caſes *diſpenſe* with penal ſtatutes, and the exerciſe of this *diſpenſing* power was one of the moſt ignominious badges of ſlavery and engines of tyranny, which ever diſgraced and harraſſed this country; but by 1 W. and M. ſtat. 2. c. 2. it is declared, that the ſuſpending or *diſpenſing* with laws by regal authority, without the conſent of parliament, is illegal: it is alſo a maxim in law, that 'it requires the ſame ſtrength to diſſolve, as to create an obligation. See Blackſt. Com. vol. i. p. 142, 185, 342. and vol. ii. p. 429, 432. See PREROGATIVE.

DISPENSATION *by non-obſtante*. See NON-OBSTANTE.

DISPENSATION, *in Pharmacy*, the diſpoſition and arrangement of ſeveral medicines, either ſimple or compound, all weighed in their proper doſes, or quantities; in order to be employed in the making of a compoſition.

DISPERSION, *in Dioptrics*. *Point of* DISPERSION, is a point from which refracted rays begin to diverge, when their refraction renders them divergent.

It is called *point of diſperſion*, in oppoſition to the point *of concourſe*, which is the point wherein converging rays concur after refraction.

But the latter is more uſually called *focus*, and the former, *virtual focus*.

DISPERSION *of light*, occaſioned by the REFRANGIBILITY of the rays, or the nature of the refracting MEDIUM. See ABERRATION, and INFLECTION.

DISPERSION *of Mankind*, in the *Hiſtory of the World*, was occaſioned by the CONFUSION *of tongues*, and took place in conſequence of the overthrow of Babel at the birth of Peleg; whence he derived his name: and it appears by the account given of his anceſtors, Gen. chap. xi. 10—16, to have happened in the 101ſt year after the flood, according to the Hebrew chronology, and by the Samaritan computation in the 401ſt. However, various difficulties have been ſuggeſted by chronologers concerning the true æra of this event. Sir John Marſham and others, in order to reconcile the Hebrew and Egyptian chronologies, maintain a *diſperſion* of mankind before the birth of Peleg: others, unable to find numbers ſufficient for the plantation of colonies in the ſpace of 101 years, according to the Hebrew computation, fix the *diſperſion* towards the end of Peleg's life, thus following the computation of the Jews: Petavius aſſigns the 153d year after the flood; Cumberland, the 180th; and Uſher, though he generally refers it to the time of Peleg's birth, in one place aſſigns the 131ſt after the flood for this event. Mr. Shuckford ſuppoſes the *diſperſion* to have been gradual, and to have commenced with the ſeparation of ſome companies at the birth of Peleg, and to have been completed thirty-one years after. According to the calculation of Petavius, the number of inhabitants on the earth at the birth of Peleg amounted to 32,768; Cumberland makes them 30,000; Mr. Mede ſtates them at 7000 men, beſides women and children; and Mr. Whiſton, who ſuppoſes that mankind now double themſelves in four hundred years, and that they doubled themſelves between the deluge and the time of David in ſixty years at a medium, when their lives were ſix or ſeven times as long as they have been ſince, by his computation, produces about 2389, a number much too inconſiderable for the purpoſes of ſeparating and forming diſtinct nations. This difficulty induced Mr. Whiſton to reject the Hebrew, and to adopt the Samaritan chronology, as many others have done; which, by allowing an interval of 401 years between the flood and the birth of Peleg, furniſhes, by the laſt mentioned mode of computation, more than 240,000 perſons. Marſh. Can. Chron. ſec. 1. Petav. Doctrin. Temp. lib. ix. c. 14. Cumb. Orig. Gent. Antiq. p. 142—154. Uſher ad A. M. 1757 & 1787. Whiſton's View Chron. O. T.

As to the manner of the *diſperſion* of the poſterity of Noah from the plain of Shinar, it was undoubtedly conducted with the utmoſt regularity and order. The ſacred hiſtorian informs us, that they were divided in their lands, every one according to his tongue, according to his family, and according to his nation; Gen. x. 5, 20, 31; and thus, as Mr. Mede obſerves, they were ranged according to their nations, and every nation was ranged by their families, ſo that each nation had a ſeparate lot and each family in every nation. The following abſtract will ſerve to give a general idea of their reſpective ſettlements: Japhet, Noah's eldeſt ſon, had ſeven ſons, viz. Gomer, whoſe deſcendants inhabited thoſe parts of Aſia, which lie upon the Ægean ſea and Helleſpont northward, containing Phrygia, Pontus, Bithynia, and a great part of Galatia: the Galatians, according to Joſephus, were called Gomerai; and the Cimmerii, according to Herodotus, occupied this tract of country: and from theſe Gomerians, Cimmerii or Celtæ, Mr. Camden derives our ancient Britons, who ſtill retain the name Cymro or Cymru: Magog, the ſecond ſon of Japhet, was probably the father of the Scythians on the eaſt and north-eaſt of the Euxine ſea: Madai planted Media, though Mr. Mede aſſigns Macedonia to his ſhare: Javan was the father of the Grecians about Ionia, whoſe country lies along upon the Mediterranean ſea; the radicals of Javan and Ionia being the ſame יון: Tubal and Meſhech belonged Cappadocia and the country which lies on the borders of the Euxine ſea; and from them, migrating over the Caucaſus, it is ſuppoſed the Ruſſians and Muſcovites are deſcended: and Tiras occupied Thrace. The ſons of Shem were five: Elam, whoſe country lay between the Medes and Meſopotamians, and was called by the Gentile writers Elymais; and Joſephus calls the Elamites the founders of the Perſians: Aſſur, who was driven out of Shinar by Nimrod, afterwards ſettled in Aſſyria, and there built Nineveh and other cities: Arphaxad, who gave name to the country which Ptolemy calls Arrapachitis, a province of Aſſyria, though Joſephus makes him the father of the Chaldees: Lud, who inhabited and gave name to the country of Lydia about the river Mæander, remarkable for its windings, in Aſia Minor: and Aram, the father of the Aſſyrians. Ham, the youngeſt ſon of Noah, had four ſons, viz. Cuſh, whoſe poſterity ſpread into the ſeveral parts of Arabia, over the borders of the land of Edom, into Arabia Felix, up to Midian and Egypt: Mizraim, the father of them who inhabited Egypt and other parts of Africa: Phut, to whom Bochart aſſigns the remaining part of Africa, from the lake Tritonides to the Atlantic ocean, called Lybia: and Canaan, to whom belonged the land of Canaan, whence the Phœnicians derived their origin. Mede's Works, vol. i. diſc. 30. p. 276, &c. Bochart, Phaleg. lib. iii. & iv. Patrick in loc. Shuckford's Conn. vol. i. book i. and Un. Hiſt. vol. i. part 3. book i. chap. 2. § 6.

Dr. Bryant has advanced a new hypotheſis on this ſubject, and ſupported it with his uſual acuteneſs and learning: he maintains, that the *diſperſion* as well as the CONFUSION *of tongues* was local, and limited to the inhabitants of the province of Babel; that the ſeparation and diſtribution recorded to have taken place in the days of Peleg, Gen. x. 25, 31, 32, which was the reſult of divine appointment, occaſioned a general migration; and that all the families among the ſons of men were concerned in it: the houſe of Shem, from whom the Meſſiah was to ſpring, was particularly regarded in the diſtribution; the portion of his children was near the place of ſeparation; they in general had Aſia to their lot; as Japhet had Europe, and Ham the large continent of Africa. But the ſons of Chus would not ſubmit to the divine diſpenſation; they went off under the conduct of Nimrod, and ſeem to have been for a long time in a roving ſtate: however, at laſt they arrived at the plains of Shinar, and having ejected Aſſur and his ſons, who were placed there by divine appointment, ſeized his dominions, and laid there the foundation of a great monarchy. But afterwards fearing leſt they ſhould be divided and ſcattered abroad, they built the tower of Babel, as a land-mark, to which they might repair, and probably to anſwer the purpoſes of an idolatrous temple, or high altar, dedicated to the hoſt of heaven, from which they were never long to be abſent. They only, viz. the ſons of Chus or the Cuthites, and their aſſociates from other families, who had been guilty of rebellion againſt divine authority, and of wicked ambition and tyranny, were puniſhed with the judgment of confounded ſpeech through a failure in labial utterance, and of the *diſperſion* recorded in Gen. x. 8, 9: in conſequence of which they were ſcattered abroad from this city and tower, without any certain place of deſtination. The Cuthites invaded Egypt or the land of Mizraim, in its infant ſtate, ſeized the whole country, and held it for ſome ages in ſubjection: and they extended likewiſe to the Indies and Ganges, and ſtill further into China and Japan. From them the province of Cuthan or Gothen in Egypt derived its name; here they obtained the appellation of royal ſhepherds; and when they were by force driven out of the country, after having been in poſſeſſion of it for two hundred and ſixty or two hundred and eighty years, the land which they had been obliged to quit was given to the Iſraelites, who were alſo denominated ſhepherds, but ſhould not be confounded with the former or the antecedent inhabitants of Goſhen. Bryant's Analyſis of Ancient Mythol. vol. iii. p. 16, &c.

DISPERSION *of inflammation*, in *Medicine*. See INFLAMMATIONS.

DISPLANTING, among *Gardeners*, is the plucking up a tree or plant out of the ground.

DISPLANTING *ſcoop*, an inſtrument for taking up plants with earth about their roots.

DISPLAYED, in *Heraldry*, is understood of the position of an eagle, or other bird, when it is erect, with its wings expanded, or spread forth.

DISPONDEE, in the *Greek* and *Latin Poetry*, a double spondee; or a foot consisting of four long syllables: as *fŭrāmĭntă, rĕlēctāntĭs, Φωτοφανεῖσιν*.

DISPOSITION, from *dis*, and *pono, I place*, in *Architecture*, is the just placing of all the several parts of an edifice, according to their proper nature and office. See BUILDING.

DISPOSITION, in *Logic*, is that operation of the mind, whereby we put the ideas, propositions, and arguments which we have formed concerning one subject, into such an order as is fittest to gain the clearest knowlege of it, to retain it longest, and to explain it to others in the best manner: the effect of this is called METHOD. Watts's Logic.

DISPOSITION, in a *Military Sense*, is the arrangement of an army or body of men upon the most advantageous ground, and in the best situation for a vigorous attack or defence.

DISPOSITION, in *Rhetoric*, is defined, by Cicero, the act of distributing the things, or arguments, invented or found out, into a proper order; or a due placing, or ranging, the several parts of speech, or discourse.

The *disposition* makes one of the great branches, or divisions, of rhetoric. Isocrates was the first among the Greeks, that made them sensible of the beauty of *disposition*; and Cicero among the Romans.

The *disposition* is of the same necessity in oratory, as the marshaling of an army in order to a battle; or a beautiful composition in architecture, painting, &c. Horace enjoins it expressly in poetry: *Singula quæque locum teneant sortita decenter*. The *disposition* then, is the order, or arrangement, of the parts of an oration; which parts are usually reckoned four, viz. the *exordium*, or *beginning*; the *narration*; the *confirmation*; and the *peroration*, or *conclusion*. Though some make them six, viz. the *exordium*, *division*, *narration*, *confirmation*, *confutation*, and *peroration*; as indicated in that popular verse:

Exordia, narro, fides, firmo, refuto, peroro.

But the division is more naturally referred to the exordium; and the confutation to the confirmation.

The *disposition* is either *natural* or *artificial*. *Natural*, is the order the parts are above rehearsed in. *Artificial*, is wasted, for some particular reason, we recede from the order of nature. See each part under its proper article, EXORDIUM, &c.

DISPROPORTION, a term of relation implying a want of proportion, or symmetry.

DISPROVING, in *Rhetoric*. See REFUTATION.

DISPUTE, or DISPUTATION, from *dis*, and *puto, I think*, in the *Schools*, &c. a contest, or combat, either by word or writing, on some point of learning or religion, for a degree, prize, exercise, or even for the mere sake of truth, or advantage of a party, or the honour of a triumph. See DUELLO.

The Port Royalists take occasion to observe, that nothing gives so many different lights and openings, for discovering the truth, as *disputation*. The movements of a mind, employed singly in the examination of any subject, are usually too cool and languid: the mind needs a certain degree of heat to awake its ideas. Now, by the oppositions in a *dispute*, we come to find wherein the difficulty lies, and the vigour the mind has acquired enables us to surmount it.

DISQUISITION, from *dis*, and *quæro, I enquire*, an enquiry into the nature, kinds, and circumstances of any problem, question, or topic; in order to gain a right notion of it, and to discourse clearly about it.

DISSECTION, from *dis*, and *seco, I cut*, in *Anatomy*, the operation of cutting and dividing the parts of an animal body, with a knife, scissars, &c. in order to see and consider each of them apart.

The ancients made *dissections* of living men: as we read of Herophilus and Erasistratus; and, in our own times, of Carpus and Vesalius.

Yet, Le Gendre observes, that the *dissection* of a human body, even dead, was held a sacrilege till the time of Francis I. And the same author assures us, he has seen a consultation held by the divines of Salamanca, at the request of Charles V. to settle the question, whether or no it were lawful, in point of conscience, to *dissect* a human body, in order to learn its structure? See ANATOMY.

DISSEISIN, in *Law*, an unlawful dispossessing a man of his land, tenement, or other immoveable and incorporeal right.

Disseisin is of three sorts; viz. *simple disseisin*, committed by day, without force and arms: and *disseisin by force*, for which fee DEFORCEOR; and FRESH *disseisin*. See also RE-DISSEISIN and POST-DISSEISIN. *Wrongful force* makes no descent in law.

Assises are called *writs of disseisin*, which lie against disseisors in any case: whereof some are termed *little writs of disseisin*, as being vicontial, that is, suable before the sheriff in the county-court, because determinable by him without assise.

DISSEISOR, he who *disseiseth*, or puts another out of his land: as *disseisee* is he who is put out.

If a *disseisor*, after he has expelled the right owner, gains peaceable possession of the lands five years without claim, and continues in possession, so as to die seised, and the land descends to his heirs, they will have a right to the possession till the owner recovers at law; and the owner shall lose his estate for ever, if he doth not prosecute his suit within the time limited by the statute of limitations.

DISSEMINATE *vocum*. See VACUUM *disseminatum*.

DISSENTERS, a general denomination of equal import with non-conformists.

It expresses certain sects, or parties, in England, who, in matters of religion, church-discipline, and ceremonies, *dissent* from, or disagree with the church of England, and have a TOLERATION by law for the same.

Such, particularly, are the presbyterians, independents, anabaptists, and quakers. See PRESBYTERIANS, &c.

At the Revolution, a law was enacted, that the statutes of queen Elizabeth, and king James I. concerning the discipline of the church, should not extend to protestant *dissenters*: but the persons *dissenting* are to subscribe the declaration of 30 Car. II. c. 1. and take the oaths or the declaration of fidelity, &c. And they must not hold their meetings until their place of worship is certified to the bishop, &c. or to the justices at their quarter sessions, and registered there; also they are not to keep the doors of their meeting-houses locked, &c. If any person disturbs them at their worship, on conviction at the sessions, he shall forfeit 20*l.* Stat. 1 W. and M. And there are many statutes relating to *dissenters* beside the toleration. act: as 5 and 6 Edw. VI. c. 1. 23 Eliz. c. 1. 3 Jac. I. c. 4. 13 Car. II. c. 1. 17 Car. II. c. 2. 22 Car. II. c. 1. 1 W. and M. c. 18. 10 Anne, c. 2. 1 Geo. I. c. 6. &c.

DISSEPIMENTUM, among *Botanists*, the thin septum separating the cells of the fruit of plants.

DISSIDENTS, a denomination applied in Poland to those of the Lutheran, Calvinistic, and Greek profession. The king of Poland engages by the *pacta conventa* to tolerate them in the free exercise of their religion, but they have often had reason to complain of the violation of these promises.

DISSIMILAR *leaves*, denote the two first leaves of any plant at its first shooting out of the ground.

They are thus called, because they usually are of a different form from the common leaves of a grown plant.

These Dr. Grew observes to be nothing but the very lobes of the seed thus expanded, and thus advanced.

Their use is for the protection of the plume; which being young and tender, is thus guarded on each side, and has also some rain and dew gradually conveyed down to it by this means. See PLUME.

DISSIMILAR, in *Anatomy*. Authors divide the parts of the body into *similar*, and *dissimilar*.

Dissimilar parts, by some called also *compound*, and *organical* parts, are such as may be divided into various parts, of different structure, &c. Thus the hand is divisible into veins, muscles, bones, &c. whose subdivisions are neither of the same nature nor denomination.

DISSIMILITUDE, in *Geometry*, &c. See SIMILITUDE.

DISSIMILITUDE, or DISSIMILI, in *Rhetoric*, &c. an argument, wherein, from *dissimilar*, or unlike things, other *dissimilars* are deduced.

Thus Cicero, *Si barbarorum est in diem vivere, nostra consilia semiternum tempus spectare debent*. Catullus furnishes a very beautiful argument from *dissimilitude*.

Soles occidere & redire possunt.
Nobis cum semel occidit brevis lux,
Nox est perpetua una dormienda.

DISSIMULATION, in *Morals*, the act of dissembling, by fallacious appearances, or false pretensions.

Good princes regard *dissimulation* as a necessary vice; but tyrants consider it as a virtue.

It is apparent that secrecy is often necessary, to oppose those who may be willing to circumvent our lawful intentions. But the necessity of precaution would become very rare, were no enterprizes to be formed, but such as could be avowed openly. The frankness with which we could then act, would engage people in our interests. Marshal Biron would have saved his life, by dealing ingenuously with Henry IV.

With respect to *dissimulation*, three things are to be observed; 1. That the characters of those are not to be esteemed,

eſteemed, who are reſerved and cautious without diſtinction. 2. Not to make ſecrets of unimportant matters. 3. To conduct ourſelves in ſuch manner, as to have as few ſecrets as poſſible.

DISSIPATION, in *Phyſics*, an inſenſible loſs, or conſumption, of the minute parts of a body: or, more properly, that flux whereby they fly off, and are loſt. See EFFLUVIA.

We do not ſay *diſſipation*, but loſs of blood, in ſpeaking of the blood diſcharged at a wound, or in any other ſenſible manner: on the contrary, we ſay *diſſipation*, or expence, of ſpirits: this is more copious than that of the ſolid parts; and, conſequently, the reparation ought to be more copious.

DISSIPATION, *Circle of*, or ABERRATION, in *Optics*, denotes that circular ſpace upon the retina of the eye, which is occupied by the rays of each pencil in indiſtinct viſion: thus, if the diſtance of the object, or the conſtitution of the eye be ſuch, that the image falls beyond the retina, as when objects are too near; or before the retina, when the rays have not a ſufficient divergency, the rays of a pencil, inſtead of being collected into a central point, will be *diſſipated* over this circular ſpace: and all other circumſtances being alike, this circle will be greater or leſs, according to the greater or leſſer diſtances from the retina of the focules of refracted rays. But this circle cauſes no perceptible difference in the diſtinctneſs of viſion, while that circle is not greater than ſome determinate magnitude; as ſoon as it exceeds that magnitude, we begin to perceive an indiſtinctneſs, which increaſes as the circle of *diſſipation* increaſes, and at length the object is loſt in confuſion. This circle is alſo greater or leſs, according to the greater or leſs magnitude of the viſible object: and though it is not eaſy to aſſign the diameter of the ſaid circle, it ſeems very probable, that viſion continues diſtinct for all ſuch diſtances, or ſo long, as theſe circles or the pencils of light from them do not touch one another upon the retina; and the indiſtinctneſs begins, when the ſaid circles begin to interfere. It has been often obſerved, that a preciſe union of the reſpective rays upon the retina is not neceſſary to diſtinct viſion; but the firſt author that aſcertained the fact beyond all doubt, was Dr. Jurin. See a variety of obſervations and experiments on this ſubject, in his Eſſay on Diſtinct and Indiſtinct Viſion, in Smith's Optics, Appendix. See MOON, and VISION.

DISSIPATION, *Radius of*, is the radius of the circle of DISSIPATION.

DISSOLVENT, ſomething that *diſſolves*, i. e. divides, and reduces a body into its ſmalleſt parts. See DISSOLUTION.

Thus, AQUA *regia* is the *diſſolvent* of gold; AQUA *fortis* of ſilver, and other metals; water, of ſalts and gums; ſpirit of wine, of reſins; ſpirit of vinegar, of pearls, corals, &c.

Sea-ſalt is found the proper *diſſolvent* of gold. This, in almoſt any form, whether as a fluid, or a ſolid, or a ſpirit, does the buſineſs: accordingly, this is a baſis, or fundamental ingredient, of *aqua regia*.

So nitre is the proper *diſſolvent* of ſilver, and has that effect, in whatever form it is applied: and, accordingly, it is the baſis of *aqua fortis*.

Spirit of nitre, added to that of ſea-ſalt, makes it *diſſolve* gold the better: but ſpirit of ſea-ſalt, added to ſpirit of nitre, diſables it from having any effect on ſilver. Yet Mr. Homberg furniſhes an inſtance of a *diſſolution* of ſilver made by the *diſſolvent* of gold. An *aqua regia* may be compoſed of ſpirit of ſalt, and ſpirit of nitre, only in ſuch ſmall quantity each, that they may float ſeparately in a third liquor, and not meet often enough to unite, at leaſt not in any quantity. This water may be made ſo weak as not to *diſſolve* gold, but only extract a flight yellow tincture from it, that ſcarce takes off any thing of the weight of the metal: nor will it *diſſolve* ſilver, as being too weak; ſo that both metals are ſafe from it. But this *aqua regia*, after it has *diſſolved* gold as far as it can do; that is, after it has extracted a yellowiſh tincture from it, is ſtill in a condition to *diſſolve* ſilver.

This phenomenon Mr. Homberg accounts for hence: that ſpirit of ſalt, whether alone, or joined with ſpirit of nitre, being employed in keeping thoſe few particles of gold *diſſolved*, will not meddle with the ſilver: which, by this means, receiving the impreſſion of the greater quantity of ſpirit of nitre alone, is *diſſolved* thereby. But the experiment cannot be inverted, i. e. *aqua regia* cannot begin with *diſſolving* ſilver lightly firſt, and afterwards *diſſolve* gold; becauſe ſpirit of nitre does not hinder ſpirit of ſalt from acting on gold, as ſpirit of ſalt does ſpirit of nitre from acting on ſilver.

Diſſolvents are uſually called by the chemiſts, *menſtruums*.

DISSOLVENT, *Univerſal*. See ALCAHEST.

DISSOLUTION, in *Chemiſtry*, *Pharmacy*, and *Phyſics*, a diſcontinuation, or analyſis, of the ſtructure of a mixed body; whereby, what was one, and contiguous, is divided into little parts, either homogeneous, or heterogeneous. See ANALYSIS, and DIVISION.

Diſſolution, then, is a general name for all reductions of concrete bodies into their ſmalleſt parts, without any regard either to ſolidity or fluidity: though, in the uſual acceptation of the word among authors, it is reſtrained to the reduction of ſolid bodies into a ſtate of fluidity, by the action of ſome fluid MENSTRUUM or *diſſolvent*; in which caſe an union is formed between the integrant parts of one body, and thoſe of another of a different nature; ſo that it is nothing elſe than an act of COMBINATION: this is more properly expreſſed by SOLUTION, as a branch of *diſſolution*.

According to the opinion of F. Tertius de Lanis, adopted by the learned Boerhaave, in his Chemiſtry, the power, or faculty, of diſſolving, is lodged in fire alone.

Other fluids, commonly ſuppoſed diſſolvents, only produce their effect by means of the fiery ſpicula they abound with. Even air, which is judged a powerful menſtruum, owes all its force to the rays of light diffuſed therein.

Sir Iſaac Newton accounts for all *diſſolutions*, and the ſeveral phenomena thereof from the great principle of attraction; and, in effect, the phenomena of *diſſolution* furniſh a great part of the arguments and conſiderations, whereby he proves the reality of that principle.

A ſpecimen of that great author's way of philoſophiſing on the ſubject of *diſſolution*, take as follows:

When ſalt of tartar diſſolves by lying in a moiſt place, is not this done by an attraction between the particles of the ſalt of tartar, and thoſe of the water which float in the air in form of vapours? And why does not common ſalt, or ſaltpetre, or vitriol, do the like, but for want of ſuch an attraction? And when *aqua fortis*, or ſpirit of vitriol, poured on ſteel-filings, diſſolves the filings, with a great heat and ebullition, is not this heat and ebullition effected by a violent motion of the parts? And does not that motion argue, that the acid parts of the liquor ruſh towards the parts of the metal with violence, and run forcibly into its pores; till getting between the outermoſt particles and the main maſs of metal, they looſen them therefrom, and ſet them at liberty to float off into the water? When a ſolution of iron, in *aqua fortis*, diſſolves *lapis calaminaris*, and lets go the iron; or a ſolution of copper diſſolves iron immerſed in it, and lets go the copper; or a ſolution of mercury in *aqua fortis*, poured on iron, copper, tin, or lead, diſſolves the metal, and lets go the mercury; does not this argue, that the acid particles of the *aqua fortis* are attracted more ſtrongly by the *lapis calaminaris*, than by iron; by iron, than by copper; by copper, than by ſilver; and by iron, copper, tin, and lead, than by mercury? And is it not for the ſame reaſon, that iron requires more *aqua fortis* to diſſolve it, than copper; and copper, more than the other metals; and that of all metals, iron is diſſolved moſt eaſily, and is moſt apt to ruſt; and next after iron, copper? When *aqua fortis* diſſolves ſilver, and not gold; and *aqua regia* diſſolves gold, and not ſilver; may it not be ſaid, that *aqua fortis* is ſubtile enough to penetrate the pores of gold as well as of ſilver, but it wants the attractive force to give it entrance; and the ſame of *aqua regia*, and ſilver? And when metals are diſſolved in acid menſtruums, and the acids, in conjunction with the metal, act after a different manner; ſo as that the taſte of the compound is milder than that of the ſimples, and ſometimes a ſweet one; is it not becauſe the acids adhere to the metallic particles, and thereby loſe much of their activity? And if the acid be in too ſmall a proportion to make the compound diſſoluble in water; will it not, by adhering ſtrongly to the metal, become unactive, and loſe its taſte; and the compound become a taſteleſs earth? For ſuch things as are not diſſoluble by the moiſture of the tongue are inſipid. Newt. Opt. in Calce.

Dr. Friend gives us a mechanical account of *diſſolution*, in the inſtance of ſalt diſſolved in water, which is the moſt ſimple operation that falls under this head. This motion he aſcribes to that attractive force, which is ſo very extenſive in natural philoſophy, that there is no kind of matter but what is under its influence. It may be obſerved, he ſays, that the corpuſcles of ſalts, which are the moſt ſimple of any, are withal very minute, and, for their bulk, very ſolid; and therefore they exert a very ſtrong attractive force, which, *cæteris paribus*, is proportional to the quantity of matter. Hence it comes to paſs, that the particles of water are more ſtrongly attracted by the ſaline particles than they are by one another: the particles of water, therefore, cohering but looſely, and being eaſily moveable, approach the corpuſcles of ſalts, and run, as it were, into their embraces; and the motion of them is quicker, or ſlower, according

to their leſs or greater diſtances; the attractive force, in all bodies, being ſtrongeſt at the point of contact. Therefore, if ſalt be thrown into the middle of a diſh full of water, we ſhall find the aqueous particles, which are in the middle of the diſh, ſharp and pungent to the taſte; but the water upon the ſides of the veſſel almoſt inſipid: ſo that, when ſuch a motion once ariſes, the aqueous particles are carried with the ſame force toward the ſalts; and the moment of them is to be eſtimated from the ratio of their weight, and celerity conjunctly. By the force of this impulſe, they open to themſelves a paſſage into the pores of the ſalts, which are very numerous; and, at length, they ſo break and divide its texture, that all cohęſion of the parts is deſtroyed: hereupon, being ſeparated and removed to a convenient diſtance from one another, they are diſperſed, and float here and there about the water.

M. Geoffroy furniſhes ſome curious experiments on *cold diſſolutions*: it is nothing ſurprifing, that a ſimple *diſſolution* ſhould be cold; that common water, for inſtance, wherein ſea-ſalt, or ſal ammoniac, or vitriol, has been caſt, ſhould become the colder by the mixture of ſuch ſalts; it being obvious, that the ſalts, being of themſelves deſtitute of motion and coming to ſhare that which the fluidity gives the water, muſt diminiſh it, when they become intimately mixed therewith by *diſſolution*; and it is generally agreed, among philoſophers, that heat is a motion, and cold a ceſſation, or, at leaſt, a diminution of motion.

Yet, notwithſtanding this general principle, it is no great wonder all *diſſolutions* are not cold, as thoſe are of all volatile alkalis in common water; but that ſome are hot, as thoſe of all fixed alkalis. This difference may be accounted for hence, that all fixed alkalis having been calcined by a vehement fire, they have impriſoned and retained in the pores ſome of the particles thereof. But it is ſurpriſing, that *diſſolutions*, accompanied with fermentation, &c. where the matters boil and ſwell, and that with a great noiſe, ſhould be cold, and make the thermometer fall when immerged therein.

This coldneſs, with ſo conſiderable an augmentation of motion, is ſomewhat extraordinary. But this is not all; for of theſe cold fermentations, there are ſome that emit hot vapours. Thus it is with a mixture of oil of vitriol, and ſal ammoniac; for a thermometer being plunged in the mixture, and another a little higher, to receive only the fumes thereof; the firſt thermometer is ſeen to fall very haſtily, through the coldneſs of the fermentation; and the latter to riſe, through the heat of the vapours. M. Geoffroy adds an experiment, ſhewing that cold water is rendered ſtill colder, for a few moments, by throwing a large quantity of live coals therein.

DISSOLUTION *of metals, &c.* by fire, is particularly called *fuſion*.

DISSOLUTION *of the blood*, is an affection of that humour, directly oppoſite to coagulation.

The *diſſolution* is ſuch a comminution of the fibrous parts of the blood, as indiſpoſes it for that ſeparation of the craſſamentum from the ſerous part, which always enſues in healthy blood, on its cooling out of the body.

This *diſſolution* is frequently the conſequence of malignant and peſtilential fevers, and ſhews itſelf in petechiæ, or purple ſpots; alſo of certain poiſons, particularly the bites of venemous beaſts, &c.

DISSOLUTION *of parliament*. ſee PARLIAMENT.

DISSONANCE, or DISCORD, in *Muſic*, a falſe conſonance, or concord.

A *diſſonance* is properly the reſult of a mixture, or meeting, of two ſounds, which are diſagreeable to the ear: ſuch are *ditones*, *tritones*, *ſol-fe fifth*, *redundant fourth*, *ſeventh*, &c.

Diſſonances are ſometimes uſed in muſic, and have a good effect therein, though it be only occaſionally. See DISCORD.

DISSYLLABLE, a word of two ſyllables; as *fortune*, *lament*, &c.

The ſpondee, trochee, iambus, and pyrrhichius, are *diſſyllable* feet. See SPONDEE, &c.

DISTAFF, an inſtrument about which flax is tied, in order to the ſpinning of it.

DISTAFF-*thiſtle*, a name ſometimes given to the *carduſſus* of authors. See THISTLE.

DISTANCE, properly denotes the ſhorteſt line between two points, objects, &c.

Diſtance, according to an ingenious author, cannot of itſelf and immediately be ſeen. For *diſtance* being a line directed endwiſe to the eye, it projects only one point in the fund of the eye, which point remains invariably the ſame, whether the diſtance be longer or ſhorter. Dr. Berkeley, Eſſay on Viſion.

A late eminent mathematician obſerves, that the *diſtance* here ſpoken of is *diſtance* from the eye; and that what is ſaid of it muſt not be applied to *diſtance* in general. The apparent *diſtance* of two ſtars is capable of the ſame variations as any other quantity or magnitude. Viſible magnitudes conſiſt of parts into which they may be reſolved, as well as tangible magnitudes; and the proportions of the former may be aſſigned, as well as thoſe of the latter: ſo that it is going too far to tell us, that viſible magnitudes are no more to be accounted the object of geometry than words, and that the ideas of ſpace, and things placed at a *diſtance*, are not, ſtrictly ſpeaking, the object of ſight, and are not otherwiſe perceived by the eye than by the ear. Mr. Maclaurin, in his account of Sir Iſaac Newton's Diſcoveries, p. 225.

The word is alſo uſed figuratively for an interval, not only in reſpect of place, but alſo of time, or quality.

Thus, we ſay the *diſtance* of the creation of the world, from the nativity of Jeſus Chriſt, is upwards of four thouſand years: the *diſtance* between the Creator and creature is infinite.

For the diviſion of DISTANCES, or the manner wherein we come by the idea of *diſtance* in objects, ſee VISIBLE.

DISTANCE, in *Aſtronomy*. The *diſtance* of the ſun, planets, and comets, is found from their PARALLAX.

The proportional or relative *diſtances* of the planets are deduced with great exactneſs from the theory of gravity: for Kepler has long ſince diſcovered that the ſquares of their periodical times are as the cubes of their *diſtances*. Epit. Aſtron. lib. iv. See alſo Greg. Aſt. book i. prop 40. If we, therefore, ſuppoſe the mean *diſtance* of the earth from the ſun to be 100000, we ſhall obtain by the preceding analogy, from the periodical times which are known, the relative *diſtances* of the other planets: thus,

The periodical revolutions to the ſame fixed ſtar in days and decimal parts of a day.

Mercury.	Venus	Earth.	Mars.	Jupiter.	Saturn.
87,9692	224,6176	365,2564	686,9785	4332,5141	10759,275

Relative mean *diſtances* from the Sun.

38710	72333	100000	152369	520096	954006

In order to find the real *diſtance* of the earth, and for an account of the real *diſtances* of the other planets, ſee PARALLAX and PLANETS.

For the *diſtances* of the ſecondary planets from the centres of their reſpective primaries, ſee SATELLITES.

That of the fixed ſtars, as having no ſenſible parrallax, we can do little more than gueſs at.

Dr. Hooke, by exact obſervation with a teleſcope of ſixteen feet, perpendicularly placed, firſt diſcovered, that the *diſtances* of the ſtars from the zenith is not the ſame at all times of the year; particularly the bright ſtar in the Dragon's Head he found twenty-ſeven or thirty ſeconds nearer the zenith of Greſham college, in the winter ſolſtice, than the ſummer; and, after him, Mr. Flamſteed obſerved the like variations in the pole-ſtar. See LIGHT.

DISTANCE *of the ſun from the moon's node, or apogee*, is an arch of the ecliptic intercepted between the ſun's true place, and the moon's node, or apogee. See NODE.

DISTANCE, *Curtate*. See CURTATE.

DISTANCE *of the baſtions*, in *Fortification*, is the ſide of the exterior polygon.

DISTANCES, in *Geometry*, are meaſured by the chain, decempeda, and the like. See CHAIN, &c.

DISTANCES, *Inacceſſible*, are found by taking bearings thereto from the two extremes of a line, whoſe length is given. See PLAIN-TABLE, THEODOLITE, &c.

DISTANCE, in *Geography*, is the arch of a great circle interſected between two places.

To find the *diſtances* of two places A and B (*Tab. Geogr. fig.* 4.), far remote from each other. Aſſume two ſtations, C and D, from which both the places A and B may be ſeen; and with a proper inſtrument find the angles ADC, CDB, ACD, and DCB; and meaſure the *diſtance* CD.

Then in the triangle ACD we have two angles given, ACD and ADC, together with a ſide; from which, by an eaſy rule in trigonometry, delivered under the article TRIANGLE, we find AD.

So alſo, in the triangle CDB, the baſe DC, and the angles at the ſame, being given; DB is found.

Laſtly, in the triangle ADB, having the ſides AD and DB, together with the included angle ADB; the *diſtance* required, AB, is found by the rules given for the reſolution of triangles.

The height of a remote object being known, to find its *diſtance*, when the eye firſt deſcries it; and, again, the height of the eye being given, to find the *diſtance* to which the eye can reach on the ſurface of the ſea, or land. Add the height of the eye AB (*fig* 9.) to the ſemi-

ſemidiameter of the earth BC, by which you have AC; and ſince in the rectangled triangle ADC the ſides AC and DC are given, the angle DCA is found by the common rule for reſolution of triangles, the quantity of which angle forms the arch DB; which arch, converted into feet, or the like, gives the *diſtance* required.

Suppoſe e. g. the height of the eye AB five feet, which is ſomewhat leſs than in a man of ordinary ſtature; ſince BC is 19695539, AC will be 19695544; and the angle DAB will be found 89° 57′ 43″: conſequently DCB, or the arch DB, is 2′ 17″, or 137″; and therefore, ſince 1″, or 3600″, make 343752 Paris feet, DB is 130813 feet.

After the ſame manner we find the *diſtance* DB, to which an object of a given altitude AB may be ſeen; and, conſequently, we know what diſtance we are off from an object of a given altitude, when we firſt diſcover the top thereof. See HORIZON.

DISTANCE, *Apparent*, in *Optics*, that *diſtance* which we judge an object to be from us when ſeen afar off, being commonly very different from the true *diſtance*; becauſe we are apt to think that all very remote objects, whoſe parts cannot well be diſtinguiſhed, and which have no other object in view near them, to be at the ſame *diſtance* from us, though perhaps the one is thouſands of miles nearer than the other, as is the caſe with regard to the ſun and moon.

M. De la Hire enumerates five circumſtances, which aſſiſt us in judging of the *diſtance* of objects; viz. their apparent magnitude, the ſtrength of the colouring, the direction of the two eyes, the parallax of the objects, and the diſtinctneſs of their ſmall parts. Dr. Smith maintains, that we judge of *diſtance* principally, or ſolely, by the apparent magnitude of objects; and concludes univerſally, that the *apparent diſtance* of an object ſeen in a glaſs, is to its *apparent diſtance* ſeen by the naked eye, as the apparent magnitude to the naked eye is to its apparent magnitude in the glaſs: but Alhazen long ſince obſerved, that we do not judge of *diſtance* merely by the angle under which objects are ſeen; and Mr. Robins clearly ſhews the hypotheſis of Dr. Smith to be contrary to fact, in the moſt common and ſimple caſes. Thus, if a double convex glaſs be held upright before ſome luminous object, as a candle, there will be ſeen two images, one erect, and the other inverted: the firſt is made ſimply by reflexion from the neareſt ſurface; the ſecond, by reflexion from the farther ſurface, the rays undergoing a refraction from the firſt ſurface both before and after the reflexion. If this glaſs has not too ſhort a focal *diſtance*, when it is held near the object, the inverted image will appear larger than the other, and alſo nearer; but if the glaſs be carried off from the object, though the eye remain as near to it as before, the inverted image will be diminiſhed ſo much faſter than the other, that it will, at length, appear very much leſs than it, but ſtill nearer. Here, ſays Mr. Robins, two images of the ſame object are ſeen under one view, and their *apparent diſtances* immediately compared; and it is evident that thoſe *diſtances* have no neceſſary connexion with the apparent magnitude. This experiment may be made ſtill more convincing, by ſticking a piece of paper on the middle of the lens, and viewing it through a ſhort tube. He obſerves farther, that the apparent magnitude of very diſtant objects, is neither determined by the magnitude of the angle only under which they are ſeen, nor is the exact proportion of that angle compared with their true *diſtance*, but is compounded alſo with a deception concerning the *diſtance*; ſo that if we had no idea of difference in the *diſtance* of objects, each would appear in magnitude proportional to the angle under which it was ſeen; and if our apprehenſion of the *diſtance* was always juſt, our idea of their magnitude would be, in all *diſtances*, unvaried; but in proportion as we err in our conception of their *diſtance*, the greater angle ſuggeſts a greater magnitude. By not attending to this compound effect, Mr. Robins apprehends that Dr. Smith was led into his miſtake.

Montucla alſo, without being appriſed of what Mr. Robins had written, made ſimilar objections to the hypotheſis of Dr. Smith. Dr. Porterfield has made ſeveral remarks on the five methods of judging concerning the *diſtance* of objects above recited from M. De la Hire; and he has added to them, the conformation of each eye. See *Circle of* DISSIPATION. This, he ſays, can be of no uſe to us, with reſpect to objects that are placed without the limits of diſtinct viſion. But the greater or leſs confuſion with which the object appears, as it is more or leſs removed from thoſe limits, will aſſiſt the mind in judging of its *diſtance*: the more confuſed it appears, the farther will it be deemed. However, this confuſion hath its limits; for when an object is placed at a certain *diſtance* from the eye, to which the breadth of the pupil bears no ſenſible proportion, the rays proceeding from a point in the object may be conſidered as parallel; in which caſe, the picture on the retina will not be ſenſibly more confuſed, though the object be removed to a much greater *diſtance*. The moſt univerſal, and often the moſt ſure means of judging of the *diſtance* of objects, he ſays, is the angle made by the optic axes: our two eyes are like two different ſtations, by the aſſiſtance of which *diſtances* are taken; and this is the reaſon why thoſe perſons who have loſt the ſight of one eye, ſo frequently miſs their mark in pouring liquor into a glaſs, ſnuffing a candle, and ſuch other actions as require that the *diſtance* be exactly diſtinguiſhed.

With reſpect to the method of judging by the apparent magnitude of objects, he obſerves, that this can only ſerve, when we are otherwiſe acquainted with their real magnitude. Thus he accounts for the deception to which we are liable in eſtimating *diſtances*, by any extraordinary magnitudes that terminate them; as, in travelling towards a large city, caſtle, or cathedral, we fancy them to be nearer than they really are. Hence alſo animals and ſmall objects ſeen in a valley, contiguous to large mountains, or on the top of a high mountain or building, appear exceeding ſmall. Dr. Jurin accounts for the laſt recited phenomenon, by obſerving that we have no diſtinct idea of *diſtance* in that oblique direction, and therefore judge of them merely by their pictures on the eye. Dr. Porterfield obſerves, with reſpect to the ſtrength of colouring of different objects, that if we are aſſured they are of a ſimilar colour, and one appears more bright and lively than the other, we judge the brighter object to be the nearer. When the ſmall parts of objects appear confuſed, or do not appear at all, we judge that they are at a great *diſtance*, and *vice verſa*; becauſe the image of any object, or part of an object, diminiſhes as the *diſtance* of it increaſes. Finally, we judge of the *diſtance* of objects by the number of intervening bodies, whereby it is divided into ſeparate and diſtinct parts; and the more this is the caſe, the greater will the *diſtance* appear. Thus, *diſtances* upon uneven ſurfaces appear leſs than upon a plane, becauſe the inequalities do not appear, and the whole *apparent diſtance* is diminiſhed by the parts that do not appear in it: and thus the banks of a river appear contiguous to a diſtant eye, when the river is low and not ſeen. Accidens de la Vue, p. 358. Smith's Optics, vol. i. p. 52. and Rem. p. 51. Robins's Tracts, vol. ii. p. 230, 247, 251. Porterfield on the Eye, vol. i. p. 105, vol. ii. p. 387, &c. See Prieſtley's Hiſt. of Viſion, p. 205, and p. 689, &c. See VISIBLE.

DISTANCE, in *Navigation*, is the number of miles, or leagues, that a ſhip has ſailed from any point. See SAILING.

DISTANCE, *Line of*, in *Perſpective*, is a right line drawn from the eye to the principal point. Such is the line OF *(Tab. Perſpective, fig. 12.)*, drawn between the eye O, and the principal point F.

This, as it is perpendicular to the plane, or table, can only be the *diſtance* from the eye to the table.

DISTANCE, *Point of*, in *Perſpective*, is a point in the horizontal line at ſuch *diſtance* from the principal point, as is that of the eye from the ſame.

Such are the points P and Q *(Tab. Perſpective fig. 12.)* in the horizontal line PQ, whoſe *diſtance* from the principal point F, is equal to that of the eye from the ſame F.

DISTASTE, or DISGUST, a loſs of appetite, or an averſion, or repugnance, to foods which are commonly eaten.

Diſtaſte is held, by phyſicians, one of the principal diſorders of the ſtomach. It ariſes from a want of ſenſation in the upper orifice of the ventricle, which may be occaſioned various ways: as by a too great abundance of food; thick, heavy humours in the ſtomach; fat, viſcid aliment; obſtructions of the lacteals; ſuppreſſions of the uſual evacuations; intermiſſions of the ordinary exerciſes, a deſect of the nerves, in having their natural faculty aboliſhed, or ſuſpended as in a lethargy, and apoplexy; and according to Sylvius, by a groſs viſcid ſaliva, or a thick bile, aſcending out of the ſmall guts into the ſtomach.

DISTEMPER, in *Medicine*. See DISEASE.

DISTEMPER is alſo uſed in *Painting*, for the working up of colours with ſomething elſe beſides bare water, or oil.

If the colours be prepared with the former of theſe, that kind of painting is called *limning*; and if with oil, it is called *painting in oil*, or ſimply *painting*.

If the colours be mixed with ſize, whites of eggs, or any ſuch proper glutinous, or unctuous ſubſtance, and not with oil, they then ſay, it is done in *diſtemper*; as thoſe of the admirable cartoons, formerly at Hampton court.

The

The beſt method of compounding the colours with the vehicles, is to mix the ſize in water; then to levigate the colours in part of it, and afterwards to put each kind into a proper pot, adding as much more of the melted ſize as will bring it to a due conſiſtence, and mixing the whole well together in the pot, with a proper bruſh or wooden ſpatula. Warm water may be afterwards added, if neceſſary, for grinding the colours, or for working. The pots muſt be tied with bladders. This method of painting is chiefly confined to ſcenes, and groſſer works, where the effect depends more upon the perſpective art, and oppoſition of the colours, than on their brightneſs.

DISTENSION, the act of ſtretching a thing; alſo a ſtate of a thing violently ſtretched, and diſtended. See TENSION.

DISTENSION, *Diſtenſio*, Διαταϛις, in the *Ancient Muſic*, was uſed for the differences of ſounds with relation to acute and grave. Wallis's Append. ad Ptolem. Harm. p. 154.

Nature in this reſpect, ſtrictly ſpeaking, aſſigns no limits. But, with regard to our uſe, the ancient muſicians held, that the nature of what ſounded, and alſo of what was to judge, that is, the human ear, was to be conſidered: for, neither the human voice, nor even any inſtrument, can give intervals or *diſtenſions* immenſely great or ſmall, nor could the ear judge of ſuch. Ariſtoxenus fixes the leaſt interval or *diſtenſion* in practice, to the *dieſis enharmonica*. As to the greateſt, he thinks it does not exceed two octaves, and a fourth, or a fifth, if we conſider any human voice, or three octaves, if we conſider one and the ſame inſtrument. He does not deny that the extent of the voice, conſidered in different ſubjects, as in men and children, may go even beyond four octaves. Ariſtoxen. p. 21. edit. Meibom.

DISTICH, Διςιχον, a couplet of verſes; or a piece of poetry, the ſenſe whereof is comprehended in two lines. There are excellent morals in Cato's *Diſtichi*. See Vigneul de Marville on the *Diſtichs* of Cato, tom. i. p. 54, 55. Hexameter and pentameter verſes, otherwiſe called elegiacs, are diſpoſed in *diſtichs*.

DISTICHIASIS, in *Medicine*, a diſorder of the eye-lids; wherein, inſtead of one, they have two rows of cilia, or hairs.

The word is formed of Δις, *twice*, and ςιχος, or ςιχες, *order*, *rank*.

In the *diſtichiaſis*, over the common, and natural hairs, there grows another extraordinary row, which frequently eradicates, and tears up the former; and, pricking the membrane immediately inveſting the eye, occaſions pain, and draws defluxions upon it.

It is cured by plucking up the ſecond rows of hairs with nippers, and cauteriſing the pores out of which they iſſued.

DISTICHOUS *Stalk*, in *Botany*. See STALK.

DISTILLATION, or DESTILLATION, in *Chemiſtry* and *Pharmacy*, the art, or act, of ſeparating, or drawing off the ſpirituous, aqueous, oleaginous, or ſaline parts of a mixed body from the groſſer and more terreſtrial parts, by means of fire; and collecting and condenſing them again by cold.

The uſe of *diſtillation* is very great; it being by means hereof that waters, ſpirits, eſſences, and extracts, are chiefly made.

Diſtillation is uſually performed by means of fire raiſed to a greater or leſſer degree, as circumſtances require.

The fire is either applied immediately to the veſſels wherein the matters are to be *diſtilled*; or it is applied mediately, by means of water, ſand, iron filings, &c. Theſe different methods of applying the fire, are called *baths*, *balneæ*; *balneum Mariæ*, or *maris*; *balneum arenoſum*, &c. They are alſo called *beats*; as ſand-heat, water-heat, &c.

Diſtillation is twofold: 1. *Per aſcenſum*, *by aſcent*; when the matter to be *diſtilled* is above the fire, and the ſpirit, or other principle, is raiſed from it.

2. *Per deſcenſum*, *by deſcent*; when the matter which is to be *diſtilled* is below the fire, and the vapour drawn from it is precipitated to the bottom of the veſſel.

Diſtillation by aſcent is either *right*, or *oblique*.

DISTILLATION, *Right*, is performed with a common ALEMBIC, or cucurbit; wherein the liquor is raiſed, and deſcends again, in form of drops, into a receiver. This is chiefly uſed when the texture of the body is ſuch as allows of an aſcent, as in vegetables.

DISTILLATION, *Oblique*, is performed ſideways, and in crooked veſſels, as RETORTS. This has been called *diſtillation per latus*. Its uſe is, for ſuch bodies as conſiſt of heavier particles, and which cannot be raiſed without a ſtrong impulſe, nor even by the ſtrongeſt, ſo high as the top of the alembic; of which kind are almoſt all minerals and metals.

Mr. Woulfe, F. R. S. has contrived an apparatus for *diſtilling* a variety of ſubſtances, by which the fumes of vapours, that uſually eſcape in the ordinary method of *diſtillation*, and are often injurious to the lungs, are condenſed by paſſing into water, or ſome other fluid. See *Tab. Chemical Veſſels*, *fig.* 7. A is a retort, in the room of which may be ſubſtituted, on ſome occaſions, an iron pot, with a ſtone ware head, having its neck inſerted into the receiver. B is a receiver, into the neck of which that of the retort is inſerted; this has a ſpout at its bottom, through which the diſtilled liquor paſſes into the bottle C, and an opening in the ſide at D, into which one end of a tube, bent at right angles, is inſerted: the other end of the tube paſſes into a veſſel H, open at both ends, having its lower opening cloſed with a glaſs ſtopple. Through the upper mouth of the veſſel H, one end of another tube I, bent twice at right angles, paſſes, while the other end is inſerted into a bottle F, and immerſed in the water or other fluid contained in that bottle. The crooked tubes are fitted into the mouth of the veſſel H, by means of a cock, in which are two ſemicircular notches, through which the tubes paſs, and by lute. The tube which paſſes into the bottle F is fitted into its mouth by means of a cock, with a ſemicircular notch, but without lute. The vapour that is raiſed from the ſubſtance expoſed to heat in the retort, paſſes into the receiver B, where part of it is condenſed, and flows into the bottle C, while the reſt of it paſſes through the tube at D into the veſſel H. From this veſſel the vapour that remains ſtill uncondenſed paſſes through the crooked tube I into the water contained in the bottle F, by which it is all condenſed excepting ſome elaſtic air, which is extricated in almoſt all *diſtillations*. This elaſtic air riſes through the water, and eſcapes at the ſemicircular notch of the cock in the mouth of the veſſel, which on this account is not accurately cloſed with lute. In moſt *diſtillations*, a quantity of air is abſorbed at different times during the proceſs; and in this caſe the external air will preſs on the liquor in the bottle F, and force it through the tube I, into the veſſel H, from which it may be taken by opening the ſtopple L. The uſe of the veſſel H is to receive the liquor that may be thus raiſed from the bottle F, and to prevent it from paſſing into the receiver B, and from thence into the bottle C, where it might ſpoil the diſtilled liquor. By *diſtilling* 12 lb. of Britiſh fal ammoniac with 26 lb. of quick-lime and two gallons of water, Mr. Woulfe obtained 8¼ lb. of volatile alkaline ſpirit, ſtrong enough to make eau de luce, which was collected in the bottle joined to the receiver; and on adding two other gallons of water, he obtained 7 lb. of weak volatile ſpirit. Two ſtone gallon bottles, with three quarts of water in each, were ſucceſſively made uſe of to condenſe the vapour; as the one was heated by the fumes, the other was ſubſtituted in its room; and by the condenſed vapour, the ſix quarts acquired an increaſe of 2⅝ lb. in weight: and it appeared from experiments made with a view to compare the ſtrength of the alkali thus condenſed by water with that of the ſtrongeſt alkaline liquor firſt obtained, that a pound of the former was to a pound of the latter as 140 to 761; ſo that the quantity ſaved was nearly equal to 5 lb. of volatile alkali, which would have been loſt by the common method of *diſtillation*. Mr. Woulfe obſerved a ſingular difference betwixt the alkaline liquor collected in the bottle joined to the receiver, and that condenſed by the water in the bottle F; a conſiderable heat was excited by mixing the latter with the vitriolic acid, whereas there was no heat in a mixture of the former with the ſame acid.

Mr. Woulfe likewiſe *diſtilled* 14 lb. of common ſalt with an equal quantity of oil of vitriol, diluted with 7 lb. of water; and collected 9 lb. 5½ oz. of ſpirit of ſalt in the bottle C, and 6 lb. 12½ oz. of the ſame ſpirit condenſed in ſix quarts of water in the bottle F; and the reſiduum weighed 18 lb. 6 oz. ſo that there was a loſs of 8 oz. or 1/28th of the whole, moſt of which was probably elaſtic air. The ſtrength of the acid condenſed in water was found to be to the ſtrength of that collected in the bottle C, as 200 to 109; ſo that the 6 lb. 12½ oz. of the former is equal to near 13 lb. 1 oz. of the latter, and ſo much was ſaved by this method of *diſtillation*.

He obſerves, that the flower the *diſtillation* was conducted, the more concentrated were the acid vapours condenſed in water: and that the moſt concentrated portion of the acid of ſea-ſalt is the moſt volatile; and that in ſtrength it is to the vitriolic acid, whoſe ſpecific gravity was to that of water as 24 to 13, in the proportion of 444 to 31: and moreover, that the vapour of ſpirit of ſalt condenſed in water contained no vitriolic acid, though the ſpirit collected in the bottle C contained ſome of that acid. Mr. Woulfe formed a marine ÆTHER, by applying the vapour of rectified ſpirit of wine to this very concentrated vapour of ſpirit of ſalt, and

and condenſing the combined vapours in ſpirit of wine. The proceſs for this purpoſe was briefly as follows: the necks of two retorts, one of which contained the ſpirit of wine, and the other the ſea-ſalt and vitriolic acid, from which the marine acid was to be diſtilled, opened into one receiver, where the vapours meet; from this receiver the vapours paſſed through a tube into ſpirit of wine contained in a bottle; and thoſe which were not there condenſed, paſſed through another tube into ſpirit of wine contained in a ſecond bottle. By a farther *diſtillation* and cohobation, with flaked lime, of the ſeveral liquors collected in the receiver, and in the ſpirit of wine in which the vapours were condenſed, a very ſubtle penetrating æther was produced. The apparatus for this purpoſe is repreſented in *fig.* 8. B is a glaſs tubulated retort, coated with loam up to B, and placed in the furnace A: D is another tubulated retort fixed in a veſſel with ſand in the furnace C. E is a ſtone veſſel, in which the vapours of B and D are combined together; F is the bottle for receiving the liquor which diſtils; G is a tube about three quarters of an inch bore fitted to E, and H a crooked pipe about a quarter of an inch bore; I and K are glaſs veſſels containing ſpirit of wine, and L is a crooked glaſs tube.

Mr. Woulfe apprehends that his method of condenſation may be applied to the *diſtillation* of vitriolic acid, to the rectification of phoſphorus, the vapours of both which ſubſtances ſhould be condenſed by means of water; to the rectification or *diſtillation* of vitriolic æther, the vapours of which ſhould be condenſed in ſpirit of wine; and to many other *diſtillations*. Phil. Tranſ. vol. lviii. for 1767. art. 50. or Dict. Chem. vol. iii. ad fin.

DISTILLATION *by deſcent*, is where the fire is applied on the top, and all around the veſſel, whoſe orifice is at the bottom; and, conſequently, the vapour not being able to riſe upwards, it is forced to precipitate, and diſtil down to the bottom. This method of *diſtillation* has many faults, is abſolutely unneceſſary, and is entirely neglected.

There is a ſecond kind of *diſtillation* by deſcent, called *per deliquium*; which is a natural liquefying, or reſolving, of ſalts into a liquor, by means of moiſture.

In the reſolution of ſimples, an excellent method to preſerve their virtues is, in lieu of fire, or any other foreign heat, which might alter or deſtroy theſe virtues, to make uſe of the heat of a dunghil made of putrefied herbs.

The proceſs and meaſures of *diſtillation* are very different, according to the different ſubjects to be diſtilled. Care ſhould be taken that no greater heat is applied than is juſt neceſſary to raiſe the ſubſtances to be diſtilled: this is proper, both for the ſucceſs of the operation, and for preventing the breaking of the veſſels.

Acid ſpirits are uſually drawn into a *reverberatory* FURNACE, and with a vehement fire; ponderous woods, as guaiacum, box, &c. are diſtilled in a retort, after the ſame manner. In theſe, firſt comes a little phlegm, and then, the fire increaſing, the ſpirits fly out in white clouds: when they ceaſe to come, the matter in the receiver is filtrated through a tunnel, which lets paſs the ſpirits, leaving a black fetid oil behind. See CONCENTRATION.

Odoriferous plants, as baum, wormwood, ſage, hyſſop, &c. are diſtilled by the CUCURBIT, or veſica; firſt pouring a ſtrong decoction of the ſame plant hot upon the plant itſelf bruiſed, or adding common water to the plant, whether dry or freſh, cut with ſhears into ſmall pieces, and letting the whole digeſt in a cloſe veſſel two days: then about half the water, or ſpirit, is drawn away by *diſtillation*; and what remains, being preſſed, filtrated, and evaporated, to the conſiſtence of honey, is the extract of the plant. Laſtly, drying what remained in the cloth after expreſſion, and burning it, they make a lixivium of its aſhes; which being filtrated, and evaporated to dryneſs, what remains is the fixed ſalt of the plant.

Plants not odoriferous, are ſometimes managed thus: the plant, being pounded, and two thirds of the alembic, or retort, filled with it; they pour a good quantity of the expreſſed juice of the ſame plant upon it, ſo as the bruiſed matter may float therein, without ſticking any where to the veſſel; then they draw off about half as much water as there was juice, which is the diſtilled water of that plant: what remains being preſſed in a cloth, and the juice ſettled, they filtrate, and evaporate it to two thirds; and, ſetting it in a cool place, the eſſential ſalt ſhoots into cryſtals.

There is a method of DISTILLING *cold*; which is thus performed; they take, for inſtance, four pounds of flowers, more or leſs, and put them in three or four pints of water, and put the whole in a limbec, which they lute exactly; then place it in a veſſel half filled with ice, beaten and ſalted, as if they meant to freeze the water; then fit on a receiver, and lute it well: then, wetting a linen cloth in hot water, they cover the limbec-head therewith, repeating this ſeveral times; by which means, the fineſt parts are raiſed from the flowers. But care muſt be taken, that all the ſuperfluous water hath been firſt emptied out of the limbec.

Dr. Beal, in the Philoſophical Tranſactions, mentions an extraordinary kind of cold *diſtillation*, viz. made by froſt and cold air: his thermometer being expoſed out of doors, during the ſevere froſts of 1665, fine clear drops, like dew, aſcended to the top of the tube, which afterwards, in time, re-deſcended into the ſtem, and filled the ſpace of half an inch; and, though the ſpirit of wine itſelf was tinged very deep, yet this ſecond ſpirit was clearer and brighter than any cryſtal. The like he did by expoſing his thermometer to the hot air in the middle of ſummer; and hence takes occaſion to recommend a farther proſecution of this pſychrotechnia.

The aſcent of fluids, we are taught by philoſophy, is effected two ways: 1. By their ſpecific gravity; and, 2. By impulſe.

The firſt way of elevation is manifeſt, from this lemma, viz. that particles of bodies which ſwim in any fluid, if they be ſpecifically lighter, muſt be borne upwards by that fluid: hence, as diſtilled liquors are carried upwards through the air, it is to be inquired, how they come to be ſpecifically lighter than air.

Now, a fluid will be ſpecifically lighter than another, when, under a larger ſurface, it has an equal, or a leſs gravity: according to this proportion, the bulk of the fluid ought to be increaſed in *diſtillation*; and how eaſily, by the help of fire, it may be increaſed, or, which is the ſame thing, rarefied, will appear, from what we have ſaid under the articles HEAT, and RAREFACTION. It is known, by computation, that the proportion of the ſpecific gravity of water to that of air, is ſomething more than as eight hundred to one: ſince, therefore, ſimilar ſpheres, or ſolids, are as the cubes of their diameters; and the ſpecific gravity decreaſes reciprocally in the very ſame proportion as the cubes of the diameters increaſe; in order to make a particle of water lighter than a particle of air, no more is neceſſary than to rareſy it till its diameter becomes ten-times greater; which, in this caſe, is but a very ſmall degree of rarefaction: for the cube of the diameter, in a particle ſo rarefied, is 1000: if the diameter be made eleven times greater, the cube will be 1331; and if twelve, 1728: ſo that water, when rarefied but twelve degrees, will be above doubly lighter than air; and if the rarefaction be carried on farther, it may eaſily be collected from the increaſe of the numbers, that a particle of water may be rendered almoſt infinitely lighter than air. Now, the elevation of bodies equally fluid, and heavy, is always proportionable to their different aptitude to be rarefied; that is, they aſcend quicker, upon the application of any force, the more ſuſceptible they are of rarefaction: but, in bodies whoſe aptitude to rarefy is equal, the time of aſcent is to be determined by their ſpecific gravity.

But it is not only ſpecific gravity that ſerves to elevate bodies in *diſtillation*; but an external impulſe may alſo cauſe their aſcent: the impulſe we have here to do with, comes from the fire; whoſe particles, though extremely ſmall and light, yet may raiſe bodies much heavier than themſelves, by acting upon them with a certain degree of force. For ſince the moment of a body, or that force by which it acts upon another, is in a compound ratio of the quantity of matter, and celerity; the celerity may be ſo increaſed, as to give a ſufficient force to the body, though the quantity of matter in it be ever ſo ſmall. Let ſome heavy body, therefore, be ſuppoſed to deſcend, with no other moment than what it receives from its own gravity; in this caſe, then, the air, which is much lighter, may be moved with ſuch celerity, as not only to ſuſtain that body, but to mount it up higher: and the more rapid the impetus of the air is, or the ſurface of the body more diffuſed, the higher and ſwifter will the elevation be.

So fire, though it be a body of the minuteſt ſize, may be moved with that rapidity, as to acquire and communicate what force can be deſired towards removing any obſtacles. When, therefore, the moment of fire is augmented in the manner explained, ſo as to exceed the force of the diſtilled body, it will remove it from its former ſituation; or, what is here the ſame thing, becauſe the direction of its motion tends upwards, it will carry it up. And thus, particles ſpecifically heavier than the air contained in the retort, as thoſe of acid ſpirits are, aſcend by a more violent impulſe of the fire uſed in *diſtillation*.

Another thing to be noted, is, that the ſame quantity of matter is elevated ſo much the eaſier, in proportion as the

the ſurface is enlarged: for the more this is diffuſed, the more particles of fire it receives. Having, therefore, this united force to drive it up, it more eaſily aſcends; ſo that, by the ſame degree of fire, bodies will not equally ariſe, though they are equally heavy, if there be that difference in their ſurfaces already ſuppoſed.

The air, alſo, has no ſmall ſhare in the buſineſs of an impulſe: for, being rarefied by the fire, it is not only impelled upwards itſelf, but it carries other particles up with it: and it may be learned, by many very familiar experiments, what impetus bodies, ſo rarefied, exert. Whoſoever, therefore, well conſiders theſe things, viz ſpecific levity, an impelling force, and the extent of ſurface; and what may be effected by them; and how many ways, and in what proportions, all of them may be changed; will very eaſily account for all the variety which is found in the ſeveral proceſſes of *diſtillation*.

DISTILLATION, *Combinatory*, a term introduced into uſe by Dr. Shaw, in his Eſſay on Diſtillation, to expreſs that ſort of rectification of diſtilled ſpirits which is done with ADDITIONS, and which he otherwiſe calls improper rectification, by way of diſtinction from that proper rectification, which is the only method of reducing a ſpirit to its utmoſt degree of purity and perfection.

In the *combinatory diſtillation*, many ingredients are added in order to rectify the ſpirit, as the diſtillers expreſs it; and ſome part of theſe actually come over and mix themſelves along with the ſpirit ſo intimately, as not to be ſeparable again without great difficulty. This is done with a deſign to alter, improve, or aboliſh the natural flavour of the ſpirit; but inſtead of rectifying it, they only obſcure and pervert its true qualities. In the buſineſs of rectification, properly ſo called, of the malt ſpirit, all that is neceſſary is the re-diſtilling of the low wines procured from the waſh; the again diſtilling over of the ſpirit thus obtained, and called proof-ſpirit, into a totally inflammable liquor called alcohol. This is done by the common proceſſes, only taking care not to increaſe the fire by ſudden ſpurts, ſo as to raiſe the oil with the ſpirit, which if once mixed will not be eaſily ſeparated again, and ſcarce ever perfectly, whatever care is uſed.

The methods of combinatory rectification, on the other hand, are very numerous, every diſtiller having his peculiar noſtrum about it. Malt ſpirit is the general ſubject of this proceſs, and the means uſed to rectify it on this plan may be reduced to three heads. 1. That by fixed alkaline ſalt alone. 2. That by fixed alkaline ſalts and acid ſpirits. And 3. That by ſaline bodies and flavouring additions. The general method is that by fixed alkaline ſalts alone; but it is ſurprizing to ſee in how careleſs and ſlovenly a manner this is done by the generality of our diſtillers, though we are allowed to excel all other nations in it. The effect of this operation, when carefully performed is to attenuate and thin the ſpirit, and to keep back a part of its groſs and fœtid oil, and ſo far to alter the part of the oil which comes over, as ſcarce to leave the ſpirit diſtinguiſhable for a malt ſpirit. This end is greatly promoted by a prudent and ſteady management of the fire, and by leaving out the faints; but this is a thing our diſtillers never attend to: they hurry over the operation, working the ſtill in its full force, and by this means raiſe and carry over the oil; though the whole buſineſs of the proceſs is to keep it back; and they even ſuffer the fulſome bitter oil, made into a kind of liquid ſoap with the ſalt in this proceſs, to run among the ſpirit with the faints; by this the whole intent of the proceſs is fruſtrated, and the ſpirit rendered much harder to clean than it was before.

This operation is uſually performed upon proof-ſpirit, and the quantity allowed is from eight to fourteen pounds of ſalt of tartar, fixed nitre, pot-aſh, or more commonly calcined tartar, to the piece. The tartar being only roaſted to a blackneſs in this laſt proceſs, is ſold under the abſurd notion of a vinous ſalt; and the dealers will often praiſe the vinoſity of their ſpirit, becauſe diſtilled from this ſalt: but the truth is, that this ſalt never fails to give, inſtead of a vinoſity, a ſaponaceous, urinous, or lixivial taſte and ſmell. This is the great misfortune that attends the method of rectifying by means of fixed ſalt, for they all of them become volatile in part during the operation; and this volatile portion paſſes over the helm with the ſpirit, and impregnates it, uniting itſelf alſo with that portion of oil yet retained in the ſpirit, and much more firmly combining it and the ſpirit together than they were before; ſo that in reality the ſpirit thus rectified is no other than an alkaline or tartariſed ſpirit, as the chemiſts call it, a thing extremely different from a true vinous ſpirit.

This method, therefore, though it were practiſed to the utmoſt perfection, would never do what was intended by it, but would alter, inſtead of rectifying the ſpirit. Hence there appears the neceſſity of ſome acid to deaden the force of the alkali thus uſed in the rectification. The neceſſity of this, gave occaſion to the method of mixing acids and alkalis together for theſe purpoſes. The acids uſed by our diſtillers on this occaſion, are thoſe of the mineral kingdom, becauſe of their cheapneſs; and the moſt common in uſe among them are oil of vitriol, ſpirit of nitre, oil of ſulphur, and the like. The moſt celebrated rectifiers in the malt way have got their reputation by the uſe of theſe acids. There is ſome choice, however, to be made of the ſpirits according to the greater or leſſer foulneſs and need of rectification, and they muſt not only be well proportioned, but carefully introduced, and regularly mixed; and indeed without ſome ſkill and judgment in the management of theſe corroſives, no diſtiller ought to attempt to meddle with them.

Theſe ſtrong and violent acids at beſt are not ſo well adapted to the work as the milder ones, particularly the ſulphureous ſpirit of vitriol, which comes over in the rectification of the oil; to this may be added the common *ſpiritus nitri dulcis*, and Mr. Boyle's acid ſpirit of wine well prepared.

Some of our rectifiers, inſtead of the fixed ſalt, uſe quick-lime, which cleanſes and dephlegmates conſiderably: but this method requires the aſſiſtance of acids alſo afterwards, to take off not only the alkaline diſpoſition, but alſo the ſtinking flavour it leaves behind it. Some alſo uſe chalk, virgin earth calcined, and burnt animals bones. Theſe are of conſiderable uſe in the rectifying of brandy without rendering the ſpirit any more unfit for the purpoſe of the compounders than before, or requiring much acid afterwards.

The great art of uſing the flavouring ingredients in rectification, is the proper admixture of ſalts in the operation, for without theſe the flavours added by this means do very little. The ſalts uſed on this occaſion are either the fixed alkalis, as pot-aſh and calcined tartar, or decrepitated common ſalt, or calcined vitriol, alum, or ſandiver. The flavouring ingredient is to be applied afterwards, and the whole quantity of the ſpirit either drawn over again, or not, as the occaſion and nature of the addition requires. But theſe ſaline bodies perform ſo very little, that the ſpirit is uſually left impregnated with a flavour from its own oil, which is but badly hidden, or overpowered by the other ingredients. The moſt common flavourers, as they call them, are theſe: mace, orrice-root, parſnip, artichoak, rhodium, raiſin-ſtalks, damaſk-roſes, wine-lees, rape or grape-huſks, and the oil of wine. The laſt of theſe is infinitely preferable to all the others, but is not ſo well known. Theſe and the like ingredients judiciouſly mixed, will, when the ſpirit is very well purified firſt, give the flavour of foreign brandies with ſome tolerable exactneſs; but if this is not attained, their flavour will be loſt in the original one, and the general taſte reſulting from the whole will be like nothing at all. The ultimate perfection aimed at in all the proceſſes of *combinatory diſtillation*, is the departing of the Engliſh malt ſpirit at one operation, ſo as to render it taſteleſs and inodorous, and yet vinous; or elſe to make it reſemble the French brandy, arrack, or ſome other low-flavoured vinous ſpirits.

This is certainly practicable, though not uſually practiſed to the perfection that it might be; the principal thing to be endeavoured after, is the obtaining of a taſteleſs ſpirit, capable of receiving any impreſſion, and then the buſineſs of flavouring is eaſy. The method of rectifying, by fixed alkaline ſalts, is capable of great improvement, as by ſteeping the ſpirit firſt brought near to the ſtate of alcohol, upon a well-dried ſalt of tartar, or any other cheaper, but pure fixed alkali; by this means it will be almoſt totally freed of its oil without volatiliſing much of the ſalt, as it does in the way of *diſtillation*; by this means a weak tincture of ſalt of tartar may be procured, and an acid added to this, to take off the effects of the alkali in the ſpirit; the whole is then to be diſtilled, and the fire being well managed, a very clean ſpirit will be thus procured at one operation, ſuch as can no way elſe be obtained at once.

The uſe of the compound neutral ſalts in rectification ſeems not yet to be ſufficiently known; what is meant by theſe ſalts is a fixed alkaline ſalt ſaturated with an acid one. Such a ſalt has indeed been expected from the *caput mortuum*, or white ſaline cake, remaining upon the *diſtillation* of the ſpirit of nitre with oil of vitriol; but it proves too hard, ſtony, and inſoluble, to be of any great uſe on this occaſion: a much better effect may be expected from ſoluble tartar, carefully prepared, and properly uſed; though even this is apt to render the ſpirit a little ſaponaceous. Some compound neutral ſalts have been made, however, upon this foundation, that would rectify common malt ſpirit from proof at a ſingle operation,

tion, much better than all the other more perplexed and tedious methods in uſe. A prudent uſe of fine dry ſugar may alſo be of ſome ſervice, as it readily unites with the eſſential oil, and detains and fixes it without imparting any urinous or other naufeous flavour to the ſpirit rectified upon it. Another hint to this purpoſe, which may be made to turn to very good account, is that given by the ingenious method invented by Dr. Cox, of taking all the oil out of the volatile ſalts, by firſt bringing them to a neutral ſtate with the ſpirit of ſalt, and then ſubliming them with ſalt of tartar, which does the buſineſs to perfection. In the caſe of ſpirits the acid may be varied, and virgin-earth, chalk, calcined flints, or the like abſorbents uſed inſtead of ſalt of tartar, and yet the general effect will be the ſame. Shaw's Eſſay on Diſtillery.

DISTILLATION, *Brewing for.* See BREWING.

DISTILLATION *of ſalt water*, in order to obtain freſh. See *Salt*-WATER.

DISTILLED *Juice of tar.* See TAR-*water*.

DISTILLED *Waters.* The waters *diſtilled* from plants and other medicinal things, may receive ſomething from the veſſels in which they are *diſtilled*, which may in ſome degree alter their properties. Even water alone *diſtilled* in glaſs veſſels, and in thoſe of metal, differs ſo much, that theſe two diſtillations being mixed, will render one another turbid. The Florentine academicians have taken this change of waters under their conſideration, among the many other minutiæ of natural and experimental philoſophy omitted by others. They found that common water *diſtilled* in leaden veſſels would render all other waters turbid, on mixing with it; whether it were ſpring, fountain, river, or well water, except alone the water of the conduit at Piſa: an experiment that proved a quality in that water, different from all others, though never before ſuſpected in it. The experiment being repeated at various ſeaſons afterwards, the water of this conduit was ſometimes found to grow turbid alſo; but this was at ſuch times as other waters, from rain, &c. had blended themſelves with the genuine water of the ſpring. Waters *diſtilled* in glaſs veſſels, and mixed with waters *diſtilled* in lead veſſels, were ſuppoſed by the Florentines indeed not to render one another turbid; but, by the obſervations often made by the curious Redi, it proved that they did. See Redi's Obſervat.

Common water *diſtilled* in gold, ſilver, or glaſs, with a glaſs head, and kept in glaſs, remains always clear; but, in cryſtal of Piſa, it grows turbid in a few hours, then milky, and in a few days yellow, and after all this bitter; whereas in cryſtal of Rome or Venice, the ſame water does not grow turbid till after two or three days, and never becomes yellow or bitter in it; and in cryſtal of Paris it will ſcarce grow turbid, but after a very conſiderable time. The various materials uſed in the making of theſe ſeveral kinds of cryſtal, at the glaſs houſes of theſe different places, and the various manner of working them, are the occaſion of this great difference in them; and on theſe principles we may find a new and more than ordinary way of judging of the goodneſs of glaſſes, which ſeem equal to one another. See WATERS.

DISTILLED *Waters of laurel-leaves.* See LAUREL.

DISTILLER, a perſon who diſtils ſpirits for ſale. Such a perſon is liable to the ſurvey and duties; and is not allowed to have any ſtill or number of ſtills, which ſingly or together contain leſs than a hundred gallons under the penalty of 100*l.* and the waſh-ſtill ſhall contain at leaſt four hundred gallons, excluſive of the head, under the ſame penalty. 2 Geo. III. c. 5. and 14 Geo. III. c. 73.

Diſtillers are to enter their warehouſes, ſtills, and veſſels, &c. at the next office of exciſe, on pain of 20*l.* and perſons occupying any ſuch ſhall forfeit 50*l.* and the veſſels are to be marked by the gager. 8 and 9 W. c. 16. 24 Geo. II. c. 40.

Diſtillers who uſe private pipes, &c. for conveyance of diſtilled liquor, forfeit 100*l.* 10 and 11 W. c. 4. They ſhall alſo make holes in the breaſt of the ſtill for taking gages and ſamples and provide locks on the ſtill-heads, the holes, diſcharge-cocks, and furnace-door, under a penalty of 50*l.* and of 200*l.* for breaking or wilfully damaging ſuch lock or faſtening, after it has been ſecured by the officer. 12 Geo. III. c 46. 14 Geo. III. c. 73.

Diſtillers are required to give notice to the officer of exciſe, before they receive any wine, cyder, &c. or any kind of fermented waſh, on pain of 50*l.* and alſo before they charge or open the ſtill, expreſſing and deſcribing the number and marks of the waſh-batches uſed; and they are prohibited from charging the ſtill with any other, under a penalty of 100*l.* 24. Geo. II. c. 40. 12 Geo. III. c. 46. 14 Geo IIIe. 73

Diſtillers, in preparing grift for waſh, that uſe more wheat than in the proportion of one quarter of wheat to two quarters of any other grain, forfeit 50*l.* 33 Geo. II. c. 9.

Exciſe officers may enter warehouſes, &c. uſed by *diſtillers* and dealers, to take account of liquor, by day or night; and perſons obſtructing them forfeit 50*l.* 6 Geo. I. c. 21. and 5*l.* a gallon is forfeited for all liquors concealed, 3 W. c. 15.

Retailers of diſtilled liquors, or ſuch as ſell the ſame in leſs quantity than two gallons, muſt take out a licence; which is to be granted only to thoſe who keep taverns, victualling-houſes, inns, coffee-houſes, or ale-houſes; who, within the limits of the head office of exciſe in London, pay 10*l.* a year rent and pariſh rates, and in places where the occupiers are not rated, 12*l.* a year; and who, in other parts of the kingdom, pay to church and poor. They muſt firſt be licenced to ſell ale in the places where they dwell. Retailers without licence forfeit 10*l.* which may be either levied, and is in no caſe to be mitigated below 5*l.* or the offender may be committed to hard labour for two months; and by another act, the forfeiture is 50*l.* 16 Geo. II. c. 8. 17 Geo. c. II. 17. 24 Geo. II. c. 40. 16 Geo. II. c. 13. 9 Geo. III. c. 6. 13 Geo. III. c. 56. Hawkers of ſpirituous liquors in the ſtreets, &c. are liable to a forfeiture of 10*l.* 9 Geo. II. c. 23. 11 Geo. II. c. 26. Perſons giving away ſpirituous liquors, or paying wages in them, ſhall be deemed retailers. 9 Geo. II c. 23. Keepers of gaols, work-houſes, &c. ſelling ſpirituous liquors, or knowingly ſuffering them to be ſold, except ſuch as are preſcribed by a phyſician, ſurgeon, or apothecary, forfeit for the firſt offence 100*l.* and for the ſecond their office. Debts for ſpirituous liquors cannot be recovered, unleſs they have been contracted, or the liquors delivered at one time to the value of 20*l.* or upwards: and *diſtillers* knowingly ſelling or delivering diſtilled liquors to unlicenced retailers, forfeit 10*l.* and treble their value; and the retailer, convicting the *diſtiller*, is entitled to a ſhare of the penalty, and is himſelf indemnified. Perſons riotouſly reſcuing offenders, or aſſaulting informers, and their aiders or abettors, are guilty of felony, and liable to ſeven years tranſportation. 24 Geo. II. c. 40. No liquor exceeding one gallon ſhall be removed without a permit. 6 Geo. I. c. 21. Britiſh ſpirits made from corn are allowed on exportation as merchandize, a bounty or drawback of 3*l.* 12*s. per* ton; provided that they are not exported in caſks containing leſs than a hundred gallons, and in veſſels of leſs burden than a hundred tons; except to Africa and Newfoundland, whither they may be exported in any veſſels of more than ſeventy tons 2 Geo. III. c. 5. and 6 Geo. III. c. 46.

DISTILLERY, the art of diſtilling BRANDY and other ſpirits. This art was firſt brought into Europe by the Moors of Spain, about the year 1150: they learned it of the African Moors, who had it from the Egyptians: and the Egyptians are ſaid to have practiſed it in the reign of the emperor Dioclesian, though it was unknown to the ancient Greeks and Romans. Anderſon's Hiſt. of Commerce, vol. i. p. 83. See FERMENTATION, and MALT *diſtillery*.

DISTINCT *notion*, or *idea*, according to M. Leibnitz, is, when we can enumerate marks and characters enough whereby to recollect a thing.

Such, e. gr. is this; that a circle is a figure bounded with a curve line that returns into itſelf; all the points whereof are equally diſtant from one middle part. Or, it is that wherein the mind perceives a difference from all other ideas.

DISTINCT *baſe*, in *Optics*, is that diſtance, from the pole of a convex glaſs, in which objects, beheld through it, appear *diſtinct*, and well defined: ſo that the *diſtinct baſe* coincides with what we otherwiſe call the focus.

The *diſtinct baſe* is cauſed by the collection of the rays proceeding from a ſingle point in the object, into a ſingle point in the repreſentation: and therefore concave glaſſes which do not unite, but ſcatter and diſſipate the rays, can have no real *diſtinct baſe*.

DISTINCTION, a diverſity in things, or conceptions.

Logicians define *diſtinction*, an aſſemblage of two, or more words, whereby diſparate things, or their conceptions, are denoted.

There are three kinds of *diſtinctions*, taken from the three different modes of exiſtence: the firſt *real*; the ſecond, *modal*; and the laſt *rational*.

DISTINCTION, *Real*, is that between things which may exiſt, or be conceived to exiſt, apart from each other: ſuch is that between two ſubſtances, or the modes of two ſubſtances.

DISTINCTION, *Modal*, is that between ſeveral *things*, one whereof may exiſt without the other; but not *vice verſa*, the other without that: ſuch is that between the mind,

and

and an act of will; between wax, and its hardneſs; water, and its freezing, &c.

DISTINCTIO *Rationis*, or *Rational* DISTINCTION, is that between ſeveral things, which are really one and the ſame, and whereof one cannot exiſt without the other, nor, *vice verſa*, the other without this: ſuch is that between a thing, and its eſſence; between the eſſence, and properties, &c.

Of this *diſtinction* ſome authors admit two kinds; the one barbarouſly called *rationis ratiocinatæ*, having ſome foundation in things; as when we diſtinguiſh the juſtice of God from his mercy: the other called *rationis ratiocinantis*, which has no foundation at all; and therefore is, by many, quite rejected.

Though others contend, that there is no *diſtinctio rationis*, but is, at the ſame time, a *real diſtinction*: thus, ſay they, God, and juſt God, are, to each other, as milk, and white milk; and a juſt God, and merciful God, as white milk, and ſweet milk. But when I ſay, milk is *diſtinguiſhed* from white milk, or white milk from ſweet milk, the *diſtinction* falls between whiteneſs and ſweetneſs, which is a *real diſtinction*. See REALISTS.

DISTINCTION, *Metaphyſical*, called alſo by the ſchoolmen *aliutas*, *aiteritas*, and *diverſitas*, is a non-agreement of being, whereby this entity is not that, or one thing is not another.

DISTINCTIO, or DISTINGUO, in the *Schools*, an expedient to evade an argument, or to clear up, and unfold an ambiguous propoſition, which may be true in one ſenſe, and falſe in another. The reſpondent was hard preſſed, but he diſengaged himſelf by a *diſtinguo*. Moliere makes T. D. ſay to his miſtreſs, who had told him, he muſt ſubmit to the will of a perſon he loved: *Diſtinguo, Mademoiſelle, pour l'interêt de ſon amour, Concedo; contre ſa paſſion, Nego.*

DISTORTION, in *Medicine*. DISTORTIO *oris*, or DISTORTION *of the mouth*, is a contraction, or ſhortening of one ſide of the mouth, occaſioned by a convulſion, or a palſy of the muſcles of one ſide of the face.

When a *diſtortion* ariſes from a convulſion, it is on the ſame ſide with the convulſion, the force of the convulſed part being ſuperior to that of the ſound part: on the contrary, when it ariſes from a palſy, it is on the oppoſite ſide, the paralytic part being here ſurmounted by that which is ſound.

In a *diſtortion of the mouth*, the patient can only ſpit on one ſide; and if he laughs, or pronounces the letter O, he only moves one ſide of his mouth.

The Greeks call this diſorder σπασμος κυνικος, *ſpaſmus cynicus*. This malady is often the effect of careleſſneſs and ill habits. A remarkable inſtance of this kind is mentioned by Wincklow; in which, by careleſſneſs, dreſſing, and leaning, the back-bone of a young lady became crooked, and bent ſideway in contrary directions, like the letter S.

DISTORTION *of the eye*, is called alſo SQUINTING, or STRABISMUS.

DISTORTOR *oris*, in *Anatomy*, a muſcle of the mouth, called alſo ZYGOMATICUS.

DISTRACTION, in *Medicine*, ſometimes denotes the act of pulling a fibre, membrane, or the like, beyond its natural extent: and what is capable of this enlargement, is ſaid to be *diſtractile*.

DISTRAIN, in *Law*. *To* DISTRAIN, is to attach, or ſeize on one's goods, for the ſatisfaction of a debt.

DISTRESS, in *Law*, a compulſion recurred to in certain real actions, for bringing a man to appear in court, or pay rent, or other duty denied: and by the common law, *diſtreſſes* for rent were not to be ſold, but only detained for enforcing payment of the rent; but this is altered by ſtatute.

The method of *diſtreſs* for rent has been much altered in this caſe. If any tenant of lands or tenements ſhall fraudulently carry away his goods, to prevent *diſtreſs*, the landlord may within thirty days after *diſtrain* them wherever they ſhall be found, as if they had been on the premiſes; but no ſuch goods ſhall be *diſtrained*, if ſold, *bona fide*, for valuable conſideration before ſeizure, to any perſon not privy to the fraud. Tenants committing ſuch fraud, or others aſſiſting, ſhall forfeit double the value of the goods carried off, to be recovered by action of debt, &c. and where they ſhall not exceed fifty pounds value, the landlord may exhibit a complaint before two juſtices of the peace, who are to examine the fact, and enquire into the value of the goods, and thereupon order the offender to pay double value, leviable by *diſtreſs* and ſale; or for want thereof, commit the offender to the houſe of correction for ſix months. Landlords or their agents may, with the aſſiſtance of a conſtable, ſeize any goods fraudulently concealed in any houſe, out-houſe &c. And in caſe of a dwelling-houſe, on oath firſt made to ſome juſtice, of reaſon to ſuſpect that ſuch goods are therein, may break open the ſame, and *diſtrain* them. They may alſo *diſtrain* for rent, any cattle, or ſtock of their tenants, feeding on any common; or corn growing on the land, which they ſhall cure, and lay up when ripe, in any proper place, giving notice to the tenant within a week where lodged; and diſpoſe thereof toward ſatisfaction of the rent and charges; the appraiſement to be taken when cut and cured. But if after *diſtreſs* ſo taken, before the product be ripe and gathered, the tenant ſhall pay the rent, and charges of the *diſtreſs*, the ſaid *diſtreſs* ſhall ceaſe. Perſons may ſecure *diſtreſſes* lawfully taken, and fell them upon the premiſes, in like manner as may be done off the ſame, by 2 W. and M. and any perſons may go to and from the premiſes, to view, appraiſe, buy, or take away the goods of the purchaſer; and if a reſcous be made for the *diſtreſs*, the perſons aggrieved ſhall have the remedy given by the ſaid ſtatute. Stat. 11 Geo II. cap. 19.

The uſual effect of *diſtreſs* is to drive the party *diſtrained* to replevy the *diſtreſs*, and ſo take his action of treſpaſs againſt the *diſtrainer*; or elſe to compound with him for the debt, or duty, for which *diſtreſs* was made.

There are ſevera things not *diſtrainable*, for a *diſtreſs* muſt be of a thing, whereof a valuable property is in ſomebody; and, therefore, dogs, bucks, coneys, &c. that are *fera naturæ*, cannot be *diſtrained*.

Again although it be of a valuable property, as a horſe, (yet when a man or woman is riding on him) or an ax (in a man's hand cutting wood) and the like, are for that time privileged, and cannot be *diſtrained*.

Again, valuable things ſhall not be *diſtrained* for rent, which are for the benefit and maintenance of trades, and which, by conſequence, are for the commonwealth, and are by the authority of the law there; as an horſe in a ſmith's ſhop; materials in the weaver's ſhop for making cloth; cloth, or garments, in the taylor's ſhop; ſacks of corn, or meal in a mill, or a marker; nor any thing *diſtrained* for damage feſant, for it is in *cuſtodia legis*.

Again, nothing ſhall be *diſtrained* for rent, which cannot be rendered again in as good a plight as it was at the time of the *diſtreſs* taken; as ſheaves or ſhocks of corn cannot be *diſtrained* for rent, but for damage-feſant they may. Again, beaſts belonging to the plough ſhall not be *diſtrained*.

Laſtly, furnaces, cauldrons, or the like, fixed to the freeholds, or doors, or windows of an houſe, or the like, cannot be *diſtrained*; when a *diſtreſs* is taken that has life in it, it muſt be brought into the common pound, or kept in an open place, where the owner may give it food.

Diſtreſs is divided, by Briton, into *real* and *perſonal*.

DISTRESS, *perſonal*, is made by *diſtraining* a man's moveable goods, and ſeizing all the profits of his lands and tenements, from the teſte, or date of the writ, for the defendant's contempt in not appearing to an action brought againſt him when he was ſummoned, or attached; and the iſſues ſo returned by the ſheriffs, are forfeited to the king, and eſtreated into the exchequer.

DISTRESS, *real*, is made on immoveable goods. It differs from an attachment in this, that it cannot be taken by any common perſon, without the compaſs of his own fee; except it be preſently after the cattle, or other things, are driven, or borne off the ground, on purpoſe to avoid *diſtreſs*.

Diſtreſs is alſo divided into *finite* and *infinite*.

DISTRESS, *finite*, is that limited by law, how often it ſhall be made to bring the party to trial of the action; viz. once, twice, &c.

DISTRESS, *infinite*, is without limitation, till the party come; as againſt a jury, which refuſes to appear upon certificate of aſſiſe, the proceſs is *venire facias*, *habeas corpus*, and *diſtreſs infinite*.

Laſtly, *diſtreſs* is again divided into *grand diſtreſs*, by Fitzherbert called *magna diſtrictio*; and *ordinary diſtreſs*.

DISTRESS, *grand*, is that made of all the goods and chattels the party has within the county.

DISTRIBUTION, the act of dividing a thing into ſeveral parts, in order to the diſpoſing each in its proper place. See DIVISION.

DISTRIBUTION, in *Architecture*. DISTRIBUTION *of the plan*, denotes the dividing, and diſpenſing the ſeveral parts, and members, which compoſe the plan of a building.

DISTRIBUTION *of ornaments*, is an equal, orderly placing of the ornaments in any member, or compoſition of architecture. See ORNAMENT.

DISTRIBUTION, in *Law*, the ſurplus of an eſtate, or *pur autre vie*, is diſtributable by adminiſtrators. See ADMINISTRATOR.

For the *diſtribution* of the eſtates of inteſtates, ſee INTESTATE.

DISTRIBUTION, in *Logic*, is a kind of diviſion which diſtinguiſhes

tinguiſhes an univerſal whole into its ſeveral kinds or ſpecies. The rules of a good *diſtribution* are much the ſame as thoſe of DIVISION.

DISTRIBUTIONS, *manual* and *quotidian*, in *Eccleſiaſtical Matters*, denote certain ſmall ſums of money, appointed by the donors, or founders thereof, to be *diſtributed* to ſuch of the canons of a chapter as are actually preſent, and aſſiſtant at certain offices.

DISTRIBUTION, in *Painting*, denotes the diſpoſition of the objects and lights in a picture. See CLAIR-OBSCURE.

DISTRIBUTION, in *Printing*, the taking a form aſunder, ſeparating the letters, and diſpoſing them in the caſes again, each in its proper cell.

DISTRIBUTION, in *Rhetoric*, is a kind of deſcription; or a figure whereby an orderly diviſion and enumeration is made of the principal qualities of a ſubject.

For example, He has underſtanding to ſee our faults, juſtice to reſtrain them, and authority to puniſh them. Their throat is an open ſepulchre; they flatter with their tongues; the poiſon of aſps is under their lips; their mouth is full of curſing, and lyes; and their feet are ſwift to ſhed blood.

DISTRIBUTIVE, that *diſtributes*, from *dis*, *aſunder*; and *tribuere*, *to give*.

DISTRIBUTIVE *juſtice*, is that whereby we give every perſon what belongs to him. See JUSTICE.

DISTRIBUTIVES, in *Grammar*. See NUMERALS.

DISTRICT, the territory, or extent of juriſdiction, of a judge.

A judge or officer, cannot act out of his own *diſtrict*. See JUDGE.

DISTRICT, in *Law*, properly denotes the place wherein a man has the power of diſtraining; or, the circuit, or territory, wherein one may be compelled to appear.—Where we ſay, *hors de ſon fee*; others ſay, *extra diſtrictum ſuum*.

DISTRINGAS, a writ directed to the ſheriff, or other officer, commanding him to diſtrain one for a debt to the king; or for his appearance at a certain day. See DISTRESS.

DISTRINGAS *juratores*, a writ directed to a ſheriff, whereby he is commanded to diſtrain upon a jury to appear, and to return iſſues on their lands, &c. for non-appearance. This writ iſſues for the ſheriff to have their bodies in court, &c. at the return of the writ.

DISVELOPED, in *Heraldry*, is uſed much in the ſame ſenſe with diſplayed. Thus colours, ſaid in an army to be flying, are, in heraldry, ſaid to be *diſveloped*.

DISUNITE, in the *Manege*, is uſed for a horſe that drags his haunches, that gallops falſe, or upon an ill foot. See GALLOP.

DITCH, in *Agriculture*. In marſhes, and other wet land, where there are no hedges, the common fence or incloſure for land is a *ditch*. They allow theſe *ditches* ſix feet wide againſt high ways that are broad, and againſt commons five feet. But the common *ditches* about incloſures, dug at the bottom of the bank, on which the quick is raiſed, are three feet wide at the top, one at the bottom, and two feet deep; by this means each ſide has a ſlope, which is of great advantage; for where they neg'ect this, and dig them perpendicular, they are always waſhing down: beſide in a narrow bottomed *ditch*, if cattle get down into it, they cannot ſtand to turn themſelves to crop the quick; but where the *ditch* is four feet wide, it ſhould be two and a half deep; and where it is five wide, it ſhould be three deep, and ſo in proportion.

DITCH, in *Fort ification*, called alſo *foſs* and *moat*, a trench dug round the rampart, or wall of a fortified place, between the ſcarp, and counterſcarp. See *Tab. Fortif. fig.* 21. *lit. b b b*, &c.

Some *ditches* are dry; others full of water; each whereof have their advantage. The earth dug out of the *ditch* ſerves to form the rampart.

The *ditch* in front ſhould be of ſuch breadth as that the talleſt tree may not reach over it, i. e. from eighteen to twenty feet, and about ſeven or eight feet deep; and the *ditches* on the ſides are about ten feet wide, and ſix feet deep; though the rule others give for the dimenſions of the *ditch*, is, that it afford earth enough to build the rampart of due magnitude. The ſpace between the rampart and *ditch*, being about ſix feet, is called the *berm*, or *liſt*.

DITCH-*water*. See WATER.

DITHYRAMBIC, ſomething that relates to the *dithyrambus*. We ſay, a *dithyrambic* verſe, *dithyrambic* poet, *dithyrambic* heat, &c. A compound *dithyrambic* word, Mr. Dacier obſerves, has ſometimes its beauty and force. Some moderns call compoſitions which are in the taſte of an ode, only not diſtinguiſhed into ſtrophes, and conſiſting of all kinds of verſe indifferently, *dithyrambic* odes.

Dithyrambic poetry owes its birth to Greece, and the tranſports of wine. It favours ſtrongly of its original; as admitting of no rules, but the ſallies of a fiery imagination. And yet art is not quite excluded; but delicately applied, to guide and reſtrain the *dithyrambic* impetuoſity, and only indulge it in flights that are pleaſing. In effect, what our poets ſay of the ode, is more true of the *dithyrambic* than of the ode, that its diſorder is an effect of art.

DITHYRAMBUS, *Διθυραμβος*, in the *Ancient Poetry*, a hymn in honour of Bacchus, full of tranſport, and poetical rage.

The meaſure, which is what diſtinguiſhes this kind of poetry, is ſaid to have been invented by *Dithyrambus*, a Theban; but Pindar attributes it to the Corinthians; and the modern etymologiſts furniſh us with another origin of the word.

In effect, the verſe might be called thus from the god it was conſecrated to, who himſelf was named *Dithyrambus*; either on account of his having been brought twice into the world, according to the fable of Semele and Jupiter, or by reaſon of his having triumphed twice; from *δις*, *twice*, and *θριαμβος*, *triumph*. But this as it will, the ancients, we are told by Ariſtotle and Horace, gave the appellation *dithyrambus* to thoſe verſes wherein none of the common rules or meaſures were obſerved; much like theſe called by the French *vers libres*, by the Italians *verſi ſciolti*, and by the modern Greeks *politici*, a name they give to proſe, which theſe verſes reſemble more than poetry.

We have now no remains of the *dithyrambi* of the ancient poets, ſo that we cannot ſay preciſely what their meaſure was; all we know is, that it is very bold and irregular. The poets not only took the liberty to forge new words for the purpoſe, but they made double, and compound words, which contributed very much to the magnificence of the *dithyrambus*.

Horace has ſometimes imitated them. Dacier, Fe Commire, and ſome other modern writers, have compoſed Latin pieces of all kinds of verſe indifferently, according as the ſubject and words preſented themſelves, without any order, or diſtribution into ſtrophes, and call them *dithyrambi*. See PINDARIC.

DITONE, DITONUM, in *Muſic*, an interval comprehending two tones, a greater and a leſs. See INTERVAL, and TONE.

The word is formed of *δις*, *twice*, and *τονος*, *tone*.

The ratio of the ſounds that form the *ditone* is of 4 to 5; and that of the *ſemi-ditone*, of 5 to 6. F. Parran makes the *ditone* the fourth kind of ſimple concords; others make it the firſt diſcord, dividing the *ditone* into eighteen equal parts, or commas, the nine on the acute ſide go to the greater tone. Salomon de Caux.

DITONICO, DITONIC, in *Muſic*, according to Zarlino, is the pure and natural diatonic genus, or the diatonic of Didymus; in which not one of the ſounds is in the leaſt altered: ſuch is the plain chant of the church. But the *genus diatonum diatonicum* of Ptolemy, which coincides with the *diatonic* of Pythagoras, and reſults from that diviſion of a monochord bearing the name of Euclid's ſection of the canon, is expreſſed by $\frac{16}{15} \times \frac{9}{8} \times \frac{10}{9} = \frac{4}{3}$. But theſe ancient ſyſtems have juſtly been laid aſide, ſince the invention of a temperament, as being unfit for the execution of muſical compoſitions in ſeveral parts. Smith's Harmon. p. 33.

DITONICUM *Diatonum*. See GENUS.

DITRIGLYPH, in *Architecture*, the ſpace between two triglyphs. See TRIGLYPH.

DITRIHEDRIA, in *Natural Hiſtory*, the name of a genus of ſpars. The word is derived from the Greek *δις*, *twice*, *τρις*, *three*, and *εδρα*, *a ſide or plane*. The bodies of this genus are ſpars compoſed of twice three planes, being formed of two trigonal pyramids joined baſe to baſe, without the intervention of any intermediate column. Of this genus there are five known ſpecies: 1. One with long and pointed pyramids, found in the mines of Cornwall, and ſome other parts of England. 2. One with long and broad pyramids, found looſe in the fiſſures of the alabaſter quarries of Blanckenberg, in Germany. 3. One with ſhort and broad pyramids, found in the mines of Rammelſberg. 4. One with extremely broad depreſſed pyramids, found in the alabaſter quarries at Blanckenberg, and ſometimes in the mines of Goſſelaer in Saxony. 5. One with ſhort, but ſharp-pointed pyramids, found very frequently in the mines of the Harte Foreſt, and ſometimes on Mendip Hills with us. Hill's Foſſils, p 218.

DITTANDER, or PEPPER-*wort*, or *Poor Man's Pepper*, *Lepidium*, in *Botany*, a genus of the *tetradynamia ſiliculoſa* claſs. Its characters are theſe: the flower has four oval petals placed in form of a croſs, and ſix awl-ſhaped ſtamina, two of which are ſhorter than the other; in the centre is ſituated a heart-ſhaped germen, which turns to

a ſpear-ſhaped ſeed-veſſel with two cells, divided by an intermediate partition, containing oblong ſeeds. There are ſeveral ſpecies.

The leaves of the broad-leaved *dittander*, bruiſed and mixed with hog's lard, and applied as a cataplaſm to the hips, helps the ſciatica; when chewed, they cauſe a great flux of rheum; and by that means are ſaid to help ſcrophulous humours of the throat. The women in Suffolk give them boiled in ale, to haſten the birth.

The *dittander* with a graſs leaf, or *iberis*, is alſo commended for its virtues in ſciaticas, when applied as the former: and hence it has been ſometimes called the *ſciatica creſs*.

DITTANY, *white*, *Dictamnus*, in *Botany*, a genus of the *decandria monogynia* claſs. Its characters are theſe: the flower hath five petals, which are unequal, and ten ſtamina, which are as long as the petals. In the centre is ſituated a five-cornered germen, which afterward becomes a capſule, with five cells joining together, enclofing ſeveral roundiſh, hard, ſhining ſeeds. We have but one ſpecies, which is the white *dittany*, commonly called *fraxinella*.

There are three varieties of this plant; one with a pale red flower, ſtriped with purple; another with a white flower, and one with ſhorter ſpikes of flowers; but as they have been obſerved to vary when propagated by ſeeds, they are to be eſteemed only ſeminal varieties.

This is a very ornamental plant for gardens; and as it requires very little culture, deſerves a place in all good gardens. It hath a perennial root, which ſtrikes very deep into the ground.

The *fraxinella*, or *white dittany* of authors, is cultivated in gardens with us, and grows wild in France, Italy, and Germany. It generally grows about two feet high. The leaves much reſemble thoſe of the common aſh-tree, whence it has its name; the flowers are produced in long ſpikes, and are of a whitiſh red, mixed with purple. The cortical part of the root is ſometimes brought to us, dried and rolled up in the form of quills.

This root ſhould be choſen plump and full, white within and without, little burdened with ſmall fibres, and clean. It is alexipharmic, anthelmintic, diuretic, and uterine, but now very rarely uſed.

DITTANY, *baſtard*. See HOREHOUND.

DITTANY *of Crete*. See *Wild* MARJORAM.

DITTO, in *Books of Accounts*, written contractedly D°. ſignifies the *ſame*, viz. as the preceding article.

The word is corrupted from the Italian *detto*, the *ſaid*; as in our law-phraſe "the ſaid premiſes," meaning the ſame as were aforementioned.

DIVAL, in *Heraldry*, the herb NIGHT-SHADE, a plant with poiſonous berries, looking like black cherries, uſed by ſuch as blazon with flowers and herbs inſtead of colours and metals, for ſable, or black. See SABLE.

DIVALIA, in *Antiquity*, a feaſt held among the ancient Romans on the twenty-firſt day of December, in honour of the goddeſs Angerona; whence it is alſo called ANGERONALIA.

On the day of this feaſt, the pontifices performed ſacrifice in the temple of Voluptia, or the goddeſs of joy and pleaſure, who, ſome ſay, was the ſame with Angerona; and ſuppoſed to drive away all the ſorrows and chagrins of life.

DIVAN, a council-chamber, or court, wherein juſtice is adminiſtered, in the eaſtern nations, particularly among the Turks.

Divan is an Arabic word, ſignifying the ſame with *ſopha* in the Turkiſh dialect.

There are two ſorts of *divans*, that of the grand ſignior called the council of ſtate, which conſiſts of ſeven of the principal officers of the empire; and that of the grand vizir, compoſed of ſix other vizirs, or counſellors of ſtate, the chancellor and ſecretaries of ſtate, for the diſtribution of juſtice.

The word is alſo uſed for a hall, in the private houſes of the orientals. The cuſtom of China does not allow the receiving of viſits in the inner parts of the houſe, but only at the entry, in a *divan* contrived on purpoſe for ceremonies. Le Compte.

Travellers relate wonders of the ſilence and expedition of the *divans* of the Eaſt.

DIVAN-BEGHI, the appellation of one of the miniſters of ſtate in Perſia.

The *divan-beghi* is the ſuperintendant of juſtice; his place is the laſt of the ſix miniſters of the ſecond rank, who are all under the athemadaulet, or firſt miniſter.

To the tribunal of the *divan-beghi* appeals lie from ſentences paſſed by the governors. He has a fixed ſtipend, or appointment, of 40,000 crowns, that he may render juſtice *gratis*. All the ſerjeants, ushers, &c. of the court, are in the ſervice of the *divan-beghi*. He takes cognizance of the criminal cauſes of the chams, governors, and other great lords of Perſia, when accuſed of any fault, and receives appeals from the daruga.

There are *divan-beghis* not only at court, and in the capital, but alſo in the provinces, and other cities of the empire.

This officer is not confined by any other law or rule, in the adminiſtration of juſtice, but the Alcoran, which alſo he interprets at pleaſure. He takes no cognizance of civil cauſes.

DIVER, in *Ornithology*, the Engliſh name of the COLYMBUS, a genus of water birds; the characters of which are theſe: they have narrow, ſtraight, and ſharp bills; the upper mandible is the longeſt, with the edges of each bending in, the noſtrils are linear, their heads are ſmall, the tongue pointed, long, and ſerrated near the baſe, their wings ſhort, their feet placed far backward on the body, and near the tail, which is ſhort, conſiſting of twenty feathers, and their legs broad and flatted, their claws broad like the nails of one's fingers. They are called *colymbi*, and in Engliſh *divers*, from their great expertneſs in diving, and long continuance under water.

There are properly two ſubordinate genera of theſe birds; the one having the feet not webbed, but the toes looſe, yet all widened by a membrane, and having no tail. Thoſe of the other genus have webbed feet like the duck, and have tails.

Of each of theſe genera there are ſeveral ſpecies. See *Tab.* IV. *Birds*, N° 47. and articles DOR-*chick*, *Sea-turtle* DOVE, LUMME, and FLUDDER.

DIVER, *black*. See SCOTER.

DIVER, *dun*. See DUN-*diver*.

DIVERGENCY. For the point of *divergency* or *divergence* in *Optics*, ſee *Virtual* FOCUS.

DIVERGENT, or DIVERGING *lines*, in *Geometry*, are ſuch whoſe diſtance is continually increaſing.

Lines which converge one way, *diverge* the oppoſite way.

DIVERGENT, or DIVERGING, in *Optics*, is particularly applied to rays, which, iſſuing from a radiant point, or having in their paſſage undergone a refraction, or reflection, do continually recede farther from each other.

In which ſenſe the word is oppoſed to *convergent*, which implies the rays to approach each other; or to tend to a centre, where, being arrived, they interſect; and, if continued farther, become *diverging*.

Concave glaſſes render the rays *diverging*; and convex ones, converging.

Concave mirrors make the rays converge; and convex ones, *diverge*. See FOCUS.

It is demonſtrated, in *Optics*, that as the diameter of a pretty large pupil does not exceed $\frac{1}{4}$ of a digit; *diverging* rays, flowing from a radiant point, will enter the pupil, parallel, to all intents and purpoſes, if the diſtance of the radiant from the eye be 40,000 feet. See LIGHT, and VISION.

DIVERGING *hyperbola*, is one whoſe legs turn their convexities towards one another, and run towards quite contrary ways.

DIVERSIFYING, in *Rhetoric*, is of infinite ſervice to the orator; it is an accompliſhment eſſential to his character, and may fitly be called the ſubject of all his tropes and figures. Voſſius lays down ſix ways of *diverſifying* a ſubject. 1. By enlarging on what was briefly mentioned before. 2. By a conciſe enumeration of what had been inſiſted on at length. 3. By adding ſomething new to what is repeated. 4. By repeating only the principal heads of what had been ſaid. 5. By tranſpoſing the words and periods. 6. By imitating them. Voſſ. Rhet. lib. v. p. 281, ſeq.

DIVERSION, in *Medicine*, the turning of the courſe or flux of humours from one part to another, by proper applications.

DIVERSION, in *War*, the act of attacking an enemy in one place, where he is weak, and unprovided, with deſign to make him call his forces from another place, where he was going to make an irruption, or is to be attacked with greater force.

The Romans had no way to drive Hannibal out of Italy, but to make a *diverſion*, by attacking Carthage.

DIVERSITY. This differs from diſtinction in this, that the latter is the work of the mind; but the former is in things themſelves, antecedent to the operation of the mind. For things that are ſeveral, are different; even though I do not conceive them. See DISTINCTION.

The *diverſity*, or difference of things, therefore, ariſes from their eſſential attributes. See IDENTITY.

DIVERSITY, in *Painting*, conſiſts in giving every part or figure in a picture its proper air and attitude. The ſkilful painter has the penetration to diſcern the characters of nature, which vary in all men; whence the countenances and geſtures of the perſons he paints continually vary.

DIVESTING, properly ſignifies undreſſing, or ſtripping off one's garment, in contradiſtinction from *inveſting*.
In law, it is uſed for the act of ſurrendering, or relinquiſhing one's effects. By a contract of donation, or ſale, the *donor*, or *ſeller*, is ſaid to be diſſeiſed, and *inveſted* of their property in ſuch a commodity, and the donee, or purchaſer, becomes *inveſted* therewith. See INVESTITURE.
A demiſe is a general *diveſtiture*, which the fathers and mothers make of all their effects, in favour of their children.

DIVIDEND, in *Arithmetic*, the number given to be divided; or that whereof the diviſion is made.
The *dividend* muſt always be greater than the diviſor.
The *dividend* contains the diviſor as many times as the quotient contains unit.

DIVIDEND *of a bankrupt's eſtate*, is that part which is diſtributed to every creditor in proportion to his debt.

DIVIDEND, in the *Exchequer*, is one part of an indenture. 10 Ed. I. c. 11.

DIVIDEND, in *Law*, is uſed for a dividing of fees in perquiſites between officers of court, ariſing from writs, &c.

DIVIDEND *of ſtocks*, is a ſhare, or proportion of the intereſt of ſtocks erected on public funds, as the South Sea Indies, Bank, &c. diviſed among and payable half-yearly to the ſtock-holders, and the orders they have for receiving theſe *dividends*, are called *dividend-warrants*. Stealing any *dividend-warrants* of the Bank, South Sea Company, Eaſt-India Company, or of any other corporation is made felony, with or without benefit of clergy, in the ſame manner as if the offender had ſtolen, or taken by robbery, goods to the value of the money due on ſuch *dividend-warrants*." Stat. 2 Geo. II. c. 25.

DIVIDEND, in the *Univerſity*, is that part or ſhare, which every one of the fellows equally divide among themſelves, of their annual ſtipend.

DIVIDIVI, the name of a drug brought from the Caraccas into Spain in 1716; and which, by experiments that have been made upon it at Madrid, is found to be preferable to gall's in dying black.

DIVIDUAL, in *Arithmetic*, is uſed for that part of the dividend, diſtinguiſhed by a point, in working by the rule of diviſion.

DIVINATION, the pretended act, or art, of foretelling future events. This art or ſcience, in which the pagans thought themſelves ſure to ſucceed, if they proceeded according to certain eſtabliſhed rules, was founded in their ſyſtem of theology. They had deified all the parts and powers of nature, and more eſpecially the heavenly bodies; aſcribing to the latter not only life and intelligence, but a fore-perceiving motion, and a ſovereign influence on every thing here below. They had alſo other gods beſides the objects of nature, viz. DÆMONS, from whoſe ſuperiority, ſtability and mediation, *divination*, prophecy, and magic were ſuppoſed to proceed. Amman. Marcell. lib. i. c. 1. Herod. lib. ii. c. 83. Plato, in Symp. in Epinomide, in Phædra. Porphyr. ap. Euſeb. Præp. Evan. lib. iv. v. vi. & de Abſtinentia, lib. ii. Jamblich. de Myſter. Apol. Apol. id. de Deo Socrat. Diogen. Laert. in Vitis Pythag. lib. xxxii. p. 514. Farmer on Miracles, chap. iii. ſect. 3. See PROPHECY, ENTHUSIASM, &c.
Diviniation proceeded originally from the Egyptians to the Jews, Greeks, and Romans; and was divided by the ancients into *artificial*, and *natural*.

DIVINATION, *Artificial*, is that which proceeds by reaſoning upon certain external ſigns, conſidered as indications of futurity.

DIVINATION, *Natural*, is that which preſages things from a mere internal ſenſe, and perſuaſion of the mind, under a particular emotion or agitation, without any aſſiſtance of ſigns.
Plutarch, in his book De Defectu Oraculorum, allows that natures might be appointed by the gods to preſide over *divination* and oracles, and to be the guardians of the temperature of thoſe exhalations, to which they are aſcribed; but at the ſame time it is aſſerted, that the ſoul is naturally endued with the faculty of divining, and that certain exhalations of the earth were the means of exciting the prophetic power or virtue. P. 418, D. and p. 436, F.
Natural divination, again, is of two kinds; the one *active*, the other by *influx*.
The firſt is founded on this ſuppoſition, that the ſoul, which was thought to be a particle of the divine air or ſpirit, taken out from God, and to have exiſted from eternity, collected within itſelf, and not diffuſed, or divided among the organs of the body, has, from its own nature and eſſence, ſome fore-knowledge of future things: witneſs what is ſeen in dreams, extaſies, the confines of death, &c.
The ſecond is founded on this, that the ſoul receives, after the manner of a mirror, ſome ſecondary illumination from the preſence of God, and other ſpirits; and hence proceeded ORACLES.

DIVINATION, *Artificial*, is alſo of two kinds: the one arguing from natural cauſes: ſuch as the predictions of phyſicians about the events of diſeaſes, from the pulſe, urine, &c. ſuch are alſo thoſe of the politician. *O ſemelos urbem, & mos pecturam, & empiricen imperii!*
The ſecond proceeds from experiments and obſervations arbitrarily inſtituted, and is mollly ſuperſtitious.
Infinite are the ſyſtems of *divination* reducible to this head; by birds, the entrails of beaſts, dreams, lines of the hand, points marked at random, numbers, names, the motion of a fever, the air, fire, the ſorrys *Præneſtinæ, Virgilianæ*, and *Homericæ*; with numerous others, the principal ſpecies whereof, and their names, are:
Pſychomancy, or ſciomancy, which conſiſts in calling up the ſouls, or ſhades of the deceaſed, to learn of them ſomething required. Dictyomancy, performed by means of one, or more rings. Hydromancy, performed with ſea-water. Pegomancy, with ſpring-water. Ornithomancy, or diviining by the flight of birds, which was the buſineſs of the augurs. Cleidomancy, performed with keys. Coſcinomancy, with a riddle, or ſieve. Cledonifm, by words, or voice. Extiſpicina, by the entrails of victims. Alphitomancy, or alecromancy, by flour. Ketauuoſcopia, by the conſideration of thunder. Capnomancy, by ſmoke. Aleciryomancy, by cocks. Pyromancy, by fire. Lithomancy, by ſtones. Eychnomancy, by lamps. Necromancy, by the dead, or their bones, &c. Oniocritics, by dreams. Oeſcopy, by eggs. Lecanomancy, by a baſon of water. Gaſtromancy, by the belly, or by phials. Palpitation, ſalſitation, *vaticinium*, by the pulſation, or motion of ſome member. Axinomancy, by a hatchet, or cleaver. Catoptromancy, or cryſtallomancy, by a mirror. Chiromancy, by the lines of the hand. Geomancy, by the earth. Ceromancy, by figures of wax. Arithmomancy, by numbers. Belomancy, by arrows. Sycomancy, &c. all deſcribed by Cardan, in his fourth book, De Sapientia; and under their proper articles in this Dictionary.
All theſe kinds of *divination* have been condemned by the fathers, and councils, as ſuppoſing ſome compact, with the devil: though ſome of them, as well as the heathen philoſophers, contended for the ſupernatural power and efficacy of pagan *divination* and ſorcery. Euſeb. Præp. Ev. lib. v. *c.* 4. Aug. de Civ. Dei. lib. viii. c. 16. Farmer on Miracles, ubi ſupra.
Fludd has ſeveral treatiſes on the different ſpecies of *divination*: and Cicero has two books of the *divination* of the ancients, in which the ſeveral kinds of it are explained; and which he reſolves into many cauſes very different from that of an immediate revelation from ſome ſpiritual being.
In Holy Scripture, we find mention made of nine different kinds of *divination*: the firſt performed by the inſpection of planets, ſtars, and clouds: they are ſuppoſed to be the practiſers of this, whom Moſes calls מעונן *meonen*, or אנן *anan*, *cloud*, Deuter. chap. xviii. ver. 10. 2. Thoſe, whom the prophet calls in the ſame place מנחש *menhaſh*; which the Vulgate, and generality of interpreters, render *augur*. 3. Thoſe, who in the ſame place are called מכשף *mecaſheph*; which the Septuagint and Vulgate tranſlate, *a man given to ill practices*. 4. Such authors, whom Moſes in the ſame chapter, ver. 11. calls חובר *hober*. 5. Thoſe, who conſult the ſpirit called *Python*; or, as Moſes expreſſes it in the ſame book, אוב אשל, *thoſe who uſe queſtions of Python*. 6. Witches, or magicians, whom Moſes calls ידעני *jadeonis*. 7. Thoſe, who conſult the dead, *necromancers*. 8. The prophet Hoſea, chap. iv. ver. 12. mentions ſuch as conſult ſtaves, שאל מקלו; which kind of *divination* may be called *rhabdomancy*. 9. The laſt kind of *divination* mentioned in Scripture is *hepatoſcopy*, or the conſideration of the liver. See RHABDOMANCY, MAGICIANS, &c.

DIVINE, ſomething that comes from or relates to GOD.
The word is alſo uſed figuratively, for any thing that is excellent, extraordinary, and that ſeems to go beyond the power of nature, and the capacity of mankind.
In which ſenſe, the *compaſs*, teleſcope, clocks, &c. are ſaid to be *divine* inventions: Plato is called the *divine author*, the *divine Plato*; and the ſame appellation is given to Seneca: Hippocrates is called the *divine old man*, *divinus ſenex*, &c. The Arabs give the appellation *divine*, אלהון *elohiun*, to their ſecond ſect of philoſophers, conſiſting of ſuch as admit a firſt mover of all things, a ſpiritual ſubſtance free from all kind of matter; in a word, a God. By this name they diſtinguiſh them from their firſt ſect, whom they call *ſabeiun*, or *thobiun*, i. e. *worſhippers*, and *naturaliſts*, as admitting o no principles beyond the material world, and a nature.

The

The word אלהין *elohiim* is derived from אלא *Alla*, *God*: so that the *elohiim* are the *deities*, or *theologues*, as Castellus renders it; or, such as own a God.

DIVING, the art, or act of descending under water, to considerable depths, and abiding there a competent time.

The uses of *diving* are very considerable, particularly in the fishing for pearls, corals, sponges, &c. See PEARL-*fishing*.

There have been divers methods proposed, and engines contrived, to render the business of *diving* more safe and easy. The great point in all these is to furnish the *diver* with fresh air, without which, he must either make but a short stay, or perish.

Those who dive for sponges in the Mediterranean, help themselves by carrying down sponges dipt in oil in their mouths. But considering the small quantity of air that can be contained in the pores of a sponge, and how much that little will be contracted by the pressure of the incumbent air, such a supply cannot long subsist the *diver*. For it is found by experiment, that a gallon of air included in a bladder, and by a pipe reciprocally inspired and expired by the lungs, becomes unfit for respiration in little more than one minute of time. For though its elasticity be but little altered in passing the lungs, yet it loses its vivifying spirit, and is rendered effete.

In effect, a naked *diver*, Dr. Halley assures us, without a sponge, cannot remain above two minutes enclosed in water; nor much longer with one, without suffocating; nor without long practice, near so long: ordinarily persons beginning to be suffocated in about half a minute. Besides, if the depth be considerable, the pressure of the water in the vessels makes the eyes blood-shotten, and frequently occasions a spitting of blood.

Hence, where there has been occasion to continue long at the bottom, some have contrived double flexible pipes to circulate air down into a cavity enclosing the *diver*, as with armour, both to furnish air, and to bear off the pressure of the water, and give leave to his breast to dilate upon inspiration; the fresh air being forced down one of the pipes with bellows, and returning by the other of them, not unlike to an artery and vein.

But this method is impracticable when the depth surpasses three fathoms; the water embracing the bare limbs so closely, as to obstruct a circulation of the blood in them; and withal pressing so strongly on all the junctures where the armour is made tight with leather; that if there be the least defect in any of them, the water rushes in, and instantly fills the whole engine, to the great danger of the *diver*'s life.

DIVING-*bell*, is a machine contrived to remedy all these inconveniences. In this the *diver* is safely conveyed to any seasonable depth, and may stay more or less time under the water, as the bell is greater or less.

It is most conveniently made in form of a truncated cone, the smallest base being closed, and the larger open. It is to be poised with lead, and so suspended, that it may sink full of air, with its open base downward, and as near as may be in a situation parallel to the horizon, so as to close with the surface of the water all at once.

Under this cover the *diver* sitting, sinks down with the included air to the depth desired; and if the cavity of the vessel can contain a ton of water, a single man may remain a full hour, without much inconvenience, at the depth of five or six fathoms.

But the lower you go, still the more the included air contracts itself, according to the weight of the water that compresses it; so that at the depth of thirty-three feet the bell becomes half full of water; the pressure of the incumbent water being then equal to that of the atmosphere; and at all other depths, the space occupied by the compressed air in the upper part of the bell, will be to the under part of its capacity filled with water, as thirty-three feet to the depth of the surface of the water in the bell below the common surface thereof. And this condensed air, being taken in with the breath, soon insinuates itself into all the cavities of the body, and has no ill effect, provided the bell be permitted to descend so slowly as to allow time for that purpose.

One inconvenience that attends it, is found in the ears, within which there are cavities which open only outwards, and that by pores so small, as not to give admission even to the air itself, unless they be dilated and distended by a considerable force. Hence, on the first descent of the bell, a pressure begins to be felt on each ear, which, by degrees, grows painful, till the force overcoming the obstacle, what constringes these pores, yields to the pressure, and letting some condensed air slip in, presently ease ensues. The bell descending lower, the pain is renewed, and afterwards it is again eased in the same manner.

But the greatest inconvenience of this engine is, that the water entering it, contracts the bulk of air into so small a compass, that it soon heats, and becomes unfit for respiration: so that there is a necessity for its being drawn up to recruit it; besides the uncomfortable abiding of the *diver*, who is almost covered with water.

To obviate the difficulties of the *diving-bell*, Dr. Halley, to whom we owe the preceding account, contrived some farther apparatus, who obey not only to recruit and refresh the air from time to time, but also to keep the water wholly out of it at any depth; which he effected after the following manner.

His *diving-bell* (see *Tab. Hydraulics, fig.* 1.) was of wood, three feet wide at top, five feet at bottom, and eight feet high, containing about sixty three cubic feet in its concavity, coated externally with lead to heavy, that it would sink empty; a particular weight being distributed about its bottom B, to make it descend perpendicularly, and no otherwise. In the top was fixed a meniscus glass D, concave downwards, like a window, to let in light from above; with a cock, as at B, to let out the hot air; and a circular seat, as at L M, for the *diver* to sit on: and, below, about a yard under the *bell*, was a stage suspended from it by three ropes, each charged with a hundred weight, to keep it steady, and for the *divers* to stand upon to do their business. The machine was suspended from the mast of a ship by a spring, which was secured by stays to the mast-head, and was directed by braces to carry it overboard clear of the side of the ship, and to bring it in again.

To supply air to this *bell* when under water, he had a couple of barrels, as C, holding thirty-six gallons each, cased with lead, so as to sink empty, each having a bung-hole at bottom, to let in the water as they descended, and let it out again as they were drawn up again. In the top of the barrels was another hole, to which was fixed a leathern pipe, or hose, well prepared with bees wax and oil, long enough to hang below the bung-hole; being kept down by a weight appended. So that the air driven to the upper part of the barrel by the encroachment of the water, in the descent, could not escape up this pipe, unless the lower end were lifted up.

These air-barrels were fitted with tackle, to make them rise and fall alternately, like two buckets; being directed in their descent by lines fastened to the under edge of the *bell*, so that they came readily to the hand of a man placed on the stage to receive them; and who taking up the ends of the pipes as soon as they came above the surface of the water in the barrels, all the air included in the upper part thereof was blown forcibly into the *bell*; the water taking its place.

One barrel thus received and emptied, upon a signal given, it was drawn up, and at the same time the other let down; by which alternate succession fresh air was furnished so plentifully, that the learned doctor himself was one of five, who were all together in mine or ten fathoms depth of water for above an hour and a half, without the least inconvenience; the whole cavity of the *bell* being perfectly dry.

All the precaution he observed was, to be let down gradually about twelve feet at a time, and then to stop, and drive out the water that had entered, by taking in three or four barrels of fresh air, before he descended farther. And, being arrived at the depth intended, he let out as much of the hot air that had been breathed, as each barrel would replace with cold, by means of the cock B, at the top of the *bell*, through whose aperture, though very small, the air will rush with so much violence, as to make the surface of the sea boil.

Thus, he found any thing could be done that was required to be done underneath. And by taking off the stage, he could, for a space as wide as the circuit of the *bell*, lay the bottom of the sea so far dry as not to be overflowed therein. Besides, that by the glass window so much light was transmitted, that, when the sea was clear, and especially when the sun shone, he could see perfectly well to write or read, much more to fasten, or lay hold of any thing under him that was to be taken up. And by the return of the air-barrel he often sent up orders written with an iron pen on a plate of lead, directing how he would be moved from place to place.

At other times, when the water was troubled and thick, it would be as dark as night below: but in such cases he was able to keep a candle burning in the *bell*.

Dr. Halley observes, that they were subject to one inconvenience in this *bell*; they felt at first a small pain in their ears, as if the end of a tobacco-pipe were thrust into them; but after a little while there was a small puff of air, with a little noise, and they were easy. This he supposes to be occasioned by the condensed air shutting up a valve leading from some cavity in the ear, full of common air; but when the condensed air pressed harder, it forced the valve to yield, and filled every cavity. On

of the *divers*, in order to prevent this preſſure, ſtopped his ear with a pledget of paper; which was puſhed in ſo far, that a ſurgeon could not extract it without great difficulty.

The ſame author intimates, that by an additional contrivance he has found it practicable for a *diver* to go out of the *bell* to a good diſtance from it; the air being conveyed to him in a continued ſtream by ſmall flexible pipes, which ſerve him as a clue to direct him back again to the *bell*. For this purpoſe, one end of one of theſe pipes, kept open againſt the preſſure of the ſea, by a ſmall ſpiral wire, and made tight without by painted leather, and ſheep's guts drawn over it, being open, was faſtened in the *bell*, as at P, to receive air, and the other end was fixed to a leaden cap on the man's head, reaching down below his ſhoulders, open at bottom, to ſerve him as a little *bell*, full of air, for him to breathe at his work, which would keep out the water from him, when at the level of the great *bell*, becauſe of the ſame denſity as the air in the great *bell*. But when he ſtooped down lower than the level of the great *bell*, he ſhut the cock F, to cut off the communication between the two *bells*. Phil. Tranſ. abr.' vol. iv. part ii. p. 188, &c. vol. vi. p. 550, &c.

The air in this *bell* would ſerve him for a minute or two; and he might inſtantly change it, by raiſing himſelf above the great *bell*, and opening the cock F. The *diver* was furniſhed with a girdle of large leaden weights, and clogs of lead for the feet, which, with the weight of the leaden cap, kept him firm on the ground; he was alſo well clothed with thick flannels, which being firſt made wet, and then warmed in the bell by the heat of his body, kept off the chill of the cold water for a conſiderable time, when he was out of the *bell*.

Mr. Martin Triewald, F. R. S. and military architect to his Swediſh majeſty, contrived to conſtruct a *diving-bell* on a ſmaller ſcale, and leſs expence, than that of Dr. Halley, and yet capable of anſwering the ſame intents and purpoſes. This *bell*, A B (*fig.* 2.) ſinks with leaden weights DD, ſuſpended from the bottom of it. It is made of copper, and tinned all over on the inſide; three ſtrong convex lenſes GGG, defended by the copper-lids HHH, illuminate this *bell*. The iron plate E ſerves the *diver* to ſtand upon, when he is at work; this is ſuſpended by chains I FF, at ſuch a diſtance from the bottom of the *bell* that when he ſtands upright, his head is juſt above the water in the *bell*, where he has the advantage of air fitter for reſpiration, than when he is much higher up; but as there is occaſion for the *diver* to be wholly in the *bell*, and conſequently his head in the upper part of it, Mr. Triewald has contrived, that, even there, after he has breathed the hot air as long as he well can, by means of a ſpiral copper tube *b c*, placed cloſe to the inſide of the *bell*, he may draw the cooler and freſher air from the lowermoſt parts; for which purpoſe a flexible leather-pipe, about two feet long, is fixed to the upper end of the tube at *b*; and to the other end of the pipe is faſtened an ivory mouth-piece, for the *diver* to hold in his mouth, by which to reſpire the air from below. We ſhall only remark, that as air rendered effete by reſpiration is ſomewhat heavier than common air, it muſt naturally ſubſide in the bell; but it may probably be reſtored by the agitation of the ſea-water, and thus become fitter for reſpiration. See *Fixed* AIR. Phil. Tranſ. Abr. vol. viii. p. 634. or Deſaguliers's Exper. Phil. vol. ii. p. 220, &c.

The famous Corn. Drebell had an expedient in ſome reſpects ſuperior even to the *diving-bell*, if what is related of it be true. He contrived not only a veſſel to be rowed under-water, but alſo a liquor to be carried in the veſſel, which ſupplied the place of freſh air.

The veſſel was made for king James I. carrying twelve rowers, beſides the paſſengers. It was tried in the river Thames; and one of the perſons in that ſubmarine navigation, then living, told it one, from whom Mr. Boyle had the relation.

As to the liquor, Mr. Boyle aſſures us, he diſcovered by a phyſician, who married Drebell's daughter, that it was uſed from time to time, when the air in that ſubmarine boat was clogged by the breath of the company, and rendered unfit for reſpiration: at which time, by unſtopping the veſſel full of this liquor, he could ſpeedily reſtore to the troubled air ſuch a proportion of vital parts, as would make it ſerve again a good while. The ſecret of this liquor Drebell would never diſcloſe to above one perſon, who himſelf aſſured Mr. Boyle what it was. Boyle's Exp. Phyſ. Mech. of the Spring of the Air.

We have had many projects of *diving* machines, and *diving* ſhips of various kinds, which have proved abortive.

DIVING-*bladder*, a term uſed by Borelli for a machine, which he contrived for *diving* under the water to great depths, with great facility, and prefers to the common *diving-bell*. The veſica, or *bladder*, as it is uſually called, is to be of braſs or of copper, and about two feet in diameter. This is to contain the *diver's* head, and is to be fixed to a goat's ſkin habit, exactly fitted to the ſhape of the body of the perſon. Within this veſica there are pipes, by means of which a circulation of air is contrived; and the perſon carries an air-pump by his ſide, by means of which he may make himſelf heavier or lighter, as the ſiſhes do, by contracting or dilating their air bladder: by this means, the objections all other *diving* machines are liable to are obviated, and particularly that of the air; the moiſture by which it is clogged in reſpiration, and by which it is rendered unfit for the ſame uſe again, being here taken from it by its circulation through the pipes, to the ſides of which it adheres, and leaves the air as free as before. Borelli Opera Poſthuma.

DIVINITY, the quality, nature, and eſſence of God.

It is ſaſſly, that the atheiſts hold the notion of a *divinity* to be a political invention of the ancient legiſlators, to ſecure and enforce the obſervation of their laws: on the contrary, it is certain, the legiſlators, made uſe of that opinion, which they found already impreſſed on the minds of the people.

The *heathen divinities* may be reduced to three claſſes: the firſt *theological*, repreſenting the *divine* nature under divers attributes: thus Jupiter denotes the abſolute power of God, Juno his juſtice, &c.

The ſecond claſs of *divinities* are *phyſical*: thus Æoles is that power in nature, whereby vapours and exhalations are collected to form winds, &c.

The laſt are *moral divinities*. Thus the Furies are only the ſecret reproaches and ſtings of conſcience.

DIVINITY is alſo uſed in the ſame ſenſe with THEOLOGY.

DIVIOHU, in *Botany*, a name given by the people of Guinea to a ſpecies of plant, with which they uſe to ripen or break boils, beating the leaves, and laying them on.

DIVISIBILITY, a paſſive power, or property in quantity, whereby it becomes ſeparable into parts; either actually, or at leaſt mentally.

The ſchoolmen define *diviſibility*, *capacitas coextenſionis cum pluribus*; a capacity of being co-extended with ſeveral things: thus, a ſtaff four feet long is *diviſible*, becauſe it may be co-extended with four feet, or forty eight inches, &c.

This the Peripatetics and Carteſians univerſally hold an affection, or property of all matter, or body: the Carteſians, as holding the eſſence of matter to conſiſt in extenſion; for every part, or corpuſcle of the body being extended, has parts including other parts, and conſequently is *diviſible*.

The Epicureans, again, hold *diviſibility* to agree to every phyſical continuum, as, without parts adjacent to parts, there can be no continuity; and wherever there are parts to adjacent, there muſt be *diviſibility*. But they deny, that this affection agrees to all bodies; for the primary corpuſcles, or atoms, they hold perfectly inſecable, and indiviſible.

The principal argument they allege is, that, from the *diviſibility* of all body, and of every aſſignable particle of body, even after any repeated number of diviſions, it follows, that the ſmalleſt corpuſcle is infinitely *diviſible*, which with them is an abſurdity. For a body can only be divided into ſuch parts as it actually contains. But to ſuppoſe infinite parts in the ſmalleſt corpuſcle, ſay they, is to ſuppoſe it infinitely extended: for infinite parts placed externally to each other, as the parts of bodies doubtleſs are, muſt make an infinite extenſion.

They add, that there is a great difference between the *diviſibility* of phyſical, and mathematical quantities. For every mathematical quantity, or dimenſion, they grant, may be increaſed and diminiſhed infinitely; but phyſical quantity, neither the one nor the other.

An artiſt, dividing a continued body, arrives at certain minute parts, beyond which he cannot go; theſe we may call *minima artis*. In like manner, nature, which may begin where art ends, will find bounds; which we may call *minima naturæ*; and God, whoſe power is infinite, beginning where nature ends, may ſubdivide the *minima naturæ*; but he will at length come at certain parts, to which there being no other parts contiguous, they cannot be taken away. Theſe minute parts are ATOMS.

All we can ſay on this ſubject is, that on the one hand it is certain, every extended corpuſcle muſt have two ſides, and conſequently is *diviſible*; for, if it had not two ſides, it were not extended; and if it had no extenſion, an aſſemblage of divers ſuch corpuſcles would not compoſe a body. And on the other hand, the infinite *diviſibility* ſuppoſes an infinity of parts in the minuteſt corpuſcle; whence it follows, that there is no body, how ſmall ſoever,

ever, but may furnish as many surfaces, or parts, as the whole globe of the earth can; nay, and infinitely more; which, to say no worse, is a strange paradox.

The infinite *divisibility* of mathematical quantity is thus proved, and illustrated by the mathematicians: suppose a line A D (*Tab. II. Geometry, fig.* 27.) perpendicular to B F; another as G H, at a small distance from A, also perpendicular to the same line; with the centres C, C, &c. and distances C A, C A, &c. describe circles cutting the line G H in the points *e*, *e*, &c. Now, the greater the radius A C is, the less is the part *e* G; but the radius may be augmented *in infinitum*, and therefore the part *e* G may be diminished in the same manner; and yet it can never be reduced to nothing; because the circle can never coincide with the right line B F. Consequently, the parts of any magnitude may be diminished *in infinitum*.

The chief objections against this doctrine are, that an infinite cannot be contained by a finite; and that it follows from a *divisibility in infinitum*, either that all bodies are equal, or that one infinite is greater than another. To which it is answered, that to an infinite may be attributed the properties of a finite and determined quantity; and who has ever proved, that there could not be an infinite number of parts infinitely small in a finite quantity; or that all infinites are equal? The contrary is demonstrated by mathematicians in innumerable instances. We are not here contending for the possibility of an actual division *in infinitum*; we only assert, that however small a body is, it may be still farther divided; which we imagine may be called a division *in infinitum*, because what has no limits, is called *infinite*.

All that is supposed, in strict geometry, concerning the *divisibility* of magnitude, amounts to no more, than that a given magnitude may be conceived to be divided into a number of parts, equal to any given or proposed number. It is true, that the number of parts, into which a given magnitude may be conceived to be divided, is not to be fixed or limited, because no given number is so great but a greater may be conceived and assigned; but there is not, therefore, any necessity of supposing the number of parts actually infinite; and if some have drawn very abstruse consequences from such a supposition, yet geometry ought not to be loaded with them. Mac-Laurin's Fluxions, art. 290. See EXTENSION.

It is true, that there are no such things as parts infinitely small; yet the fubility of the particles of several bodies is such, that they very much surpass our conception; and there are innumerable instances in nature of such parts actually separated from one another.

Mr. Boyle gives us several instances of this. He speaks of a silken thread 300 yards long, that weighed but two grains and a half. He measured leaf-gold, and found by weighing it, that fifty square inches weighed but one grain: if the length of an inch be divided into 200 parts, the eye may distinguish them all; therefore there are in one square inch 40000 visible parts; and in one grain of it there are 2000000 of such parts; which visible parts no one will deny to be farther *divisible*.

Again, a whole ounce of silver may be gilt with eight grains of gold, which may be afterwards drawn into a wire thirteen thousand feet long.

In odoriferous bodies we can still perceive a greater subtility of parts, and even such as are actually separated from one another; several bodies scarce lose any sensible part of their weight in a long time, and yet continually fill a very large space with odoriferous particles.

The particles of LIGHT, if light consists of real particles, furnish another surprising instance of the minuteness of some parts of matter. A lighted candle placed on a plane will be visible two miles, and consequently fill a sphere, whose diameter is four miles, with luminous particles, before it has lost any sensible part of its weight. And as the force of any body is directly in proportion to its quantity of matter multiplied by its velocity; and since the velocity of the particles of light is demonstrated to be at least a million of times greater than the velocity of a cannon ball, it is plain, that if a million of these particles were round, and as big as a small grain of sand, we durst no more open our eyes to the light, than expose them to sand shot point-blank from a cannon.

By help of microscopes, such objects as would otherwise escape our sight, appear very large: there are some small animals scarce visible with the best microscopes; and yet these have all the parts necessary for life, as blood, and other liquors. How wonderful must the subtility of the parts be, which make up such fluids! See ANIMALCULES.

Whence is deducible the following theorem:

Any particle of matter, how small soever, and any finite space, how large soever, being given; it is possible for that small sand, or particle of matter, to be diffused through all that great space, and to fill it in such manner, as that there shall be no pore in it, whose diameter shall exceed any given line; as is demonstrated by Dr. Keil. Introduct. ad Ver. Phyl.

DIVISION, the act of separating a whole into the parts it contains.

If the whole be composed of parts really distinct, called *integral parts*, the *division* made thereof is properly called *partition*; as when a house is divided into its apartments.

If the whole be composed of parts, called *subjective*; that is, if the whole be only one common term, the subjects comprised in the extent whereof are the parts, the *division* thereof is what we properly call *division*: such is the *division* of a genus into its species, &c.

DIVISION, in *Algebra*, or *Species*, is performed by reducing the dividend and divisor into the form of a fraction; this fraction being the quotient.

Thus, if ab were to be divided by cd, it must be placed thus, $\frac{ab}{cd}$, and that fraction is the quotient; though others choose to write it thus, $cd) ab$, or $cd : ab$, or $ab \div cd$, which last mark $\div$ is the most common character for *division*.

To perform the work of *division* algebraically, these rules are to be observed: 1. When the dividend is equal to the divisor, the quotient is unity, and must be placed in the quotient, because every thing contains itself once.

2. When the quotient is expressed fraction-wise (as in simple *division*) if the same letters are found equally repeated in each member of the numerator, and denominator; cast away those letters, and the remainder is the quotient: thus, $\frac{a\,b}{a}\,a$, and $\frac{a\,b\,c}{a\,b}\,c$, &c.

3. When there are any co-efficients, divide them as in common arithmetic, or divide them by any common measure, and to the quotients annex the quantities expressed by letters: thus, $\frac{360\,a\,b}{24\,b} = 15\,a$

4. The general way of *division* of compound quantities, after ranging them according to the dimensions of one of their letters, is like the ordinary way in common arithmetic, respect being had to the rules of algebraic addition, subtraction, and multiplication; as also that the like signs give +, and unlike — in the quotient; taking care to divide every part of the dividend by its corresponding divisor (that is, that whose letters shew it of the same kind with the other), to prevent a fraction, which would otherwise arise: thus,

$$\begin{array}{l} a+b) \; aa+ab-ca-cb \; (a-c \\ \quad aa+ab \\ \hline \quad 0 \\ \qquad\quad -ca-cb \\ \qquad\quad -ca-cb \\ \hline \qquad\quad 0 \end{array}$$

That the same reason for like signs giving a positive and unlike a negative quotient, does hold in *division*, as in multiplication, is clear from considering the nature of *division* (which is only resolving the thing into its parts); consequently, since every dividend is nothing else but the product of the divisor and quotient multiplied by each other, the quotient must consist of such signs, which could produce the dividend; therefore, if the dividend be divided by a quantity, that has a similar sign with it, the quotient must be positive; if by a quantity having a dissimilar sign, the quotient must be negative. It may be a general rule in compound *division* in algebra, always to place such a letter in the quotient, as will, when multiplied into the divisor, produce the dividend; for that is always a rectangle under the divisor, and the quotient: as for example,

$$\begin{array}{l} zz-16) \; z^4-8z^3-12\,4\,zz-64 \; (z^2+8z+4. \\ \quad z^4-16z^2 \\ \hline \quad\quad -8z^3-12\,4\,zz \\ \quad\quad -8z^3-128zz \\ \hline \quad\quad\quad\quad 4zz-64 \\ \quad\quad\quad\quad 4zz-64 \\ \hline \quad\quad\quad\quad 0 \end{array}$$

In some cases the quotient will form an *infinite* SERIES, and then it is usual to set down the last remainder with the divisor under it.

DIVISION, in *Arithmetic*, is the last of the four fundamental rules, being that whereby we find how often a less quantity is contained in a greater; and the overplus.

Division, in reality, is only a compendious method of subtraction; its effect being to take a less number from another greater as often as possible; that is, as oft as it is contained therein. There are, therefore, three num-

bers concerned in division: 1. That given to be divided, called the *dividend*. 2. That whereby the dividend is to be divided, called the *divisor*. 3. That which expresses how often the divisor is contained in the dividend; or the number resulting from the *division* of the dividend by the divisor, called the *quotient*.

There are diverse ways of performing *division*, one called the *Engliſh*, another the *Flemiſh*, another the *Italian*, another the *Spaniſh*, another the *German*, and another the *Indian* way, all equally juſt, as finding the quotient with the ſame certainty, and only differing in the manner of arranging, and diſpoſing the numbers.

We have likewiſe *diviſion* in integers; *diviſion* in fractions; and *diviſion* in ſpecies, or algebra.

Diviſion is performed by ſeeking how often the divisor is contained in the dividend; and when the latter conſiſts of a greater number of figures than the former, the dividend muſt be taken into parts, beginning from the left, and proceeding to the right, and ſeeking how often the divisor is found in each of thoſe parts.

For example, it is required to *divide* 6759 by 3. I firſt ſeek how oft 3 is contained in 6, viz. twice; then, how oft in 7, which is likewiſe twice, with one remaining. This 1, therefore, is joined to the next figure 5, which makes 15, and I ſeek how oft 3 in 15; and laſtly, how oft 3 in 9. All the numbers expreſſing how oft 3 is contained in each of thoſe parts, I write down according to the order of the parts of the dividend, that is from left to right, and ſeparate them from the dividend itſelf, by a line, thus,

Diviſor.	Dividend.	Quotient.
3)	6759	(2253

It appears therefore, that 3 is contained 2253 times in 6759, or that 6750 being divided into 3 parts, each part will be 2253. If there be any remainder, that is, if the diviſor repeated a certain number of times is not equal to the dividend, what remains is wrote over the diviſor fraction-wiſe. Thus, if inſtead of 6759 the dividend were only 6758, the quotient will be the ſame as in the former caſe, except for the laſt figure 8: for 3 being only contained twice in 8, the laſt number in the quotient will be 2; and as twice three is only 6, there remains 2 of the dividend; which I write after the quotient, with the diviſor underneath it, and a line to ſeparate the two, thus:

3) 6758 (2252$\frac{2}{3}$

If the diviſor is a digit, the *diviſion* may be eaſily performed without ſetting down any thing but the remainders. Again, if the diviſor has cyphers in the firſt places towards the right-hand, theſe may be cut off, provided that an equal number of figures be cut off from the right of the dividend; and when the *diviſion* is finiſhed, we obtain the integral quotient: then to the remainder annex all the excluded figures of the dividend, and ſubjoin the whole diviſor. Thus,

8)00) 367854 (459 integral quotient.
Rem. 654, and the fractional part of the quotient is $\frac{654}{800}$

Moreover, if the diviſor is the product of two or more digits, which may be eaſily diſcovered, divide firſt by any one of theſe, and then divide the quotient by the other, and ſo on; the laſt quotient is that required; and for the fractional part, multiply the laſt remainder by the preceding diviſor, and to the product add the preceding remainder; multiply this ſum by the next preceding diviſor, and to the product add the next preceding remainder, and ſo on, till you have got through all the diviſors and remainders to the firſt. Thus, to divide 3428689 by 126, divide by 3, 6, and 7, becauſe $3\times6\times7=126$; the firſt quotient is 1142896, and the remainder 1; the ſecond quotient is 190482, and the remainder 4; the laſt quotient is 27211, and the remainder 5, which multiplied by the preceding diviſor 6, produces 30, to which the preceding remainder 4 being added, we have 34; this multiplied by the preceding or firſt diviſor, produces 102, and, the remainder 1 added, makes 103, the true remainder; and the fractional part of the quotient is $\frac{103}{126}$. For the *diviſion* of concrete, or applicate numbers, ſee REDUCTION.

Proof of DIVISION.

Diviſion is proved by multiplying the quotient by the diviſor, or the diviſor by the quotient; and adding what remains of the *diviſion*, if there be any thing. If the ſum be found equal to the dividend, the operation is juſt, otherwiſe there is a miſtake.

DIVISION, in *Decimal Fractions*. See DECIMAL.

DIVISION, in *Gunnary*, or *geometrical* DIVISION, is alſo called *application*; the deſign of which, when it is employed about the conſtruction of plain problems, is this: viz. a rectangle being given, as alſo a right line; to find another right line, the rectangle contained under which, with the right line given, ſhall be equal to the rectangle firſt given. Such effection, or conſtruction, is called the *application* of a given rectangle to a right line given; and the right line aſſigned by ſuch application, is called the *geometrical quotient*.

Thus is found by the rule of three, by ſaying, as the line given is to one ſide of the rectangle, ſo is the other ſide to the line ſought.

Not unlike to which is Des Cartes's way of working *diviſion* in lines, by ſcale and compaſs: thus, ſuppoſe ac (=6), were to be divided by ad (=3) (*Tab.* II. *Geometry*, *fig.* 28.) make any angle at pleaſure, and therein ſet off firſt ad (=3) the diviſor, and then on the ſame leg, au =to unity; then on the other leg of the angle ſet ac (=6) the dividend, and join dc, and to it through u, draw ub parallel to dc, which ſhall cut off ab the quotient ſought; for as $ad:au::ac:ab$; that is, as the diviſor: is to unity:: ſo is the dividend: to the quotient: on which proportion depends all *diviſion*.

DIVISION *of a word*, in *Grammar*, is a diſcourſe explaining the latitude, or comprehenſion of a word; the intitude, when the word is univerſal; as when the genus is *divided* into ſpecies, and differences; the comprehenſion, when the word is ambiguous, as *ſtarre*, *Lat.* which ſometimes denotes a conſtellation, ſometimes a beaſt, and ſometimes a mountain.

DIVISION *by Logarithms*. See LOGARITHM.

DIVISION, in *Logic*, is the ſeparating any thing into diverſe parts, or ideas. See DISTRIBUTION.

The ſchoolmen define it a diſcourſe, explaining a thing by its parts; in which it approaches near to the nature of a definition, whoſe character is to define a thing by its parts.

Diviſion, we have ſaid, is a diſtribution of a whole, &c. But there are two ſorts of wholes, as above expreſſed.

The firſt is what conſiſts of integral parts; as the human body, which contains diverſe members.

The ſecond is properly no other than an abſtract idea common to more things than one, as the univerſals; or a compound idea comprehending the ſubſtance and its accidents, or at leaſt moſt of its accidents.

The whole admits of a triple *diviſion*. 1. When the genus, or kind, is divided by its ſpecies, or differences; as when ſubſtance is *divided* into body and ſpirit; or into extended, and thinking.

2. When any thing is *divided* into ſeveral claſſes, by oppoſite accidents; as when the ſtars are *divided* into thoſe which ſhine by their own light, and thoſe that only reflect a borrowed light.

3. When the accidents themſelves are *divided* according to the ſubjects in which they inhere; as when goods are *divided* into thoſe of the body, the mind, and fortune.

The laws of *diviſion* are, 1. That it be full and adequate, that is, that the members of the *diviſion* entirely exhauſt the whole thing *diviſed*; as when all numbers are *divided* into equal, and unequal.

2. That the members of the *diviſion* be oppoſite; as equal, and unequal; corporeal, and not corporeal; extended, and thinking.

3. That one member of the *diviſion* be not contained in another, ſo as the other may be affirmed of it: though, in other reſpects, it might be included without any fault in the *diviſion*: thus extenſion, geometrically conſidered, may be *divided* into a line, ſurface, and ſolid; though the line be included in the ſurface, and the ſurface in the ſolid.

4. The *diviſion* muſt not be made into too many, or too general parts. Laſtly, the members, unleſs the ſubject require it, not to be too unequal; as if the univerſe were *divided* into heaven and earth.

DIVISION *of mathematical inſtruments*. See GRADUATION, and MURAL *Arc*.

DIVISION *of a mode*, divides a quality into its degrees. Philoſophers, after the phyſicians, ſuppoſe eight degrees of every quality: hence when a quality is ſaid to be in the eighth degree, it marks, that it can be no farther intended, or heightened.

DIVISION, in *Muſic*, imports the dividing of the interval of an octave into a number of leſſer intervals.

The 4th and 5th, each of them, divide or meaſure the octave perfectly, though differently. When the 5th is below, and ſerves as a baſis to the 4th, the *diviſion* is called *harmonical*; when the 4th is below, the *diviſion* is called *authentic*.

DIVISION *by Napier's Bones*. See NAPIER'S *Bones*.

DIVISION, in *Phyſics*, or DIVISIO *continui*, is the ſeparation of the parts of a quantity; whereby, what before was one, is now reduced into ſeveral. See CONTINUITY, and DISSOLUTION.

This *division* is effected by means of motion, without which these can be no separation of any continuum, or even contiguum.

This motion is performed diverſe ways, by fraction, ſciſſion, ſection, fiſſion, reſolution, dilution, maceration, diſperſion, effuſion, diſtraction, &c.

DIVISION *of Powers.* See POWERS.

DIVISION *of Proportion.* See PROPORTION.

DIVISION, in *Rhetoric*, the arrangement of a diſcourſe under ſeveral heads, to be ſpoken to ſeparately. See DISPOSITION.

DIVISION, in *Vulgar Fractions.* See FRACTION.

DIVISIONS *of an army*, in the *Military Art*, the ſeveral brigades and ſquadrons into which it is cantoned. See BRIGADE.

DIVISIONS *of a battalion*, the ſeveral platoons into which it is divided in marching or firing, each of which is commanded by an officer. See BATTALION.

DIVISION, in the *Sea-Language*, the third part of a naval army, or fleet; or one of the ſquadrons thereof, diſtinguiſhed by a particular flag or pendant, under the command of ſome flag-officer. See SQUADRON.

The white flag denotes the firſt ſquadron of France, the white and blue the ſecond, and the third is characterized by the blue. In England, the firſt admiral, or the admiral of the fleet, diſplays the union flag at the main top-maſt-head; next follows the white flag with St. George's croſs, and afterwards the blue. The private ſhips carry pendants of the ſame colour with their reſpective ſquadrons at the maſts of their particular *diviſions*; ſo that the laſt ſhip in the *diviſion* of the blue ſquadron carries a blue pendant at her mizen-top-maſt-head.

Naval battles are uſually ranged in three lines, according to their three *diviſions*.

DIVISIONES, in *Antiquity*, certain preſents of money, oil, bread, wine, or the like, appointed by will to be diſtributed annually among certain perſons or companies, and ſometimes to the people in general.

DIVISOR, the dividing number; or that which ſhews how many parts the dividend is to be divided into.

DIVISOR, *common*. See COMMON *meaſure*.

DIVORCE, from *divertere*, *ſtare away*, a breach or diſſolution of the bond of MARRIAGE.

In our law, *divorce* is of two kinds; the one total, *a vinculo matrimonii*, which alone is properly *divorce*; the other partial, *a menſa & thoro*; a ſeparation from bed and board.

The woman divorced *a vinculo matrimonii*, receives all again that ſhe brought with her; the other has a ſuitable, ſeparate maintenance allowed her out of her huſband's effects. See ALIMONY.

The firſt only happens through ſome eſſential impediment, as conſanguinity or affinity within the degrees forbidden, precontract, impotency, &c. of which impediments the canon law allows fourteen, comprehended in theſe verſes:

Error, conditio, votum, cognatio, crimen,
Cultus, disparitas, vis, ordo, ligamen, honeſtas,
Si ſis affinis, ſi forte coire nequibis,
Si parochi & duplicis deſit præſentia teſtis,
Raptave ſit mulier, nec ſpatii redditus intra.

In this kind of *divorce*, the marriage is declared null, as having been abſolutely unlawful, *ab initio*, and the parties are ſeparated *pro ſalute animarum*, and allowed to marry again; the iſſue of ſuch marriage as is thus entirely diſſolved, are baſtards. *Divorce a menſa & thoro* diſſolveth not the marriage, becauſe it was juſt and lawful *ab initio*; but for ſome ſupervenient cauſe, it becomes improper or impoſſible for the parties to live together; as in the caſe of intolerable ill temper, of adultery, in either of the parties. However, *divorces a vinculo matrimonii*, for adultery, have of late years been frequently granted in England, by act of parliament.

Divorce is a ſpiritual judgment, and therefore is paſſed in the ſpiritual court. Under the old law, the woman *divorced* was to have of her huſband a writing, as St. Jerom and Joſephus teſtify, to this effect: *I promiſe, that hereafter I will lay no claim to thee*; which was called a *bill of divorce*.

Divorce was allowed in great latitude both among the Pagans and Jews. At Rome, barrenneſs, age, diſeaſe, madneſs, and baniſhment, were the ordinary cauſes of *divorce*. Spurius Carvinus, between 500 and 600 years after the building of Rome, under the conſulſhip of M. Attilius, and P. Valerius, was the firſt who put away his wife, becauſe ſhe was barren; though Plutarch, in his Roman Queſtions, maintains, that Domitian was the firſt who permitted *divorce*.

Juſtinian afterwards added impotence, a vow of chaſtity, and the profeſſion of a monaſtic life, as valid reaſons of *divorce*.

The Roman lawyers diſtinguiſh between *repudium* and *divortium*; making the former to be the breaking of a contract or eſpouſal, and the latter ſeparation after ſolemnity. Romulus enacted a ſevere law, which ſuffered not the wife to leave her huſband, but gave the man the liberty of turning off his wife, either upon poiſoning her children, counterfeiting his private keys, or for the crime of adultery; but if the huſband on any other occaſion put her away, he ordered one moiety of his eſtate for the wife, and the other to the goddeſs Ceres; beſides an atonement to the gods of the earth. Plut. in Rom. However, in later times, the women, as well as the men, might ſue a *divorce*. Juvenal, Sat. ix. Martial, lib. x. Ep. 41.

The common way of *divorcing* was by ſending a bill to the woman containing the reaſons of ſeparation, and the tender of all her goods which ſhe brought with her; and this was called *repudium miſſum*; or elſe it was performed in her preſence, and before ſeven witneſſes, and accompanied with the formalities of tearing the writings, refunding the portion, taking away the keys, and turning the woman out of doors.

The Grecian laws concerning *divorces* were different: the Cretans allowed *divorce* to any man that was afraid of having too many children. The Spartans ſeldom *divorced* their wives; and it was extremely ſcandalous for a woman to depart from her huſband. The Athenians allowed *divorce* on very ſmall grounds, by a bill, containing the reaſon of the *divorce*, and approved, if the party appealed, by the chief magiſtrate; and women alſo were allowed to leave their huſbands on juſt occaſions. Perſons *divorcing* their wives were obliged to return their portions, otherwiſe, the Athenian laws obliged them to pay nine obols a month for alimony. The terms expreſſing the ſeparation of men and women from each other were different; the men were ſaid ἀποπέμπειν, or ἀπόπεμπειν, *to diſmiſs their wives*, but wives ἀπολείπειν, *to leave their huſbands*. Pott. Arch. Græc. vol. ii. book iv. cap. 12.

Among the Jews, beſides incontinence and adultery, ugline's, old age, or ill humour in a wife, were ſufficient reaſons for giving her a bill of *divorce*. Nay, even the man's own pleaſure, or his repenting of his match, were admitted as good reaſons. Selden de Uxore Heb. lib. iii. cap. 17.

It is generally held, that Jeſus Chriſt allowed of *divorce* in the caſe of adultery. But ſome take this for a miſtake; and maintain, that *divorce* is no where permitted in the New Teſtament for adultery; but only a ſeparation. See Matt. xix. 9. Mark x. 11. Paul 1 Cor. vii. 27. See alſo the council of Florence, at the end, after the queſtions propoſed to the Greeks. Tertull. de Monogam. cap. 9. & 10. Auguſtin. de Bono Conjugio, & de Adult. Conjug. See ADULTERY.

Pope Innocent I. in his decretal to Exuperius, declares ſuch as contract a new marriage after *divorce*, adulterers; as well as the perſons with whom they marry. The occaſion of this decree was, that ſuch marriages were then allowed of by the Roman laws. There is an exception, however, in caſe of marriage between two heathens, which the decrees allow to be diſſolved after the converſion of one of the parties. And St. Paul ſays the ſame, 1 Cor. vii. 15. Yet even in this caſe, 1. The marriage is not immediately diſſolved by the converſion of one of the parties, but they may ſtill live together, and even on ſome occaſions they ought to do ſo. Nor is it even diſſolved by the ſeparation of the infidel party; for if ſhe be afterwards converted, he is obliged to take back his wife. But the marriage is totally diſſolved by a ſecond marriage of the converted party with another perſon.

2. Though the party converted to the faith may, the minute of his converſion, legally ſeparate himſelf, and contract with another, a liberty the Chriſtian law allows him, as in juſtice he is not deemed to owe any thing to an infidel; yet charity frequently forbids ſuch *divorce*, and ſeparation: nay, ſo far, if the infidel conſent to live with him, and do not moleſt him in his religion; if his faith be not at all in danger; if there be any hopes of converting her, or of gaining the children; if the ſeparation would prove a ſcandal to the heathens, and render Chriſtianity odious, &c. See St. Paul 1 Cor. vii. 13. 16.

The fourth council of Toledo decrees, that in a country where Chriſtianity is the prevailing religion, the infidel party muſt be adverſified to become Chriſtian; which if ſhe refuſe, the marriage muſt be diſſolved.

The council of Trent prohibits *divorce* on any occaſion whatever. The papal diſpenſations, however, are a falſe for this inſtance of rigour.

In England, *divorce* can only be had by conſent of parliament. Milton has an expreſs treatiſe of the doctrine and diſcipline of *divorce*, where he maintains, that *divorce* ought to be permitted for a mere incompatibility of humours.

DIURE'TICS, *Diuretic*, that ſeparation which is made of the urine by the kidney.

The

The word is formed from διὰ, *through*, and οὖρον, *I make water*.

DIURETICS, in *Medicine*, are such remedies as provoke or promote the discharge of urine.

Such is water drank plentifully, white wine drank in a morning; alkali salts of all kinds; sea-salt, sal gemmæ, nitre, borax, alum, tartar, sal ammoniac, whey, sour milk, lemon juice, &c.

Aqueous liquors are generally *diuretic*, especially if mixed with salt, and drank cold. Fermented liquors are the least *diuretic* of all; and the less so, as they are the fatter. Sharp, thin, sour wines, Rhenish, &c. as also acid spirits of vinegar, salt, sulphur, alum, vitriol, &c. asparagus, bitter almonds, smallage, eryngium, eupatorium, sassafras, &c. are all *diuretics*.

DIURETICUS *sal*. See SAL *Diureticus*.

DIURNAL, from *dies*, *day*, in *Astronomy*, something relating to the day; in opposition to nocturnal, which regards the night.

DIURNAL *arch*. See ARCH.

DIURNAL *circle*. See CIRCLE *Diurnal*.

DIURNAL *motion of a planet*, is so many degrees and minutes, &c. as any planet moves in twenty-four hours.

The DIURNAL *motion of the earth*, is its rotation round its axis, the space whereof constitutes the natural day.

The reality of the *diurnal rotation* of the earth is now past all dispute.

DIURNAL is also used in speaking of what belongs to the nychthemeron, or natural day of twenty-four hours. In which sense it stands opposed to annual, menstrual, &c.

The *diurnal* phenomena of the heavenly bodies are solved from the *diurnal* revolution of the earth; that is from the revolution of the earth round its own axis in twenty-four hours. To illustrate this: suppose the circle PRTH (*Tab. Astron. fig. 2.*) to denote the earth; C the centre of the earth, through which its axis is conceived to pass, around which a *diurnal* revolution is performed; P denotes any place in the earth; the line EW the visible horizon of the place; E the east point of the said horizon, W the west; the circle *abcdefg* the circumference of the heavens; the circle S, the sun in the heavens; the semicircle PRT, the enlightened hemisphere of the earth; so that half of it opposite to the sun; and lastly, the semicircle PHT, the darkened hemisphere of the earth.

Now, the earth supposed in this situation, and moving round its axis towards the sun; it is evident, the place P of the earth will then just begin to be enlightened by the sun; and so the sun will appear there to be just rising, or ascending the horizon at E the east point of it. The earth being moved round its own axis, so that the place P of the earth, which before was under the point *a* in the heavens, is now under the point *b*; it is evident, the horizon of the said place P will be now so situated, as that the sun will appear to a spectator at P, considerably ascended above E, the east end of the horizon. And while, by the revolution of the earth round its axis, the place P passes from under the point *b* in the heavens, to the point *c*, the horizon of the place P will continually sink lower and lower in respect of the sun, and so the sun will appear to ascend higher and higher, till P is come under *c*, where the sun will appear in its greatest height above the horizon for that day; and so it will be noon, or mid-day, at the place P. The earth moving on, as the place P passes from under *c* to *d*, the west point of its horizon will ascend higher and higher, and to the sun will appear more and more to descend, as is represented by the horizon at the point of the earth under *d*. The place P being carried by the *diurnal* revolution of the earth from under *d* to under *e*, the sun will then appear just in W, the west point of the horizon; and so will appear to be just setting. The place P being come under *f*, it will be then midnight there. Lastly, the place P being come round again under *a*, it will be there sun-rising again. The same holds good as to any other of the celestial lights, and the earth, as is obvious from the figure: the circle representing the sun being taken to denote any other star, planet, &c.

It remains to observe, that whereas, by the *diurnal* revolution of the earth, all the several celestial lights seem to move in the heavens from east to west, hence this seeming *diurnal motion* of the celestial lights is called their *common motion*, as being common to all of them. Besides which, all the celestial lights, except the sun, have a proper motion; from which arise their proper phenomena; as for the proper phenomena of the sun, they likewise seem to arise from the proper motion of the sun; but they are really produced by another motion, which the earth has, and whereby it moves round the sun once every year, whence it is called the *annual motion of the earth*.

DIURNARY, DIURNARIUS, an officer in the Greek empire, who wrote down, in a book for that purpose, whatever the prince did, ordered, regulated, &c. every day.

DIUTURNITY, the long continuance or duration of any being.

DIVUS, DIVA, in *Antiquity*, appellations given to men and women who had been deified, or placed in the number of the gods.

Hence it is, that on medals struck for the consecration of an emperor or empress, they give them the title of *Divus*, or *Diva*. For example: DIVUS JULIUS. DIVO ANTONINO PIO. DIVO PIO. DIVO CLAUDIO. DIVA FAUSTINA AUG. &c.

DIZOSTOS, in *Botany*, a name given by some of the old Greek writers to the *apium*, or knobby-rooted spurge: it is so called, because of its having usually two or three slender and rush-like stalks, growing up from the roots, which seem as if they were fit to be used as cords or bandages. See APIOS.

DIZZINESS, in *Medicine*. See VERTIGO.

DO, in the *Italian Music*, is a syllable used instead of *ut*, being supposed more resonant and musical than *ut*.

Do *lous*.—To *do lous*, *facere lucem*, is the same as to *make lous*, anno 23 Hen. VI. cap. 14. See MAKE.

DOB-CHICK, or DIDAPPER, in *Ornithology*, the common English name of a small water-fowl, the least of all the *diver-kind*, and known among authors by the name of *colymbus minor*; and called by Linnæus *colymbus auritus*. It seldom exceeds six ounces in weight, and has a short beak, not more than a finger's breadth long, large at the base, but tapering to a point at the end; its eyes are large, and it is covered with a very thick downy plumage: it is of a very deep blackish brown on the back, and very white on the belly; its wings are very small, and it has no tail.

This bird is of such a structure, that it moves much more easily under water, than on its surface, or aloft. He raises himself from the water with great difficulty; but when he is got up to the air, he can then continue his flight for a long time. He forms his nests by the water, near the banks, with a large quantity of vegetables, the fermentation of which, occasioned by the warmth of the bird, hatches the eggs, though the water rises through the nest, and keeps them wet. Phil. Trans. N° 200. p. 990.

DOBULA, in *Ichthyology*, a name given by Gesner, and other writers, to the chub. It has been called *capito* and *cephalus* by the moderns, and *fluvialis* by the ancients; but it requires no generical name, being properly only a species of the cyprinus. See CEPHALUS and CYPRINUS.

DOBULA is also used for a fresh-water fish, of the leuciscus, or dace kind, but is of a larger and thinner shape, and a much better tasted fish. It is caught in the fresh waters of Germany about Hamburgh, and in many other places. Schonefeldt, Hist. Pisc.

DOCETÆ, from δοκεῖν, *to appear*, in *Ecclesiastical History*, the followers of Julius Cassianus, one of the VALENTINIAN sect, towards the close of the second century, who revived a notion that had been adopted by a branch of the GNOSTICS, against whom St. John, Ignatius, and Polycarp, had asserted the truth of the incarnation. They believed and taught, as their name imports, that the actions and sufferings of Jesus Christ were not in reality, but only in appearance.

DOCIMASIA, δοκιμασία, from δοκιμάζω, *I try*, in *Antiquity*, a custom among the *Athenians*, by which every man, before he was admitted to a public employment, was obliged to give an account of himself and his past life, before certain judges in the forum; for if any man had lived a vicious and scandalous life, he was thought unworthy of the meanest office. Nor was this thought enough; for in the first ordinary assembly after their election, they were a second time brought to the test; when, if any thing scandalous was found against them, they were deprived of their honours. Pott. Archæol. Græc. lib. ii. cap. 12. tom i. p. 73.

DOCIMASTICAL *experiments*. See ASSAYING.

DOCIMENUM *marmor*, a name given by the ancients to a species of marble, of a bright and clear white, much used in the large sumptuous buildings, as temples and the like. It had its name from Docimeno, a city of Phrygia, afterwards called Synaia, near which it was dug, and from whence it was sent to Rome. It was accounted little inferior to the Parian in colour, but not capable of so elegant a polish: whence it was less used by the statuaries, or in other smaller works. The emperor Adrian is said to have used this marble in building the temple of Jupiter, and many other of the great works of the Romans are of it.

DOCK, *Rumex*, *Lapathum*, in *Botany*, a genus of the *hexandria trigynia* class. Its characters are these: the empalement of the flower is permanent; the flower has three

three petals, which are larger than the empalement, to which they are very like. It hath six short hair-like ſtamina, terminated by erect thin ſummits; and a three-cornered germen, ſupporting three hair-like reflexed ſtyles, thrusting out of the cleft of the petals, crowned by large jagged ſtigmas; the germen afterward becomes a three-cornered ſeed, included in the petals of the flowers. Linnæus reckons twenty-eight and Miller ſixteen ſpecies.

The great *water-dock*, or *rumex aquaticus* of Linnæus, has been long famous in medicine. The roots of the common wild *docks* are nearly of the ſame quality; and equally diſcover their aſtringent matter, both to the taſte, and by ſtriking an inky blackneſs with ſolution of chalybeate vitriol. Munnigius wrote a treatiſe De Britannica Antiquorum Herba. His endeavours to prove, that its name *Britannica* was not derived from that of our iſland, but from Teutonic words, expreſſing the power of faſtening looſe teeth, or of curing the diſeaſe which makes them looſe; and later experience has ſhewn, that it is a medicine of conſiderable efficacy againſt putrid ſcurvy gums, and as an internal antiſcorbutic. The roots are principally uſed, and are ſaid to be of great ſervice in the jaundice, in the herpes, and eryſipelas, and in diſpoſing inveterate ulcers to heal. It is alſo ſaid to be a remedy in quinſies.

It has been chiefly uſed in medicated wines and ſmall ale, with the addition of ſome ſpicy materials, and ſometimes of other antiſcorbutic plants, as ſcurvy-graſs, buck-beans, horſe-radiſh, &c.

The *hippomon ecstrum*, *Orchiaſtrum*, *rumex* worts of Linnæus, or ſharp-pointed-leaved *dock*, is as eminent as an antiſcorbutic, and a cleanſer of the blood. It is ſuppoſed to have an aperient as well as an aſtringent virtue, and is recommended in habitual coſtiveneſs, and obſtructions of the viſcera. A decoction of half an ounce, or an ounce, of the freſh roots, or of a dram or two of the dry roots, is commonly directed for a doſe. It is alſo uſed externally in fomentations and ointments againſt the itch, and other cutaneous diſeaſes.

The TORMIL, as well as the *Monk's* RHUBARB, have been claſſed by Linnæus under this genus.

DOCK, in the *Manage*, is uſed for a large caſe of leather, as long as the *taile* of a horſe's tail, which ſerves it for a covet. The French call the *dock*, *trouſſequeue*. It is made faſt by ſtraps to the crupper, and has leathern thongs that paſs between his thighs, and along the flanks to the ſaddle-ſtraps, in order to keep the tail tight, and to prevent its whiſking about.

DOCK, among *Sportſmen*, is uſed for the fleſhy part of a boar's chine, between the middle and the buttock.

DOCK, DOCKING, in *Law*, a means or expedient for cutting off an eſtate tail in lands, or tenements, by means of a common recovery; that the owner may be enabled to ſell, give, or bequeath the ſame.

DOCK, probably from *δοχὴ*, *receptaculum*, of *δέχομαι*, *I receive*, in the *Sea-Language*, a pit, pond, or creek, by the ſide of an harbour, made convenient to work in, in order to build or repair ſhips.

This is of two ſorts: a *dry dock*, where the water is kept out by gates or floodgates, till the ſhip is built, or repaired; but afterwards can be eaſily let into it again to float, and launch her.

A *wet dock* is any place in the ocean, where a ſhip may be haled in, and to *dock* herſelf, or ſink herſelf a place to lie in; and where the can be cleaned only during the receſs of the tide.

DOCK-*yards*, are magazines of all ſorts of naval ſtores, and timber for ſhip-building; the royal *dock-yards* in England, are thoſe at Chatham, Portſmouth, Plymouth, Woolwich, Deptford, and Sheerneſs. In time of peace, ſhips of war are there built, and the ſhip is built, or repaired, moſtly at Chatham, where, and at other yards, they receive, from time to time, ſuch repairs as are neceſſary.

Theſe yards are generally ſupplied from the northern crowns, with hemp, pitch, tar, roſin, canvaſs, oak-plank, and ſeveral other ſpecies. But as for maſts, particularly thoſe of the largeſt ſize, they have been uſually brought from New England.

The principal *dock-yards* are governed by a commiſſioner, reſident at the port, who ſuperintends all the matters of the officers, artificers, and labourers, employed in the *dock-yard*, and ordinary. He alſo controuls their payments; examines the accounts; contracts and draws bills on the navy-office to ſupply the deficiency of ſtores; and regulates whatever belongs to the yard, maintaining due order in the reſpective offices.

DOCKET ſometimes denotes a little bill tied to wares or goods, and directed to the perſon and place they are to be ſent to.

DOCKET, or DOCQUET, in *Law*, is a brief in writing, on a ſmall piece of paper, or parchment, containing the purport and effect of a larger *writing*. The rolls of judgment are *docketed*, when they are brought into the court of common-pleas, and entered on the *docket* of that term: ſo that by ſearching theſe *dockets*, any judgment may be found, if the attorney's name is known. Decrees in chancery are alſo *docketed*.

DOCTOR, a perſon who has paſſed all the degrees of a faculty, and is empowered to teach, or practiſe the ſame.

The title of *doctor* was firſt created towards the middle of the twelfth century; to ſucceed to that of maſter, which was become too common and familiar.

The eſtabliſhment of the *doctorate*, ſuch as now in uſe among us, is ordinarily attributed to Irnerius, who firſt drew up the formulary. The firſt ceremony of this kind was performed at Bologna, in the perſon of Bulgarus, who began to explain the Roman law, and on that occaſion was ſolemnly promoted to the *doctorate*, A. D. 1888. Hence *jure ſtrictiſſimo doctor*. But the cuſtom was ſoon tranſferred from the faculty of law to that of theology: the firſt inſtance whereof was given in the univerſity of Paris, where Peter Lombard, and Gilbert de la Porre, the two chief divines of thoſe days, were created *doctors* in theology, *ſacræ theologiæ doctores*.

Spelman takes the title of *doctor* not to have commenced till after the publication of Gratian's decretum, about the year 1140; and others, who have ſo explained that work to their ſcholars, were the firſt that had the appellation of *doctors*.

Others go much higher, and hold Bede to have been the firſt *doctor* at Cambridge, and John de Beverley at Oxford; which latter died in the year 721. But Spelman will not allow *doctor* to have been the name of any title or degree in England, till the reign of king John, about the year 1205.

To paſs *doctor* in divinity at Oxford, it is requiſite the candidate have been four years bachelor of divinity, but *doctor of laws*, he muſt have been ſeven years in the univerſity to commence bachelor of laws; five years after which he may be admitted *doctor of laws*. Otherwiſe, in three years after taking the degree of maſter of arts, he may take the degree of bachelor in laws, and in four years more, that of LL. D. which ſame method and time are likewiſe required to paſs the degree of *doctor in phyſic*.

At Cambridge, to take the degree of *doctor in divinity*, it is required the candidate have been ſeven years bachelor of divinity. Though in ſeveral of the colleges, the taking of the bachelor of divinity's degree is diſpenſed with, and they may go out *per ſaltum*. To commence *doctor in laws*, the candidate muſt have been five years bachelor of law, or ſeven years maſter of arts. To take *doctor in phyſic*, he muſt have been bachelor in phyſic five years, or ſeven years maſter of arts.

A *doctor* of the civil law may exerciſe eccleſiaſtical juriſdiction, though a layman, ſtat. 37 Hen. VIII. cap. 17. ſect. 2.

DOCTOR *of the law* was a title of honour or dignity among the Jews.

The Jews, it is certain, had *doctors* long before Jeſus Chriſt. The inveſtiture, if we may ſo ſay, of this order, was performed by putting a key, and a table-book in their hands; which is what ſome authors imagine our Saviour had in view, Luke xi. 52. where ſpeaking of the *doctors of the law*, he ſays, *Woe unto you, doctors of the law; for you have taken away the key of knowledge; you entered not in yourſelves, and them that were entering, you hindered*.

The Greek text of St. Luke calls them νομικοὶ; and the Vulgate *legiſperiti*; agreeably to which, our Engliſh tranſlators call them *lawyers*. But the French verſion of *docteurs de la loi* ſeems the moſt accurate. In effect, the word *lawyer*, *legiſperitus*, is only found in St. Luke, and in Titus iii. 13. and in Matthew xxii. 35. and Acts v. 34. in St. Matthew xxii. 35. it is rendered by the Vulgate, *legiſperitus*, though the Engliſh verſion ſtill retains the word *lawyer*.

Thoſe Jewiſh *doctors* are the ſame whom they otherwiſe call SCRIBES.

DOCTOR *of the church*, a title given to certain of the fathers whoſe doctrines and opinions have been the moſt generally followed and authorized.

We uſually reckon four *doctors* of the Greek church, and three of the Latin. The firſt are St. Athanaſius, St. Baſil, St. Gregory Nazianzen, and St. Chryſoſtom. The latter are St. Jerom, St. Auguſtine, and Gregory the Great.

In the Roman breviary there is a particular office for the *doctors*. It only differs from that of the confeſſors, by the anthem of the Magnificat, and the leſſons.

DOCTOR is alſo an appellation aſſumed by ſeveral ſpecific authors, expreſſing wherein the matter of ſuch or the ſchools wherein they were maſters, conſiſted.

Thus Alexander Hales is called the *doctor doctorum*; Durand, the *doctor doctor*; on account of his following Thomas Aquinas, called the *doctor Angelicus*; and Scotus, the *doctor ſubtilis*.

80086

venture, the *Seraphic Doctor*; John Duns Scotus, the *Subtile Doctor*; Raimond Lully, the *Illuminous Doctor*; Roger Bacon, the *Admirable Doctor*, &c.

DOCTOR, *Athanasius*, in the Greek *Church*, is a particular officer, appointed to interpret part of the Scriptures. He who interprets the Gospel, is called *Doctor of the Gospels*; he who interprets St. Paul's Epistles, *Doctor of the Epistles*; he who interprets the Psalms, *Doctor of the Psalter*.

DOCTOR's *Commons*. See COLLEGE of *Civilians*.

DOCTRINE, from *docco*, *I teach*, denotes in general any thing that is taught; as a matter either of faith or practice; and the term has accordingly been applied to a variety of opinions, that have been adopted and inculcated in philosophy, religion, &c. There are certain *doctrines* respecting the political constitution of Great Britain, the asserting and publishing of which are made illegal by statute. Thus, if any person maliciously or advisedly affirm, that both or either of the houses of parliament have any legislative authority without the king, such person shall incur all the penalties of a præmunire. 13 Car. II. cap. 1. Also if a person affirms and maintain, by writing or printing, that the king and parliament have no right to direct the succession of the crown, he is guilty of high treason; and if he maintains the same *doctrine* by teaching, or advised speaking, he incurs a præmunire. 13 Eliz. cap. 1. 6 Anne, cap. 7. There are also other doctrines of a religious nature, which it is unlawful publicly to maintain and preach. See BLASPHEMY, COMMON *Prayer*, HERESY, TRINITY, &c.

DOCTRINE, *Christian*, *fathers of*. See FATHERS.

DOCUMENT, in *Law*, some written monument produced in proof of any fact asserted, especially an ancient one.

DODARTIA, in *Botany*, a genus of the *didynamia angiospermia* class. Its characters are these: the empalement is cut into five parts at top; the flower hath one petal, and the upper-lip is twice as long as the lower. It has four stamina, two of which are shorter than the others; in the centre is situated a round germen, which afterwards becomes a globular capsule with two cells, filled with small seeds. There are two species, natives of the East. James says there are no medical virtues attributed to this plant.

DODDER, *Cuscuta*. In the Linnæan system of *Botany*, this makes a distinct genus of plants, of the *tetrandria digynia* class, the characters of which are these: the calyx is a one-leaved perianthium, in form of a cup, fleshy at the base, and divided slightly into four obtuse segments at the rim. The flower is composed of only one petal, of an oval figure, a little longer than the cup, and divided slightly into four obtuse segments at the edge. The stamina are four pointed filaments of the length of the cup; the antheræ are roundish; the germen of the pistil is roundish; the styles are two in number, and are erect, and short; the stigmata are simple; the fruit is fleshy, and roundish, and contains two cells splitting open horizontally; the seeds are two from each flower.

This is a plant that differs from all others, in having no leaves, but consisting of a number of long, slender, red threads, or filaments, by which it takes hold, and twists about the plants that are near it, sucking its nourishment from them. It has several monopetalous flowers, divided generally into four short and narrow segments, to which succeed little round seed-vessels, containing each four small seeds. It grows frequently upon heaths and commons, on furze and nettles; as also in the fields upon flax and tares, doing great damage, and almost choaking them; whence it is called by the country-people hellweed, and devil's guts.

The *usfeta* grows indifferently on all kinds of herbs; and, of consequence, the kinds thereof are infinite; to which writers usually attribute the particular virtues of the plants they grow on.

The most known of these plants, and those most used in medicine, are such as grow on thyme, which are the proper *epithymi*; and those on flax. There are two kinds in the shops; the one from Venice, the other from Candia; they have both an aromatic taste, but that of Venice has the strongest.

Dodder of thyme has been accounted opening and cleansing; good to purge melancholy and bilious humours, to open obstructions in the liver and spleen, good for the jaundice, and serviceable against the itch. But in this country it is an entire stranger to practice; though the remarkable lubility of its taste seems to promise some considerable medicinal power.

DODECACTIS, in *Natural History*, a name by which Linnæus, and some other authors, have called a kind of aithrophyte, or branched Burnith, which has twelve rays, first parting from the body, and each of these finally divided into many others.

DODECADACTYLON, in *Anatomy*, a name given by some of the old authors, to the gut called the DUODENUM, from its being anciently supposed to be about twelve fingers-breadth long.

DODECAGON, from δώδεκα, *twelve*, and γωνία, *angle*, a regular polygon, or figure, with twelve equal sides and angles.

Dials are sometimes drawn on all the sides of a *dodecagon*. In *Fortification*, a place surrounded with twelve bastions is called a *dodecagon*; such is Palma Nova in Friuli, &c.

DODECAGYNIA, from δώδεκα, *twelve*, and γυνὴ, *female*, a *wife*, in *Botany*, an order of plants, comprehending such as have twelve styles. See *Tab. II. of Botany*.

DODECAHEDRON, from δώδεκα, *twelve*, and ἕδρα, *seat*, in *Geometry*, one of the regular bodies, comprehended under twelve equal sides; each whereof is a pentagon.

Or, a *dodecahedron* may be conceived to consist of twelve quinquangular pyramids, whole vertices, or tops, meet in the centre of a sphere conceived to circumscribe the solid; consequently they have their bases and altitudes equal.

To find the solidity of the DODECAHEDRON. Find that of one of the pyramids, and multiply it by the number of bases, viz. 12; the product is the solidity of the whole body. Or its solidity is found by multiplying the base into $\frac{1}{3}$ of its distance from the centre, twelve times; and to find this distance, take the distance of two parallel faces; the half is the height.

The diameter of the sphere being given, the side of the *dodecahedron* is found by this theorem: the square of the diameter of the sphere is equal to the rectangle under the aggregate of the sides of a *dodecahedron*, and hexahedron inscribed in the same, and triple the side of the *dodecahedron*. Thus, if the diameter of the sphere be 1, the side of the *dodecahedron* inscribed will be $\sqrt{\frac{1}{3}} - \sqrt{\frac{1}{15}} = \frac{1}{24}$ consequently, that is to this as 2 to $(\sqrt{\frac{1}{3}} - \sqrt{\frac{1}{15}})$, and the square of that, to the square of this, as $6 : 3 - \sqrt{5}$. Therefore the diameter of the sphere is incommensurable to the side of an inscribed *dodecahedron*, both in itself, and its power.

DODECANDRIA, in *Botany*, the eleventh class of plants, which have hermaphrodite flowers, with twelve, or from twelve to nineteen, inclusive, stamina, or male parts in each. See *Tab. of Botany, Class* 11.

The word is formed of δώδεκα, *twelve*, and ἀνὴρ, *male*. This class comprehends five orders, viz. the *monogynia*, *digynia*, *trigynia*, *pentagynia*, and *dodecagynia*.

Of this class of plants are the agrahaxca, agrimony, &c.

DODECATEMORY, from δώδεκα, *twelve*, and μέρος, *part*, the twelfth part of a circle.

The term is chiefly applied to the twelve houses, or parts of the zodiac of the primum mobile; to distinguish them from the twelve signs.

DODECATEMORY is also a denomination some authors give to each of the twelve signs of the zodiac, because they contain a twelfth part of the zodiac apiece.

DODECATHEON, in *Botany*, a genus of plants of the *pentandria monogynia* class, with a wheel-shaped reflex flower, the stamina resting on the tubular base, and the fruit an oblong capsule, containing a fingle cell. There is one species.

DODO, in *Ornithology*, the name of a bird, called also by some *ignavi cucullatus*, by others *gallus gallinaceus peregrinus*, and by Bontius *dronte*. It is a very singular bird, somewhat larger than a swan, but wholly different from the swan in shape, though by some esteemed a kind of that bird. Its head is large, and is covered with a membrane resembling a hood; its beak is of an oblong figure, and is yellow at its origin, and black at the point, and is somewhat crooked; it is very naked, having only a few feathers scattered over its body, and the rudiments of wings made up of a few naked quills; the hinder parts of its body are very bulky and fat, and it has a tail made of four or five curled greyish feathers, resembling those of the ostrich. Its legs are very thick and strong. See *Tab. of Birds*, N° 6.

Dodo, or *dinar*, is a distinct genus of the *gallinæ* in the Linnæan system.

DODONÆA, in *Botany*, the name of a genus of plants, about which authors were very unsettled in their opinions, till Linnæus characterized it under this name, and ranged it in the *octandria monogynia* class. Burman has made it a species of the carpinus, and Plumier of the *staphylodendron*. The characters are these: the perianthium is divided into three oval, erect, and equal segments; there are no petals; the stamina are eight in number, and are extremely short; the antheræ are of an oblong figure, they stand very low, and scarce exceed the length of the cup; the germen of the pistil is of a three-cornered shape; the style is subulated and very long, and the stigma is simple; the fruit is a roundish capsule, having three inflated cells, with prominent angles; the seeds are contained each in one cell. The cup has sometimes four segments, and the fruit four cells.

DODONÆUS, Dodonian, in *Antiquity*, an epithet given to Jupiter, as adored, or worshipped, in the temple of *Dodona*, in a foreſt of the ſame name.

Dodona, whence the appellation ariſes, is an ancient city of Epirus, celebrated on divers accounts, as the foreſt of *Dodona*, the oracle of *Dodona*, and the fountain of *Dodona*.

Dodona's foreſt was a wood, or grove of oaks, all conſecrated to Jupiter. In this was a temple of that god, wherein was the moſt famous, and, as it is ſaid, the moſt ancient oracle of all Greece.

Indeed it was not in the temple only that oracles were delivered; the very pigeons that inhabited the wood are ſaid to have done the ſame.

The origin, and occaſion of this fable, we have from Herodotus, who obſerves, it was founded on this, that πελειαι, which in the Theſſalian language ſignifies a pigeon, does likewiſe ſignify a witch, or propheteſs. But what is more extraordinary ſtill, another tradition among the poets as if the very oaks of the foreſt of *Dodona* ſpoke and delivered oracles. This fable is eaſily deduced from the former; the pigeons in the oak being ſuppoſed to ſpeak. it was no great flight of poetical fancy, to introduce the trees themſelves ſpeaking, &c. See Voſſius de Idololat. lib. 1. cap. 7. p. 27.

The fountain of *Dodona* was in the temple of Jupiter. The ancient naturaliſts aſſure us, it had a property of rekindling torches, &c. when newly extinguiſhed. This, no doubt, it did by means of ſome ſulphureous fumes exhaling from it: as we ſtill find a fountain in Dauphiné, called the *burning fountain*, do. It is alſo ſaid to have extinguiſhed lighted torches; which is no great miracle, ſince plunging them into a place where the ſulphur was too denſe, or into the water, muſt have that effect.

DODRA, in *Roman Antiquity*, a drink prepared from nine different ingredients; which are enumerated by the epigrammatiſt in the following line,

Jus, aqua, mel, unum, panis, piper, herba, oleum, ſal.

Vid. Auſon. Epigram 86.

DODRANS, in *Antiquity*, a diviſion of the AS; being ¾ thereof, or nine unciæ.

DOE, the female of the buck.

DOG, *Canis*, in *Zoology*, a large genus of quadrupeds. See Canis.

The *dog* in its wild ſtate lives in the woods in many parts of the Eaſt; it does not ſtruck a man, neither does it diſcover any of that familiarity which we find in tame ones. Indeed many other animals may be made as tame as the *dog* by the ſame treatment; as has been tried on the other, with ſucceſs.

Authors mention many ſpecies of this animal, as the maſtiff, wolf-*dog*, hound, grey-hound, ſpaniel, water-ſpaniel, bull-*dog*, lap-*dog*, &c. but theſe are only varieties of the original wild kind, which is of a middle ſize between the maſtiff and greyhound, and diſtinguiſhed by a tail bending upwards.

Dr. Caius, an Engliſh phyſician in the reign of queen Elizabeth, has given the following ſyſtematical arrangement of Britiſh *dogs*.

I. the moſt generous kinds
- *Dogs* of chace
  - Hounds
    - Terrier
    - Harrier
    - Blood-hound
    - Gaze-hound
    - Grey-hound
    - Leviner, or Lyemmer
    - Tumbler
- Fowlers
  - Spaniel
  - Setter
  - Water-ſpaniel, or Finder
- Lap *dogs*
  - Spaniel gentle, or Comforter

II. Farm-dogs
- Shepherd's *dog*
- Maſtiff, or Ban-*dog*

III. Mongrels
- Wappe
- Turnſpit
- Dancer.

See Hound, Maſtiff, Spaniel, Terrier, &c. Pennant's Zoology, vol. 1. p. 59. &c.

By a late act, commencing May 1, 1770, ſtealing of *dogs* incurs a forfeiture of 20*l.* and charges of conviction for the firſt offence, or an impriſonment for any time between ſix and twelve months; and for a ſubſequent offence of not leſs than 30*l.* and charges, or, on non-payment, impriſonment for twelve months, and public whipping. Perſons alſo in whoſe cuſtody *dogs*, or their ſkins, are found, are liable to like penalties.

Dog, *ſetting*. See Setting.

Dog, *water*. See Spaniel.

The ſportſmen generally eſteem the black *water-ſpaniels* above thoſe of any other colour, they being generally the moſt hardy. If there be any farther judgment to be made from the colour, it is, that the ſpotted or pied are generally the quickeſt at ſcent, and the ſimple liver-coloured the quickeſt at ſwimming. Theſe, however, are but very uncertain rules to judge by, and the things principally to be regarded are the *dogs* being of a good breed, and well taught. As to the ſhape, the head of a good *water-dog* is generally round, and the hair curling, the ears large and broad, and hanging down; the eyes full and lively, the noſe ſhort, and the lips like a hound's. The neck ſhould be thick and ſhort, the ſhoulders broad, the legs ſtraight, and the chine ſquare. The buttocks ſhould be round, and the thighs brawney; the paſterns ſtrong and the fore-feet round; the hair in general ſhould be long and curled, not looſe and ſhaggy.

As to the training up of a dog for ſporting, the maſter of him cannot begin when he is too young, the principal thing to be taught being obedience, and that being beſt taught while the creature is young. As ſoon as he can lap, he ſhould be taught to couch and lie cloſe at command, and not to dare to ſtir from that poſture till he is ordered, he will ſoon be brought to this, by beating when he diſobeys, and encouraging him when he does right. He ſhould always be taught before the times of his eating, and never have his food given him but when he has done ſomething to deſerve it. This will teach him always to do well, for the ſake of the expected victuals. No perſon ſhould ever interfere in the teaching; for two maſters breed a confuſion, and the creature never will learn well from them.

The teacher muſt be careful always to uſe the ſame words in his leſſons; thoſe words are to be choſen which are the moſt plain in their ſounds, and the moſt diſtinct from one another; and when theſe are once fixed upon, they muſt never be altered; for the *dog*, being guided wholly by the ſound, and not at all by the ſenſe, any alteration of them, though the change be into words of the ſame ſenſe, quite confounds the creature. The word *down* is ſhort and expreſſive, and no other need be uſed when he is ordered to couch; but this being once given him is never to be varied afterwards. The next ſound he ſhould be taught after this, is the word of correction; for no leſſon can be given but faults will be committed, and no fault ſhould paſs without correction or blame; in this caſe, the word *ſirrah*, ſpoke angrily, will always be underſtood. This, at firſt, ſhould be uſed with a lath or a blow, and after a time he will know it as a word of diſpleaſure, and it will do for ſmall faults without the blow. Certain words of cheriſhing and encouragement muſt alſo be taught him at the ſame time, as *good boy*, or the like, uſing always with theſe actions and looks of cheerfulneſs and pleaſure, as clapping him on the back, and the like. After theſe, he muſt be taught the meaning of ſome words of advice, to put him in mind of his buſineſs, when he is out upon the ſport, ſuch as *take heed*, or the like. Theſe will not only ſet him upon the watch, and make him diligent; but he will alſo be careful and cunning, and at the ſame time cheerful and pleaſed in himſelf, as knowing that he is doing his maſter a pleaſure.

When the young *dog* is thus far inſtructed, and knows the meaning of the words of inſtruction, correction, encouragement, and advice, and will couch and lie down at his maſter's feet, how and when he pleaſes, and that with the ſignal of a word, or look only; he is then to be taught to follow cloſe at his maſter's heels, by leading him by a line tied to his collar, he is to be carefully taught this, ſo that when taken out to the ſport, he muſt neither run under the legs, nor hang too far back; this alſo will tend to the making him the more obedient. When he has been thus taught to follow with a line, he muſt be taught to follow in the ſame manner, looſe, and without a line, and always be at his maſter's heels.

The next leſſon he is to be taught, is to fetch and carry any thing he is commanded; this muſt be taught him by way of ſport, as a diverſion, by ſhaking a glove at his head, and teaching him to ſnatch it, and afterwards to catch it when thrown from the hand, and bring it back again: this he is to be encouraged in with cheriſhing words, and all other means.

The beſt method of perfecting the creature in this, is by letting

letting him have no food, but what he earns by doing well, always feeding him when he does as he should do. If he carry the glove away, or play wantonly with it, and refuse to bring it back, his master is to use the word of instruction, as *take heed*. If this does not bring him to, he is to use the word of correction; and if he does not bring it back at this, he must proceed to blows; and on many other trials he must have nothing given him to eat, till he has done as he ought, and has it by way of reward. When by this means he is taught to well, that he will bring back the glove, wherever it is thrown, and carry it only to his master, though he is in company with other persons, who all call him; he is then to be cherished and encouraged, and taught to bring back any thing else that is thrown, whether sticks, stones, or any thing whatever. After this, he is to be taught to carry dead fowl, and finally live ones, and this with so tender a mouth, as not to hurt them: thus he will be taught at length to bring the fowl that his master shoots, without tearing them or hurting a feather. The next lesson is to be taught by taking him out in the field, and dropping something unknown to him; after he is come to some distance from the place, he is to be sent back to seek for it, and if he bring it back, he is to be encouraged. If he bring back a wrong thing, he is to be encouraged for the attempt, and sent back again. By repeating this at different distances, he will be taught to go back ever so far in search of any thing; and if he fails in the lesson, he is to be chid, beaten, or kept fasting, for it, according to the offence.

When he has been perfected in all these lessons, he must be taught his business of hunting; he is to be first taught with some fowl, which his master is to still him in making, and reward and encourage him when he has done. After this he is to be sent in without assistance to take the fowl alone; and if he succeeds, he is to be encouraged and rewarded, and corrected if he fails. By this practice he will soon become master of his game; but great care is to be taken in teaching him, when he has caught it, to bring it back to the shore, without biting or hurting it.

The next thing to this is the training him to the gun; to this purpose, he must be taught to follow step by step behind his master, and under cover of his shadow, till he has shot, or, when there is occasion, to couch and lie close, never daring to stir till the gun has gone off; and then, upon the least notice or beckoning, to come and do what he is commanded.

Many of these *dogs* are so expert, that they will have their eye upon the game as soon as their master; and the moment the gun is gone off, they will, without bidding, go and fetch it; but this is being too forward; and if he is used afterwards with nets or lime-twigs, he will do great mischief, by rushing on the birds as soon as they are taken, and tearing the nets, or spoiling the twigs. Obedience is the best quality in this sort of *dog*; and it is better he should wait for command, than know his business without it.

The sportsmen, who know the time of birds moulting, make a very good use of this sort of *dog*, taking him with them without gun, net, or any other assistance. The common moulting-time of *water-fowl* is from June to August; in this time they are not able to fly well; and in some part of it, when their old wing-feathers are off, and the new ones are grown scarce at all, the *dog* is then to be taken to the sides of rivers and other waters, and set to hunt about the close places, among which they hide themselves at this time; the *dog* being set to hunt, will easily find them in these retreats, and will take them either by leaping suddenly upon them, or fairly pursuing such of them as have not the use of their wings.

There is also another great use of the *dog* in driving them without catching them. This is practised only in moorish and fenny countries, where they are very numerous. In these countries a proper place is to be sought for, where the birds retire to, and these are planted with nets; then the *dog* is sent into the waters and places of covert, where they are supposed to be, and this at the moulting-time, when they cannot fly away from him. The alarm he puts them into which he first attacks, soon calls many others together, and there is a large body of them formed, which the *dog* drives before him like a flock of sheep; and being directed by the sportsmen, frightens directly into the places of their retreat, where the nets are placed before hand to receive them.

DOG, in *Astronomy*, a name common to two constellations called the *Great* and *Little Dog*; but, among astronomers, more usually, *Canis major*, and *minor*. See CANIS *major* & *minor*.

DOG-*drawn*, in the *Forest Law*, a manifest apprehension of an offender against venison in a forest; when he is found *drawing* after a deer by the scent of a hound, led in his hand. There are four offences in the forest, noted by Manwood; viz. *stable-stand*, *dog-drawn*, *bow-bent*, or *back-berand*, and *hand-habend*. See STABLE-*stand*, &c.

DOG's *bane*, in *Botany*, *Apocynum*, from *axe* and *nexe*, a *dog*, because the ancients believed this plant would kill dogs. This belongs to the class of *pentandria digynia*, in the Linnæan system. Its characters are these: the flower is of one leaf, cut into five acute segments at the top, which turn backwards; and in the bottom of the flower are situated five nectariums, which surround the germina; and there are five stamina, which are scarcely visible. In the centre are two oval germina, which afterward become two large pointed capsules, having one cell, which is filled with compressed seeds, lying over each other like tiles on a house, and furnished with long feathery down; by which, when the pods are ripe and open, the seeds are wafted by the wind to a considerable distance; so that where these plants grow naturally, they are very troublesome weeds. Linnæus reckons five, and Miller eleven species.

The down of these plants is in great esteem in France, for stuffing easy chairs, and making very light quilts, which are so very warm and light, that they are very proper covering for gouty persons. This the French call *dogwood*, and in the southern parts of France, where some of the sorts will thrive in the open air, and perfect their seeds, there are many plantations of these plants for the sake of the down.

James attributes no virtues to this plant.

DOG's *Bane*, *Spurious*, *Cynanchum*, in *Botany*, a genus of the *pentandria digynia* class. Its characters are these: the flower hath one petal, which is spread open, plain, and divided into five parts; the nectarium, which is situated in the centre of the flower, is erect, cylindrical, and of the length of the petal. It hath five stamina, which are parallel to the nectarium, and an oblong bind germen; the empalement becomes a capsule, with two oblong pointed pods, which open longitudinally, and are filled with seeds, lying over each other imbricatim, crowned with long down. Linnæus enumerates nine and Miller seven species, natives of warm climates.

DOG-*berry tree*. See *Cornelian* CHERRY.

DOG's-*bane*. See *Dog's* CABBAGE.

DOG-*days*. See CANICULAR *days*.

DOG-*fish*. See CANIS *galeus*.

DOG-*fly*, *Cynamyia*, in *Natural History*, the name of a species of fly common in woods and among bushes, and particularly troublesome to *dogs*. It usually seizes upon the ears, and it is in vain to beat it off; for it returns in a moment, and cannot be prevented but by being killed. It flings very severely, and always raises a blister in the part. It somewhat resembles the flat black fly, so troublesome to cattle. It has no trunk, but has two teeth much resembling those of the wasp. Its wings are always placed so close upon its body, that they are not seen. There are two kinds of it, one larger, and found in woods, and the other common in hedges.

DOG's *grass*. See GRASS.

DOG's *Mercury*. See MERCURY.

DOG-*rose*, a name for the common briar, or hip-tree. It is observable of some kinds of this shrub, that the flowers smell extremely sweet in the night, or very early in the morning, but not at all in the day-time. The reason of which seems to be the same as in all the narcotic plants, of which there are several kinds, as some of the geraniums, and of the jasmines, &c. that is, that the sun exhales and dissipates their odorous effluvia in the day-time as soon as they are expanded from the flower, but that in these cold times the vapours are condensed, and reach our nostrils in an agreeable manner. Phil. Transf. N° 114.

DOG's *tail grass*, *Cynosurus*, in *Botany*, a kind of grass called *gridata* by Schreuchzer, and other authors; but in the Linnæan system of botany, under this name, it makes a distinct genus of plants, of the *triandria digynia* class; the characters of which are, that the cup is only a partial covering, lying on one side, but large, and made of two leaves, which are pennated, and remain when the flower is fallen; the glume contains many flowers, and is bivalve, the valves being slender, pointed, and equal in size; the flower is made of two valves, the exterior one is long, hollow, and bristled; the interior plain and naked; the filamina are three capillary filaments; the antheræ are oblong; the germen of the fructification of a truncated form; the styles are two of moderate length, hairy, and crooked; the stigmata are single; the pericarp does not open, but nicely encloses the seed, which is single, of an oblong shape, and pointed at both ends. There are ten species.

DOG's *teeth*, in *Anatomy*. See TEETH.

DOG's *tongue*, in *Botany*. See HOUND's *tongue*.

Dog's

DOG's *tooth, Violet*, in *Botony, Dens Canis*, or *Erythronium*, a genus of the *hexandria monogynia* class. Its characters are these: the flower is bell-shaped, compoſed of ſix oblong petals, which ſpread open to their baſe. It hath ſix ſtamina joined to the ſtyle; in the centre is ſituated a three-cornered germen, which afterwards becomes an oblong, obtuſe, capſule, with three cells, filled with flat ſeeds. There are two ſpecies. The flowers are propagated by off-ſets from their roots; and love a ſhady ſituation, and a loamy ſoil; but ſhould not be too often removed.

The powder of the dried root of this plant is ſaid to kill worms in children. Drank in wine, it is an approved remedy for the colic. It is ſaid to be reſtrictive and reſtorative, and taken in water, cures children of the epilepſy: it is alſo eſteemed a great provocative to venery.

DOG's *tooth Shell*. See DENTALIS.

DOG-*wood*. This wood, when put into water, is ſaid to ſtupify fiſh there, ſo that they are eaſily taken with the hand. It is uſed in America for this purpoſe; and the method is to tie it to the ſtem of the fiſhing boat. It is the wood of a ſpecies of cornus. See *Cornelian* CHERRY.

DOG-*wood of Jamaica*. See ACACIA.

DOG-*wood of Virginia*. See BAY-*tree*, and CORALLODENDRON.

DOGA, in *Antiquity*, a large veſſel into which the wine was put when newly brought from the vintage.

DOGE, the chief magiſtrate in the republics of Venice and Genoa.

The word properly ſignifies *duke*, being formed from the Latin *dux*; as *dogate* and *ducatus*, *duchy*.

The *dogate*, or office and dignity of *doge* is elective: at Venice, the *doge* is elected for life; at Genoa, only for two years; he is addreſſed under the title of *Serenity* which among the Venetians is ſuperior to that of highneſs.

The *doge* is the chief of the council, and the mouth of the republic; yet the Venetians do not go into mourning at his death, as not being their ſovereign, but only their firſt miniſter. In effect, the *doge* of Venice is no more than the phantom or ſhadow of the majeſty of a prince, all the authority being reſerved to the republic. He only ſends his name to the ſenate; the power is diffuſed throughout the whole body, though the anſwers be all made in the name of the *doge*. If he gives any anſwers on his own account, they muſt be very cautiouſly expreſſed, and in general terms, otherwiſe he is ſure to meet with a reprimand. So that it is abſolutely neceſſary he be of an eaſy and pliable diſpoſition.

Anciently, the *doges* were ſovereigns; but things are much altered; and at preſent, all the prerogatives reſerved to the quality of *doge*, are theſe which follow: he gives audience to ambaſſadors; but does not give them any anſwer from himſelf, in matters of any importance; only he is allowed to anſwer according to his own pleaſure to the compliments they make to the ſignory; ſuch anſwers being of no conſequence. The *doge*, at being firſt magiſtrate, is head of all the councils; and the credentials which the ſenate furniſhes its miniſters in foreign courts, are written in his name; and yet he does not ſign them; but a ſecretary of ſtate ſigns them, and ſeals them with the arms of the republic. The ambaſſadors direct their diſpatches to the *doge*; and yet he may not open them, but in preſence of the counſellors. The money is ſtruck in the *doge*'s name, but not with his ſtamp, or arms. All the magiſtrates riſe, and ſalute the *doge*, when he comes into council; and the *doge* riſes to none but foreign ambaſſadors.

The *doge* nominates to all the benefices in the church of St. Mark; he is protector of the monaſtery delle Virgini; and beſtows certain petty offices of uſhers of the houſhold, called *Commanders of the Palace*. His family is not under the juriſdiction of the maſter of the ceremonies; and his children may have ſtaff-officers, and gondoliers in livery.

His grandeur, at the ſame time, is tempered with a variety of circumſtances which render it burdenſome. He may not go out of Venice, without leave of the council; and if he does go out, he is liable to receive affronts, without being entitled to demand ſatisfaction; and, if any diſorder ſhould happen where he was, it belongs not to him, but to the podeſta, as being inveſted with the public authority, to compoſe it.

The children and brothers of the *doge* are excluded from all the chief offices of ſtate. They may not receive any benefice from the court of Rome; but are allowed to accept of the cardinalate, as being no benefice, nor including any juriſdiction. The *doge* may not diveſt himſelf of his dignity, for his eaſe; and after his death, his conduct is examined by three inquiſitors, and five correctors, who ſit it with great ſeverity.

DOGGS, machines of iron for burning wood on; alſo hooks fixed in large timbers, for drawing them with horſes.

DOGGER, a ſmall ſhip, built after the Dutch faſhion, with a narrow ſtern, and two maſts; viz. a main-maſt, and a mizen-maſt, principally uſed in fiſhing on the *Dogger* bank.

DOGGERS, in the Engliſh *Alum-Works*, a name given by the workmen to a ſort of ſtone found in the ſame mines with the true alum-rock, and containing ſome alum, though not nearly ſo much as the right kind. The county of York, which abounds greatly with the true alum-rock, affords alſo a very conſiderable quantity of theſe *doggers*; and in ſome places they approach ſo nearly to the nature of the true rock, that they are wrought to advantage. See ALUM.

DOGGER-*fiſh*, in our *Statutes*, ſeems to be fiſh brought in the faſhing-veſſels, called *doggers*, to blackneis Haven, &c. anno 31 Edw. III ſtat. 3. cap. 2.

DOGGER-*men*, fiſhermen belonging to *dogger*-ſhips. 25 Hen VIII. cap. 4.

DOGGET. See DOGREY.

DOGMA, *Δογμα*, a maxim, tenet, ſettled propoſition, or principle; particularly in matters of religion, or philoſophy.

DOGMATICAL, ſomething relating to a doctrine, or opinion.

In common uſe, a *dogmatical* philoſopher is one who aſſerts every thing poſitively in oppoſition to a ſceptic, who doubts of every thing.

A *dogmatical* phyſician is he, who, on the principles of the ſchool philoſophy, rejects all medicinal virtues not reducible to manifeſt qualities.

DOGMATICI, DOGMATISTS, a ſect of ancient phyſicians, called alſo, *logici*, *rationales*, from their uſing the rules of logic and reaſon, in ſubjects of their profeſſion.

They laid down definitions, and diviſions, reducing diſeaſes to certain genera, thoſe genera to ſpecies, and furniſhing remedies for them all; ſuppoſing principles, drawing conſequences, and applying thoſe principles and conſequences to the particular diſeaſes under conſideration. In which ſenſe the *dogmatics* ſtand contradiſtinguiſhed to empirics, and methodiſts.

The *dogmatiſts* were thoſe who brought phyſic into a form, and arrangement, like thoſe of other ſpeculative ſciences; *defining*, dividing, laying down principles, and drawing concluſions; and hence they had alſo the appellation of *logici*, q. d. *reaſoners*. They alſo applied themſelves to ſeek the cauſes of diſeaſes, the nature of remedies, &c.

Eraſiſtratus, a famous *dogmatiſt*, went ſo far, that, not content to diſſect dogs, and other brute animals, he begged condemned criminals of the magiſtrates, and opened them while alive, and ſcorched in their entrails.

DOITKIN, a kind of baſe coin of ſmall value, prohibited by the ſtatute 3 Hen. V. cap. 1. Hence came the phraſe, *Not worth a doitkin*.

DOLABRUM, among the Romans, a kind of knife uſed in ſacrifices among that people. Vide. Hiſt. Acad. Inſcript. tom ii. p. 345.

DOLE, in the Saxon and Britiſh tongue, ſignifies a part or portion, moſt commonly of a meadow.

Hence alſo *dole-meadow*; a meadow wherein ſeveral perſons have ſhares.

The word ſtill ſignifies a *ſhare*; a diſtributing, or dealing of alms; or a liberal gift made by a great man to the people.

DOLE, in the *Law of Scotland*, is uſed for a malevolent intention. The word is taken from the civil law term *dolus*.

Dole, in the law of Scotland, as well as in the civil law, is an eſſential ingredient to conſtitute an action criminal. In crimes wherein the will, not the event, muſt be regarded, no negligence can equal *dole*, unleſs the negligence be ſo extremely ſupine, as not to be conceivable without implying *dole*.

Under *dole* are comprehended the vices and errors of the will, which are immediately productive of the criminal fact, though not premeditated, but the effect of ſudden paſſion. In this reſpect *dole* differs from what the Engliſh law calls malice. However both laws agree in this, that the bare intention never brought forth into act, is no crime; yet giving counſel to perpetrate is criminal, if the fact is done purſuant thereto.

DOLE-*fiſh*, in our *Statutes*, ſeems to be that fiſh, which the fiſhermen, yearly employed in the North ſeas, do of cuſtom receive for their allowance or ſhares. Vide. ſtat. 35 Hen. VIII. cap. 7.

DOLET, in *Natural Hiſtory*, a word uſed by ſome writers, in *Medicine*, for red vitriol, or colcothar of vitriol.

DOLG-BOTE, in the Saxon *Laws*, a recompence, amends, or ſatisfaction, made for a ſcar or wound.

DOLICHODROMUS, in the *Ancient Exercises*, one who ran the length of a DOLICHOS.

DOLICHOLITHOS, in *Natural History*, a name given by some authors to a species of stone, of a blackish colour, and of the shape of a kidney-bean, found in great abundance about Tyrol, and yielding a smell on rubbing.

DOLICHOS, in *Antiquity*, a word used by different writers in different senses. The ancient physicians understood by it long or prolix, and used it in this sense in their description of diseases. Others used it for the fruit or pod of the kidney-bean. Suidas makes it signify a race, or course, of twelve stadia, or of twenty-four.

DOLICHOS, in *Botany*, the name of a genus of plants, of the *diadelphia decandria* class, the characters of which are these: the perianthium is composed of one leaf; it is very short, and is divided into four segments at the end; the upper segment is emarginated; the flower is of the papilionaceous kind; the vexillum is roundish, large, and emarginated, and is wholly bent backward; and there are two callous oblong bodies running parallel to one another, and growing in the tender part of the vexillum towards its base; these compress the alæ together; the alæ are of an obtuse oval figure, and are of the length of the carina; the carina is compressed, the filaments are diadelphous, and the anthera are simple; the germen of the pistil is slender and compressed, the style points upward, the stigma is bearded, and runs from the middle of the inner part of the style to its apex, which is callous and obtuse. The fruit is a large pod, of a pointed oblong figure; it is bivalve, and is divided into two cells; the seeds are of an elliptic figure, and usually are compressed; this plant approaches greatly to the phaseoli, but is distinguished at first sight by the carina of the flower, which is not spiral, as in that genus.

DOLIMAN, a kind of long cassock worn by the Turks, hanging down to the feet, with narrow sleeves, buttoned at the wrist.

The Turks, both men and women, wear drawers next the skin; over that a shift, or shirt; and over the shirt a *doliman*. In summer it is linen, or muslin; in winter, sattin, or stuff.

DOLIUM, in *Natural History*, the name of a genus of shells, called by some *concha globosa*, and by the French, *tonnes*. The characters are these: it is an univalve shell, with a globose, or round belly, with a lax aperture, sometimes smooth, and sometimes dentated. The clavicle is either moderately umbonated or depressed; and the columella is in some species smooth, in others wrinkled. Some authors have called these *concha ampullacea*; and they have had, at times, many other names, but all tending to the same sense, and expressing the globular figure of the body, which is the great character by which these are distinguished from all other shells. See *Tab. of Shells*, N° 15.

The Persian shell, so much esteemed in cabinets, is a very singular one; but the globose figure of its body evidently refers it to this genus, though it differ in many other particulars from all the species of it. Aldrovandus could not tell what to make of the shells of this genus, but has thrown them together at the end of his book of covering, that they seemed to be of the turbinated kind, but that they want the turbo.

Of the round umbilicated *dolia*, there are six species; of the oblong and smooth, five species; of the oblong costated, and umbonated, seven species; of those with long and arched tails, five species; of that series, which from their shape are called *bullæ*, seven species: to which is be added a very rare species of *dolium*, which is fasciated, of a blue colour on the outside, and white within; this is called by some the *vitta cærulea*; and there is an olive-coloured shell of the same kind.

DOLLAR, or DALLER, a silver COIN, nearly of the value of the Spanish piece of eight, or French crown.

Dollars are coined in divers parts of Germany and Holland; and have their diminutions, as *semi-dollars*, *quarter-dollars*, &c.

They are not all of the same fineness, nor weight. The Dutch *dollars* are the most frequent. In the Levant they are called *ostani*, from the impression of a lion thereon.

DOLOR, *Pain*, in *Medicine*. Galen, in his first book of Elements has defined pain, in opposition to pleasure, to be a disagreeable and troublesome sensation. Of pain there are various kinds; one is attended with pulsation; another with a sense of incumbent weight; another with a tension. There is a *pain* which attends tension, incision, punction, and perforation, comprehended with these and the like differences, under the name of acute; and lastly there is a *pain* attended with a torpor or numbness.

Pains considered as prognostics of a recovery. *Pains* affect the patient in the beginning of a disease, or afterward: in the beginning they are for the most part to be accounted as pathognomonic signs, signifying that some part among the viscera labours under an inflammation. Thus it is when the *pain* begins with a fever, and a tumor or tension of some part; and these sorts of *pains* are called inflammatory. It is best for the patient when these *pains* are neither violent nor continual; but after a short duration, are either quite removed, or else mitigated, and are, besides, attended with no other pernicious signs. But it is best of all, and safest in such a case, when these *pains* cease or remit with reason, or for some manifest cause; as it happens when such cessation or remission is owing to some beneficial evacuation, excited by nature or procured by art; such as venesection, spontaneous bleeding at the nose, sweats, stools, spitting, or when a subsequent fever removes the *pain* by virtue of its heat, as we learn from Hippocrates.

As for those *pains* which arise on the progress of the distemper, those which the physicians call critical, are thought to be the more kindly and favourable; because partly as a sign, and partly as a cause, they prognosticate a happy crisis. As a sign they indicate an hæmorrhage, vomiting, or some other evacuation, agreeable to the observation of Hippocrates. 1 Epid. sect. 3.

These are the *pains*, which, by indicating a happy crisis, prognosticate a recovery; such, in particular, are the *pains* which affect, sometimes for a long time together, the ignoble parts which lie remote from the viscera, and are principally to be regarded, as well as other signs, when they happen on a critical day, with manifest tokens of concoction, in which circumstance we may with confidence predict a recovery, if none of the mortal signs appear.

Pains prognosticating death. All pains affecting a noble part of the body are bad; whether they are produced together with the disease, and so are esteemed pathognomonic signs, or are excited afterward; for the former, in conjunction with other pathognomonic, or proper signs, form a prognostic. Thus a violent and continual pain of the head in a phrensy, with other destructive signs of a phrensy, is mortal. Some *pains* are generally mortal, from the excellence and usefulness of the part which they affect: those, for instance, which seize the heart, or cause strangulations in the mouth of the stomach, the fauces, head, ears, breast, or bladder. For *pains* in these members are always pernicious, and especially when attendant on a continual fever, with other bad symptoms, indicating an inflammation, which are generally mortal.

Pains in the viscera and noble parts, which affect not the patient in the beginning of acute distempers, but are felt afterward in the progress of the disease; if severe and constant, are to be esteemed very pernicious; as shewing some noble part of the viscera to be afflicted with a high inflammation, necessary to the fever, and not to be subdued but by extraordinary strength of nature. Wherefore these pains are usually succeeded by very formidable symptoms, such as a coldness in the extreme parts, which is the ordinary consequence of violent pains, according to Hippocrates. 7 Aph. 26.

Thus may be seen what judgment is to be made, and what prognostics to be drawn, from pains unfelling the viscera, or noble parts; but if these *pains* are accompanied or succeeded by some mortal sign, no less than the destruction of the patient is indicated. The same consequence may be prognosticated from a variety of *pains* affecting the noble parts, or other severe symptoms of a different kind, appearing at the same time; for these, as they are indications of several dangerous disorders in conjunction, so when attendant on *pains*, or a multiplicity of *pains*, they portend nothing but the worst of events. For if nature finds it difficult to subdue one considerable distemper, it must certainly sink and give way to the joint attacks of many diseases, unless upheld by an extraordinary measure of strength.

Pains in the ignoble parts we have before declared to be good; and if attended with a concoction of the humours, of considerable duration, are effectual in removing, or at least in mitigating the fever, with its threatning symptoms, and putting the patient in a better state. Such *pains* begin on critical days, and are not concerned in exasperating any of the symptoms. But *pains* in the ignoble parts, in the beginning of a disease, when all things are crude, by which no symptoms of the noble parts are removed or diminished, but rather exasperated and multiplied, and the sick rendered worse, are of a bad kind. But *pains* arising in the ignoble or remote parts, are most to be dreaded, when succeeded by a fever, and other no less severe and dangerous symptoms, under which the patient grows worse.

Pains of the ignoble parts are no less formidable, and to be suspected, when they vanish, and become insensible on

on a sudden; or when they begin in a remote part, and thence remove toward the viscera; which indicate a conflux of humours to the noble parts.

Æsculapius considered *pain* as a principal indication for bleeding; for he thought *pain* was caused by a retention of the larger molecules, in the pores or paſſages, which nothing but bleeding could diſlodge. The rule is excellent, whatever the reaſon he gives for it may be; for it would be difficult to lay down a maxim in phyſic either more univerſal, or of greater importance. James.

Pain, conſidered as a ſymptom of a diſeaſe, makes a conſiderable article in a palliative cure.

Pain is mitigated, or allayed, divers ways; as, 1. By diluting and ſoftening acrimonies, with warm water mixed with flour, applied by way of drink, fomentation, clyſter, or bath. 2. By reſolving and waſhing away obſtructions, by the ſame means, and reſolvents. 3. By relaxing the nervous veſſels, with drinks, fomentations, baths, relaxants, anodynes, and aperients. 4. By correcting the acrimony itſelf with proper remedies. 5. By freeing the obſtruent, obſtructed, and acrimonious parts from the too great preſſure of the vital humour; and by ſuſtaining, and ſeparating, and depurating them. 6. By rebating or deadening the ſenſe by narcotics, either internally or externally.

DOLPHIN, *Delphinus*, in the Linnæan ſyſtem of *Zoology*, makes a diſtinct genus of fiſhes of the order of *cete*, and claſs of MAMMALIA; the characters of which are, that there are teeth in both jaws, and a pipe in the head.

In the Artedian ſyſtem of *Ichthyology*, *delphinus* is alſo the name of a genus of the plagiuri, or cetaceous fiſhes; the characters of which are theſe: the teeth are placed in both the jaws, the pipe or opening is in the middle of the head, and the back is always pinnated.

The ſpecies of this genus are theſe: 1. The *Delphin*, with a coniform body, with a broad back, and a ſub-obtuſe ſnout: this is the *phocæna*, or porpeſſe. 2. The *delphin*, with an oblong ſubcylindric body, with a long acute ſnout: this is the *delphinus* of the generality of authors, and is called the *porpeſſe* alſo by the Engliſh. 3. The *delphin* with the back ridged upwards, and with broad ſerrated teeth: this is the *orca* of authors, called by us the *grampus* and *north caper*; the body of this fiſh is ſo thick, that its breadth is equal to half its length. See PORPESSE.

The name *delphinus* is of Greek origin, and is ſuppoſed by ſome to be derived from the word δελφὺς, a *pig* or *hog*; and, according to others, from the word δελφὺς, *vulva*, this fiſh being of the viviparous kind, and one of thoſe few which have the vulva and penis in the different ſexes, like thoſe of land animals.

All the nations who have given this fiſh their ſeveral names, have derived them from its reſemblance to the ſame creature, a hog; and this not without reaſon, as there is much analogy between the two animals: the *delphin* being as fat as the hog, and having his intrails externely like thoſe of that quadruped; but in this there has yet been ſome confuſion, as the common porpeſſe, which much reſembles the *delphin* in many reſpects, has alſo been indiſcriminately called by the ſame name with that fiſh. The difference between the two is, that the *delphin* has a much longer ſnout or noſe, ſticking out ſomewhat in form of a gooſe's bill, and is in the whole a longer, ſlenderer, more fleſhy, and leſs fat fiſh, and is the larger of the two. The *phocæna* or *porpeſſe* is ſhorter, ſmaller, broader backed, and has a more obtuſe and ſhorter ſnout.

The *delphin* is a cetaceous fiſh, covered with a ſubcuth, but very tough and firm ſkin; its body is long and rounded, and its back prominent. Above the ſnout it has a pipe, by which it throws out the water neceſſarily taken in with the food. Theſe fiſh are ſuppoſed to live a great number of years. The figures of them on ſome antique marbles and coins, which repreſent them crooked and unnatural, have been conceived originally by perſons who had ſeen them playing about on the ſurface of the water, in which caſe they ſometimes deceive the eye, and appear crooked: from theſe probably our ſign-painters took their idea of the *dolphin*. They are an extremely ſwift fiſh in ſwimming, and are able to live a long time out of the water, though they can continue but a little while under it without air; hence they are ſometimes taken up dead by fiſhermen in their nets, having been ſuffocated by being forcibly kept under water, they have been known to live three days on dry ground. Willoughby, Hiſt. Piſc. p. 30.

This fiſh was conſecrated by the ancients to the gods, and called the ſacred fiſh. Scarce an accident could happen at ſea, but the *dolphin* offered himſelf to convey to ſhore the unfortunate. The ſtory of Arion, the muſician, is related by Ovid, Faſti, lib. ii. ver. 113.

It was formerly reckoned a great delicacy in this country.

DOLPHIN is alſo a name given by the Engliſh to the fiſh called *hippuris*, by the generality of authors; but by ſome *hippoſele* and *equiſele*, and by others *dirade*. According to the new ſyſtem of Artedi, this fiſh is a ſpecies of the *coryphæna*, and is diſtinguiſhed from all the other kinds, by its having a forked tail. See HIPPURIS and CORYPHÆNA.

DOLPHIN, *Delphinus*, in *Aſtronomy*. See DELPHINUS.

DOLPHINS *of a cannon*, in *Gunnery*, are the two handles placed on the ſecond reinforce ring of braſs guns, reſembling the fiſh of that name. They ſerve for mounting and diſmounting the guns.

DOLPHIN *of the maſt*, in *Sea-Language*, is a peculiar kind of wreath, formed of platted cordage, to be faſtened occaſionally round the maſts, as a ſupport to the PUDDENING, whoſe uſe is to ſuſtain the weight of the fore and main-yards, in caſe the rigging or chains, by which thoſe yards are ſuſpended, ſhould be ſhot away in the time of battle.

DOM, or DON, a title of honour, originally Spaniſh, though uſed occaſionally in other countries. See TITLE.

It is equivalent to *maſter*, *ſir*; or *lord*, *manſieur*, *ſieur*, *monſieur*, *&c.*

Goſſut, in his Mem. des Bourg. liv. v. chap. ii. aſſures us, that the firſt on whom the Spaniards conferred the title, was *dom* Pelayo; when, upon their being routed, and driven out, by the Saracens, at the beginning of the eighth century, they rallied again on the Pyrenean, and made him king.

In Portugal, nobody is allowed to aſſume the title of *dom*, which is a badge or token of nobility, without the king's leave.

DOM is likewiſe uſed in France among ſome orders of religious, as the Chartreux, Benedictines, &c.

We ſay, the reverend father *dom* Calmet, *dom* Alexis, *dom* Balthaſar, &c.

In the plural they write *doms*, with an *s*, in ſpeaking of ſeveral. RR. PP. *doms* Claude du Rubie, and Jaques Douceur.

The word is formed from the Latin *dominus*, or *domnus*; of which it is an abbreviature. *Domnus* is found in diverſe Latin authors of the barbarous age. Onuphrius aſſures us, it was a title firſt given to the pope alone; then to the biſhops, abbots, and others, who held any eccleſiaſtical dignity, or were eminent for virtue and religion. At length it was uſurped by the mere monks.

Some ſay, the religious declined the title *dominus* out of humility, as belonging to God alone; and aſſumed that of *domnus*, as expreſſing inferiority, *quaſi minor dominus*. Indeed, the appellation *domnus* for *dominus* appears very ancient, if we conſider the ſurname of Julia, wife of the emperor Septimus Severus, who is called on medals, IVLIA DOMNA, for JULIA DOMINA.

DOM and SOM, words uſed in ancient charters, ſignifying a power of judging, and ſecurity in poſſeſſing. Hence *dome's* men, who were perſons appointed to determine ſuits and controverſies between parties. See DAY's *man*.

DOM-*Book*. See DOMES-DAY.

DOMAIN, the inheritance, eſtate, or poſſeſſion, of any one. See DEMESNE.

Menage derives the word from *domanium*, written in the barbarous Latin for DOMINIUM.

DOME, or DOOM, ſignifies judgment, ſentence, or decree. The ſomagers oath, in the Black Book of Hereford, ends thus: So help me God at his holy *dome*, and by my trowthe.

DOME, in *Architecture*, a ſpherical roof; or a work of a ſpherical form raiſed over the middle of a building, as a church, hall, pavilion, veſtibule, ſtair-caſe, &c. by way of crowning, or acroter. See *Tab. Architecture, fig.* 40. D.

The word is formed from the barbarous Latin, *domus*, which ſignified a *roof*, or *open porch*; as is obſerved by Papias. It is frequent in the corrupt Latin authors, who borrowed it from the Greeks, among whom *trullus*, or *trullum*, is a common name for any round building; ſuch as the palace of Conſtantinople, wherein was held the council thence called *in trullo*.

Domes are the ſame with what the Italians call *cupolas*; and we frequently *cupolas* the Latin, according to Vitruvius, *tholi*.

They are uſually made round; though we have inſtances of ſquare ones; as thoſe of the Louvre; and others that are polygons, as that of the Jeſuits church in the Rue St. Antoine at Paris. They have uſually columns ranged around their outſides, both by way of ornament, and to ſupport the vault.

DOME, *a flat*, is that whoſe ſweep, or contour, is leſs than a hemiſphere.

DOME, *eye of a*. See EYE.

DOME, in *Chemiſtry*, the arched cover of a reverberatory furnace. See REVERBERATORY.

DOMENGER, in *Middle Age Writers*, is sometimes used for DAMSEL.

DOMES-DAY, or DOOMS-DAY-*Book*, *Liber judiciorius vel consualis Angliæ*, the judicial book, or book of the survey of England; a most ancient record made in the time of William the Conqueror; upon a survey, or inquisition, of the several counties, hundreds, tithings, &c.

Its name is formed from the Saxon *dom*, *doom*, *judgment*, *sentence*; and *day*, which has the same force; so that *dome-day* is no more than a reduplicative, importing *judgment judgment*.

But some condemn this etymology as whimsical; and contend that if it was just, the Latin for *domesday* would be *dies judicii*; whereas, as appears above, it is styled *Liber judiciarius, vel consualis Angliæ*. Baillet, in his Celtic Dictionary, hath the word *dom*, which he reads *seur*, *seigneur* (and hence the Spanish word *don*), as also the words *deya*, and *deia*, which he renders *proclamation*, *advertisement*. *Domday* therefore signifies the lord's or king's proclamation, or advertisement, to the tenants who hold under him; and agrees well with great part of the contents of this famous survey. Observations on the Statutes, p. 190. note *f*.

The drift, or design of the book, is to serve as a register, by which sentence may be given in the tenures of estates; and from which that noted question, whether lands be ancient demesne, or not, is still decided. Its contents are summed up in the following verses:

Quid debeatur filco, quæ, quanta tributa,
Nomine quid census, quæ vectigalia, quantum
Dissipet tenentur feodali solvere jure,
Qui sint exempti, vel quis augurio damnat,
Quis teneat vel glebæ servi, vel conditionis,
Quove manumissus patronis jure ligatur.

This book is still remaining, fair and legible; consisting of two volumes, a greater and a less; the greater comprehending all the counties of England, except Northumberland, Cumberland, Westmoreland, Durham, and part of Lancashire, which were never surveyed; and except Essex, Suffolk, and Norfolk, which are comprehended in the lesser volume, which concludes with these words: *Anno millesimo octogesimo sexto ab incarnatione Domini, vicesimo vero regis Wilhelmi, facta est ista descriptio non solum per hos tres comitatus, sed etiam alios.*

It is called *Liber judicialis*, because a just and accurate description of the whole kingdom is contained therein; with the value of the several inheritances, &c.

It was begun by five justices, assigned for that purpose in each county, in the year 1081, and finished in 1086. Camden calls it *Gulielmi Librum consualem*, king William's Tax-book.

This book was formerly kept under three different locks and keys; one in the custody of the treasurer, and the others of the two chamberlains of the exchequer. It is now deposited in the chapter-house at Westminster, where it may be consulted, on paying to the proper officers a fee of 6*s.* 8*d.* for a search, and 4*d.* per line for a transcript.

Our ancestors had many *dome-books*. We are told by Ingulphus, that king Alfred made a like register with that of William the Conqueror. It was begun upon that prince's dividing his kingdom into counties, hundreds, tithings, &c. when an inquisition being taken of the several districts, it was digested into a register, called *Domboc*, q. d. the *Judgment-book*, and was repositted in the church of Winchester; whence it is also called the *Winchester-book*, and *Rotulus Wintoniæ*. This book is said to have been extant so late as the reign of king Edward IV. but is now unfortunately lost. It probably contained the principal maxims of common law, the penalties for misdemeanors, and the forms of judicial proceedings. And upon the model of this *Dom-boc* it is, that the *Domesday* of the Conqueror was formed.

That of king Alfred referred to the time of king Ethelred; and that of the Conqueror, to the time of Edward the Confessor; the entries being thus made, *G. tenet tres Gulielmus in dominio, & valet tbi decenas*, &c. T. R. E. *valebat*; q. d. it is worth so much *tempore regis Edwardi*, in the time of king Edward.

There is a third *Dom-boc*, or *Domes-day-book*, in quarto, differing from the other in folio, rather in form than matter. It was made by order of the same Conqueror; and seems to be the more ancient of the two.

A fourth book there is in the exchequer, called *domesday*; which, though a very large volume, is only an abridgment of the other two. It has abundance of pictures, and gilt letters at the beginning, which refer to the time of Edward the Confessor. There is also a fifth book called *Domes-day*, and the same with the fourth now mentioned.

DOMESTIC, from *domus*, *house*, a term of somewhat more extent than that of servant; the latter only signifying such as serve for wages, as footmen, lacquies, porters, &c. whereas *domestic* comprehends all who act under a man, compose his family, and live with him, or are supposed to live with him. Such are secretaries, chaplains, &c.

Sometimes *domestic* goes farther, being applied to the wife and children.

DOMESTIC *piece*, *s. m.* *domestica*. See TOGA.

DOMESTICUS, *Comes*, in *Aulic polity*, was a particular officer in the court of the emperors of Constantinople.

Fabrot, in his glossary on Theophylax Simocatta, defines *domesticus* to be any person entrusted with the management of affairs of importance; a counsellor, *cujus fidei graviores ubique res, & secretiores committuntur*.

Others hold, that the Greeks called *domestici* those who at Rome were called *comites*; particularly, that they began to use the name *domesticus*, when that of count was become a name of dignity, and ceased to be the name of an officer in the prince's family.

Domestici, therefore, were such as were in the service of the prince, and assisted him in the administration of affairs; both those of his family, those of justice, and those of the church.

The grand DOMESTIC, *Magnus domesticus*, called also absolutely the *domestic*, served at the emperor's table, in quality of what we occidentals call *steward*. Others say, he was rather what we call a *master of the horse*.

DOMESTICUS *curiæ* did the office of grand seneschal, or steward.

DOMESTICUS *rei domesticæ* acted as master of the household.

DOMESTICUS *scholarum*, or *legionum*, had the command of the reserved forces called *scholæ palatinæ*, whose office was to execute the immediate orders of the emperor.

DOMESTICUS *murorum*, had the superintendance of all the fortifications.

DOMESTICUS *regionum*, that is, of the east and west, had the care of public causes, much like our attorney or solicitor-general.

DOMESTICUS *icanatorum*, or of the military cohorts.

There were divers other officers of the army, who bore the appellation *domesticus*, which signified no more than commander, or colonel. Thus, the *domestic of the legion* called *optimate*, was the commander thereof.

DOMESTICUS *chori*, or *chori*, whereof there were two in the church of Constantinople; one on the right side of the church, and the other on the left. They were also called *protopsaltes*.

Dom. Magri distinguishes three kinds of *domestici* in the church: *domestic of the patriarchal clergy*; *domestic of the imperial clergy*, that is, master of the emperor's chapel; and *domesticus depositus*, or of the empress. There was another order of *domestici*, inferior to any of those above mentioned, called *patriarchal domestics*.

DOMESTICI was also the name of a body of forces in the Roman empire. Panciroll us takes them to have been the same with those called *protectores*; who had the chief guard of the emperor's person, in a degree above the prætorians; and who under the Christian emperors had the privilege to bear the grand standard of the cross.

They are supposed to have been 3500 before Justinian's time, who added 2000 more to the number. They were divided into several companies, or bands, which the Latins called *scholæ*, some whereof are said to have been instituted by Gordian. Some of them were cavalry, and some infantry.

Their commander was called *comes domesticorum*.

DOMICELLARY *canons*. See CANONS.

DOMICELLUS. See DAMSEL.

DOMIFYING, DOMIFICATION, in *Astrology*, the dividing or distributing the heavens into twelve houses; in order to erect a theme, or horoscope, by means of six great circles, called *circles of position*.

There are diverse ways of *domifying*, according to diverse authors. That of Regiomontanus, which is the most usual, makes the circle of position pass through the intersections of the meridian, and horizon. Others make them pass through the poles of the world, or the equator; and others through the poles of the Zodiac.

DOMINANT *of a mode*, in *Musick*, that sound which makes a perfect fifth to the final, in authentic modes; and a third to the final or fifth, to the lowest chord of a plagal mode.

DOMINARUM AQUA, a name given by Mynsicht to a distilled water, which he recommends to the ladies to facilitate delivery.

DOMINATION, in *Theology*, the fourth order of angels, or blessed spirits, in the hierarchy; reckoning from the seraphim. See HIERARCHY, and SERAPH.

St. DOMINGO *Company*. See COMPANY.

DOMINI—*Anno* DOMINI. See ANNO

Bull in Cœna DOMINI. See BULL.

DOMINIAL *offices.* See OFFICE.

DOMINICAL *Letter*, in *Chronology*, properly called *Sunday Letter*, one of the seven letters of the alphabet A B C D E F G, uſed in almanacs, ephemerides, &c. to denote the Sundays throughout the year.

The word is formed from *Dominica*, or *Dominicus dies*, *Lord's day*, *Sunday*.

The *Dominical letters* were introduced into the calendar by the primitive Chriſtians, in lieu of the nundinal letters in the Roman calendar.

Theſe letters, we have obſerved, are ſeven: and that, in a common year, the ſame letter ſhould mark all the Sundays will eaſily appear; inaſmuch as all the Sundays are ſeven days apart, and the ſame letter only returns in every ſeventh place.

But in biſſextile, or leap-year, the caſe is otherwiſe: for by means of the intercalary day, either the letters muſt be thruſt out of their places for the whole year afterwards, ſo, e. gr. as that the letter which anſwers to the firſt of March, ſhall likewiſe anſwer to the ſecond, &c. or elſe the intercalary day muſt be denoted by the ſame letter as the preceding one. This latter expedient has been judged the better, and accordingly the Sundays after the intercalary day have another *Dominical letter*.

Hence, 1. As the common Julian and Gregorian year conſiſts of 365 days, i. e. of 52 weeks, and one day; the beginning of the year, every common year, goes forward by one day: thus, e. gr. if this year the beginning, or firſt day fall on a Sunday, the next year it will fall on Monday, the next on Tueſday, &c. Conſequently, if A be the *dominical letter* of the preſent year, G will be that of the next year, becauſe, as it is ſuppoſed to begin on Monday the Sunday will fall on the ſeventh day; and ſo on in a retrograde order.

2. As the Julian, and Gregorian biſſextile, or leap-year, conſiſts of 366 days, i. e. 52 weeks and 2 days, the beginning of the next year after biſſextile goes forward 2 days. Whence, if in the beginning of the biſſextile year, the *Dominical letter* were A, that of the following year will be F: for if the biſſextile or leap year begins on Sunday, it will end on Monday; and the next year will begin on Tueſday, ſo that the firſt Sunday muſt fall on the ſixth of January, to which is annexed the letter F.

3. Since in leap-years the intercalary day falls on the 24th of February, in which caſe the 23th and 25th days are conſidered as one day, and denoted by the ſame letter; after the 24th day of February the *Dominical letter* goes back one place: thus, if in the beginning of the year the *Dominical letter* be A, it will afterwards be G. This day is now added to the end of February, and thence the change takes place.

4. As every fourth year is biſſextile, or leap-year, and as the number of letters is 7; the ſame order of *Dominical letters* only returns in 28 years; which, without the interruption of biſſextiles, would return in 7 years.

5. Hence the invention of the ſolar cycle of 28 years; upon the expiration whereof the *Dominical letters* are reſtored ſucceſſively to the ſame days of the month, or the ſame order of the letters returns.

To find the DOMINICAL *letter of any given year.* Seek the cycle of the ſun for that year, as directed under CYCLE; and the *Dominical letter* is found correſponding thereto. When there are two, the propoſed year is biſſextile; and the firſt obtains to the end of February; and the laſt for the reſt of the year.

The *Dominical letter* for any year of the preſent century may be found by the following canon:

Divide the odd years, their fourth and four by ſeven,
What is left ſubtract from ſeven, the letter is given.

Thus for the year 1778, the letter will be D.

The *Dominical letter* may be found univerſally, for any year of any century, thus:

Divide the centuries by four; and twice what does remain
Take from ſix; and then add to the number you gain
Their odd years and their fourth; which, dividing by ſeven,
What is left take from ſeven, and the letter is given.

Thus the letter for the year 1878 is F.

The reaſon of the foregoing rules may be eaſily explained. Every common year brings the *Dominical letter one* backward, and every leap-year *two*; therefore to any number of years, under 100, add its fourth part for the leap years, omitting fractions; and the ſum will be the number of times the *letter* has ſhifted backward during that number of years, which, being divided by 7, leaves a remainder, that will be the number of the letter of the preſent year, reckoning from the *letter* belonging to the laſt centeſſimal year, in a retrograde order; or the complement of the remainder to 7 will be the preſent *Dominical letter* in a direct order. It is alſo evident, that four Gregorian centuries, containing three centeſſimal common years, which remove the letter two forward, and one centeſſimal leap-year, which removes it one forward, will compleat a revolution of the letter. Thus the *Dominical letter* of 1600 is A; of 1700 C; of 1800 E; of 1900 G; of 2000 A, &c. Therefore A, the ſixth letter backward from G, is the *Dominical letter* of a biſſextile centeſſimal year; and 6 muſt be added to the odd years and their fourth, and the ſum be divided by 7, in order to obtain the *letter* of any year in the next century, or the ſeventeenth; and, as the firſt common centeſſimal year brings the letter two forward from A, or two leſs than ſix backward from G, the remainder, after dividing the centuries by 4, muſt be doubled; and ſo we ſhall have 6—2=4 to be added to the odd years, and their 4th, in the ſecond common century; and 6—4, or 2, muſt be added in the third, and 0 in the 4th, becauſe the Gregorian biſſextile recurs, and the number of centuries may be divided by 4, without leaving any remainder.

By the reformation of the calendar under pope Gregory, the order of the *Dominical letters* was again diſturbed in the Gregorian year; for the year 1582, which at the beginning had G for its *Dominical letter*; by the retrenchment of ten days after the 4th of October, came to have C for its *Dominical letter*; by which means the *Dominical letter* of the ancient Julian calendar is four places before that of the Gregorian; the letter A in the former anſwering to D in the laſter.

DOMINICAL, in *Church Hiſtory*. The council of Auxerre, held in 578, decreed, that women communicate with their *dominical*. Some authors contend, that this *dominical* was a linen cloth, wherein they received the ſpecies; as not being allowed to receive them in the bare hand. Others will have it a kind of veil, wherewith they covered the head. The moſt probable account is, that it was a ſort of linen cloth, or handkerchief, wherein they received, and preſerved, the euchariſt, in times of perſecution, to be taken on occaſion at home. This appears to have been the caſe by the practice of the firſt Chriſtians, and by Tertullian's book Ad Uxorem.

DOMINICAL was alſo formerly uſed in the ſame ſenſe with HOMILY.

DOMINICANS, an order of religious, called in ſome places *Jacobins*, and in others *Predicants*, or *Preaching Friers*. See JACOBINS, &c.

The *Dominicans* take their name from their founder Dominic de Guzman, a Spaniſh gentleman, born in 1170, at Calaroga, in Old Caſtile. He was firſt canon and archdeacon of Oſma; and afterwards preached with great zeal and vehemence againſt the Albigenſes in Languedoc, where he laid the firſt foundation of his order. It was approved of in 1215, by Innocent III. and confirmed in 1216, by a bull of Honorius III. under the title of St. Auguſtin; to which Dominic added ſeveral auſtere precepts and obſervances, obliging the brethren to take a vow of abſolute poverty, and to abandon entirely all their revenues and poſſeſſions; and alſo the title of *Preaching Friers*, becauſe public inſtruction was the main end of their inſtitution.

The firſt convent was founded at Thouloufe by the biſhop thereof, and Simon de Montfort. Two years afterwards they had another at Paris, near the biſhop's houſe; and ſome time after, a third in the rue St. Jaques, St. James's ſtreet, whence the denomination of Jacobins.

Juſt before his death, Dominic ſent Gilbert de Freſney, with twelve of the brethren, into England, where they founded their firſt monaſtery at Oxford in the year 1221, and ſoon after another at London. In the year 1276, the mayor and aldermen of the city of London gave them two whole ſtreets by the river Thames, where they erected a very commodious convent, whence that place is ſtill called Black Friers, from the name by which the *Dominicans* were called in England.

St. Dominic, at firſt, only took the habit of the regular canons, that is a black caſſock, and rochet; but this he quitted in 1219, for that which they now wear, which, it is pretended, was ſhewn by the bleſſed Virgin herſelf to the beatified Renaud d'Orleans.

This order is diffuſed throughout the whole known world. It has forty-five provinces under the general, who reſides at Rome; and twelve particular congregations, or reforms, governed by vicars-general.

They reckon three popes of this order, above ſixty cardinals, ſeveral patriarchs, a hundred and fifty archbiſhops, and about eight hundred biſhops; beſide maſters of the ſacred palace, whoſe office has been conſtantly diſcharged by a religious of this order, ever ſince St. Dominic, who held it under Honorius III. in 1218.

The *Dominicans* are alſo inquiſitors in many places. See INQUISITION.

Of all the monaſtic orders, none enjoyed a higher degree of power and authority than the *Dominican* friers.

whose credit was great and their influence univerſal. But the meaſures they uſed in order to maintain and extend their authority, were ſo perfidious and cruel, that their influence began to decline towards the beginning of the ſixteenth century. The tragic ſtory of Jetzer, conducted at Bern in 1509, for determining an intereſting diſpute between them and the Franciſcans, relating to the *immaculate* CONCEPTION, will reflect indelible infamy on this order. See an account of it in Burnet's Travels through France, Italy, Germany, and Switzerland, p. 31. of Moſheim's Eccl. Hiſt. vol. iii. p. 294, 8vo. They were indeed perpetually employed in ſtigmatizing with the opprobrious name of hereſy numbers of learned and pious men; in encroaching upon the rights and properties of others, to augment their poſſeſſions; and in laying the moſt iniquitous ſnares and ſtratagems for the deſtruction of their adverſaries. They were the principal counſellors, by whoſe inſtigation and advice Leo X. was determined to the public condemnation of Luther. The papal ſee never had more active and uſeful abettors than this order, and that of the JESUITS.

The dogmata of the *Dominicans* are uſually oppoſite to thoſe of the Franciſcans.

There are alſo nuns, or ſiſters of this order, called in ſome places, *Preaching Siſters*. Theſe are even more ancient than the friers; St Dominic having founded a ſociety of religious maids, at Promilles, ſome years before the inſtitution of his order of men; viz. in 1206.

There is alſo a *third order of Dominicans*, both for men and women.

DOMINIUM, DOMINION, in the *Civil Law*, denotes the abſolute power, or property, of a thing, to uſe or diſpoſe of it how we pleaſe.

Directum dominium is the right alone of *dominium*; and *dominium utile*, the profit reſounding from it. The wife retains the *dominium directum* of her jointure, and the *dominium utile* paſſes to her huſband. With reſpect to ſignory, he who pays rent, has the *dominium utile* of the lands; and the lord he pays it to, the *dominium directum*.

DOMINIUM, DOMINION, or DOMAINE, in our *Ancient Cuſtoms*, denotes a rent due to the lord, where the property is not his.

DOMINORUM, *Affidatio*. See AFFIDATIO.

DOMINUS, in *Ancient Times*, a title prefixed to a name, uſually to denote the perſon either a knight, or a clergyman. See VICE-DOMINUS.

Though the title was ſometimes alſo given to a gentleman not dubbed; eſpecially if he were lord of a manor. See DOM, GENTLEMAN, and SIR.

In Holland, the title *dominus* is ſtill retained, to diſtinguiſh a miniſter of the reformed church.

Recte quando DOMINUS *remittit*. See RECTO.

DOMO *reparanda*, a writ that lies for one againſt his neighbour, by the fall of whoſe houſe he fears damage to his own. Reg. of Writs, fol. 153. In which caſe the civilians have the action *de domno infecto*.

DONARIA, among the *Ancients*, in its primary ſignification, was taken for the places where the oblations offered to the gods were kept; but afterwards was uſed to denote the offerings themſelves; and ſometimes, though improperly, the temples.

DONATION, DONATIO, an act, or contract, whereby a man tranſfers to another, either the property, or the uſe, of the whole, or a part of his effects, as a free gift.

A *donation*, to be valid and complete, ſuppoſes a capacity both in the donor, and the donee; and requires conſent, acceptance, and delivery; and by the French law regiſtry alſo.

DONATION *mortis cauſa*, in *Law*, a diſpoſition of property made by a perſon in his laſt ſickneſs, who, apprehending his diſſolution near, delivers, or cauſes to be delivered to another, the poſſeſſion of any perſonal goods, to keep in caſe of his deceaſe. If the donor dies, this gift needs not the conſent of his executor; but it ſhall not prevail againſt creditors; and it is accompanied with this implied truſt, that, if the donor lives, the property ſhall revert to himſelf, being only given in proſpect of death, or *mortis cauſa*. This method of *donation* ſeems to have been conveyed to us from the civil lawyers, who borrowed it from the Greeks. Odyſſey, lib. xvii. ver. 78. and Euripides, Alceſtes, ver. 1020. See Blackſt. Com. vol. ii. p. 514.

DONATISTS, ancient ſchiſmatics in Africa, ſo denominated from their leader, Donatus.

They had their origin in the year 311, when, in the room of Menſurius, who died in that year, on his return to Rome, Cæcilian was elected biſhop of Carthage, and conſecrated without the concurrence of the Numidian biſhops, by thoſe of Africa alone; whom the people refuſed to acknowlege, and to whom they oppoſed Majorinus; who, accordingly, was ordained by Donatus, biſhop of Caſæ Nigræ. They were condemned, in a council held at Rome, two years after their ſeparation; and afterwards in another at Arles, the year following; and again at Milan, before Conſtantine the Great, in 316, who deprived them of their churches, and ſent their ſeditious biſhops into baniſhment, and puniſhed ſome of them with death. Their cauſe was eſpouſed by another Donatus, called the Great, the principal biſhop of that ſect, who, with numbers of his followers, was exiled by order of Conſtans. Many of them were puniſhed with great ſeverity. See CIRCUMCELLIONES. However, after the acceſſion of Julian to the throne in 361, they were permitted to return, and reſtored to their former liberty. Gratian publiſhed ſeveral edicts againſt them; and in 377 deprived them of their churches, and prohibited all their aſſemblies. But notwithſtanding the leverities they ſuffered, it appears that they had a very conſiderable number of churches towards the cloſe of this century; but at this time they began to decline, on account of a ſchiſm among themſelves, occaſioned by the election of two biſhops, in the room of Parmenian, the ſucceſſor of Donatus; one party elected Primian, and were called Primianiſts, and another Maximian, and were called Maximianiſts. Their decline was alſo precipitated by the zealous oppoſition of St. Auguſtine, and by the violent meaſures which were purſued againſt them, by order of the emperor Honorius, at the ſolicitation of two councils held at Carthage; the one in 404, and the other in 411. Many of them were fined, their biſhops were baniſhed, and ſome put to death. This ſect revived and multiplied under the protection of the Vandals who invaded Africa in 427, and took poſſeſſion of this province; but it ſunk again under new ſeverities, when their empire was overturned in 534. Nevertheleſs they remained in a ſeparate body till the cloſe of this century, when Gregory, the Roman pontiff, uſed various methods for ſuppreſſing them; his zeal ſucceeded, and there are few traces to be found of the *Donatiſts* after this period. They were diſtinguiſhed by other appellations; as Circumcelliones, Montenſes, or Mountaineers, Campites, Rupites, &c. They held three councils, or conciliabules; that of Cirta in Numidia, and two at Carthage.

The errors of the *Donatiſts*, beſide their ſchiſm, were, 1. That baptiſm conferred out of the church, that is, out of their ſect, was null; and accordingly they rebaptized thoſe who joined their party from other churches, and re-ordained their miniſters. 2. That theirs was the only true, pure and holy church; all the reſt of the churches they held as proſtitute, and fallen.

Donatus ſeems likewiſe to have given into the doctrine of the Arians, with whom he was cloſely allied; and accordingly, St. Epiphanius, Theodoret, and ſome others, accuſed the *Donatiſts* of Arianiſm; and it is probable that the charge was well founded, becauſe they were patronized by the Vandals, who were of theſe ſentiments. But St. Auguſtine, ep. 185. to count Boniface, & Hær. 69. affirms, that the *Donatiſts*, in this point, kept clear of the errors of their leader.

DONATIVE. DONATIVUM, a preſent made to any perſon; called alſo *gratuity*.

The Romans made large *donatives* to their ſoldiers. Julia Pia, wife of the emperor Severus, is called, on certain medals, MATER CASTRORUM, becauſe of the care ſhe took of the ſoldiery, by interpoſing for the augmentation of their *donatives*, &c.

Donatives was properly a gift made to the ſoldiery; as CONGIARIUM was that made to the people.

Salmaſius, in his notes to Lampridius, in his Life of Heliogabalus, mentioning a *donative* that emperor gave of three pieces of gold per head, obſerves, that this was the common and legitimate rate of a *donative*. Caſaubon, in his notes on the Life of Pertinax by Capitolinus, obſerves, that Pertinax made a promiſe of three thouſand denarii to each ſoldier; which amounts to upwards of ninety-ſeven pounds ſterling. The ſame author writes, that the legal *donative* was twenty thouſand denarii; and that it was not cuſtomary to give leſs, eſpecially to the prætorian ſoldiers; that the centurions had double, and the tribunes, &c. more in proportion.

DONATIVE, in the *Canon Law*, a benefice given, and collated to a perſon, by the founder, or patron; without either preſentation, inſtitution, or induction by the ordinary. If chapels founded by laymen be not approved by the dioceſan, and, as it is called, *conſecrated*, they are not accounted proper benefices, neither can they be transferred by the biſhop, but remain to the pious diſpoſal of the founders; ſo that the founders, and their heirs, may give ſuch chapels without the biſhop.

Gwin obſerves, that the king might of ancient time found a free chapel, and exempt it from the juriſdiction of the dioceſan; ſo may he, by letters patent, give liberty to a common perſon to found ſuch a chapel, and make it *donative*, not preſentable; and the chaplain, or beneficiary, ſhall be deprivable by the founder or his heir, and

not

not by the bishop. And this seems to be the original of *donatives* in England.

Donatives are within the statute against simony; and if they have cure of souls, within that against pluralities. If the patron of a *donative* doth not nominate a clerk, there can be no lapse thereof, unless it be specially provided for in the foundation; but the bishop may compel him to do it by spiritual censures. But if it be augmented by queen Anne's bounty, it will lapse like other presentative livings. 1 Geo. I. stat. 2. cap. 10. The ordinary cannot visit a *donative*, and therefore it is free from procuration, and the incumbent is exempted from attendance at visitations.

All bishopricks in ancient time were *donative* by the king. Again, where the bishop has a gift of the benefice, it is properly called a *donative*, because he cannot present to himself.

DONAX. in *Ichthyology*, a name by which several of the old authors have called the solen, or razor-fish. See SOLEN.

DONAX, in *Botany*, the name by which some authors call the great reed, the arundo maxima, or arundo Cyptia of others. Tourn. Inst. p. 256. See REED.

DONE *sur, grant and render*, in *Law*, a double fine, comprehending the fine *sur cognizance de droit com ces*, and the fine *sur concessit*, which may be used to create particular limitations of estates. See FINE.

DONGON, in *Natural History*, a name given by the people of the Philippine islands to a peculiar species of crane, which has a large body like a goose, and a shorter neck than the common kind: it has a long and very broad beak, and is of a grey colour; they have, besides this, another species of crane, which they call tipul or tihoi; as remarkable for the length of it neck and legs, as this for the breadth of its beak. This tipul can stand erect, and look over a tall man's head.

DONJON, in *Fortification*, generally denotes a large strong tower, or redoubt, of a fortress, where the garrison may retreat in case of necessity, and capitulate with greater advantage. See DONGON.

DONIS *conditionalibus, statute de*, in *Law*, is the statute of Westminster 2, viz. 13 Edw. I. cap. 1. which revived in some sort the ancient feodal restraints, that were originally laid on alienations, by enacting, that from thenceforth the will of the donor be observed; and that the tenements so given, to a man, and the heirs of his body, should in all events go to the issue, if there were any; or, if none, should revert to the donor. Blackst. Com. vol. ii. p. 112.

DONNA, or *La* DONNA, in *Ichthyology*, a name given by Zuchelli, and some other authors, to the manati, or SEA-cow.

DONOR, in *Law*, he who gives lands or tenements, to another, in tail. As donee, is he to whom the same are given.

DONZELLINA, in *Ichthyology*, a name by which some called the *julis*, a very beautifully painted fish of the Mediterranean, approaching to the nature of the turdus or wrasse. See JULIS.

DOOLS, a term used in several parts of the kingdom for balks, or slips of pasture, left between the furrows of ploughed lands.

DOOR, in *Architecture*, an aperture in a wall, to give entrance, and exit, in and out of the building, or some apartment thereof. Most of the observations that are applicable to WINDOWS may be applied to *doors*.

The proportions of *doors* are adjusted by those of a man: in larger buildings they must always be larger than in smaller; but in none should they be less than six feet high, to admit a man of just stature, erect; and as the breadth of a man, with his arms placed a-kimbo, is nearly subduple his height, the width should never be less than three feet.

Some architects give us these dimensions: in small buildings the breadth of the *door* four feet, or four and a half; in middling buildings, five or six; in large ones, seven or eight; in chambers of the first, three and a half, three quarters, or four; of the second, four, or four and a half: and of the third, five, or six; in churches seven, or eight: in gates, nine, ten, or twelve: hence their height is easily determined; except for the gates of cities, which should only be four fifths of their breadth.

It is an observation of Palladio, that the principal *door*, or entrance, of a house, must never be regulated by any certain dimensions, but by the dignity of the person that is to live in it: yet, to exceed rather in the more, than the less, is a mark of generosity; and may be excused with some noble emblem, or inscription, as that of the conte de Bevilacqua over his large gate at Verona, where bad been committed a like disproportion. *Patet Janua, Cor magis.*

The principal *door*, as it is the entrance into all the apartments, should be in the centre of the edifice; though in small houses convenience may sometimes require its being placed on one side.

DOOR, *scenography of a*. See SCENOGRAPHY.

DOOR, *architrave*. See ARCHITRAVE.

DOR, the English name for the common black beetle. Some also apply it to the dusky beetle, that flies about hedges in the evening. See SCARABEUS.

DORADO, in *Astronomy*, a southern constellation, not visible in our latitude; it is also called XIPHIAS. The stars of this constellation, in Sharp's Catalogue, are six.

Names and situation of the stars.	Signs.	Longitude.		Latitude.		Magnitude.
		°	′	°	′	
In the head	♏	7	36	27	33	46	6
In the gills	♐	13	11	17	85	25	20	6
In the belly	♑	22	50	07	78	14	20	5
Above the back	♑	18	52	07	85	4	22	4
In the tail	♑	4	5	31	74	38	11	3.4
	♑							
In the end of the tail	♑	2	44	28	70	12	28	4

DORADO, in *Ichthyology*, the name of a large sea-fish, called by the Brasilians, guaracapema; and so much resembling the hippurist, as by many to be supposed to be the same fish; it grows to six or seven feet in length, and is of a somewhat broad and flatted form, being a foot and a half broad near the head; the head ends in a square, and is thinned away to an edge, for the advantage of the creature's swimming the more swiftly. Its mouth is but small for its size, and is furnished with very sharp teeth; its eyes are large and round, and placed but a little above its mouth; its gills are large. It has one long fin running the whole length of the back, and another answering it on the belly, reaching from the anus to the tail; the tail is long, large, and forked; its scales are very smooth, and scarce sensible to the touch; its head, back, and sides, are of a silver-green, its belly white; its back and sides are spotted with blue; it is a very swift fish in swimming, and is very delicate and well tasted.

DOREAS *Lybica*, in *Natural History*, the name by which Ælian and some other authors have called the common antelope. See GAZELLA.

DOREE, or *John* DOREE, in *Ichthyology*, a name given by us to a fish, called by authors the faber and gallus marinus. We have borrowed the name *doree* from the French; and, as to the word *John*, by some writers prefixed to it, it seems only a corruption of the French word *jaune*, *yellow*; they expressing the colour of the sides of this fish, which is a gold-yellow, by the phrase *jaune doré*; this has given us the words *John Dorée*, or by those who spell yet worse, *John Dory*; as we see it in some authors.

According to the new Artedian system, this is a species of the zeus, and is distinguished by that author from the others of that genus, by the name of the zeus with a prickly belly, and with a tail, not forked at the end, but rounded. Willughby, Hist. Pisc. p. 295. See ZEUS.

It is a short and very broad and flat fish, being every where of the same thickness, and something approaching to the plaise in figure, but swimming upright. Its head is large and very much flatted, its mouth extremely wide, and its eyes large. Its sides are of an olive colour, beautifully variegated with a bluish white; and in the middle of each side, there is one large black spot of the size of a silver two-pence. It has two fins on the back, the anterior is the higher, and has ten rigid spines, accompanied with softer and very large rays, which bend into the form of a reaper's sickle. The tail ends in a circular figure. Its usual size is from six to ten inches in length, and it is commonly nearly half as broad as long. *See Tab.* V. *Fishes*, N° 67.

The flesh is well tasted, and by many preferred to that of the turbot. It is caught in the Mediterranean and other seas, and is not uncommon on the Cornwall coast, and other of the English shores.

The *Indian* DOREE is a fish caught in many parts of the East Indies, and called by the Dutch there, the merbaen, the same with the abacatuaia of Margrave, caught in the Brasilian seas. See ABACATUAIA.

DORIA, in *Botany*. See GOLDEN-*rod*.

DORIALTIDES, in *Natural History*, the name of a stone, to which great virtues, medicinal and magical, were attributed by the writers of the middle ages.

DORIAN, in *Ancient Music*, the fourth species of the DIAPASON.

DORIC, in *Architecture*, is the second of the five orders; being that between the Tuscan and Ionic. It is usually

placed upon the Attic base, though originally it had no base.

The *Doric* order seems the most natural, and best proportioned, of all the orders; all its parts being founded on the natural position of solid bodies. Accordingly, the *Doric* is the first, and most ancient, of the orders of architecture; and is what gave the first idea of regular building. See *Tab. Archit. fig.* 25. See also ARCHITECTURE.

At its first invention it was more simple than at present; and when in after-times they came to adorn and enrich it more, the appellation *Doric* was restrained to this richer manner, and the primitive simple manner they called by a new name, the Tuscan order, which was chiefly used in temples; as the former, being more light and delicate, was for porticos and theatres.

The tradition is, that Dorus, king of Achaia, having first built a temple of this order at Argos, which he dedicated to Juno, occasioned it to be called *Doric*; though others derive its name, from its being invented, or used by the Dorians.

Some time after its invention they reduced it to the proportions, strength, and beauty, of the body of a man; hence, as the foot of a man was judged the sixth part of his height, they made the *Doric* column, including the capital, six diameters high, i. e. six times as high as thick. Afterwards they added another diameter to the height, and made it seven diameters; with which augmentation it might be said to be nearer the proportion of a man; the human foot, at least in our days, not being a sixth, but nearly a seventh part of the body.

The characters of the *Doric* order, as now managed, are, the height of its column, which is eight diameters; its frize, which is enriched with triglyphs, drops, and metopes; its capital, which is without volutes; and its admitting of cymatiums.

Vitruvius, indeed, complains of the *Doric* as very troublesome and perplexing, on account of the triglyphs and metopes, so as scarce to be capable of being used, except in the pycnostyle, by putting a triglyph between each two columns, or in the areostyle, by putting three triglyphs between each two columns.

The moderns, on account of its solidity, use it in large strong buildings; as in the gates of cities, and citadels, the outsides of churches, and other massy works, where delicacy of ornaments would be unsuitable.

The gate of Burlington-house in Piccadilly, is of the *Doric* order.

The most considerable ancient monuments of this order, are the theatre of Marcellus, at Rome; wherein the capital, the height of the frize, and its projecture, are much smaller than in the modern architecture; and the Parthenion, or temple of Minerva, at Athens, in which the short and massy columns bear upon the pavement without a base; and the capital is a simple torus with its cincture, and a square, plain, and solid abacus.

Vignola adjusts the proportions of the *Doric* order thus: the whole height of the order, without pedestal, he divides into twenty parts, or modules; one of which he allows the base, fourteen to the shaft, or fust, one to the capital, and four to the entablature.

The particular proportions, &c. of the several parts and members, see under their respective articles, ARCHITRAVE, BASE, CAPITAL, COLUMN, CORNICH, ENTABLATURE, FRIZE, and PEDESTAL.

DORIC *Cymatium*. See CYMATIUM.

DORICS in *Grammar*. The *Doric dialect* is one of the five *dialects*, or manners of speaking, which obtained among the Greeks. See DIALECT.

It was first used by the Lacedæmonians, and particularly those of Argos; thence it passed into Epirus, Libya, Sicily, the islands of Rhodes, and Crete.

In this *dialect*, Archimedes and Theocritus wrote, who were both of Syracuse; as likewise Pindar.

In strictness, however, we should rather define *Doric*, the manner of speaking peculiar to the Dorians, after their recess near Parnassus, and Asopus; and which afterwards came to obtain among the Lacedæmonians, &c. Some even distinguish between the Lacedæmonian and *Doric*; but, in reality, they were the same; setting aside a few particularities in the language of the Lacedæmonians; as is shewn by Rulandus, in his excellent treatise, De Lingua Græca, ejusque Dialectis, lib. v.

Besides the authors already mentioned to have written in the *Doric* dialect, we might add Archytas of Tarentum, Bion, Callinus, Simonides, Bacchylides, Cypselus, Aleman, and Sophron.

Most of the medals of the cities of Græcia Magna, and Sicily, favour of the *Doric* dialect in their inscriptions: witness, ΑΜΒΡΑΚΙΩΤΑΝ, ΑΠΟΛΛΩΝΙΑΤΑΝ, ΑΧΕΡΟΝΤΑΝ, ΑΧΤΡΙΤΑΝ, ΗΡΑΧΛΕΩΤΑΝ, ΤΡΑΧΙΝΙΩΝ, ΘΕΡΜΙΤΑΝ, ΚΑΤΑΩΝΙΑΤΑΝ, ΚΟΡΙΝΘΑΤΑΝ, ΤΑΥΡΟΜΕΝΙΤΑΝ, &c. Which shews the countries wherein the *Doric* dialect was used.

The general rules of this dialect are thus given by the Port-royalists:

D's Ητα, d'α grand, d'ι, du & d'α l'a fait le Dore.
D'ει fait ητα: d'ε, ει & d'ου ou fait ουτε.
Oste ς de l'infinit: & pour le singulier.
Se sert au feminin du nombre pluriel.

But they are much better explained in the fourth book of Rulandus; where he even notes the minuter differences of the dialects of Sicily, Crete, Tarentum, Rhodes, Lacedæmon, Laconia, Macedonia, and Thessaly.

The α abounds every-where in the *Doric*; but this dialect bears so near a conformity with the Æolic, that many reckon them but one.

DORIC, in *Musick*. The *Doric mode* is the first of the authentic modes of the ancients.

Its character is, to be severe, tempered with gravity and mirth: it is proper for occasions of religion, and war. It begins with *D, Sol, Re*.

Plato admires the music of the *Doric* mode; and judges it proper, to preserve good manners, as being masculine. And on this account he allows of it in his Commonwealth.

The ancients had likewise the *Sub-Doric* mode, which was one of their plagal modes. Its character was, to be very grave, and solemn. It began with *G Ut*, a diatessaron lower than the *Doric mode*.

DORING, or DARING, among the *Sportsmen*, a term used to express a method of taking larks, by means of a CLAPNET, and a looking-glass. For this sport there must be provided four sticks, very straight and light, about the bigness of a pike; two of these are to be four feet nine inches long, and all notched at the edges, or at the end. At one end of each of these sticks there is to be fastened another of about a foot long on one side; and on the other side a small wooden peg, about three inches long. Then four more sticks are to be prepared, each of one foot length; and each of these must have a cord of nine feet long fastened to it at the end. Every one should have a buckle for the commodious fastening on to the respective sticks when the net is to be spread.

A cord must also be provided, which must have two branches. The one must be nine feet and a half, and the other ten feet long, with a buckle at the end of each; the rest or body of the cord must be twenty-four yards long. All these cords, as well the long ones as those about the sticks, must be well twisted, and of the bigness of one's little finger. The next thing to be provided is a staff of four feet long, pointed at one end, and with a ball of wood on the other, for carrying these conveniencies in a sack or wallet.

There should also be carried, on this occasion, a spade to level the ground where there may be any little irregularities; and two small rods, each eighteen inches long, and having a small rod, fixed with a packthread at the larger end of the other. To these are to be tied some packthread loops, which are to fasten the legs of some larks; and there are to be reels to these, that these birds may fly a little way up and down.

When all this is done, the looking-glass is to be prepared in the following manner. Take a piece of wood, about an inch and a half thick, and cut it in form of a bow, so that there may be about nine inches space between the two ends; and let it have its full thickness at the bottom, that it may receive into it a false piece; in the five corners of which, there are to be let in five pieces of looking glass. These are to be so fixed, that they may part their light upwards, and the whole machine is to be supported on a moveable pin, with the end of a long line fixed to it; and made in the manner of the children's play-thing of an apple and a plum-stone; so that the other end of the cord being carried through a hedge, the barely pulling it may set the whole machine of the glasses a-turning. This and the other contrivances are to be placed in the middle between the two nets. The larks fixed to the place, and termed calls, and the glittering of the looking-glasses, as they twirl round in the sun, invite the other larks down; and the cord that communicates with the nets, and goes through the hedge, gives the person behind an opportunity of pulling up the nets, so as to meet over the whole; and take every thing that is between them. The place where the sport of sporting succeeds best are open fields, remote from any trees or hedges, except one by way of shelter for the sportsman, and the wind should always be either in the front or back; for if it blows sideways, it prevents the playing of the nets.

DORMANT, from *dormio*, *I sleep*, is the herald's term for the posture of a lion, or other beast, borne as sleeping in a coat of arms.

DORMANT-

DORMANT-*tree*, in *Building*, a name the workmen frequently give to a great beam lying across the house; usually called a *summer*.

DORMANT, or DORMAR-*tyles*. See TYLE.

DORMER, or DORMANT, in *Architecture*, denotes a window made in the roof of an house, or above the entablature; being raised upon the rafters.

The Latins call it *lucerna*, whence the French *lucerne*, and our *luthern*.

There are diverse kinds; square, round, &c. See LUTHERN.

DORMITORY, a gallery in convents, or religious houses, divided into several cells, wherein the religious lodge, or lie, &c.

The word is formed from the Latin *dormitorium*; of *dormire*, *to sleep*.

It is deemed a crime in a religious to lie out of the *dormitory*. By chap. xxii. of the rule of St. Benedict, it appears, that the ancient *dormitories* were not divided into cells, but were a kind of large open wards, filled with beds, as in our hospitals.

DORMITORY is also used for a burying-place. See COEMETERIUM.

DORMOUSE, in *Zoology*, the name of a species of wild field-mice, called also the sleeper, classed under the genus of MOUSE, in the order of *glires*, in the Linnæan system. It has two cutting-teeth in each jaw; four toes before, and five behind, and naked ears. There are two kinds of this creature, a larger and a smaller.

The larger *dormouse* is the *mus quercinus* of Linnæus, with a long hairy tail, and a black spot under the eyes, and nearly of the size of the common rat. Its colour is a brownish grey, like that of the common mouse, but variegated with somewhat of a reddish cast on the sides, and on the head; the tail is all over hairy, and is terminated by a thick tuft of white fur. The eyes are large and prominent, and of a fine jetty shining black. The beard is partly white, and partly black. Round about the eyes, and round the ears, there is a fine blackness; the upper part of the tail is also black. The smell of this creature is the same with that of the mouse, and its dung of the same kind. It lives in caverns under-ground, and sleeps the chief part of the winter. It feeds on vegetables, and is particularly fond of hazel-nuts, which it usually hoards up. It lodges in holes in the walls, and brings five or six young at a time; infests gardens; and is very destructive to fruits of all kinds.

The smaller kind is the *mus avellanarius* of Linnæus, with a long hairy tail, red body, and whitish throat, and is much more common than the larger one. This is of the size of the common mouse, and in different countries varies much in colour. In Italy, Mr. Ray observed it all over of a reddish tawney on the upper part, except the end of the tail, and its upper part white, the tail only excepted; the tail covered with long and thick-set hairs, and looking somewhat like a squirrel's. The eyes are very black and prominent. Those which the same author observed in England were less of the reddish hue on the back, and were not white under the belly, but only on the throat; neither had they the white tip at the end of the tail. Possibly the Italian and English may be really distinct species. This creature feeds on nuts, and other such fruits. It retires into caves in winter, rolls itself up, and sleeps much. It lives in thick hedges, forms its nest of dead leaves, moss, or grass, and brings three or four young at a time.

DORONICI *radix*, in the *Materia Medica*, the name of a root kept in the shops in some places, but at present little used. There are two kinds of it, the Roman and the German. The Roman is a small yellow root, appearing white when broken, of a sweet astringent taste, and viscous in the mouth. The fairest and plumpest roots should be chosen, and such as are fresh dried, or at least not worm-eaten. The root is brought from the Alps, and some other places. The plant which produces it is the *doronicum officinarum* of Gerrard, and is kept with us in the gardens of the curious. The leaves are broad, and the flower is yellow, and of the size of a marygold.

It is said to be an alexipharmic, but is not used in the present practice. Authors are indeed not at all agreed about its nature; some accounting it a very valuable medicine, and others a poison.

The German *doronicum* is a native of the mountainous parts of Germany, and flowers through the summer. The leaves and flowers bruised, emit a light pungent smell, which provokes sneezing. They yield their virtues by infusion, both to water, and rectified spirit; the roots are more aromatic than the other parts. This plant has been esteemed in Germany as a specific for dissolving coagulated blood, occasioned by falls and bruises, and thence has been intitled *lapsorum panacea*. It is likewise recommended in various obstinate chronical disorders; but its operation is too violent. Lewis's Mat. Med. p. 255. See DURUNERGI.

DORONICUM, in *Botany*. See LEOPARD's *Bane*.

DORSAL, from *dorsum*, *back*, any thing that belongs to the back; as *dorsal* GLANDS, *dorsal* NERVES, *dorsal* MUSCLES, &c.

DORSCH, in *Ichthyography*, the common name of a small fish of the cod-kind, frequent in the Baltic, but more rare in other seas, and called by authors the asellus varius, or striatus. It is remarkable for having the smoothest and softest skin of all the cod-kind; nevertheless it has small scales. It is usually caught of a foot, or a little more, in length. It approaches nearest to the species called the whiting-pollack, but differs from it in having a beard. It is a fine fish for the table.

DORSI *primus*, in *Anatomy*, a name given by Fallopius, and many other authors, to a muscle, now generally known by the name of *quadratus lumborum*, or the external lumbal muscle. See QUADRATUS.

DORSI *latissimus*, in *Anatomy*. See LATISSIMUS *dorsi*.

DORSI *longissimus*, a muscle common to the loins, and the back. It rises from the upper part of the os sacrum, ilium, and first vertebra of the loins; and in its beginning is confounded, if not the same, with the sacrolumbaris. It runs upwards along the whole tract of the back, and is connected to every transverse process in its way; ending sometimes in the first vertebra of the back, and sometimes in the first of the neck. See *Tab. Anat. (Myol.) fig. 7. n. 17. 17.*

DORSI, *sacer*. See SACER.

DORSIFEROUS, or DORSIFAROUS *plants*, from *dorsum*, and *fero*, *I bear*, are those of the capillary kind; which are without stem, and bear their seeds on the backside of their leaves.

DORSTENIA, in *Botany*. See CONTRAYERVA.

DORSUM, in *Anatomy*, is the hind part of the thorax; commonly translated the *back*.

The *dorsum* includes also the LOINS.

DORSUM *manus*, and *pedis*, is the outside of the hand and foot; or that part opposite to the palm and sole.

DORSUM *nasi* is the ridge of the nose, which runs the whole length of that part.

In those we call Roman noses, the *dorsum* is higher, and more prominent, about the middle, than in the rest; which part is called the *spina*, or *spine*.

DORT, *synod of*, in *Ecclesiastical History*, a national synod, summoned by authority of the states-general, the provinces of Holland, Utrecht, and Overyssel, excepted, and held at Dort in 1618. The most eminent divines of the United Provinces, and deputies from the churches of England, Scotland, Switzerland, Bremen, Hessia, and the Palatinate, assembled on this occasion, in order to decide the controversy between the GOMARISTS, or CALVINISTS, and ARMINIANS; the latter of whom were declared corrupters of the true religion. But the authority of this synod was far from being universally acknowledged either in Holland or in England. The provinces of Friesland, Zealand, Utrecht, Guelderland, and Groningen, could not be persuaded to adopt their decisions; and they were opposed by the authority of archbishop Laud, and king James I. in England. The reformed churches in France, though at first disposed to give a favourable reception to the decisions of this famous synod, in process of time espoused doctrines very different from those of the Gomarists; and the churches of Brandenburgh and Bremen would not suffer their doctors to be tied down to the opinions and tenets of the Dutch divines. The liberty of private judgment, with respect to the doctrines of PREDESTINATION and GRACE, which the spirit that prevailed among the divines of Dort seemed so much adapted to discourage and suppress, acquired new vigour, in consequence of the arbitrary proceedings of this assembly. Mosh. Eccl. Hist. vol. iv. p. 408, &c. 8vo ed.

DORTMANNA, in *Botany*. See LOBELIA.

DORYCNIUM, in *Botany*, a name given by some to the upright umbellated silvery bindweed, called by others *cneorum*. See CONVOLVULUS.

DORYDREPANON. See DREPANON.

DORYPHORI, from δόρυ, *spear*, and φέρω, *I bear*, an appellation given to the life-guard-men of the Roman emperors. They were held in such high estimation, as frequently to have the command of armies conferred on them.

It was usual also for chief commanders to have their *doryphori*, or life-guard, to attend them.

DOSE, in *Pharmacy*, &c. the quantity of a medicine to be taken at one time.

The word is formed from the Greek δοσις, which signifies gift, or a thing given; from δίδωμι, *do*, *I give*.

A secret in physic is nothing, unless the *dose* be known.

In authors, and dispenſatories, that deſcribe the ſame remedy, frequently the *dole* is different; which occaſions a great difference in its effect.

Dr. Cockburn has given us an eſſay towards determining the *doſes* of purgative medicines, on mechanical principles.

Several attempts have been made to aſcertain the proportional *doſes* for the different ages and conſtitutions of patients; but, after all that can be ſaid on this ſubject, much muſt be left to the judgment of the perſon who adminiſters the medicine. The following general proportions may be obſerved, though by no means intended for exact rules. A patient between 20 and 14 may take two-thirds of the *doſe* ordered for an adult; from 14 to 9, one half; from 9 to 6, one third; from 6 to 4, one fourth; from 4 to 2, one ſixth; from 2 to 1, a tenth; and under one, a twelfth. Buchan's Dom. Med. App. p. 695.

DOSENS, ſtreight clothes made in Devonſhire, and ſo called in Rot. Parl. 2 Hen. V. See DOWSEINES.

DOSITHEANS, DOSITHEI, an ancient ſect among the Samaritans, in the firſt century of the Chriſtian æra.

Mention is made in Origen, Epiphanius, Jerom, and divers other Greek and Latin fathers, of one Doſitheus, the chief of a faction among the Samaritans; but the learned are not at all agreed as to the time wherein he lived. St. Jerom, in his dialogue againſt the Luciferians, places him before our Saviour; wherein he is followed by Druſius, who, in his anſwer to Serrarius, places him about the time of Sennacherib, king of Aſſyria: but Scaliger will have him poſterior to our Saviour's time. And, in effect, Origen intimates him to have been contemporary with the apoſtles; where he obſerves, that he endeavoured to perſuade the Samaritans, that he was the Meſſiah foretold by Moſes.

He had many followers; and his ſect was ſtill ſubſiſting at Alexandria in the time of the patriarch Eulogius; as appears from a decree of that patriarch, publiſhed by Photius. In that decree, Eulogius accuſes Doſitheus of injuriouſly treating the ancient patriarchs and prophets; and attributing to himſelf the ſpirit of prophecy. He makes him contemporary with Simon Magus; and accuſes him of corrupting the Pentateuch in divers places, and of compoſing ſeveral books, directly contrary to the law of God.

Archbiſhop Uſher takes Doſitheus to be the author of all the changes made in the Samaritan Pentateuch; which he argues from the authority of Eulogius; but all we can juſtly gather from the teſtimony of Eulogius is, that Doſitheus corrupted the Samaritan copies ſince uſed by that ſect; but that corruption did not paſs into all the copies of the Samaritan Pentateuch, now in uſe among us, which vary but little from the Jewiſh Pentateuch.

And in this ſenſe we are to underſtand that paſſage in a Samaritan chronicle, where it is ſaid, that Douſis, i. e. Doſitheus, altered ſeveral things in the law of Moſes.

The author of that chronicle, who was a Samaritan by religion, adds, that their high-prieſt ſent ſeveral Samaritans to ſeize Douſis, and his corrupted copy of the Pentateuch. Epiphanius takes him to have been a Jew by birth, and to have abandoned the Jewiſh party for that of the Samaritans. He imagines him likewiſe to have been the author of the ſect of the Sadducees: this is inconſiſtent with his being later than our Saviour. And yet the Jeſuit Serrarius agrees to make Doſitheus the maſter of Sadoc, from whom the Sadducees are derived.

Tertullian, making mention of the ſame Doſitheus, obſerves, that he was the firſt who dared to reject the authority of the prophets, by denying their inſpiration. But he charges that as a crime peculiar to this ſectary, which, in reality, is common to the whole ſect, who have never allowed any but the five books of Moſes for divine.

DOSSER, a ſort of baſket to be carried on the ſhoulders of men. It is uſed in carrying the overplus earth from one part of a fortification to another, where it is wanted. There are like wiſe ſmall carts and wheel-barrows for the ſame uſe.

DOSSIL, in *Surgery*, is lint made into a cylindric form, or reſembling the ſhape of dates or olive ſtones. *Doſſils* are ſometimes ſecured by a thread tied round their middle. Heiſt. Surgery, Introd. ſect. 53.

DOTAL *goods*. See GOODS.

DOTE *aſſignando*, in *Law*, a writ that lay for a widow, where it was found by office, that the king's tenant was ſeiſed of tenements in fee, or fee-tail, at the day of his death; and that he held of the king in chief, &c. in which caſe, the widow came into the chancery, and there made oath, that ſhe would not marry without the king's leave. Anno 15 Edw. III. c. 4. And hereupon ſhe had this writ to the eſcheator; for which ſee Reg. of Writs, fol. 297. and Fitz. Nat. Br. fol. 263.

Theſe widows are called the king's widows.

DOTE *unde nihil habet*, in *Law*, a writ of dower that lies for the widow againſt the tenant, who bought land of her huſband in his life time, whereof he was ſolely ſeiſed in fee-ſimple or fee-tail, in ſuch ſort, as the iſſue of them both might have inherited. Fitz. Nat. Br. fol. 147.

DOTE, *rectoſte*. See RECTO.

DOTIS *admenſurationes*. See ADMEASUREMENT, and Reg. of writs, fol. 171.

DOTTEREL, in *Ornithology*, the name by which the *morinellus* is commonly known in moſt parts of England.

The uſual weight of this bird is a quarter of a pound; but the male is ſmaller than the female, and weighs uſually half an ounce leſs. Its beak is a finger's breadth long. Its head is very beautifully variegated with ſmall black and white ſpots, and has a line of white over the eyes. Its throat is of a greyiſh white, variegated with ſtreaks of brown. Its breaſt, and the under part of its wings, are of a duſky yellow. It is common in Lincolnſhire, and ſome other counties of England; and is a very delicate bird. It is commonly caught in the night. Ray's Ornith p. 230.

DOTTEREL, *Sea*, *Morinella* TRINGA, in the Linnæan ſyſtem, a name given by authors to the bird, commonly known in England by the name of the TURNSTONE; and called by Turner, *cinclus*. Ray's Ornith. p. 231.

DOTTO, in *Natural Hiſtory*, a name given by ſome authors to a ſpecies of the emerald, which was a good green, but not clear or fine.

DOUBLE, in the *Manege*. A horſe is ſaid to *double* his reins, when he leaps ſeveral times together to throw the rider. Thus we ſay, this *runningue doubles* his reins, and makes *pontlevis*. See RAMINGUE, and PONTLEVIS.

A hare is ſaid to *double* when ſhe keeps the plain fields, and winds about to deceive the hounds. Dict. Ruſt.

DOUBLE *Aſpect*. See ASPECT.

DOUBLE-*banked*, in *Sea-language*, denotes the ſituation of the oars of a boat, when two oppoſite ones are managed by rowers ſeated on the ſame bench, or thwart. The oars are alſo ſaid to be *double-banked* when two men row upon every ſingle one.

DOUBLE *Baſtion*. See BASTION.

DOUBLE *Caſt*, in *Huſbandry*, a term uſed by the farmers for that method of ſowing which does not diſpenſe the neceſſary quantity of ſeed for a piece of land at one bout, but requires the going over it twice. Plott. Oxf. p. 251.

DOUBLE *Children*, DOUBLE *Cats*, DOUBLE *Pears*, *&c.* inſtances of, are frequent in the Philoſophical Tranſactions, and elſewhere. See MONSTER.

Sir John Floyer, in the ſame Tranſactions, giving an account of a *double* turkey, furniſhes ſome reflections on the production of *double* animals in general. Two turkeys, he relates, were taken out of an egg of the common ſize, when the reſt were all hatched, which grew together by the fleſh of the breaſt-bone; but, in all other parts, were diſtinct. They ſeemed leſs than the ordinary ſize, as wanting bulk, nutriment, and room for their growth, which latter, too, was apparently the occaſion of their cohæſion.

For, having two diſtinct cavities in their bodies, and two hearts, they muſt have ariſen from two cicatriculas; and conſequently, the egg had two yolks, which is no uncommon accident. He had a dried *double* chicken: he aſſures us, that though it had four legs, four wings, &c. it had but one cavity in the body, one heart, and one head; and that this, conſequently, was produced from one cicatricula.

So, Parœus mentions a *double* infant with only one heart: in which caſe, the original, or ſtamen of the infant, was one, and the veſſels regular: only the nerves and arteries towards the extremities, dividing into more branches than ordinary, produced thoſe *double* parts.

The ſame is the caſe in the *double* flowers of plants, occaſioned by the richneſs of the ſoil. So it is in the eggs of quadrupeds, &c.

There are, therefore, two reaſons of duplicity in embryos: 1. The conjoining, or connexion of two perfect animals; and, 2. An extraordinary diviſion, and ramification of the original veſſels, nerves, arteries, &c.

DOUBLE *Concave*, and DOUBLE *Convex Glaſs*. See CONCAVE, CONVEX, and GLASS.

DOUBLE *Cone*. See CONE.

DOUBLE *Dancette*, in *Heraldry*. See DANCETTE.

DOUBLE *Deſcant*, in *Muſic*. See DESCANT.

DOUBLE *Horizontal-Dial*, one with a double gnomon, whereof one points out the hour on the outward circle, and the other ſhews the hour on the ſtereographic projection drawn upon it. This dial finds the meridian, hour, the ſun's place, riſing, ſetting, &c. and many other poſitions of the globe. See DIAL.

DOUBLE *Diſſa*. See DIESIS.

DOUBLE *Eccentricity*. See ECCENTRICITY.

DOUBLE *Feaſt*. See FEAST.

DOUBLE *Fever*. See FEVER.

DOUBLE *Fiché*, or DOUBLE *Fichy*, in *Heraldry*. A croſs is denominated *double fiché*, when the extremities are pointed at each angle; that is, when each extremity has two points: in contradiſtinction to *fiché*, where the extremity is ſharpened away to one point.

Gibbon expreſſes it by an octagonal croſs, the two points whereof at each extremity are parted inwards by a ſmall ſpace of a line; by which it is diſtinguiſhed from the croſs of Malta, the two points whereof proceed from a third point, or acute angle between them.

DOUBLE *Fine*. See FINE.

DOUBLE *Fugue*. See FUGUE.

DOUBLE *Leaf*, in *Botany*. See TWYBLADE.

DOUBLE *Letter*, in *Grammar*, a letter, which has the force and effect of two; as the Hebrew *Tſaddi*, which is equivalent to *T* and *S*; or the Greek ξ, or Latin *x*, &c.

Theſe letters are evidently equal to two; when we pronounce the Latin *axis*, or the Engliſh *auxiliary*, we give the *x* the ſame ſound, as if it were written with two *c*, *axis*, *acciliary*; or *c* and *s*. *asſis*, *aſſiliary*.

The Greeks have three, *Z*, Ξ, Ψ; the Latins only two, X and Z; and moſt of the modern languages have the ſame.

DOUBLE *Meaſure*. See MEASURE.

DOUBLE *Peſtal*. See PEDESTAL.

DOUBLE *Plea*, in *Law*, is where the defendant alleges for himſelf two ſeveral matters in bar of the action; whereof either is ſufficient to effect his deſire, in debarring the plaintiff.

This is not admitted in common law: for which reaſon it is to be well obſerved, when a plea is *double*, and when not: for if a man alleges ſeveral matters, one not at all dependent on another, the plea is accounted *double*; but if they be mutually depending on each other, then it is accounted but *ſingle*.

DOUBLE *Plough*. See PLOUGH.

DOUBLE *Point*, in the *Higher Geometry*. When all the right lines tending the ſame way with the infinite leg of any curve, do cut it only in one point (as happens in the ordinates of the Carteſian, and the cubical parabola,) and in the right lines which are parallel to the abſciſſes of hyperbolas, and parabolas, then you are to conceive, that thoſe right lines paſs through two other points of the curve, placed, as it may be ſaid, at an infinite diſtance. Which coincident interſection, whether it be a finite, or an infinite diſtance, Sir Iſaac Newton calls the *double point*.

DOUBLE *Poſition*. See POSITION.

DOUBLE *Quarrel*, *Double querela*, a complaint made by a clerk, or other, to the archbiſhop of the province, againſt an inferior ordinary, for delaying juſtice in ſome eccleſiaſtical cauſe; as to give ſentence, inſtitute a clerk preſented, or the like.

Its denomination ſeems owing to this, that it is commonly made both againſt the judge, and him at whoſe ſuit juſtice is delayed.

DOUBLE *Ratio*. See DUPLE.

DOUBLE *Roads*. See ROADS.

DOUBLE *Tenaille*. See TENAILLE.

DOUBLE *Time*. See TIME.

DOUBLE *Tongue*, in *Botany*, a name ſometimes given to the BUTCHER'S *broom*, and GERANIUM.

DOUBLE *Vault*. See VAULT.

DOUBLE *Veſſel*, in *Chemiſtry*, is when the neck of one bolt-head, or matraſs, is put, and well luted, into the neck of another.

Of theſe there are divers kinds and forms, uſed in the circulation of ſpirits, in order to their being exalted, and refined, as high as can be. See CIRCULATION.

DOUBLE *wheeled plough*. See PLOUGH.

DOUBLE *winding ſtairs*. See STAIRS.

DOUBLE *inciſion*, *grafting by*. See ENGRAFTING.

DOUBLE *voucher*, *recovery with*. See RECOVERY.

DOUBLED *Column*. See COLUMN.

DOUBLES, in our *Statutes*, ſignify as much as letters patent, being a French word made of the Latin *diploma*. Anno 14 Hen. VI. cap. 6.

DOUBLETS, among *Lapidaries*, denote cryſtals wrought into ſuch a form, and ſo coloured, that the ſurfaces of two pieces thus coloured being laid together, might produce the ſame effect as if the whole ſubſtance of the cryſtal had been tinged. For this purpoſe, two plates of cryſtal muſt be cut in the manner of a brilliant, and fitted ſo exactly, that no diviſion can appear when they are laid together. The upper part muſt be poliſhed ready for ſetting, and then the colours may be put between them by the following proceſs: take of Venice, or Cyprus turpentine, two ſcruples, and add to it one ſcruple of the grains of pure maſtic powdered. Melt them together in a ſilver or braſs ſpoon ladle, or other veſſel, and mix with them any of the coloured ſubſtance propoſed, well powdered. Warm the *doublets* to the ſame degree of heat with the mixture, and paint the upper ſurface of the lower part, and put the upper one inſtantly upon it, preſſing them evenly together. When the cement is quite cold, ſcrape the edges, and let the *doublets* be ſkilfully ſet, by carrying the mounting over the joint, ſo that the two pieces may be well ſecured from ſeparating. The colour of the ruby may be imitated, by mixing a fourth part of carmine with fine crimſon lake; the ſapphire and amethyſt may be counterfeited by mixing very bright Pruſſian blue with a ſmall quantity of crimſon lake; the emerald may be imitated by diſſolved verdigriſe, with a little powdered aloes; the garnet may be counterfeited by dragon's blood, the brightneſs of which may be improved by the addition of a ſmall quantity of carmine; the yellow topazes may be imitated by mixing the powdered aloes with a little dragon's blood. Glaſs may be alſo prepared in the ſame manner.

Doublets may be eaſily diſtinguiſhed, by holding them betwixt the eye and the light, in ſuch poſition, that the light may paſs through the upper part and corner of the ſtone; which will then ſhew ſuch parts to be white, and that there is no colour in the body of the ſtone. Handmaid to the Arts, vol. ii. p. 328, &c.

DOUBLINGS, in *Heraldry*, the linings of robes, or mantles of ſtate; or of the mantlings in atchievements.

DOUBLING, in a *Military Senſe*, is the putting of two ranks, or files of ſoldiers, into one.

When the word of command is, *double your ranks*, then the ſecond, fourth, and fixth ranks are to march up into the firſt, third, and fifth; ſo that of ſix ranks they make but three, leaving double the interval there was between them before. But it is not ſo when they *double the half files*, becauſe then three ranks ſtand together, and the three others come up to *double* them; that is, the firſt, ſecond, and third, are *doubled* by the fourth, fifth, and fixth; or on the contrary.

Double your files, directs each to march to that next to it on the right or left, according to the word of command; in which caſe the ſix ranks are turned into twelve, the men ſtanding twelve deep; the diſtance between the files being now *double* of what it was before.

DOUBLING *a Cape*, or *Point*, in *Navigation*, ſignifies the coming up with it, paſſing by it, and leaving it behind the ſhip.

The Portugueſe pretend to be the firſt that ever *doubled* the Cape of Good Hope, under their admiral Vaſquez de Gama: but we have accounts in hiſtory, particularly in Herodotus, of the Egyptians, Carthaginians, &c. having done the ſame long before them.

DOUBLING-*nails*, among *Shipwrights*, are the nails commonly uſed to faſten the lining of the gun-ports, &c.

DOUBLING-*upon*, in a *Naval Engagement*, is the act of cloſing any part of a hoſtile fleet between two fires, or of cannonading it on both ſides. It is uſually performed by the van or rear of that fleet which is ſuperior in number taking the advantage of the wind; or of its ſituation, and tacking, or veering round the van or rear of the enemy, who are thereby expoſed to great danger, and can ſcarcely avoid being thrown into a general confuſion.

DOUBLON, DUBLOON, a Spaniſh and Portugueſe coin, being the *double* of a piſtole. See PISTOLE and COIN.

There are alſo *double doubloons* formerly current among us for three pounds twelve ſhillings.

DOUBTING, the act of with-holding a full aſſent from any propoſition; on ſuſpicion, that we are not thoroughly apprized of the merits thereof; or from our not being able peremptorily to decide between the reaſons for, and againſt it.

The Sceptics and Academics *doubt* of every thing; the character of their philoſophy is, not to allow any thing for truth; but to with-hold the aſſent, and keep the mind free, and in ſuſpenſe. See SCEPTICS.

The Epicureans truſt their ſenſes, and *doubt* of their reaſon: their leading principle is, that our ſenſes always tell truth; that they are the firſt and only criterions of truth; and that if you go ever ſo little from them, you come within the proper province of *doubting*.

The Carteſians, on the contrary, of all things bid us *doubt* our ſenſes; they are perpetually inculcating the deceitfulneſs of our ſenſes; and tell us, that we are to *doubt* of every one of their reports, till they have been examined, and confirmed by reaſon. See CARTESIANS.

DOUBTING, in *Rhetoric*, a figure wherein the orator appears ſome time fluctuating, and undetermined what to do, or ſay. See APORIA and DIAPORESIS.

Tacitus furniſhes us with an inſtance of *doubting*, almoſt to a degree of diſtraction, in thoſe words of Tiberius, written to the ſenate: *Quid ſcribam, P. S. aut quomodo ſcribam, aut quid omnino non ſcribam hoc tempore, dii me deæque pejus perdant quam perire quotidie ſentio, ſi ſcio.*

DOUCETS, or DOULCETS, among *Sportſmen*, denote the teſtes of a deer or ſtag. Dict. Ruſt.

DOUCINE,

DOUCINE, in *Architecture*, a moulding, or ornament, on the highest part of the corniche, in form of a wave, half convex, and half concave. See *Tab. Archit. fig.* 8.
The *doucine* is the same with a *cymatium*, or *gula*. See CYMATIUM, and GULA *recta*, and *inversa*.

DOVE, in *Ornithology*. See PIGEON.

DOVE, *ring*, in *Ornithology*, the name of a bird of the pigeon kind, called by Aldrovand, and other authors, the *palumbus torquatus*, and by the Greeks *phaſſa*. Its beak is yellow, its feet naked and red, its legs feathered almoſt down to the feet. The head, back, and coverts of the wings, are of a bluiſh aſh-colour; the lower ſide of the neck and breaſt are of a purpliſh red, daſhed with aſh-colour. The upper part of its neck has a very regular and beautiful white circle, from which the bird has its name: and its whole neck, above and below this, is beautifully variegated with changes of colours, according as it is oppoſed to the light. The belly is of a dirty white, the greater quill feathers are duſky, the reſt aſh-coloured; underneath the baſtard wing is a white ſtroke, pointing downwards. It is the largeſt pigeon we have, and may be diſtinguiſhed by its ſize. It ſeldom flies ſingle, but in large flocks, and builds on trees; its food is ivy-berries, and other vegetable matter. They begin to coo in March, when they pair, and leave off in the beginning of winter. See *Tab. of Birds*, N° 13.

DOVE, *turtle*, *turtur*, in *Ornithology*, a very beautiful little bird of the pigeon kind. The head, neck, and back, are of the bluiſh grey colour of the common pigeon, with ſome mixture of a roddiſh brown near the rump, and the bottom of the neck. Its belly is white; but its breaſt and throat of a fine bright purple, having the verge of each feather yellow; and the ſides of the neck are variegated with a ſort of ringlet of beautiful white feathers, with black baſes. The tail is about three inches and a half long, having the two middlemoſt feathers of a duſky brown, and the others black, with white tips; and the end and exterior ſide of the outmoſt feathers wholly white. The weight of this bird is about four ounces. It feeds on hemp-ſeed, and other vegetable matters. It is remarkably ſhy, and breeds in thick woods, generally of oak.

DOVE, *ſea-turtle*, or *Greenland-dove*, in *Ornithology*, is a ſpecies of the DIVER, or the COLYMBUS *grylle* of Linnæus. The bill is an inch and a half long; ſtraight, ſlender, and black; on each wing is a large bed of white, which in young birds is ſpotted; the tips of the leſſer quill-feathers, and the inner coverts of the wings, are white; except theſe the whole plumage is black. In winter it is ſaid to change to white; and a variety, ſpotted with black and white, is not uncommon in Scotland. The tail conſiſts of twelve feathers; and the legs are red. Theſe birds always keep at ſea, except in breeding time, and they are ſhot with great difficulty, becauſe they dive at the flaſh of the pan. The Welch call this bird *coſganllungwr*, or the ſailor's hatred, from a notion that its appearance forebodes a ſtorm. It viſits St. Kilda's iſle in March, makes its neſt far under ground, and lays a grey egg, or, as ſome ſay, a whitiſh egg, ſpotted with ruſt, and ſpeckled with aſh colour.

DOVE's *foot*, in *Botany*. See GERANIUM.

DOVE-*tail*, in *Carpentry*, the ſtrongeſt of all the kinds of jointings; wherein the tenon, or piece of wood that enters the other, goes widening to the extreme, and ſo cannot be drawn out again, becauſe the tip, or extreme, is bigger than the whole.
It has its denomination from the reſemblance the tenon bears to a *dove*'s tail. The French call it *queue d'aronde*, *ſwallow's tail*; which name the Engliſh themſelves alſo retain in fortification.

DOVELLA, in *Ichthyology*, a name given by the Maſſilians to the fiſh called the donzellina by the Italians: it is the julis, or julis, of authors; and, according to the Artedian ſyſtem, it is a ſpecies of the labrus. That author diſtinguiſhes it by the name of the labrus of variegated colours, with two large teeth in the upper jaw. See LABRUS.

DOULEIA, Δουλεια, among the Athenians, a kind of puniſhment, by which the criminal was reduced into the condition of a ſlave. It was never inflicted upon any but the *artiſts*, *ſojourners*, and *freed ſervants*. Potter's Archæol. Græc. lib. i. cap. 25. tom. i. p. 130.

To DOUSE, in *Sea Language*, is to lower ſuddenly, or ſlacken; and it is applied to a ſail in a ſquall of wind, an extended hawſer, &c.

DOWAGER, DOTISSA (q. d. a widow *endowed*, or that has a jointure), a title, or addition, applied to the widows of princes, dukes, earls, and perſons of high rank only.

DOWAGER, *queen*. See QUEEN.

DOWER, DOTARIUM, DOARIUM, or DOS, a portion of lands, or tenements, which a widow enjoys for term of life, from her huſband, in caſe ſhe ſurvives him; and which, at her death, deſcends to their children. But ſhe muſt have been the wife of the party at the time of his deceaſe; or not divorced *a vinculo matrimonii*: nor, if ſhe has eloped from her huſband, and lives with an adulterer, ſhall ſhe be entitled to *dower*, unleſs her huſband be voluntarily reconciled to her. The widows of traitors are alſo barred of their *dower* by 5 and 6 Ed. VI. cap. 11. but not the widows of felons. An alien cannot be endowed, unleſs ſhe be queen-conſort. And if a woman levies a fine with her huſband, or if a common recovery be had with the huſband and wife of the huſband's lands, ſhe is barred of her *dower*. A widow, clear of theſe impediments, is by law entitled to be endowed of all lands and tenements, of which her huſband was ſeiſed in fee-ſimple or fee-tail at any time during the coverture; and of which any iſſue ſhe might have had, might by poſſibility have been heir. See JOINTURE.
Our law-books diſtinguiſh five kinds of *dower*; viz. *dower per legem communem*; *per conſuetudinem*; *ex aſſenſu patris*; *ad oſtium eccleſiæ*; and *de la plus belle*. But the two firſt are now only in uſe.

DOWER *by the common law* is a third part of ſuch lands as the huſband was ſole ſeiſed of in fee during the marriage; which the wife is to enjoy during her life, and for which there lies a *writ of error*.

DOWER *by cuſtom* gives the wife, in ſome places, half her huſband's lands, ſo long as ſhe lives ſingle, as in gavelkind. And as cuſtom may enlarge, ſo that the widow may have the whole during life, which is called her *free bench*, ſo may it abridge, *dower*, and reſtrain it to a fourth part.

In DOWER *ex aſſenſu patris*, and *ad oſtium eccleſiæ*, the wife may have ſo much *dower* as ſhall be aſſigned, or agreed upon; but it ought not to exceed the third part of the huſband's lands. If this be done before marriage, it is called a *jointure*.

DOWER *de la plus belle*. By this ſhe is *endowed* with the faireſt and beſt part of her huſband's eſtate.

DOWER, *admeaſurement of*. See ADMEASUREMENT.

DOWER, *aſſignment of*. See ASSIGNMENT.

DOWER. *tenant in*. See TENANT.

DOWLE and DEAL, in our *Old Writers*, are uſed to ſignify a diviſion. The word comes from the Saxon *dal*, i. e. *diviſio*, and that from *dælan*, *dividere*; whence our Engliſh word *dealing* is formed.
In this ſenſe it is, that the ſtones laid to the boundaries of lands are called *doweleſtones*.

DOWN, in *Natural Hiſtory*, denotes the firſt feathers of geeſe, with which beds and pillows are ſtuffed. The cottony ſubſtance on the tops of thiſtles, &c. is alſo thus called.

DOWNS, a bank, or elevation, of ſand, which the ſea gathers and forms along its ſhores; and which ſerves it as a barrier.
The word is formed from the French *dune*, of the Celtic *dum*, a *mountain*. Charles de Viſch. in his Compend. Chronolog. Exord. & Progreſſ. Abbat. Clariſſ. B. Mariæ, de Dunis, ſays, *Vallem reperit arenarum collibus* (*quos incolæ* Duynen *vocant*) *undique cinctam*.
Downs are particularly uſed for a famous road for ſhips, along the eaſtern coaſt of the county of Kent; from Dover to the North Foreland.
This road has excellent anchorage, and is well defended by the caſtles of Sandwich, Deal, and Dover.
Here it is the Engliſh fleets uſually meet.

DOWNY, ſomething partaking of the nature of *down*. Thus ſome leaves and fruit, &c. are ſaid to be covered with a *downy* matter.

DOWRY, DOS, is properly the money, or fortune, which the wife brings her huſband in marriage, to have the uſe of it, during her marriage, towards ſupporting the charge thereof.
It is otherwiſe called *maritagium*, *marriage goods*; by the Romans *dos*; and it differs from *dower*. See DOWER.
Among the Germans, it was anciently cuſtomary for the huſband to bring a *dowry* to his wife. *Romanos non in uſu fuit uxoribus dotes retribuere; ideo verbo genuino carent quo hoc dignoſcitur; & rem ipſam in Germanorum moribus mirator Taciti*: dotem, *inquit, non uxor marito, ſed uxori maritus offert*. Spelman.

DOWRY is alſo uſed, in a monaſtic ſenſe, for a ſum of money given along with a maid, upon entering her in ſome religious order.
In France, the *dowry* of perſons entering a monaſtery, to make profeſſion of a religious life, is limited by law. Ann. e. gr. given upon entering a monaſtery of Carmelites, Urſulines, and others, not regularly founded, but eſtabliſhed ſince the year 1600, by letters patent, muſt not exceed the ſum of 8000 livres, in towns where parliaments are held; nor 6000, in other places.

DOWSEINES, a ſort of kerſeys made in Devonſhire, in length

length twelve yards; whence alſo their name, which is otherwiſe writ *doſeni*, *dozens*, or *dozains*.

DOXOLOGY, an appellation given by the Greeks to the fourteenth verſe of the ſecond chapter of St. Luke, *Glory be to God in the higheſt*, &c. becauſe beginning with the Greek word δόξα, *glory*.

This they diſtinguiſh by the name of *great doxology*; and the *Gloria Patria*, *Glory be to the Father*, they call the *leſs doxology*, as beginning with the ſame word δόξα.

Philoſtorgius, lib. iii. c. 13. gives three formulas of the *leſſer doxology*. The firſt is, *Glory be to the Father, and to the Son, and to the Holy Ghoſt*; the ſecond, *Glory be to the Father, by the Son, in the Holy Ghoſt*; and the third, *Glory be to the Father, in the Son, and the Holy Ghoſt*.

Sozomen, and Nicephorus, give a fourth; viz. *Glory be to the Father, and the Son, in the Holy Ghoſt*.

The firſt of theſe *doxologies* is that in common uſe through out the weſtern church. It was firſt inſtituted about the year 350, by the Catholics of Antioch, then called *Euſtathians*. The three others were compoſed by the Arians; the ſecond was that of Eunomius, and Eudoxus, and which was approved by Philoſtorgius. The three were all made about the year 341, in the council of Antioch, when they firſt began to diſagree among themſelves. Philoſtorgius aſſures us, that Flavian, afterward patriarch of Antioch, was the author of the firſt, or *catholic doxology*; but Sozomen, and Theodoret, ſay nothing of it; and Philoſtorgius's ſingle authority is hardly ſufficient.

There were anciently very great diſputes, and principally at Antioch, as to the form of *doxology*; that moſtly uſed among the orthodox was, the ſame as ſtill obtains; the reſt were affected by the Arians, and other Antitrinitarians; yet St. Baſil, in his book on the Holy Spirit, defends the ſecond as orthodox, and legitimate; and it is certainly more agreeable to Scripture authority; to which we muſt ultimately appeal, as the only infallible rule of our devotion, as well as of our conduct: and it has been urged, that no inſtance of the former *doxology* occurs in the New Teſtament.

Some authors write hymnology as ſynonymous with *doxology*; but there is a difference: hymnology is applied to Pſalms, or the recitation of Pſalms: and *doxology* only to the little verſe, *Glory be to the Father*, &c. repeated at the end of each Pſalm.

DOZEIN, *Dozenna*. In the ſtatute for view of frank-pledge, made 18 Edw. II. one of the articles for ſtewards in their leets to enquire of, *is*, if all the *dozeins* be in the aſſize of our lord the king, and which not, and who received them. Art. 3. See DECIERS.

DOZEIN is alſo uſed for a ſort of Devonſhire kerſeys. Anno 5 and 6 Edw. VI cap. 6. See DOWLASSES.

DOZELINA, in *Ichthyology*, a name by which ſome authors have called the muſtela of the common ſpecies, which we in Engliſh term the *fea-loche*, and *whiſſle-fiſh*.

DRABA, in *Botany*, *Whitlow-graſs*, a genus of the *tetradynamia ſiliquoſa* claſs. Its characters are theſe: the flower hath four petals, in form of a croſs, and ſix ſtamina, four of which are as long as the empalement. In the centre is ſituated a baſid germen, which afterward becomes an oblong, oval, entire pod, with two cells, ſeparated by the ſwelling ſtyle, which is oblique. The valves are parallel to the middle, and open oblique, each cell containing a ſingle ſeed. There are eight ſpecies. See DITTANDER.

DRABLER, in the *Sea-Language*, a ſmall ſail in a ſhip, which is the ſame to a bonnet, that a bonnet is to a courſe, and is only uſed when the courſe and bonnet are too ſmall to clothe the maſt. See BONNET, and COURSE.

DRABS, in the Engliſh *ſalt-works*, a name given to a ſort of wooden caſes in which the ſalt is put, as ſoon as it is taken out of the boiling-pan. Theſe are partitions like ſtalls made for horſes; they are lined on three ſides and at the bottom with boards, and at the front have a ſliding-board to put in or take out occaſionally. Their bottoms are made ſhelving, being higheſt at the backſide, and gradually inclining forwards; by which means the ſaline liquor that remains mixed with the ſalt eaſily drains out from it, and the ſalt in three or four days becomes ſufficiently dry, and is then taken out and laid up in large heaps for ſale. In ſome places they uſe cribs inſtead of the *drabs*. See CRIB.

DRACÆNA, in *Botany*, a genus of the *hexandria monogynia* claſs: the corolla is erect, and divided into ſix ſegments; the filaments are thickeſt in the middle, and the fruit is a three-celled berry, containing a ſingle ſeed. There are five ſpecies.

DRACÆNA, in *Zoology*, is alſo the name of a ſpecies of American LIZARD.

DRACHM, Δραχμὴ, an ancient ſilver coin, uſed among the Greeks. See COIN.

This they divided into ſix OBOLI; and their larger coins above the *drachm* were the *didrachm*, *tridrachm*, and *tetradrachm*, or *ſtater*. The *drachm* was likewiſe a weight as well as a piece of money; and their *mina* contained a hundred *drachms*, both as a ſum and a weight; and their talent ſixty *minæ*, or ſix thouſand *drachms*, both by weight and tale; and this method of reckoning was common to all Greece; ſo that if the *drachms* of one city differed from that of another, their talents differed in the ſame proportion. The Attic *drachma* has been ſuppoſed by moſt authors, before Greaves, who firſt ſuggeſted the contrary, to have been the ſame, among the Greeks, with the DENARIUS, among the Romans; which was equivalent to four ſeſterces. Of this opinion is Budæus, De Aſſe; who confirms it from the authorities of Pliny, Plutarch, Strabo, and Valerius Maximus, with whom δραχμὴ is ſynonymous with *denarius*. Plin Nat. Hiſt. lib. xxi. fin.

A. Gellius, who reſided long at Athens, and could not be ignorant of the value of the current money of that city, ſays, that ten thouſand *drachms* were in Roman money to many *denarii*. Lib. i. cap. 8. See alſo Val. Maxim. lib. viii. cap. 6. and Strabo Geog. lib. v. the former of whom writes, that a certain commodity was ſold for two hundred *denarii*; and the latter, in ſpeaking of the ſame thing, ſays, that it was bought for two hundred *drachmæ*. But this is no ſtrong conviction, that the two coins were preciſely of the ſame value; thoſe authors, not treating expreſly of coins, might eaſily render the one for the other, provided there were no conſiderable difference between them. Greaves's Miſc Works, by Birch, vol. i. p. 287, &c. 8vo.

Scaliger, in his diſſertation, De Re Nummaria, does not ſay abſolutely that the *denarius* and *drachma* were the ſame thing; but from a Greek paſſage in an ancient law, c. xxvi. *Menodoti*, where the *drachma* is ſaid to be compoſed of ſix oboli, he concludes, that in the age of Severus, at leaſt, they were the ſame. But Agricola, De Menſ. & Ponder. lib. xiv. ſhews, from Pliny, Celſus, and Scribonius Largus, that the denarius contained only ſeven ounces; and from Livy, Appian, Cleopatra, &c. that the *drachma* contained eight; and maintains, that when ſome Greek authors ſpeak of the ounce as only containing ſeven *drachmi*, that they do not mean the Attic *drachm*, but the Roman denarius, which Greek authors render by Δραχμὴ. We learn from Galen, that the writers on weights and meaſures differed in the number of *drachmi* or *denarii*, which they aſſigned to an ounce; moſt of them making it to contain ſeven and a half, ſome but ſeven, and others eight. De Med. Comp. ſec. Genera, lib. iii. cap. 3.

Gronovius agrees with Agricola, that the *drachma* was the eighth part of an ounce; and the opinion is confirmed by Iſidore, lib. xiv. cap. 24. by Funnius, who ſays as much in expreſs terms, and by Voſſius, who divides the ounce into twenty-four *ſcripula*, or ſcruples, of which the *drachm* comprehended three.

It is probable, that, when the Romans became maſters of Greece and Aſia, the Athenians might find it their intereſt to lower their *drachm* to the weight of their denarius, long before they were reduced into the form of a Roman province by Veſpaſian. When they did this is uncertain; but it appears by the treaty between the Romans and Antiochus, recorded by Polybius, Excerp. Leg. ſect. 35. and by Livy, lib. xxxviii. cap. 38. which ſtates the Euboic TALENT at eighty Roman pounds; and ſuppoſing this to be equal to the Attic, and to contain ſix thouſand Attic *drachms*, and eighty Roman pounds to contain ſix thouſand ſeven hundred and twenty *denarii*, that the weight of the Attic *drachm* muſt have been to that of the denarius as 6726 to 6000; and this proportion is confirmed by an anonymous Greek fragment, publiſhed by Montfaucon, which makes a hundred Attic *drachmæ* equal to a hundred and twelve *denarii*. Anal. Græc. p. 393. Pariſ. 1688.

Greaves concludes, after weighing a number of Attic *tetradrachms*, and ſtating the weight of the *tetradrachm* at two hundred and ſixty-eight grains, that the Attic *drachm* was ſixty-ſeven grains. J. Caſpar Eiſenſchmid, in his book De Pond. & Menſ. Vet. from an ancient *tetradrachm* weighing three hundred and thirty-three Paris grains, and by eſtimating the proportion between the Roman pound and Attic talent, mentioned by Livy, lib. xxxviii. makes the *drachm* 83¼ Paris grains, or almoſt 68¼ troy.

Mr. Raper has eſtimated the weight of the Attic *drachm*, by comparing it with the gold coins of Philip and Alexander, which were probably formed upon that ſtandard. They both coined gold of 4, 2, 1, and ½ an Attic *drachm*; and from a mean of twenty-one Philippics, which were equivalent to two *drachms*, preſerved in the Britiſh Muſeum, and in private collections, or mentioned by other writers, he infers, that the ſtandard weight of the Philippic was not leſs than 133 troy grains; which agrees

very nearly with the weights of some preserved silver *drachms* of Philip and Alexander, and with the mean weight of seven perfect silver *tetradrachms* of Alexander, which give a *drachm* a little more than 133½ grains. He observes, that the gold Philippics, both of Alexander and his father, are so correctly fized, and so perfect, that the mean *didrachm*, derived from them of 133 troy grains, muft be very near its juft weight; and its half, 66½ grains, that of the Attic *drachm*. Then, for the value of it, as fixty-two Englifh fhillings are coined out of eleven ounces two penny-weight troy, of fine filver, and eighteen penny-weight of allay, the troy grain of fine filver is worth $\frac{7}{12}$ths of a farthing; and fince the Greeks and Romans ufed no allay in their money, but efteemed what they coined to be fine filver, the Attic *drachm* of 66½ grains will be found worth a little more than 9¼*d.* or, for the eafe of reduction,

	£.	s.	d.
The Attic *drachm* may be ftated at	0	0	9.286
The *obolus* a little more than	0	0	1½
The *chalcus* about —	0	0	⅜ of a farthing
The *mina* —	3	17	4.6 or £3.869
The *talent* —	232	3	0 or £232.15

Phil. Tranf. vol. lxi. part ii. art 48.

Others eftimating the ancient Roman ounce equal to the modern one, or to 536 French grains and the Attic *drachma* at 67 grains, and fuppofing the filver at Athens of the fame fineneſs with ours, make it equal to 7 pence ½ ſterling. See COIN.

DRACHM, or DRAM, is alſo a weight uſed by our phyſicians containing juſt ſixty grains, or three ſcruples, or the eighth part of an ounce troy, and the ſixteenth of an ounce averdupois.

DRACHM was likewiſe an ancient Jewiſh money; having on one ſide a harp, and on the other ſide a bunch of grapes.

This coin was a half ſhekel; and was ſo called by the Jews. It is only the Greeks called it *Δραχμη*. It was equal to two Attic *drachmæ*. See SHEKEL.

DRACO, DRAGON, in *Aſtronomy*, a conſtellation of the northern hemiſphere; whoſe ſtars, according to Ptolemy, are 31; according to Tycho, 32; according to Hevelius, 40; according to Bayer, 33; and according to Mr. Flamſteed, 80. The longitudes, latitudes, magnitudes, &c. whereof, are as follow.

DRACO, DRAGON, in *Natural Hiſtory*, a fabulous animal, which has been repreſented under the form of a ſerpent with wings and feet. The ancients have given various deſcriptions of this animal, with reſpect to its ſize, ſhape, and colour, and have attributed many ill qualities to it, without foundation. Their accounts of it are very various and contradictory. They were probably led to the idea they formed of it by ſome extraordinary animals of the genus of ſerpents, lizards, or crocodiles, &c. which were ſingular either on account of their figure or ſize. See DRACO *Volans*.

DRACO, or DRAGON, in *Myſthology*, is the ſymbol of Janus, and alſo of Bacchus Beſſarus. *Dragons* are likewiſe employed to draw the chariot of Ceres; and a *dragon* keeps the garden of the Heſperides.

DRACO *Marinus*, in *Ichthyology*, the name of a fiſh of the TRACHINUS, kind, known in England by the name of the weever. It is a very long-bodied fiſh, ſomewhat flat, with a crooked belly, and ſtraight back; the mouth is large, and the lower jaw is longer than the upper. It has two fins on the back; the foremoſt of theſe is very ſhort, and the other very long. The foremoſt of theſe fins has ſeveral prickly points, tinged with black, and theſe are ſaid to inflict a ſort of poiſonous wound; the ſecond conſiſts of ſeveral ſoft rays; it commences juſt at the end of the firſt, and continues almoſt to the tail; the pectoral fins are broad and angular, and the ventral

ventral fins small. Its tail is but slightly forked, and is bluish in colour. The vent is placed very forward, very near the throat. The sides are marked lengthways with two or three dirty yellow lines, and transversely by a number of small ones: the belly of this fish is silvery; its flesh is delicate, and it grows in some seas to twelve, or even eighteen inches in length. The fishermen are much afraid of its pricking them, and always, as soon as they have caught it, cut off the back fin. This fish buries itself in the sands; and if trod on, strikes with great force. The wounds it gives are attended with pain and inflammation; sea-sand, or stale urine warmed, and rubbed on the place affected, is applied as a remedy; and when the wound has been dangerous, sweet oil has been applied, and opium and Venice treacle taken internally with success.

DRACO *Volans*, in *Natural History*, a name given by some people to one of the flying LIZARDS. But among *Meteorologists*, it is used for a fat, heterogeneous, earthy meteor, appearing long and sinous, something in the shape of a flying dragon.

This shape is supposed to arise from the hind part of the matter of this meteor being fired with greater impetuosity than what comes first out of the cloud, and it is supposed, that the broken parts of the cloud, and the sulphureous matter which adhere to them, form the apparent wings of this imaginary *dragon*.

This sort of exhalation is principally seen on the borders of rivers, and in marshy places, and seldom rises very high from the ground, but plays and dances about the surface in an agreeable manner; and if people go up to it, it will flick to their hands or cloaths without burning, or doing them any injury. They are more common in the summer months than in the winter, and are more frequently seen in thick weather than in clear.

DRACOCEPHALUM, in *Botany*. See DRAGON'S *Head*.

DRACONARIUS, in *Antiquity*, *Dragon-bearer*. Several nations, as the Persians, Parthians, Scythians, &c. bore dragons on their standards; whence the standards themselves were called *dracones*, *dragons*. The Romans borrowed the same custom from the Parthians, or, as Casaubon has it, from the Dacæ; or, as Codin, from the Assyrians.

The Roman *dracones* were figures of dragons painted in red on their flags; as appears from Ammianus Marcellinus; but among the Persians, and Parthians, they were like the Roman eagles, figures in full relievo; so that the Romans were frequently deceived, and took them for real dragons.

The soldier, who bore the dragon or standard, was called by the Romans *draconarius*: and by the Greeks δρακοφορος, and δρακοντοφορος; for the emperors carried the custom with them to Constantinople.

Pet. Diaconus, Chron. Casin. lib. iv. cap. 39. observes, that the bajuli, cerrofalarii, thurophori, aquiliferi, leoniferi, and draconarii, all marched before king Henry when he entered Rome.

DRACONIS, *caput*. See CAPUT and DRACON.

DRACONIS, *cauda*. See CAUDA.

DRACONIS, *sanguis*. See SANGUIS, and DRAGON.

DRACONIS, *venter*. See VENTER.

DRACONTEAS, a name given by Neophytus, and some others of the later Greek writers, to two plants distinguished by the epithets of the great and the little kinds. The great *dracontea* is the plant we call dragons, and the small *dracontea* is the arum. Neophytus says, that the roots of some species of the small *dracontea* were eatable, which we also know to be true at this time; for though with us the juice of this plant is fiery and corrosive, yet we know that there are eculent arums in other parts of the world. The Greek writers, from the earliest times we have accounts of, were not ignorant of this; and Theophrastus in particular has described an eculent-rooted arum under the name of arum colodinum.

DRACONTHEMA, a name used by some of the old writers in medicine for what we call *sanguis draconis*, or dragon's blood, a red vegetable resin.

DRACONTIA, or DRACONTIA *lapis*, in *Natural History*, a name given by authors to a roundish or oval pellucid stone, which seems no other than a crystal cut into that form, and polished by the savage inhabitants of several nations before the Roman conquests, and intended to be worn as ornaments. Authors tell a number of idle and fabulous stories about this stone, imagining it to be naturally of this figure and polish, and to be found in the head of a dragon. They are not indeed all agreed about the species of the stone; Ficinus describing an altroites under this name, and others some other coloured stone; but the generality of writers, especially the old ones, make it colourless and pellucid.

DRACONTIC *Month*, the space of time wherein the moon going from her ascending node, called *caput draconis*, returns to the same.

DRACONTIUM. The Greeks, from whom the botanical writers have taken this name, never used it singly as the denomination of a plant, but only as an adjective expressing some peculiarity in which that plant differed from some others of the same species. Thus the plant which we now call simply *dracontium*, was called by the Greeks *arum dracontium*, that is, the arum with stalks spotted like dragons or snakes-skins; and the plant we call dracunculus, or tarragon, had the same epithet from its fiery heat. See DRAGONS.

DRACUNCULI, in *Medicine*, a name used by authors for a sort of long and slender worms, which breed in the muscular flesh of the arms, legs, &c. and from their being more frequent in some parts of Guinea than elsewhere, are called by many Guinea-worms. They have been long known in the world: and Plutarch quotes Agatharcides for an account of these animals, which, he says, the people about the Red-sea were at a certain time very much afflicted with. It is more particularly a disease in children, wherein they feel a vehement itching; supposed to arise from these worms, called *draunculi*, generated of a vitiated humour under the skin, about the back, shoulders, and arms.

Children seized with the *draunculi* become feeble, and scarce receive any nourishment at all, though they eat plentifully. The disease, however, is not so peculiar to children, but that grown persons have been sometimes affected with it. The emperor Henry V. is said to have died of it; having had it from his birth.

The women in Poland cure their children of the *draunculi*, after the following manner: the child is washed, and bathed in warm water, wherein a quantity of crumbled bread, and a handful of ashes have been cast. The water being poured off, and the bread gathered into a mass; when they come to break it again the next day, they find in it an infinite quantity of fine hairs, which some call *dogs hairs*, and others, *worms*; and it is those hairs, or worms, which are supposed to be the cause of the disease.

After thus bathing the children, they rub their shoulders and arms with flour steeped in vinegar, or honey; upon which immediately there rises on the skin a great number of tubercles, like poppy-seed; supposed to be the heads of worms. These they scrape off as fast as they appear; otherwise they withdraw beneath the skin again. The operation is repeated till such time as no more tubercles arise.

The *draunculi* is a disease little known in England. The editors of the Leipsic Acts, speaking of it, in the tome for the month of October, 1682, call the bodies, which put forth at the pores after bathing, thick hairs, *corpuscula pilorum crassiorum instar duplo & ampliora*, and not fine slender hairs, as Degorti calls them. They add, that these little corpuscles are better called CRITHIDES; and by reason of their devouring the food, which should nourish the children, COMEDONES. Velschius, in a curious dissertation on the subject, calls them *capillary worms: exeritatis de vermibus capillaribus infantum*.

As to the nature and figure of these little bodies, the same editors observe, that the microscopes have put it past doubt, that they are real living animals, of an ash-colour, having two long horns, two large round eyes, and a long tail, terminated with a tuft of hair; but that it is difficult to draw them out whole, by scraping the child's body; because, being very soft, the least rubbing bruises them, and breaks them.

They are no where so frequent as on the Gold-coast in Guinea about Annamaboe and Cormantyn. The worm is white, round, long, and uniform, very much resembling a piece of white round tape or bobbin. It is lodged between the interstices of the membranes and muscles, where it insinuates itself to a prodigious length, sometimes exceeding five ells. It occasions no great pain in the beginning; but when it is about to shew its head, a swelling and inflammation appear on the part, which is usually the ankle, or some part of the leg or thigh.

The countries where this creature is thus produced are very hot, and subject to great droughts, and the inhabitants make use of stagnating and corrupted water, in which it is probable the ova of these animals lie: the white people and negroes, who drink this water, are equally subject to these worms.

The surgeons seldom attempt to extract this worm by incision; but when the tumor appears, they endeavour to bring it to a suppuration as soon as they can; and when they have broke the swelling, and the head of the worm appears, they fasten it to a stick, and continue gradually winding it round at the rate of an inch or two in a day, till they by this means, have wound it all out. If it be wound too hastily, it is apt to break in the operation; and if it does the end is not easily recovered again; and if not, there are abscesses formed, not only at the place where it breaks, but all along the whole winding of the

muſcles where the dead worm remains; ſo that often from one worm thus broken, there are produced a number of obſtinate ulcers in different parts. When the worm has not been broken, the ulcer out of which it was extracted heals eaſily, and there is no farther trouble about it. Town's Diſeaſes of the Weſt Indies, p. 561.

The daily uſe of aloes, or of any other anthelmintic medicine, is proper, during the extraction of the worm, in order to facilitate its diſcharge. See CHÆTIA.

DRACUNCULUS, in *Ichthyology*, the name of a ſea-fiſh, called by Bellonius and Geſner, a kind of the exocœtus. It is a ſmall fiſh, about a hand's breadth long, and ſometimes a little larger. It is of a long and rounded body, and of a dead greeniſh or olive colour on the back, and white on the belly, and is marked on the ſides with a great number of bluiſh, white, and very light ſmall ſpots. On the upper part of the head, which is large, and flat at the top, below the eyes, it has a purpliſh triangular ſpot; the eyes are large, and ſo placed in the upper part of the head, as to look upwards, whence it has been ranked among the URANOSCOPI; the mouth wide, and furniſhed with ſmall teeth; and the upper-jaw is longer than the under. The apertures of the gills are cloſed, on the end of the bones that cover them is a very ſingular trifurcated ſpine. This fiſh has two pair of fins on the belly, and two fins on the back, ſituated in a kind of furrow, the tail is long and rounded, and conſiſts of ten rays. It is common in the Mediterranean, and other ſeas, and is brought to market among other ſmall fiſh at Rome, and in other places. In the Linnæan ſyſtem it is a ſpecies of the CALLIONYMUS. See *Tab. II. of Fiſh*, N° 10.

DRACUNCULUS, in *Botany*. See DRAGON.

DRAFF, a name given in ſome places to the waſh given to hogs; and the grains given to cows.

DRAG, in *Building*. A door is ſaid to *drag*, when in opening or ſhutting it hangs, or grates upon the floor.

DRAG-*ropes*. See ROPES.

DRAG, in *Sea-Language*, is a machine, conſiſting of a ſharp, ſquare, iron ring, encircled with a net, and commonly uſed to take the wheel off from the platform or bottom of the decks.

DRAGGING *the anchor*. See ANCHOR.

DRAGMA, in *Pharmacy*, a name uſed by the ancients for a handful of any herb or other medicine.

DRAGMIS, in *Pharmacy*, a word uſed by the ancients to ſignify a pugil, or as much of any thing as can be taken up at a pinch, between the thumb and two fingers.

DRAGOMAN, or DROGMAN, a term of general uſe through the Eaſt, for an interpreter, whoſe office is to facilitate commerce between the orientals and occidentals. Theſe are kept by the ambaſſadors of Chriſtian nations reſiding at the Porte, for this purpoſe.

The word is formed from the Arabic *turgeman*, or *turgiman*, of the verb *taragem*, *he has interpreted*. From *dragoman*, the Italians formed *drogmano*, and with a nearer relation to its Arabic etymology, *turcimanno*; whence the French, and our *truchman*, as well as *drogoman*, and *drogmen*.

DRAGON, in *Aſtronomy*. See DRACO.

Dragon's head, and tail, caput & cauda draconis, are the nodes of the planets; or the two points, wherein the ecliptic is interſected by the orbits of the planets, and particularly that of the moon; making with it angles of five degrees and eighteen minutes.

One of theſe points looks northward; the moon beginning then to have northward latitude, and the other ſouthward; where ſhe commences ſouth.

This her deviation from the ecliptic ſeems (according to the fancy of ſome) to make a figure like to that of a *dragon*, whoſe belly is where ſhe has the greateſt latitude; the interſection repreſenting the head and tail, from which reſemblance the denomination ariſes.

But note, that theſe points abide not always in one place, but have a motion of their own in the zodiac, and retrograde-wiſe, 3 minutes 11 ſeconds per day; completing their circle in 18 years 225 days; ſo that the moon can be but twice in the ecliptic, during her monthly period; but at all other times ſhe will have a latitude, or declination from the ecliptic.

It is about theſe points of interſection that all eclipſes happen.

They are uſually denoted by theſe characters, ☊ *dragon's* head, and ☋ *dragon's tail*.

DRAGON-*beam*, in *Architecture*, are two ſtrong braces or ſtruts, which ſtand under a breaſt-ſummer, and meet in an angle on the ſhoulder of the king-piece.

DRAGON's *blood, ſanguis draconis*, in *Medicine*, a reſinous ſubſtance brought from the Eaſt, in oval drops, wrapped up in flag-leaves, of conſiderable uſe, as an agglutinant and deſiccative, againſt fluxes, both alvine and uterine, and ulcerations internal and external, &c.

It derives its name *dragon's blood* from the redneſs of its colour, and gives its name *dragon* to the tree that yields it. Some botaniſts talk of the figure of a *dragon*, finely repreſented under the rind of the fruit of that tree. But this is a mere fiction.

The genuine *dragon's blood* is the juice, or reſin, of a large tree, called *draco arbor*, the *dragon-tree*, reſembling the palm, growing in Africa, and America, as well as in China. The reſin is of a dark red, and in ſubſtance of no diſcernible ſmell or taſte, and eaſily diſſolves when brought towards the fire; if caſt into the fire, it flames; but it diſſolves with much difficulty in any watery liquor. It is ſoluble by the aſſiſtance of heat in rectified ſpirit, and in expreſſed oils, to which it communicates a deep red colour.

It is a good aſtringent; and is uſed in hæmorrhages and dyſenteries; as alſo to faſten the teeth, and ſtrengthen the gums. A ſolution of *dragon's blood* in ſpirit of wine is uſed for ſtaining marble, to which it gives a red tinge, which penetrates more or leſs deeply, according to the heat of the marble during application. But for fine deſigns, the marble ſhould be cold, becauſe it ſpreads while it ſinks. Mr. Du Fay ſays, that by adding pitch to this ſolution, the colour may be rendered deeper.

There is alſo a counterfeit *dragon's blood*, made of the gum of the cherry, or almond-tree, diſſolved, and boiled in a tincture of Brazil wood; but this is of no uſe, except for external diſeaſes of horſes. Theſe adulterated reſins are diſtinguiſhed from the true by their diſſolving in water, and crackling in the fire without burning.

DRAGON *revived, Knights of*, an order of knighthood inſtituted by the emperor Sigiſmund, about the year 1418, after the council of Conſtance, in memory of the condemnation of John Huſs and Jerome of Prague. This order, which once flouriſhed in Germany and Italy, is now extinct.

DRAGON-*fly, Libella*, or *Libellula*, in *Natural Hiſtory*, the name of a very large genus of four-winged flies, called by us *adder-flies*, and *dragon-flies*. They belong to the order of *neuroptera* in the Linnæan ſyſtem; they are characterized by having jaws, by antennæ ſhorter than the thorax, by extended wings, and by the male's tail being terminated by a hooked kind of forceps. See FLY. *Fish, of Inſects, fig.* 1.

Theſe flies have all two very large and reticulated eyes, covering the whole ſurface of the head, which are a beautiful object for the microſcope. They fly very ſwiftly, and prey upon the wing, being of great uſe to mankind, in clearing the air of innumerable little flies.

They are produced of ſeveral ſpecies of ſix-legged worms living in the waters, and figured by Mouffet, and other authors, under the name of *pulices* and *locuſtæ aquaticæ*. Mr. Ray deſcribes twenty-three ſpecies of theſe flies.

Moſt of theſe ſpecies are found in Auguſt and September, in our fields and gardens, eſpecially near places where there are waters, as they have their origin from worms living in that element. The great ones uſually live all their time about waters, but the ſmaller are common among hedges, and the ſmalleſt of all are moſt frequent in gardens. The ſmaller kinds often ſettle upon buſhes or upon the ground; but the large ones are almoſt always upon the wing, ſo that it is very difficult to take them. Ray's Hiſt. Inſect. p. 50.

The manner of this inſects coupling with the female is a thing that has attracted the obſervation and admiration of multitudes, as they are frequently ſeen, in the hotter months, in that ſtate, flying together about the edges of waters.

Mr. Homberg, of the Academy of Paris, has taken great pains to inform the world of the whole ſecret of this ſtrange colzus, and of ſeveral other remarable particulars in regard to the creature. The part to which the wings are fixed is called the breaſt in animals of this kind; but in this creature the lungs are not ſituated there, but in the middle of the belly, which is ſeen continually riſing and falling at inſpiration and expiration. The laſt joint of the body of the male is a ring containing the anus, and this is furniſhed with two pair of hooks; the one pair outward and larger, the other inward and ſmaller: theſe the creature is able to open and ſhut as lobſters do their claws. The extremity of the belly of the female ſeems to conſiſt of two tubes, or pipes, one placed upon the other; the upper one is the anus, at which it voids its excrements; the under one is the female part of generation, and the entrance to the womb of the animal. When the male of this ſpecies finds the female ſitting upon a leaf, or ſtick, he ſeizes her as ſhe flies, taking faſt hold of her with the hooks at the anus by the neck, or that part which joins the head to the breaſt, and immediately flies away with her, holding her fixed by the neck to the end of his tail.

The male does not carry his bride far before he ſettles himſelf upon ſome plant, and raiſes his tail ſo, that the female may be brought to ſit eaſily under him upon the ſame plant. As ſoon as the female is thus ſeated, ſhe

turns

turns up her tail, and brings it between the legs of the male, then places it to a certain part of the breaſt of the male, in which are the organs of generation in that ſex. All this while the male keeps his hold of her neck with his forceps, or hooks. They uſually remain in this poſture about three minutes; and after that the male gently raiſing up his breaſt, they become ſeparated, and leaving the hold he had on her neck, at the ſame time, he flies away as he pleaſes. The female uſually remains on the place for half a quarter of an hour, and then ſhe flies away alſo. Mr. Homberg having obſerved the coupling of theſe animals thus far, was determined to examine the organs uſed in it by diſſection. To this purpoſe he caught ſeveral of them, and on the whole collected ſeveral curious obſervations, which may be ſeen in Mem. Acad. Par. 1699.

DRAGON, *gum*. See TRAGACANTH.

DRAGON's *Head*, *Dracocephalum*, in *Botany*, a genus of the *didynamia gymnoſpermia* claſs. Its characters are theſe: the flower has one cingent petal, with large, oblong, inflated chops; the upper lip is obtuſe and arched, the under trifid. It has four ſtamina, two ſhorter than the other; and a four-parted germen, which becomes four oval, oblong ſeeds, incloſed in the empalement. Linnæus enumerates thirteen, and Miller eight ſpecies, one of which is the balm of Gilead; they all require little culture, except keeping clear from weeds.

DRAGON-*ſhell*, in *Natural Hiſtory*, a name given by people, curious in ſhells, to a ſpecies of concamerated patella or limpet. This has a top very much bent, and is of an aſh-colour on the outſide, but of an elegant and bright fleſh-colour within. This has been found ſticking on the back of a tortoiſe, as the common limpets do on the ſides of rocks; and ſome have been found affixed to large ſhells of the pinna marina, brought from the Eaſt Indies at different times.

DRAGON, *Sea*. See DRACO *Marinus*.

DRAGON, *ſnap*. See SNAP *Dragon*.

DRAGON's, *Dracontium*, in *Botany*, a genus of the *gynandria polyandria* claſs. Its characters are theſe: it hath a cloſe cylindrical ſpadix, and a boat-ſhaped ſheath; the flowers have no empalement, but have five oval concave petals. They have an oval germen, which afterward becomes a roundiſh berry, including ſeveral ſeeds. There are five ſpecies.

All the ſpecies are propagated by parting their knobby roots, which when they have ſtood undiſturbed for three years, will afford a great number of off-ſets. Theſe are to be taken off and planted in autumn, ſoon after the green leaves decay; for if they are removed after they have taken freſh root, and begun to ſhoot, they ſeldom produce flowers the ſucceeding ſummer; or if they do, they are very weak; they will thrive in almoſt any ſoil and ſituation.

Dragons are accounted a good alexipharmic, and uſeful in malignant contagious diſtempers, and peſtilential fevers; and, as the vulgar phraſe it, to drive any thing from the heart. Wherefore it is given in medicines to drive out the ſmall-pox and meaſles, and to cauſe ſweat. Miller's Bot. Off.

They have much the ſame medical virtues with the ARUM, or WAKE-*robin*.

DRAGON-*tree*. See PALM-*tree*.

DRAGON, *wild*, and *wort*. See SOUTHERNWOOD, and MUGWORT.

DRAGONET, in *Ichthyology*, a name given by Pennant to the DRACUNCULUS.

DRAGONNEE, in *Heraldry*. A *lion dragonnee*, is where the upper half reſembles a *lion*; the other half going off like the hind part of a *dragon*.

The like may be ſaid of any other beaſt as well as the lion.

DRAGOON, in *Ornithology*, the name of a ſmall kind of CARRIER-*pigeon*, called *columba tabellaria minima* by Moore. It is a baſtard-breed between the two ſpecies of pigeons called the *horſeman* and the *tumbler*. They are very good breeders, and as they are lighter than the horſeman, they are ſuppoſed more expeditious in flight for a few miles, but the horſeman outdoes them at greater lengths. One of theſe pigeons flew from St. Edmundſbury to London, being a diſtance of ſeventy-two miles, in two hours and a half.

DRAGOONS, in *War*, an order of ſoldiery, who march on horſeback, and fight on foot, though ſometimes, too, on horſeback.

Menage derives the word *dragoon* from the Latin *draconarius*, which in Vegetius is uſed to ſignify ſoldier. But it is more probably derived from the German *tragen*, or *draghen*, which ſignifies *to carry*; as being infantry carried on horſeback.

They are divided into brigades, and each regiment into troops. They encamp generally on the wings of an army, and ſometimes they cover the general's quarters.

The firſt regiment of *dragoons* raiſed in England, was in 1681, and called the regiment of *dragoons* of North Britain. In battle, or attacks, they generally fight ſword in hand after the firſt fire. In the French army they are ſaid to ride without boots.

Their arms are, a ſword, firelock, and bayonet. In the French ſervice, when the *dragoons* march on foot, their officers bear the pike, and the ſerjeants the halbert; neither of which are uſed in the Engliſh ſervice.

DRAGS, in the *Sea-Language*, is uſed for whatever hangs over the ſhip in the ſea, as thirts, coats, or the like; and boats when towed, or whatever elſe that, after this manner, may hinder the ſhip's way when ſhe ſails.

DRAIN, or DREIN, in the *Military Art*, a trench made to draw the water out of a moat, which is afterward filled with hurdles and earth, or with *faſcines*, or bundles of ruſhes and planks, to facilitate the paſſage over the mud. See TRENCHES.

DRAINS, a name given in the fen-countries to certain large cuts or ditches, of twenty, thirty, nay ſometimes forty feet wide, carried through the marſhy ground to ſome river, or other place capable of diſcharging the water they carry out of the fen-lands. Moſt of theſe *drains* are made in our fen-countries by a body of men called the *undertakers*, whoſe reward is one third of the ground they *drain*. They alſo erect ſluices at a great expence, often not leſs than two thouſand pounds each. Yet theſe, with all the care they employ in erecting them, are ſubject to be blown up by the vaſt weight of water that lies upon them when the lands are overflown. Some of theſe ſluices have two or more pair of doors, of ſix, eight, or ten feet high, which ſhut when the water in the river is higher than in the *drains*, by the weight and force of it; and ſo *e contra*, throw out a body of eight feet ſquare of water for about ſix or ſeven hours during the ebb. The real uſe of theſe *drains* is very evident from the preſent ſtate of the land where they are cut, and that of it before. In Camden's time all this was bog, and now it is all firm land. The country about Crowland was in that author's time ſo ſoft, that it was not paſſable by carriages; and thus grew a witticiſm upon it, that all the carts that entered this town were caſed on the wheels with ſilver; but this is now ſo firm ground, that carriages of any kind paſs over it. The duck-ponds uſed to be called the ſen corn-fields, and they now are ſuch in reality, their bottoms being dry, and producing oats, and rape-ſeed, or cole-ſeed, with great increaſe. Phil. Tranſ. N° 227.

Drains are alſo more generally uſed to carry off the ſuperfluous moiſture from wet and marſhy lands. For this purpoſe a deep *drain* muſt be cut in the loweſt part, ſo as to reach the bed, whether of gravel or ſand, through which the water flows; and ſmaller *drains* ſhould be made from this ditch to thoſe places which appear to be the heads of ſprings; and theſe ſhould be left open for ſome time, till the quantity of moiſture abates; they ſhould then be filled up about Michaelmas with ſtones, and over theſe heath, broom, or ſtraw, or with faggots made of the branches of trees. A ſoot depth of mould over the *drain* will be ſufficient in paſture-ground; and at leaſt a foot and a half in ploughed lands. But if the quantity of water to be diſcharged is conſiderable, the main *drain* ſhould either be left open, or made very deep and wide, and filled with ſtones. See BOG.

It may be neceſſary, in many caſes, and has proved very uſeful, to flag the bottom, and to line the ſides of the *drains* with tiles, brick, or ſtone, to keep the earth from falling in, and to preſerve a free paſſage for the water. The clay which is dug out of theſe *drains* may be converted, either by burning, or laying up in heaps with quicklime, into an excellent manure, either for corn or graſs land, where it is moſt wanted.

When the ground in which the ſprings are, lies on a gentle declivity, Mr. Tull adviſes to plough it in an horizontal direction, by which means each furrow catches off the water, which would otherwiſe ſink into the next ridge. See DRAIN.

DRAINING *Plough*. See PLOUGH.

DRAM. See DRACHM.

DRAMS. See CORDIALS.

DRAMA, in *Poetry*, a piece, or poem, compoſed for the ſtage.

The word is Greek, *δρᾶμα*, which literally ſignifies *actions*; becauſe in *dramas*, or dramatic poems, they act, or repreſent *actions*, as if they really paſſed.

A *drama*, or as we popularly call it, a *play*, is a compoſition either in proſe or verſe, conſiſting, not in the ſimple recitation, but in the actual repreſentation of an action.

Our *dramas* are, TRAGEDIES, COMEDIES, OPERAS, and FARCES.

Some critics take the book of Canticles for a *drama*, or *dramatic poem*; others maintain the ſame of the book of Job. Some ſcrupulous authors would reſtrain *drama* to

serious pieces, as tragedies; but with respect to the etymology, a comedy is as much a *drama*, as a tragedy.

The primary parts of the *drama*, as divided by the ancients, are the *protasis*, *epitasis*, *catastasis*, and *catastrophe*. The secondary parts are, the *acts* and *scenes*. The accessary parts are, the *argument* or *summary*, the *prologue*, *chorus*, *mimus*, *satura*, and *atellana*. Lastly the *epilogue*, which pointed out the use of the piece, or conveyed some other notice to the audience in the poet's name.

DRAMATIC, in *Poetry*, is an epithet given to pieces written for the stage.

For the laws of *dramatic* poetry, see UNITY, ACTION, CHARACTER, FABLE, &c.

Style DRAMATICO. See STYLE.

DRANK, a name given by our farmers to the great wild oats. These are often very troublesome to the ploughed lands, especially after wet seasons and much frost. Many to destroy this weed sow the land with black oats, which being ripe much sooner than the seeds of this plant, are cut down before it can sow itself for another year; especially if they are cut a little the earlier, which will do them no harm, if they be suffered to lie a while upon the ground afterwards, for the grain to swell before they are carried in. But, in general, when ploughed lands begin to run to these weeds and thistles, it is a token to the farmer that it is time to fallow them, or else to sow them with hay-seed, and make pastures of them. The sowing beans upon a land subject to these weeds is also a good method, because the farmer may feed in his sheep when they are about three inches high, which will eat up the *drank*, and all the other weeds, and will not hurt the beans. The general method is to put twenty sheep to an acre; but they must be put in only in dry weather, and not left too long.

DRAPERY, in *Painting* and *Sculpture*, the representation of the garments, or cloathing of human figures.

The word is French, *draperie*, formed from *drap*, *cloth*.

In the general sense, *drapery* includes not only the garments, but also the tapestry, linens, and most other things that are not carnations, nor landscapes.

The art of *drapery* consists chiefly in three points, viz. the ordering of the folds, or plaits; the different quality of the stuffs; and the variety of their colours.

As to the folds, they should be so managed, that you may easily perceive what it is that they cover, and distinguish it from any thing else. For instance, that you see it is an arm that is under the *drapery*, and not a leg, &c. The folds, again, must be large, as breaking and dividing the light the less. There should likewise be a contrast between them, otherwise the *drapery* will appear stiff.

The quality of the stuffs should likewise be well considered; some make their folds abrupt, and harsh; and others more soft and easy. The surface of some, again, has a lustre; others are dull; some are fine, and transparent; others strong, and solid.

The variety of colours, when well managed, makes the great beauty of a painting; all being not equally amicable, and friendly, with respect to each other; and some are never to be placed near certain others.

M. de Piles gives abundance of good observations relating to *drapery*. "Their first effect, he observes, and that which the painter ought to have principally in view, is, that they express the thing they are supposed to cover; and they must never be made to adhere, and stick to the parts of the body; a great lightness, and motion of the *drapery*, are only proper for figures in great agitation, or exposed to the wind. The nudities of the figures should always be designed, before the painter proceed to the *draperies*. Titian, Paul Veronese, and Vandyke, excelled in *draperies*.

DRASTIC, from δραω, *I act*, a strong and powerful medicine; more particularly, a purgative that works with speed and vigour; as jalap, scammony, and the other stronger cathartics.

DRAUGHT, in *Medicine*. See POTION.

DRAUGHT, in *Trade*, is an allowance made in the weight of commodities; the same as CLOGH.

DRAUGHT is also used sometimes for a bill of exchange, and commonly for an order for the payment of any sum of money due, &c. Then the person who gives the order is said to *draw* upon the other.

DRAUGHT, in *Painting*, &c. See DESIGN.

DRAUGHT, or, as it is pronounced, DRAFT, in *Architecture*, the figure of an intended building described on paper; wherein are laid down, by scale and compass, the several divisions and partitions of the apartments, rooms, doors, passages, conveniencies, &c. in their due proportion.

It is usual, and even exceedingly convenient, before a building is begun to be raised, to have *draughts* of the ichnography, or ground-plot of each floor, or story; as also of the form and fashion of each front, with the windows, doors, ornaments, &c. in an orthography, or upright.

Sometimes the several fronts, &c. are taken, and represented in the same *draught*, to shew the effect of the whole building: this is called a *scenography*, or *perspective*. See SCENOGRAPHY.

DRAUGHT, *reduction of a*. See REDUCTION, and PENTAGRAPH.

DRAUGHT-*compasses*, those provided with several moveable points, to draw fine *draughts* in architecture, &c. See COMPASS.

DRAUGHT-*hooks*, are large hooks of iron fixed on the cheeks of a cannon carriage, two on each side, one near the trunnion-hole, and the other at the train, and are called the fore and hind *draught-hooks*. Large guns have *draught-hooks* near the middle transom, to which are fixed the chains, which serve to ease the shafts of the limbers on a march. The fore and hind-hooks are used for drawing a gun backwards or forwards by men with strong ropes, called *draughts*, or *drag-ropes*, fixed to these hooks.

DRAUGHT-*horse*. See HORSE.

DRAW. A ship is said to *draw so* much water, according to the number of feet she sinks into it.

Thus, if fifteen feet from the bottom of her be under water, or if she sink into the water fifteen feet perpendicularly, she is said to *draw* fifteen feet water; and according as she *draws* more, or less, she is said to be of more, or less *draught*; and that this may be more readily known, the feet are marked on the fore- and stern-post regularly from the keel upwards. DRAWING denotes also the state of the sail, when it is inflated with the wind, so as to advance the vessel in her course.

DRAW, in the *Forest Law*. See DOG-*draw*.

DRAW-*back*, in *Commerce*, a rebate, or discount, upon the price of commodities purchased on certain conditions. See REBATE, and DISCOUNT.

Draw-back is more particularly used to denote certain duties, either of the customs or of the excise, that are allowed upon the exportation of some of our own manufactures, or upon certain foreign commodities that have paid a duty at importation.

The oaths of the merchants importing or exporting are required, to obtain the *draw-back* of foreign goods, affirming the truth of the officer's certificate of the entry, and the due payment of the duties; and these may be made by the agent or husband of any corporation or company, or by the known servant of any merchant, usually employed in making his entries, and paying his customs. 2 and 3 Ann. cap. 9. With respect to foreign goods entered outwards, if less in quantity or value be fraudulently shipped out than is expressed in the exporter's certificate, the goods therein mentioned, or their value, are forfeited, and no *draw-back* is to be allowed for the same. Foreign goods exported by certificate, in order to obtain the *draw-back*, not shipped or exported, or re-landed in Great-Britain, unless in case of distress, to save them from perishing, which must be immediately signified to the officers of the customs, are to lose the benefit of the *draw-back*, and are forfeited, or their value, with the vessels, horses, carriages, &c employed in the reloading of them; and the persons concerned in re-landing them, or by whose privity they are re-landed, or into whose hands they shall knowingly come, are to forfeit double the amount of the *draw-back*. 13 and 14 Car II. cap. 11. 8 Ann. cap. 13. This is to be paid for within five years after the offence. And the seizure of the horses, &c. may be adjusted by two or more justices of the peace. 6 Geo. I. cap. 21. 8 Geo. I. cap. 18. and 11 Geo. I. cap. 29. Officers of the customs conniving at, or assisting in any fraud relative to certificate goods, beside other penalties, are to forfeit their office, and to suffer six months imprisonment, without bail or mainprize; as are also masters or persons belonging to the ships employed in this business. 8 Ann. cap. 13. Bonds given for the exportation of certificate goods to Ireland must not be delivered up, nor *draw-back* allowed for any goods, till a certificate under the hands and seals of the comptroller, or collector, &c. of the customs of some port in Ireland be produced, testifying the landing, which certificate must be produced in six months from the date of the bond. 8 Ann. cap. 13. 9 Geo. I. cap. 11. 9 Geo. I. cap. 8. 2 Geo. II. cap. 28. See CUSTOMS, DEBENTURES, DUTIES, &c.

DRAW-*bridge*, a bridge made after the manner of a floor, to be drawn up, or let down, as occasion serves, before the gate of a town or castle. See BRIDGE.

DRAW-*gear*, in *Husbandry*, any kind of harness for drawing a waggon or other carriage.

DRAW-*net*, a kind of net for taking the larger sort of wild fowl, which ought to be made of the best packthread, with wide meshes: they should be about two fathoms deep, and six long, verged on each side with a very strong cord, and stretched at each end on long poles.

It ſhould be ſpread ſmooth and flat upon the ground, and ſtrewed over with ſedge, graſs, or the like, to hide it from the fowl; and the ſportſman is to place himſelf in ſome ſhelter of graſs, furn, or ſome ſuch thing.

DRAWER *of a bill of exchange*, &c. the perſon who draws the bill upon his correſpondent. See BILL, and EXCHANGE.

DRAWING *a coſt*, among *Builders*. See BOWLING.

DRAWING *medicines*, or DRAWERS. See EPISPASTIC, and RIPENERS.

DRAWING, *teeth*. See TOOTH-*drawing*.

DRAWING *of gold*, or *ſilver*, is the paſſing of it through a number of holes in an iron, each leſs than another, to bring it into a wire. See WIRE-*drawing*, and DUCTILITY.

DRAWING *of a bill of exchange*, is the writing, ſigning, and giving it to the perſon, who has already paid the value, or content thereof, to receive it in another place.

A perſon ſhould never *draw* a bill of exchange, unleſs he be well aſſured it will be accepted, and paid. See BILL *of Exchange*.

DRAWING, in *Painting*, &c. See DESIGNING, and COUNTER-DRAWING.

DRAWING, among *Hunters*, is, when they beat the buſhes after a fox.

DRAWING *amiſs* is, when the hounds, or beagles, hit the ſcent of their chace the contrary way, ſo as to purſue it up the wind, when they ſhould have done it down the wind.

DRAWING *on the ſcent* is, when the hounds touch the ſcent, and *draw* on, till they rouſe, or put up the chace.

DRAWING, *fine*. See FINE-*drawing*.

DRAY, a name given by ſportſmen to ſquirrel neſts, built on the tops of trees. See SQUIRREL.

DRAY is alſo a cart uſed by brewers to carry beer on; likewiſe a ſledge without wheels.

DRAY-*plough*. See PLOUGH.

DREAMS. According to Wolfius *every dream* takes its riſe from ſome ſenſation, and is continued by the ſucceſſion of phantaſms in the mind. His reaſons are, that when we *dream* we imagine ſomething, or the mind produces phantaſms; but no phantaſm can ariſe in the mind, without a previous ſenſation: hence neither can a *dream* ariſe without ſome previous ſenſation. He obſerves farther, that though it be certain *à priori*, from the nature of the imagination, that *dreams* muſt begin by ſome ſenſation, yet that it is not eaſy to confirm this by experience; it being often difficult to diſtinguiſh thoſe ſlight ſenſations, which give riſe to *dreams*, from phantaſms, or objects of imagination. Yet this is not impoſſible in ſome caſes, as when the weak ſenſation ſufficient to give riſe to a *dream* gradually becomes ſtronger, ſo as to put an end to it, as it often happens in uneaſy and painful ſenſations. Wolf. Pſychol. Empir. § 123.

The ſeries of phantaſms, or objects of imagination, which conſtitute a *dream*, ſeem to be ſufficiently accounted for, from the law of imagination, or of aſſociation; though it may be extremely difficult to aſſign the cauſe of every minute difference, not only in different ſubjects, but in the ſame, at different times, and in different circumſtances. We have an eſſay on this ſubject by M. Formey, in the Mem. de l'Acad. de Berlin. tom. ii. p. 316. He expreſſly adopts Wolfius' propoſition above mentioned, that every *dream* begins with a ſenſation, and is continued by a ſeries of acts of imagination, or of phantaſms; and that the cauſe of this ſeries is to be found in the law of the imagination. *Si naturale ſomnium eſt, initium capere debet per legem ſenſationis, & continuari per legem imaginationis.* Hence he concludes thoſe *dreams* to be ſupernatural, which either do not begin by ſenſation, or are not continued by the law of the imagination.

This opinion is as ancient as Ariſtotle, who expreſly aſſerted, that a *dream* is only the φαντασμα, or *appearance* of things, ariſing from the previous motions excited in the brain, and remaining after the objects are removed. Hobbes has adopted this hypotheſis: he aſcribes different *dreams* to different diſtempers of the body, and whimſically enough obſerves, that lying cold breedeth *dreams* of fear, and raiſeth the thought and image of ſome fearful object. Thus he accounts for that which was in reality the waking viſion of Bruttus, which addreſſed him the night before the battle of Philippi. "I am, Brutus, "thine evil genius; but thou ſhalt ſee me again near "Philippi." And Mr. Locke, though he does not expreſly declare how *dreams* are excited during ſleep, ſeems to aſcribe the perfection of rational thinking to the body; and traces their origin to previous ſenſations, when he ſays, "The *dreams* of ſleeping men are all made up of "the waking man's ideas, though for the moſt part "oddly put together." He urges the incoherence, frivolouſneſs and abſurdity, of many of our *dreams*, as well as the ſuppoſed fact that ſome ſleep without *dreaming*, as objections to the notion that men think always: to which it has been replied, that *dreams* may be entirely, imperfectly, or not at all remembered, according to the various degrees in which the nerves are impreſſed by the motion given to the animal ſpirits in ſleep. Ariſt. de Inſomn. cap. 3. Hobb. Lev. cap. 2. & cap. 45. Locke. Eſſ. book ii. ch. i. § 10, &c. Watt's Eſſ. § 2. p 120, &c. Dr Hartley explains all the phenomena of the imagination by his theory of vibrations and aſſociations. *Dreams*, he ſays, are nothing but the imaginations or reveries of ſleeping men, and they are deducible from three cauſes, viz. the impreſſions and ideas lately received, and particularly thoſe of the preceding day, the ſtate of the body, and particularly of the ſtomach and brain, and aſſociations. Obſ. on Man, vol. i. § 5. p. 383, &c.

Democritus and Lucretius account for *dreams*, by ſuppoſing that ſpectres and *ſimulacra* of corporeal things, conſtantly emitted from them, and floating up and down in the air, come and aſſault the ſoul in ſleep. Lucret. De Rer. Nat. lib. iv.

Thoſe who have maintained the eſſential difference between ſoul and body have aſſeted the common phenomena of *dreams* by the union of theſe two ſubſtances, and the neceſſary connection ariſing thence between ideas in the mind, and certain motions in the body, or in thoſe parts more immediately united to the ſoul; whilſt others, who have denied the exiſtence of matter, account for them in the ſame manner as for our other ideas, which may not be improperly called *waking dreams*.

A learned author has not long ſince aſſerted, that our *dreams* are prompted by ſeparate immaterial beings; an opinion which was advanced long ago by the heathens, and maintained very generally, and applied to a ſpecies of DIVINATION. He contends, that the phantaſm, or what is properly called the viſion, is not the work of the ſoul itſelf, and that it cannot be the effect of mechanical cauſes; and therefore aſcribes it to ſeparate ſpirits, having acceſs to our minds, and furniſhing us with ideas while we ſleep. See Mr. Baxter's Eſſay on the Phen. of Dreaming, in his Enquiry into the Nature of the human Soul, vol. ii. 3d edit. 1745.

The phyſicians who have accurately examined the ſtate of their patients in every particular circumſtance, have not omitted, at times, to enquire into their *dreams* in thoſe hours of ſleep which their ill ſtate allows them, and partly from experience, partly from reaſon and analogy, have found, that there are many preſages of diſeaſes to come, and many indications of ſuch as are preſent, but unperceived, at leaſt not ſeen in their full extent, to be had from what the ſenſes ſuffer in *dreams*. Indeed, if *dreams* are different from what might be expected from the buſineſs of the day, or the turn of thought before, they may always be looked upon as ſigns of a more or leſs diſtempered ſtate of the body; and the true condition of that ſtate may often be better learned from them, than from any other means. What has been obſerved by phyſicians in regard to the prognoſtics from *dreams*, may be ſummed up in the following manner: to *dream* of fire, indicates a redundance of yellow bile; to *dream* of fogs or ſmoke, indicates a predominancy of black bile; to *dream* of ſeeing a fall of rain or ſnow, or a great quantity of ice, ſhews that there is a redundance of phlegm in the body; he who fancies himſelf among ſtinks may be aſſured, that he harbours ſome putrid matter in his body; to have red things preſented before you in ſleep, denotes a redundance of blood; if the patient *dreams* of ſeeing the ſun, moon, and ſtars, hurry on with prodigious ſwiftneſs, it indicates an approaching delirium; to *dream* of a turbid ſea, indicates diſorders of the belly; and to dream of ſeeing the earth overflowed with water, or of being immerged in a pond or river, indicates a redundance of watery humours in the body; to *dream* of ſeeing the earth burnt or parched up, is a ſign of great heat and dryneſs; the appearance of monſters and frightful enemies, indicates deliriums in diſeaſes; and to *dream* often of being thrown down from ſome very high place, threatens an approaching vertigo, or ſome other diſorder of the head, as an epilepſy, apoplexy, or the like. Theſe and a great many others are the obſervations of Hippocrates on the *dreams* of his patients. From thoſe, and from other farther aſſiſtances, Lommius has carried the ſubject to a very great length, and given many rules of judging from them. Lommii Med. Obſ. But quære, how true.

DREDGE, or DARG, a term uſed by the farmers for oats and barley mingled together.

DREDGERS, a term uſed in the admiralty courts for the fiſhers for oyſters. See ſtat. 2 Geo. II. cap. 9.

DREGS *of oil*, a name given by the people who trade in oil, to that coarſe and thick part of it, which ſubſides to the bottom of the veſſels in which great quantities of it are kept. This is not fit for the common uſes of the clear

oil

oil at the top, but there are ſeveral purpoſes to which it ſerves very well. Great quantities of theſe lees or *dregs* of common oil are uſed by the ſoap-boilers, principally in making the common ſoft ſoap. The leather-dreſſers alſo uſe it in conſiderable quantities to ſoften the hides they are employed to prepare for the ſeveral artificers who uſe them. Some of theſe *dregs* are alſo uſed in the making of ſtambeaux, which inſtead of being made of yellow wax as pretended, are uſually compoſed of pitch, roſin, and this oil, mixed in ſuch a proportion as to make a maſs of a proper hardneſs and conſiſtence. People who uſe preſſes, and other works in which there are many ſcrews, ſometimes buy this to greaſe their ſcrews, inſtead of ſoap or ſuet. Theſe are the uſes mentioned by Savary; but beſide theſe we have in England another manufacture, which conſumes a greater quantity than all theſe put together. This is the making of ſpermaceti; ſome perſons among us have found the art of making this out of the faeces of oil, and will give an oilman at any time as much clear oil in exchange of theſe *dregs*, as they are in quantity. All the other uſes of theſe *dregs* leave the trader at a great loſs; and as Savary obſerves, the more faeces the oil contains, the greater is the loſs to the buyer; but with us, this is rendered equal, and there is no loſs in it.

All ſorts of oil produce more or leſs faeces and *dregs*, but of all others, the whale-oil is obſerved to produce the largeſt quantity, and the nut-oil the leaſt.

DREIT DREIT, in our *Old Writers*, ſignifies a double right, that is, *jus poſſeſſionis & jus dominii*. Bracton, lib. iv. cap. 27. and lib. iv. tract. 4. cap. 4. and lib. v. tract. 3. cap. 5. Coke on Litt. fol. 266.

DRENCH, among *Farriers*, a phyſical draught, or potion, given a horſe, by way of purge.

DRENCHES, or DRENGES, DRENGI, or THRENGI, in our *Old Cuſtoms*, a term, about which the lawyers and antiquaries are little divided. See THRENGUS.

Drengei, ſays an ancient manuſcript, were *tenentes in ſopite*: according to Spelman, they were *a genere vaſallorum non ignobilium, cum fœgali qui in domes-day nominantur ſoquelæ ſubſtinent manerio*: ſuch as, at the coming in of the Conqueror, being put out of their eſtates, were afterward upon complaint, reſtored thereto; becauſe, they, being before owners thereof, were neither in auxilio, nor conſilio, againſt him.

DRENGAGE, DRENGAGIUM, vel *ſervitium drengagii*, in our *Old Writers*, the tenure by which the *drenches* held their lands; concerning which, ſee Term. Trin. 21 Ed. III. Ebor. and Northum. Rot. 191. *Notandum eſt, eos omnes eorumque anteceſſores, qui a drengorum claſſe erant, vel per drengagium tenuere, ſua recuſaſſe patrimonia ante adventum Normannorum.* Spelm. Gloſſ. Du-Cange, Gloſſ. Lat. in voc. *Drenches.*

DREPANON, DREPANUM, among the Greeks, an engine of iron crooked like a ſickle, and fixed to the top of a long pole. It was uſed in cutting aſunder the cords of the ſail-yards, in order to diſable the ſhip by letting fall the ſails, and was otherwiſe called *darydrepanon*. Potter's Archæol. tom. ii. p. 141.

DRESSING *of hemp and flax*. See HEMP and FLAX.

DRESSING *of hops*. See HOPS.

DRESSING *of meat*, the preparing of them for food, by means of culinary fire.

The deſign of *dreſſing* is, to looſen the texture of the fleſh, and diſpoſe it for diſſolution, and digeſtion in the ſtomach. Fleſh not being a proper food without *dreſſing*, is alleged as an argument, that man was not intended by nature for a carnivorous, or fleſh-eating animal.

The uſual operations are, *roaſting*, *boiling*, and *ſtewing*. In *roaſting*, it is obſerved, meat will bear a much greater and longer heat than either in *boiling*, or *ſtewing*; and in *boiling* greater and longer than in *ſtewing*. The reaſon is, that *roaſting* being performed in the open air, as the parts begin externally to warm, they extend and dilate, and ſo gradually let out part of the rarefied included air, by which means the internal ſucculſions, on which the diſſolution depends, are much weakened, and abated; *boiling* being performed in water, the preſſure is greater, and conſequently, the ſucculſions to lift up the weight are proportionably ſtrong; by which means the coction is haſtened; and even in this way there are great differences: for the greater the weight of water, the ſooner is the buſineſs done.

In *ſtewing*, though the heat be much leſs than what is employed in the other ways, the operation is much more quick, becauſe performed in a cloſe veſſel, and full; by which means the ſucculſions are more often repeated, and more ſtrongly reverberated. Hence the force of Papin's DIGESTOR; and hence an illuſtration of the operation of DIGESTION.

Boiling, Dr. Cheyne obſerves, draws more of the rank, ſtrong juices from meat, and leaves it leſs nutritive, more diluted, lighter, and eaſier of digeſtion: *roaſting*, on the other hand, leaves it fuller of the ſtrong, nutritive juices, harder to digeſt, and needing more dilution. Strong, grown, and adult animal food, therefore, ſhould be *boiled*; and the younger and tenderer *roaſted*.

DRESSING *of ore*. See BUDDLE, and ORE.

DRESSING, in *Surgery*, denotes the treatment of a wound, or any diſordered part. The apparatus for this purpoſe conſiſts of doſſils, tents, plaſters, compreſſes, bandages, bands, ligatures, &c.

DRESSING *a ſhip*, is the act of ornamenting a ſhip with a variety of colours, as enſigns, flags, pendants, &c. diſplayed from different parts of her maſts and rigging, on a day of feſtivity.

DRIE, or DRY. See DRY.

DRIFT, in *Mining*, a paſſage cut out under the earth betwixt ſhaft and ſhaft, or turn and turn, or a paſſage or way wrought under the earth to the end of a meer of ground, or part of a meer.

DRIFT *of the foreſt*, an exact view, or examination of what cattle are in the foreſt; that it may be known whether it be overcharged, or not, and whoſe the beaſts are; and whether they are commonable beaſts, or not. See FOREST, and COMMON.

DRIFT, in *Navigation*, denotes the angle which the line of a ſhip's motion makes with the neareſt meridian, when ſhe drives with her ſide to the wind and waves, and is not governed by the power of the helm; and alſo the diſtance which the ſhip drives on that line, ſo called only in a ſtorm.

DRIFT-*ſail*, in a *Ship*, a ſail uſed under water; veered out right a-head, by ſheets, as other ſails are: its uſe being to keep the ſhip's head right upon the ſea, in a ſtorm; and to hinder a ſhip's driving too faſt in a current; with which view it is generally uſed by fiſhermen, eſpecially in the North ſea.

DRILL, in *Mechanics*, a ſmall inſtrument for making ſuch holes as *punches* will not conveniently ſerve for. *Drills* are of various ſizes, and are chiefly uſed by ſmiths and turners.

It is a very well known fact, that a *drill* made of iron has frequently not only a polarity, but ſo ſtrong an attractive virtue of the magnetic kind, that it will ſuſpend a common needle from its point. It is uſually ſuppoſed that a *drill* acquires this polarity by boring iron. But it is not only by boring of iron, that this power is obtained, but in the very making. As ſoon as one of them is finiſhed and hardened, its point becomes a north pole before it has ever been worked either in iron or any other materials, ſo that of the great numbers of theſe inſtruments found in a ſhop, endued with this power, it is to be ſuppoſed that more of them owe it to their original make, than to any after uſe. All pieces of wrought iron which in ſhape reſemble *drills*, that is, which are of a long and ſlender form, will not only have this polarity, but they will change it on being placed for ſome time in an inverted poſture, and that which was the oppoſite to the north pole, by ſtanding downwards will be the north pole. This has been an old obſervation, but on a fair experiment it does not prove to be true in all things without exception, though it be ſo in moſt particulars. The larger pieces of iron ſeem to be moſt eaſily influenced in their polarity, by changing their poſition; but the ſmall ones will ſometimes be found to have fixed poles, which no change of poſture will alter. Phil. Tranſ. N° 246. See MAGNET.

DRILL, or DRILL-*bar*, a name given to an inſtrument uſed in the new-method of horſe-hoeing huſbandry for ſowing the land. See BROAD-*caſt*, and HUSBANDRY.

The *drill* is the engine that plants the corn and other ſeeds in rows; it makes the channels and ſows the ſeeds in them, and covers them with earth when ſown, and all this at the ſame time, and with great expedition. The principal parts of the *drill* are the ſeed-box, the hopper, the plough, and its harrow. The ſeed-box is the chief of theſe; it meaſures or rather numbers out the ſeeds which it receives from the hopper, and is for this purpoſe as an artificial hand, but it delivers out the ſeed much more equally, than that can be done by a natural hand. The plough and hopper are drawn by a horſe, and by theſe the ground is opened, and the ſeed is depoſited in it; the harrow follows, and lightly rakes in the earth over them. When the ground is fine, and the ſeeds ſmall, a hurdle with ſome prickly buſhes faſtened to it under part will ſerve better than the harrow. The whole apparatus for this method of ſowing is deſcribed and illuſtrated with figures by Tull in his Horſe-hoeing Huſbandry. See *Drill*-PLOUGH.

DRILL-*rake*, in *Huſbandry*. See *Drill*-RAKE.

DRILLING is popularly uſed for exerciſing ſoldiers. The word is derived from the French *drille*, which ſignifies a *raw ſoldier*.

DRIN-

DRINK, a part of our ordinary nourishment, in a liquid form, ſerving to diſſolve and moiſten the dry meat.

The *drinks*, in different countries, are different. Thoſe uſed among us, are water, malt-liquors, wine, cyder, punch, brandy, tea, &c. See each under its proper article, CYDER, &c.

The *malt-drink* brewed in England, in one year, Chamberlayne aſſures us, amounts to very near two millions of barrels, ſtrong and ſmall.

The firſt *drinks* of mankind were certainly water and milk; but luxury ſoon introduced the art of preparing intoxicating and inebriating *drinks* out of vegetables. The vine gave the firſt of theſe liquors; after this wheat, barley, millet, oats, rice, apples, pears, and pomegranates; and after theſe the juices drained from the pine, ſycamore, and maple, were brought to this uſe; in latter times, roots, berries, and the pith of the ſugar-cane, have been employed for the ſame purpoſes. Honey alſo is at preſent in ſome repute; but before the uſe of the other things here mentioned, the vinous liquor made of honey and water was in the very higheſt eſtimation. The bees were natural purveyors, and their flores were one of the firſt delicacies probably of the human race. It was very natural to attempt the meliorating of ſo raw a drink as water, by an addition of this ſweet ſubſtance; and ſuch a mixture needing only time for fermentation to become vinous, accident might ſoon lead to this diſcovery. Mead therefore may naturally be ſuppoſed to have been one of the firſt ſtrong liquors in uſe in the world; and among the very oldeſt writers among the Greeks we find it named as a thing well known. Homer, Heſiod, and Ariſtophanes, all give plain proofs of their having been acquainted with it. The people who have ſtudied the human frame to moſt purpoſe, all agree, that amongſt the ſtrong *drinks*, wine is the moſt pernicious; and that good water, milk, beer, and cyder, are greatly preferable to it, none of them bringing on the variety of diſorders, to which immoderate wine-drinkers are ſubject, ſuch as decay of ſight, trembling of the limbs, &c.

Water, Dr. Cheyne obſerves, is the only ſimple fluid (for there are but three more in nature, mercury, light, and air, none of which is fit for human *drink*) ſuited for diluting, moiſtening, and cooling; the only ends of *drink*, appointed by nature; and happy had it been for the race of mankind, had other mixed and artificial liquors never been invented. Water alone is ſufficient, and effectual, for all the purpoſes of human wants in *drink*. Strong liquors were never deſigned for common uſe. They were formerly kept here in England, as other medicines are, in apothecaries ſhops, and preſcribed by phyſicians as they do diaſcordium, and Venice treacle, to refreſh the weary, ſtrengthen the weak, and raiſe the low-ſpirited. The effect of the ordinary uſe of wine, and ſpirituous liquors as natural cauſes will always produce their effects, is to inflame the blood into gout, ſtone, and rheumatiſm, fevers, pleuriſies, ſmall-pox, &c. to dry up the juices, and ſcorch and ſhrivel the ſolids. Thoſe whoſe appetite and digeſtion are good and entire, never want ſtrong liquors to ſupply them with ſpirits; ſuch ſpirits are too volatile, and fugitive, for any ſolid or uſeful purpoſes of life. Two ounces of fleſh-meat, well digeſted, beget a greater ſtock of more durable and uſeful ſpirits, than ten times as much ſtrong liquors.

All ſtrong liquors are as hard to digeſt, and require as much labour of the concoctive powers, as ſtrong food itſelf. Water is the only univerſal diſſolvent, or menſtruum, and the moſt certain diluter of all bodies proper for food. There are a great many ſpirituous liquors, which not only will not diſſolve, but which will harden, and make more indigeſtible, certain parts, eſpecially the ſalts of bodies, wherein their active qualities, that is, thoſe which can do moſt harm to human conſtitutions, conſiſt. And we have known perſons of tender conſtitutions, who could neither eat, nor digeſt, upon *drinking* wine, who, by drinking at meals common water, warmed, have recovered their appetites, and digeſtion, and have thriven, and grown plump. It is true, ſtrong liquors, by their heat, and ſtimulation on the organs of concoction, by increaſing the velocity of the motion of the fluids, and thereby quickening the other animal functions, will carry off the load that lies upon the ſtomach, with more preſent chearfulneſs. But then, beſide the future damages of ſuch a quantity of wine to the ſtomach, and the fluids, by its heat, and inflammation, the food is hurried into the habit unconcocted, and lays a foundation for a fever, a fit of the colic, or ſome chronical diſeaſe. Eſſay on Health, &c. p. 47, & ſeq.

With reſpect to fermented liquors, which are commonly uſed, it may be obſerved, that thoſe which are too ſtrong hurt digeſtion, and are ſo far from ſtrengthening the body, that they weaken and relax it. They keep up a conſtant fever, which exhauſts the ſpirits, heats and inflames the blood, diſpoſes to numberleſs diſeaſes, and occaſions a premature old age. But fermented liquors may be too weak, as well as too ſtrong: theſe muſt either be drank new, before the fermentation is over, and in this caſe will generate air in the bowels, and occaſion flatulencies; or they ſoon become ſtale, ſour the ſtomach, and injure digeſtion. On this account all malt-liquors, cyder, &c. ſhould be ſufficiently ſtrong to keep till they are ripe, and then they ſhould be uſed; and neither ſooner nor later. Liquors that are adulterated with a mixture of ingredients of the opiate kind, which are poiſonous in their quality, by thoſe who make them for ſale, hurt the nerves, relax and weaken the ſtomach, and ſpoil its digeſtive powers.

DRINKING-*glaſſes*. See GLASSES.

DRINKLEAN, in our *Old Writers*, a feaſt-ale or contribution of the tenants towards a potation, i. e. ale provided to entertain the lord or his ſteward. In ſome records it is written, *potura drinkleau*.

DRIP, in *Architecture*. See LARMIER.

DRIPS is alſo uſed in building, for a kind of ſteps, on flat roofs, to walk upon.

This way of building is much uſed in Italy; where the roof is not made quite flat, but a little raiſed in the middle; with *drips*, or ſteps, lying a little inclining to the horizon. See ROOF.

DRIVE, in the *Sea Language*. A ſhip is ſaid to *drive*, when an anchor being let fall, will not hold her faſt, but that ſhe ſails away with the tide, and wind.

The beſt way to prevent this, is to veer out more cable; for the more cable ſhe has, the ſurer, and ſafer ſhe rides; or elſe to let fall more anchors.

Alſo, when a ſhip is a-hull, or a-try, they ſay ſhe *drives* to leeward, or in with the ſhore, according to the way ſhe makes.

DRIVE-*bolts*, in *Ship Building*. See BOLTS.

DRIVER, the name given by our ſportſmen to an inſtrument uſed in taking pheaſant-powts, in the method called *driving*. This inſtrument conſiſts only of a parcel of ozier wands, ſuch as are uſed by the baſket-makers, which are made up into a bundle, or ſort of great whiſk, and faſtened in a handle; and to prevent their ſpreading too much at the points, are tied round in one or two places in the length; with this inſtrument the ſportſman having fixed his nets, drives the young birds into them. See DRIVING.

DRIVER, in a *Ship*, is an oblong ſail, occaſionally bolted to the mizen-peak, when the wind is very fair. The lower corners of it are extended by a boom or pole, thruſt out acroſs the ſhip, and projecting over the lee-quarter.

DRIVERS, *wool*. See WOOL.

DRIVING, among *Sportſmen*, a term applied to the taking of young pheaſants, and ſome other birds in nets of an open ſtructure. The method of doing this, is, when an eye of pheaſants is found, the ground all about is to be ſearched, for finding their principal haunts. The induſtrious ſearcher will ſoon be able to make out ſome one of their paths, which are beaten in the manner of ſheep-tracks, only more ſlightly. When one of theſe is found, the place is to be marked by ſetting up a ſtick with another tied to its top, like the hand of a road poſt, marking out the place where the path ſeems to run to. On examining the reſt of the ground thereabouts, having regard to the ſame direction, it is highly probable, that ſeveral more of the ſame ſort of tracks will be found all running the ſame way. By one or other of theſe probably the ſportſman will be led to their haunt, which he will not miſs knowing by the nakedneſs and barrenneſs of the ground, and its being covered with the dung and feathers of the young birds. When this is found, the nets are to be placed near this ſpot, looſe and circularly, in ſuch a manner, that the under part being faſtened down to the ground, the upper part may be hollow, and give a paſſage to the young birds in, and entangle them when there. When the nets are fixed, the perſon muſt go to the haunts, and call them together by the artificial note of the pheaſant-call, which is ſo like the real note of the pheaſant, that the powts, or young ones, will ſeldom fail being deceived by it. When they hear this, and begin to anſwer it with their chucking and piping, the call is to be ſtopped, and a perſon is to get behind them, taking the wind with himſelf, as they always run with the wind. He is to have in his hand the inſtrument called by the ſportſmen a *driver*.

When the perſon who carries this inſtrument perceives that he is come pretty near ſome of the powts, he muſt ſoftly beat the buſhes with the *driver*, or only lightly draw it over them; the little noiſe this makes will terrify theſe timorous creatures, and they will gather together in the track, and run a little way forward, and then all

ſtop and turn about; on this the perſon is to make the ſame noiſe again, upon which they will run farther; and when they ſtop again, the ſame noiſe will again ſend them forward. Whatever other powts are in the way will join the main body in this fright, and the whole will be *driven* in this manner, like a flock of ſheep, and by a little addreſs of the ſportſman be ſent into the nets; ſo that out of a whole eye, it often happens that not one is miſſed. If in the fright the birds happen to run out of their track, and take a wrong way, then the *driver* is to make a raking noiſe with his inſtrument dragged along the ground, on that ſide on which they are running; this will amaze and terrify them ſo, that they will immediately ſtart back, and come into the beaten track that leads directly to the haunt. There are but two cautions neceſſary to the ſucceeding perfectly in this method of taking them: theſe are ſecrecy and patience. Whatever ſtops they make, or however tedioufly they move, the ſportſman who would make ſure of them, muſt bear with it; for over-raſhneſs and hurrying will ſpoil all, and he muſt content himſelf with terrifying them by the noiſe alone, keeping himſelf carefully out of their ſight; for if they eſpy him, all the plan is diſconcerted, and they will no more move forwards, but will every one run a different way, and hide under the roots of trees, and thick buſhes, and all the art in the world will never bring them out again till night, when it will be too dark to watch them.

DRIVING *of wild fowl*, is only practicable in the moulting time, which is in July and Auguſt; and it is to be done by means of a ſpaniel, well trained to the purpoſe. The nets are to be ſet in creeks and narrow places, or at their uſual night-retreats, and the dog is to get them up, and *driving* them forward, they will be ſent immediately into the nets, not being able to fly away from the dog, from the want of their wing feathers. The people who live in the fens find great account in this practice, taking very great numbers of wild-ducks by it. They are uſually indeed poor and out of fleſh at this time, but as they are always taken alive, and without any hurt, the people find it eaſy to fatten them with beaſts livers, barley, paſte, ſcalded bran, and the like; and they will on this become, in a very little time, fat and well taſted, excelling in flavour both the tame ducks commonly kept in the yards, and the wild ducks in their natural ſtate. When the ſportſman takes the dog into places where they are not ſo frequent, he may hunt them ſingly, and the dog alone will take them.

DRIVING, in *Metallurgy*, is uſed by the refiners of ſilver, to expreſs the riſing up of copper from its ſurface in red fiery bubbles. When the lead that was added for refining the ſilver is burnt away before the copper is gone from it, theſe bubbles appear very fiercely on the ſurface. They ſay, on this occaſion, that the metal *drives*, and then add more lead, till the remainder of the copper is conſumed. Phil. Trant. N° 142.

DROCK, in *Huſbandry*, a name given by our farmers to a part of the common plough. It is an upright piece of timber, running nearly parallel with the hinder part of the plough, but belonging to the right ſide of the tail, as that does to the left. The ground wiſh of the plough is faſtened to this, as alſo is the earth-board. See WHEEL, EARTH-BOARD, and PLOUGH.

DROFFAND, or DRIVEFAND, in our *Old Writers*, was a quit-rent, or yearly payment made by ſome tenants to the king, or their landlords, for driving their cattle through the manor to fairs or markets.

The word comes from the Saxon *dryfene*, *driven*.

DROGMAN. See DRAGOMAN.

DROIT. Jus, in our *Law-Books*, ſignifies *right*, or *law*; wherein ſome diſtinguiſh ſix kinds, viz. 1. *Jus recuperandi*, right of recovering. 2. *Jus intrandi*, right of entering. 3. *Jus habendi*, right of having. 4. *Jus retinendi*, right of retaining. 5. *Jus percipiendi*, right of receiving. 6. *Jus poſſidendi*, right of poſſeſſing. See LAW, and RIGHT; as alſo RECTUM, ENTRY, POSSESSION, &c.

DROIT, *Right*, gives name to the higheſt writ of all real writs, becauſe the greateſt regard is paid to it, and it has the moſt aſſured and final judgment. Of this kind are the *droit de advowſon*, &c.

DROIT, *chaſe*. See RECTO.

DROIT *de advowſon*. See RECTO *de Advocatione Eccleſiæ*.

DROIT DROIT, *Jus Duplicatum*, or double right, is the right of poſſeſſion, joined with that of property; and when actual poſſeſſion is united to this double right, then a title is completely legal.

DROIT *de dower*. See RECTO *De dote*.

DROIT *patent*. See RECTO.

DROIT *ſur diſclaimer*. See RECTO *ſur Diſclaimer*.

DROIT, *monſtrant de*. See MONSTRANS.

DROMEDARY, in *Zoology*, the name of a ſpecies of camel, which has only one bunch on his back. Its hairs are ſoft to the touch, and are ſhorter than thoſe of our oxen, except that there are ſome longer on the head, the throat, and the top of the neck; and on the middle of the back there are hairs of a foot long, which, though very ſoft and flexile, yet naturally ſtanding in an erect poſture, make the moſt viſible part of the bunch. For when theſe are removed by the hand, the fleſh ſcarce appears more prominent, than that of the back of a hog, and there is not the leaſt fleſhy or callous excreſcence there.

The head is ſmall in proportion to the body; the upper lip is divided as in the hare; the feet are not hoofed, but each terminated by two ſmall claws; the ſole of the foot is broad and very fleſhy, and ſeems ſoft to the touch, though the ſkin is very hard and callous; the feet are indeed clothed as it were with living ſhoes, which are of very great ſervice to it in travelling over the ſandy countries. It has ſix callous hardneſſes on the knees and ſhoulders of the forelegs, and one on each of the hinder ones. And beſide theſe, there is another much larger, which adheres to the breaſt, on an eminence which is there, as if made to ſupport it; this is uſually eight inches long, ſix inches broad, and about two thick. The uſe of theſe is to ſuſtain the weight of the creature's body on occaſion of his ſtooping to reſt, or to be loaded.

Its ſtomach is very large, and divided into four parts as in other of the ruminating animals, but of a ſingular ſtructure; becauſe, at the upper part of the ſecond ventricle, there are ſeveral ſquare holes, which are the orifices of a great number of a ſort of bags placed between the membranes which compoſe the ſtomach, and theſe ſeem to be the receptacles of water kept for the time of neceſſity; for the creature always drinks a vaſt quantity at once, and will then live a great while without drinking again. It is yet a queſtion to be decided, whether this creature is of the retrocingent kind, and whether it copulates backwards? This has been affirmed by ſome, but it is greatly doubted by others. See *Tranſ. of Conſtantinople*, N° 1. and CAMEL.

The *dromedary* is ſwift; and is trained in Arabia for races, and in ſome places for carrying couriers, who can travel above a hundred miles a day on them, for nine days together, over burning deſarts, uninhabitable by any living creature. Ray and Leo Afric. 338.

DROMEUS, from *Δρόμος*, *I run*, in *Natural Hiſtory*, a word uſed by the ancients, as the name of two very different animals, the ſtag and the dromedary. The meaning of the word is *ſwift in running*; and the ſtag had this name as being ſwifter than any other animals, and the dromedary as being ſwifter than any of the camel kind beſide.

DROMONARII, in *Antiquity*, towers belonging to the ſhips called *dromones*.

DROMONES, in *Antiquity*, a kind of yachts or expeditious ſhips uſed in carrying proviſions, or other neceſſaries. Pitiſc. Lex. Ant. in voc.

DROMONS, DROMOS, or DROMUNDA, in middle age writers, ſignified any large ſhips; but afterwards it was uſed chiefly for men of war; and in this ſenſe it is uſed in Walſingham, anno 1202, and in Knighton, lib. iii. cap. 14. &c.

DRONE, in *Muſic*. See BURDEN.

DRONE, in *Natural Hiſtory*, a ſort of bee of a larger ſize than the common working bee, which being unprovided with the neceſſary apparatus, never goes out to work, in collecting either wax or honey, but lives on the honey collected by the reſt. Theſe are the males of the ſwarm; the common working bees are of no ſex at all, or rather females in diſguiſe, and the female is uſually only one in a hive: for there is reaſon to conclude, from numerous late experiments, that the queen-bee lays only two kinds of eggs, thoſe that are to produce *drones*, and thoſe from which the working bees are to proceed. The proportion of *drones* to other bees in ſwarms is various; ſome having more than others. See QUEEN *Bee*.

This larger ſpecies of *drones* may be eaſily diſtinguiſhed from the working bees, by being nearly double their ſize. Their head is round, their eyes full, their tongue ſhort, and belly broader and more obtuſe than that of the other claſſes; they are likewiſe of a darker colour, and more thickly clothed; and they make a much greater noiſe in flight, ſo that they may be eaſily known, though unſeen. They have alſo no ſting, as the other bees have. The diſſection of the *drone* gives a great proof of its being the male, as that of the queen does of her being female. In this creature there is no appearance of ovaries or eggs, nor any thing of the ſtructure of the common working bees, but the whole abdomen is filled with tranſparent veſſels, winding about in various intricacies, and containing a white or milky fluid, plainly analogous to that fluid in the males of other ani-

mals

males, which is deſtined to render the eggs of the female prolific; and this whole apparatus of veſſels, which much reſembles the turnings and windings of the ſeminal veſſels in other animals, is plainly intended only for the preparation and retention of this matter, till the deſtined time of its being emitted on the eggs. At the extremity of the laſt ring of the body, is placed the aperture of the anus in the female, and in the working bees; and it is at this aperture, that the ſting is alſo thruſt forth; but the caſe is quite otherwiſe in the *drone* or male bee; for the extremity of that ring is not open, but abſolutely cloſed; and the aperture of the anus is in the under part of that ring about its middle. On preſſing the body of this bee, there is alſo forced out at this part the penis; this is a ſmall and tender fleſhy body, contained between two horns of a ſomewhat harder ſubſtance, which join at their baſe, but gradually part aſunder as they are continued in length. When the preſſure is continued, there is finally thruſt out at the ſame aperture a part of the internal apparatus of the ſeminal veſſels, and, in fine, there is uſually ſome of the milky liquor extravaſated; but this ſeems rather to be let out by the hurting of a veſſel, than by any natural paſſage. Theſe parts, found in all the *drones*, and none of them in any other bees except theſe, ſeem to prove very evidently the difference of ſex; but there is one thing extremely remarkable in regard to them, which is, that though they appear ſo evidently on being forced out of the body by preſſure, yet it is very difficult to find them in it on diſſection. The cauſe ſeems to be their ſwelling when expoſed to the air; and Swammerdam ſuppoſes, that to this purpoſe they are furniſhed with a great number of trachеæ, which readily admit the air as ſoon as ever they are expoſed to it.

Maraldi, as well as Swammerdam, diſcovered in the ſtructure of the *drones* ſome reſemblance to the male organs of generation, and from thence concluded that they were the males; but neither of theſe accurate and induſtrious obſervers could detect them in the act of copulation. Swammerdam, therefore, entertained a notion that the female or queen-bee was fecundated without copulation; that it was ſufficient for her to be near the males, and that her eggs were impregnated by a kind of vivifying aura, exhaled from the body of the males, and abſorbed by the female. However, M. Reaumur thought, that he had diſcovered the actual copulation of the *drones* with the female bee, and he has very minutely deſcribed the proceſs of it. Hiſt. Inſect. tom. 2. p. 128. 149. 157.

Nevertheleſs, many of the ancients, as well as moderns, have ſuppoſed that the eggs of the female bee are not impregnated with the male ſperm, while in the body of the creature, but that they are depoſited unimpregnated in the cells, and that the male afterwards ejects the male ſperm on them, as they lie in the cells; in the ſame manner as the generation of fiſhes is ſuppoſed to be performed by the males impregnating the ſpawn after it is caſt out by the females.

M. Maraldi long ſince conjectured that this might be the caſe; and he was confirmed in the opinion, by obſerving a liquid whitiſh ſubſtance ſurrounding each egg at the bottom of the cell, a little while after it had been laid, and that a great number of eggs, which were not encompaſſed by this liquor, remained barren in the cell. Hiſt. Acad. &c. 1712. p. 332. See *Generation of* Bees.

This method of impregnation has been lately eſtabliſhed beyond all contradiction by the obſervations of Mr. Debraw of Cambridge. Having put ſome bees into glaſs-hives with a large number of *drones*, he obſerved on the firſt or ſecond day (always before the third) from the time in which the eggs were placed in the cells, which the queen generally lays on the fourth or fifth day after they are put into the hive, that a great number of bees faſtened themſelves to one another, and formed a kind of curtain from the top to the bottom of the hive, probably in order to conceal the proceſs of generation. Mr. Debraw, however, could ſoon perceive ſeveral bees, whoſe ſize he was not able to diſtinguiſh, inſerting the poſterior part of their bodies each into a cell, and ſinking into it; after a little while they retired, and he could ſee with the naked eye a ſmall quantity of whitiſh liquor left in the angle of the baſe of each cell, containing an egg: this liquor was leſs liquid than honey, and had no ſweet taſte. See *Generation of* Bees.

In order further to aſcertain the fact, that the eggs are thus fecundated by the males, Mr. Debraw took a ſwarm of bees, and having ſeparated the *drones*, by ſhaking all the bees into a tub of water, and leaving them in it till they were quite ſenſeleſs, replaced the working bees and their queen, as ſoon as they were recovered, by ſpreading them on a brown paper in the ſun, in a glaſs hive. The queen laid eggs, ſome of which, at the end of twenty days, were hatched into bees, others withered away, and ſeveral of them were covered with honey. Suſpecting that ſome of the males, having eſcaped his notice, had impregnated only part of the eggs, he was anxious to aſcertain the fact; and with this view he removed all the brood-comb that was in the hive, and determined to watch the motions of the bees after new eggs were depoſited in the cells. On the ſecond day he perceived the *operation*, already related in a former caſe; and on taking out a piece of the comb, containing two of the bees which had thruſt the poſterior part of their bodies into the cell, he examined them, and found that they had no ſting; and upon diſſection he diſcovered in them, by the help of a microſcope, the four cylindrical bodies, containing the whitiſh liquor above deſcribed, which Maraldi has obſerved in the large *drones*. In a ſubſequent experiment, Mr. Debraw ſeparated from the ſame parcel of bees all that had no ſtings; and he found no leſs than fifty-ſeven of the number exactly of the ſize of common bees, which on being preſſed between the fingers, yielded a ſmall quantity of whitiſh liquor. Having killed all theſe, the remainder of the ſwarm was reſtored to the hive. On the fourth or fifth day, the queen-bee depoſited her eggs in the cells, but no part of the proceſs of impregnation could be diſcovered; the eggs, after the fourth day, inſtead of changing in the manner of caterpillars, remained in the ſame ſtate they were in the firſt day, except that ſome of them were covered with honey: all the bees left their hive, and attempted to get into a neighbouring hive, probably in ſearch of males; but the queen was found dead, having been killed in the engagement. Mr. Debraw made another experiment, which muſt be conſidered as an *experimentum crucis*, and abſolutely deciſive on this ſubject. He took a part of the unimpregnated brood-comb, and placed it under a glaſs bell, in which he confined a queen, and ſome common bees, without any *drones*; the other part of the ſame brood-comb he put under another glaſs bell, with a few *drones*, a queen, and a number of common bees. In the former glaſs the eggs remained in the ſame ſtate; there was no impregnation; and when the bees were releaſed on the ſeventh day, they all flew away. The *drones*, in the other glaſs, were obſerved to impregnate the eggs in every cell, on the day after they were put in; the bees remained in the hive, and in the courſe of twenty days every egg underwent the neceſſary tranſformations, and a numerous young colony was thus produced. Phil. Tranſ. vol. lxxii. part 1. art. 3. See Queen-*Bee*.

Maraldi and Reaumur had long ago diſcovered, that there were *drones* of the ſame ſize with the common bees; but theſe curious experiments, beſides aſcertaining the fact, throw new light on their importance and uſe, and remove conſiderable difficulties, which embarraſſed the proceſs of generation among theſe uſeful inſects. It is well known that the large *drones* never appear in the hive before the middle of April, and that they are all dead before the end of Auguſt, when the principal breeding ſeaſon terminates; and they are deſtroyed, together with all their worms or nymphs, by the working bees, probably by order of the queen to ſave honey; and yet it is equally certain that the bees begin to breed early in the ſpring, ſometimes in February, if the weather is mild; and that many broods are completed before theſe *drones* appear. But if *drones* of a ſmaller ſize are ſuffered to remain, which in a time of ſcarcity conſume leſs honey than the others, theſe will anſwer the purpoſe of ſupplying the early broods, and the larger *drones* are produced againſt a time of greater plenty.

An ingenious friend of the editor, who amuſes himſelf with obſerving the œconomy of bees, and who has long ſince diſcovered the ſmall *drones*, and from whoſe amuſements the world may probably derive uſeful information with regard to theſe inſects, aſſures him, that theſe ſmaller *drones* are all dead before the end of May, when the larger ſpecies appear, and ſuperſede their uſe.

It was not without reaſon that a modern author ſuggeſted, that a ſmall number of *drones* are reſerved to ſupply the neceſſities of the enſuing year; and that theſe *drones* are very little, if at all larger, than the common bees. Nat. Diſp. p. 96.

Drone-*fly*, or Bee-*fly*, a two-winged fly, ſo extremely like the common bee as to be at firſt ſight not eaſily diſtinguiſhable from it. The diſtinction between the two inſects, however, beſide the different number of their wings, is, that the bee has a ſomewhat longer and leſs thick body, and the head is proportionably much ſmaller than that of the fly which ſo much reſembles them. The *bee-fly* alſo ever carries its wings parallel in their poſition, but without its body; whereas the bee itſelf uſually carries its wings croſſed on the back, and covers its body with them; this is not however an invariable poſ-

ture

lure with the wings of the bee, though it is the moſt frequent one. The *bee fly* is found among the flowers, as is the bee; and though it gathers no wax, it has a trunk by means of which it ſucks the honey.

The trunk, by means of which the fly is enabled to do this, has no teeth, and conſequently the fly belongs to Mr. Reaumur's firſt general claſs of the two-winged flies; and the form of its body, which is ſhort and flat, determines it to be of his firſt ſubordinate genus of that claſs.

The moſt ſingular and obſervable part of the life of this inſect is that which it paſſes without wings, and in form of a fly-worm and nymph. The general exterior form of the fly-worms of this genus has been well enough known to the generality of naturaliſts; and Goedart, Merian, and Albinus, were well acquainted with them ſo far; but they did not give themſelves the trouble of a farther examination, and were not ſenſible that theſe worms had many obſervable things to offer to our conſideration.

The matter among which they are found is that of all others the moſt offenſive and diſagreeable. They are of the claſs of thoſe with variable heads; but the great diſtinction from all others is their having a long ſlender tail. This at different times the worm makes of very different lengths, but in its ſhorteſt it is longer than the body of the creature. It is round, ſmooth, and at times extremely ſmall at the extremity, and ſometimes much reſembles the tail of a rat; whence the whole claſs of theſe worms are well diſtinguiſhed by the name of rat-tailed worms.

To know the uſe of the tail of this worm, it is however neceſſary firſt to underſtand the nature of the worm itſelf. Theſe worms being uſually found on dry land, and only picked up now and then ſparingly, gave the world for a great while no room to believe that they were ſo numerous as they really are; nor had people any idea that they were to look for them in the water. In examining veſſels of corrupted and ſtinking water, however, they have been found in very great multitudes together, living among the mud at the bottom. Theſe taken out of this filth, and put into veſſels of clean water, will ſoon ſhew the curious obſerver the uſe of their long tails. Notwithſtanding that theſe worms are to live under water, and in mud, there is no doubt to be made but that, like other of water-fly worms, they have a neceſſity of breathing freſh air; and it is to this great purpoſe that their long tail ſerves them; for while they lie buried in the mud, this is extended up to the top of the water, and being open at the extremity lets the air into the body of the creature. It is a pleaſing ſight to obſerve, that theſe animals, after having been put into a veſſel of freſh water, all get quickly to the bottom, and each thruſts up the extremity of its tail to the ſurface.

It is very eaſy, from ſeeing that at whatever depth the worms lie, their tails ſtill reach the ſurface, to conclude, that they have a power of lengthening them at pleaſure. The ready way to be aſſured of this is to add depth to the water, by pouring more into the veſſel; for as the worms love the bottom, they muſt, if they will remain there, lengthen their tails proportionably, in order to breathe from the ſurface. The repeating ſeveral of theſe additions, ſhews, that the worm is able to extend its tail to the length of five inches; an extremely remarkable length for a creature, whoſe body is not much more than half an inch, and whoſe tail in its more common ſtate is not much longer than that. Five inches are however the ſtint, beyond which they cannot go in this action; and when the water in the veſſel is made of a greater depth, the worms leave the bottom, and either crawl up the ſides of the veſſel to a proper height, or elſe ſwim in the water at the depth of five inches, which is the depth at which they carry their tails up to the ſurface.

The organization of ſo remarkable a part as the tail of this animal, cannot but appear to the curious greatly worth the enquiring into; and the tranſparence both of it, and of the body of the creature, is ſuch as to favour very greatly this examination. And indeed in many of the younger of theſe worms, and ſuch as have not yet come to the ſtate at which they quit the water, one may diſtinguiſh the parts within the body as plainly almoſt as if placed for examination in a glaſs tube. It is eaſy in all ſtates of the worm to diſtinguiſh that the tail is compoſed of two hollow tubes, the one of which nicely fits, and is eaſily retracted within the other, or thruſt out of it again, as the creature's occaſions require. The outer and larger tube ſeems an elongation of the fleſhy matter that forms the rings of the body. It is white like the body, and is compoſed of a vaſt number of rings, as the body is. Within this is lodged a leſſer pipe, a great part of which is of a blackiſh brown; and by means of this colour the inner tube may be diſtinguiſhed, even when it is wholly within the other. This inner one may be called the tube of reſpiration. It is eaſy to ſee now that the tail of the worm may be made more and more long, as his inner tube is thruſt out of the other, which ſerves it as a caſe or ſheath. But this is not all; it is eaſily known that theſe pipes are in themſelves capable of extenſion, by obſerving, that when the whole inner tube is lodged within the caſe, or outer one, yet this is of no determinate length, but is ſometimes longer, ſometimes ſhorter.

Many of the water-fly worms do not quit that element till they arrive to the fly ſtate; but this ſpecies, as ſoon as they have acquired their full growth, leave the water and crawl upon the earth. Their bodies in this new element become dirty and greyiſh; and when they have found a proper ſpot of ground where the earth is ſoft and moiſt, they bury themſelves, and after a neceſſary time for their change, come out in the form of flies.

Their changes are all made under a ſhell of their own ſkin, which in a few hours is found beginning to harden, and by degrees becomes very firm, of a yellowiſh colour, and is remarkable for having four horns, two larger and two ſmaller, placed in different directions near the head; and theſe are the organs of reſpiration to the incloſed nymph.

Theſe are the changes of the flies of this claſs. They are of ſeveral ſpecies, and differ in ſize not leſs than the worms from which they are produced. Of theſe the largeſt are found in vaults and privies; and in winter, multitudes of them may be met with in the hollows of willows, and other trees where there is water. Reaumur.

DRONTE, in *Ornithology*. See DODO.

DROPAX, Δροπαξ, in *Pharmacy*, an external medicine, in form of a plaiſter, uſed to take off the hairs from any part. See HAIR, and DEPILATORY.

The *dropax* is of two kinds, *ſimple* and *compound*. The *ſimple* is made of an ounce of dry pitch, and two drachms of oil.

The *compound* is made with pitch, wax, colophony, common ſalt, bitumen, ſulphur vivum, pepper, euphorbium, cantharides, and caſtor. There are alſo other ways of making it, to be found in the diſpenſatories.

It was anciently much in uſe alſo to warm the parts, to draw the blood and ſpirits to them, and to cure atrophies. To this purpoſe it was applied hot on the part affected, after firſt ſhaving it; and was pulled off again before it became quite cold; then heated afreſh, and applied again; and the operation thus repeated, till the part was rendered very red.

DROPPING, or DRIPPING, a term uſed among *Falconers* when a hawk mutes directly downwards, in ſeveral *drops*, not throwing out her dung, ſtraight forwards.

DROP, in *Sea-Language*, is a name ſometimes given to the depth of the principal ſails; thus, a main top-ſail *drops* ſeventeen yards.

DROPS, in *Architecture*. See GUTTÆ, and TRIGLYPH.

DROPS, in *Medicine*, a liquid remedy, whoſe doſe is eſtimated by a certain number of *drops*.

DROPS, in *Meteorology*. See RAIN.

The ſpherical figure, into which the *drops* of fluids conform themſelves, is a phenomenon that has a little perplexed the philoſophers. The ſolution commonly given was, that the equable, uniform preſſure of the ambient, or incumbent atmoſphere, cloſed them into this form. But this account will no longer paſs; now that we find that the phenomenon holds in vacuo as well as in air.

The Newtonian philoſophers, therefore, aſcribe it to their attraction, which being greater between the ſeveral particles of the fluids, than between them and thoſe of the medium, they are, as it were concentrated, and brought as near each other, and into as little compaſs, as may be; which cannot be, without their being ſpherical.

Thus, Sir Iſaac Newton: *Guttæ enim corporis cujuſque fluidi, ut figuram globoſam inducere conentur, facit mutua partium ſuarum attractio; eodem modo quo terra maria in rotunditatem undique conglobantur, partium ſuarum attractione mutua, quæ eſt gravitas.* Opt. p. 338.

DROPS, *Engliſh*, or *volatile Engliſh drops*, *Guttæ Anglicanæ*. See GUTTÆ *Anglicanæ*.

DROPPER. See FITHING.

DROPSY, ὑδρωψ, in *Medicine*, a preternatural collection of ſerum, or water, in ſome part of the body.

The word is compounded of the Greek ὕδωρ water.

The *dropſy* acquires different names from the different parts it affects, or the different parts where the water is collected in. That of the abdomen, or lower belly, is called ſimply, and abſolutely, *dropſy*, in particular diſtinguiſhed by the name ASCITES. That of the whole body, in which a ſerous humour is collected through the cellular ſyſtem, and lodges under the ſkin, is called ANASARCA, or *hydrophlegmatia*. That of the ſcrotum, HYDROCELE. There is alſo a ſpecies of this diſeaſe, ſuppoſed to be cauſed, inſtead of water, by a collection of wind, called *tympanites*,

tympanites, and by Hippocrates, the *dry dropſy*. See EMPHYSEMA.

We alſo meet with *dropſies* of the breaſt, lungs, pericardium, ovaries, uterus, &c.

Some think that the anaſarca, leucophlegmatia, hydrops aſcites, tympanites, hydrorcele, &c. differ ſo exceeding little, that it is ſcarce worth while to retain ſo many pompous Greek names. Medic. Eſſ. Edinb. vol. i.

The general cauſe of all *dropſies* is the exhalent veſſels throwing off more fluid than the abſorbent veſſels can take up; and the remote cauſes are whatever may obſtruct the ſerous part of the blood, ſo as to make it ſtagnate in the veſſels; or burſt the veſſels themſelves, ſo as to let the blood out among the membranes; or weaken and relax the tone of the veſſels; or thin the blood, and make it watery; or leſſen the perſpiration, and the vital heat.

Theſe cauſes are various; viz. ſometimes acute diſeaſes, feirrhous tumors of any of the more noble viſcera, exceſſive evacuations, particularly hæmorrhages, and remote fluxes of the belly, ſuppreſſion of cuſtomary evacuations, as the menſes, hæmorrhoids, &c. want of exerciſe, hard drinking, eſpecially of ſpirituous liquors, drinking of cold, weak, watery liquors, after having been accuſtomed to liquors of a more generous kind, or when the body has been heated by violent exerciſe, the uſe of aliment that is viſcous, and hard of digeſtion, living in a low, damp, marſhy ſituation, &c.

The aſcites, or *water-dropſy* of the abdomen, is the moſt uſual caſe, and what we particularly call the *dropſy*. In this diſorder, the water is accumulated in the cavity of the belly, between the peritonæum and the viſcera, in the dilated cavities of the glands, or other veſſels contained in the abdomen, or in the duplicature of the peritonæum: its ſymptoms are tumors, firſt of the feet and legs, and afterwards of the abdomen, which keep continually growing, and if the belly be ſtruck, or ſhaken, with one hand, whilſt the other hand is placed on the oppoſite ſide, there is heard a quaſhing of water. And to this three other attendants, viz. a dyſpnœa, intenſe thirſt, and ſparing urine; with which may be numbered heavineſs, liſtleſſneſs, coſtiveneſs, a ſlight fever, and an emaciation of the body.

This ſpecies of *dropſy* ſhould be carefully diſtinguiſhed from pregnancy, excreſcences, and other tumors in the belly, and from a tympany. In young and ſtrong patients, this diſeaſe, if taken betimes, may admit of a cure; but if the patient be old, or has led an irregular, or a ſedentary life, or if there be any reaſon to ſuſpect that the liver, lungs, or any of the viſcera, are unſound, there is ground to fear that the conſequences may prove fatal. When the anaſarca and aſcites are combined, the caſe is very dangerous.

The curative indications are two: viz. the evacuation of the water, and the ſtrengthening of the blood and viſcera. The firſt is effected by ſtrong purgatives, particularly elaterium, and the infuſion of crocus metallorum, though this laſt works upwards more than downwards. Purging medicines of different kinds will be required for different patients, and for the ſame patient at different times; but, in general, for the ſtronger, calomel and jalap; and for the weaker, calomel and rhubarb will be proper. Occaſional doſes of ipecacuanha in powder, and oxymel of ſquills, may be likewiſe adminiſtered as emetics.

But if the diſeaſe proceeds from a bad habit, or an unſound ſtate of the viſcera, ſtrong purges and vomits ſhould be avoided, and recourſe be had to ſuch medicines as will palliate the ſymptoms, by promoting the ſecretions, and to warm nouriſhing cordials for ſupporting the patient's ſtrength. For ſuch as are too weak to bear purgatives, Dr. Sydenham recommends diuretics, whereof the beſt are thoſe made of the lixivial ſalts; to which helicbore may be joined, for increaſing their effects.

Dr. Baker's tonic pills have been celebrated in *dropſies*, both as diuretic and purgative. The recipe for preparing them is as follows:

℞ Extract. helleb. nigr. rayrrhæ ſolut. ää ʒi. card. bened. pulv. ʒiii. & ℈i. m. f. maſſa acre ſicco exſiccanda: donec formandis pilulis apta ſit; fingul. ad gran. ſeptuiſſ.

Theſe pills have been given in different numbers, up to thirty, for a doſe, taken by ten at a time, and an hour between each portion.

The following diuretic infuſion, taken every four or five hours a day, may be of conſiderable ſervice: take juniper berries, muſtard ſeed, and horſe-raddiſh, of each half an ounce; infuſe them in a quart of Rheniſh wine, or ſtrong ale, for a few days, and ſtrain off the liquor. Or, take of zedoary root, two drams; dried ſquills, rhubarb, and juniper berries bruiſed, of each a dram; cinnamon in powder, three drams; ſalt of wormwood a dram and a half; infuſe them in a pint and half of old hock wine, and filter the liquor; and let a wine glaſs of it be taken three or four times a day.

Nitre, taken in the quantity of a dram every morning, has produced a very good effect; and the ſame diuretic purpoſe may be anſwered by ſix or eight grains of the powder of ſquills, with a ſcruple of nitre, adminiſtered twice a day in a glaſs of ſtrong cinnamon water. Others have extolled the efficacy of a large ſpoonful of unbruiſed muſtard ſeed, taken every night and morning, with half a pint of the decoction of the tops of green broom drank after it. Cream of tartar, the doſes of which may be gradually increaſed to two or three ounces a day, have been uſeful in ſome caſes.

The decoction of ſeneka root, or Mindererus's ſpirit, taken in a doſe of two table ſpoonfuls, in a cup of wine, three or four times a day, will promote perſpiration.

Dr. Percival, for this purpoſe, recommends rubbing the ſkin every night and morning with dry cloths, fumigated with camphor, and giving internally the julep and camphor; ſo that a dram of camphor may be taken in a day. Wainwright extols an infuſion of green tea in Rheniſh wine, and alſo briony juice, as excellent in this diſeaſe. Some alſo commend garlic.

Dropſies, attended with anaſarcous ſwellings, are not to be cured with purging alone, nor by ſoap, nor mercurials; but chiefly by the lixivial ſalts, either in the form of broom aſhes, ſalt of wormwood, or ſalt of tartar. The common method is this; about thirty or forty grains of ſalt of tartar are diſſolved in an infuſion of wormwood, to which is added ſpirit of juniper; and this mixture is to be given in three doſes and repeated daily. Beſides this it may be proper to give the patient, once in four or five days, half a dram of *pilulæ ex coloquintida cum aloe*, as a purge; and toward the decline of the diſeaſe, ſome common chalybeate. The diuretic may alſo be promoted by ſwallowing garlic, or muſtard-ſeed. See Pringle's Obſerv. on Diſeaſes of the Army, p. 213.

Dr. Buchan obſerves, that he has known an obſtinate *anaſarca* cured by the infuſion of broom aſhes in wine. It may be obſerved in general, that, when the water of an *aſcites* is carried off by any other means than by a puncture through the peritonæum, it is done by that operation of nature called ABSORPTION: and hence is derived the principal uſe of purgatives, ſudorifics, and diuretics. Lond. Med. Obſ. vol. ii. art. 2.

For the ſecond intention, exerciſe, and change of air, wine, and other generous liquors, alſo ſtomachics, chalybeates, and other corroborating medicines, are preſcribed.

The diet ſhould be dry and nouriſhing; the pungent and aromatic vegetables, as garlic, muſtard, onions, horſe-raddiſh, &c. may be freely uſed. The beſt liquor is Spa water, or Rheniſh wine. The patient ſhould alſo have his body rubbed, two or three times a day, with a hard cloth, or the fleſh bruſh; and always wear flannel next his ſkin.

Where other means fail for evacuating the water, recourſe is to be had to the PARACENTESIS, or operation of tapping. This will, at leaſt, prove a palliative; and if uſed ſoon enough may even effect a cure; but a delay is very dangerous.

Exerciſe is recommended to hydropic people immediately before tapping, that the groſſer particles in the water of their belly may be mixed with the thinner, and ſo run out with them. And if there is reaſon to ſuſpect any ſuch groſs parts remaining after the operation, ſome adviſe the injection of barley-water to dilute and bring them away.

We have lately had accounts, in the Philoſophical Tranſactions, of *dropſies* cured by tapping, and afterwards injecting Cahor wine, mixed with Briſtol water.

There is alſo an account of an uncommon *dropſy*, from the want of a kidney, in the Philoſophical Tranſactions. The ſubject was a young woman; the water evacuated from the abdomen on diſſection, meaſured near half a hogſhead, and was contained in a large ſack, which almoſt occupied the whole cavity of the abdomen above ſix feet in circumference, and extended upwards of four feet from the xyphoid cartilage to the os pubis. The figure and deſcription of this ſack, and the adjacent parts, may be ſeen in Phil. Tranſ. N° 482. ſect. 2.

We read of an hydropic body becoming ſo infectious, that the ſurgeon who tapped the corpſe, was thrown into a peſtilential fever. Phil. Tranſ. N° 454. ſect. 4.

Baglivi notes, that in a *dropſy* ariſing from a morbid liver there is always a vehement dry cough; which is never obſerved in any other ſpecies. In the appendix to vol. iii. of Dr. Prieſtley's Obſervations, &c. on Air, p. 490. we have an account of the cure of a *dropſy* by the uſe of fixed air, after all other remedies had failed, and the patient had been tapped five times.

DROPSY *of the breaſt, Hydrops Pectoris*, ariſes from water extravaſated in the breaſt on one or both ſides of the mediaſtinum; or contained in *hydatides*, ſituated on the diaphragm, pleura, lungs, heart, or pericardium. This may be occaſioned by a diſorder of the lungs, or the texture of a lymphatic, or by any of the cauſes of a common *dropſy*. Inſtances have rarely occurred in which the water hath been abſorbed; but the diſeaſe is commonly very dangerous. When the water is perceived to fluctuate, it may be drawn off by a canula and trochar, introduced between the fourth and fifth of the falſe ribs, and about four fingers' breadth from the ſpines. *Le* Dran's Oper. ed. 2. p. 117, 128. Motherby's Dict.

DROPSY *encyſted*. See DROPSY *of the lungs*.

DROPSY *of the head*. See HYDROCEPHALUS.

DROPSY *of the knee, Hydrops Genu*, is formed by water collected under the capſular ligament of the knee. Mr. Sharp recommends, for a cure, a tight bandage, leaving the ſuperfluity to be abſorbed by the bibulous veins; to which may be added ſome attenuating and diſcutient embrocations. Gooch's Caſes, &c. vol. ii. p. 259. 266. Motherby. See SPINA *ventoſa*.

DROPSY *of the lungs, Hydrops Pulmonum*, is ſeated in the cellular membrane of the lungs. This is a very uncommon diſtemper; but it has been ſometimes obſerved by the phyſicians of our own nation. The moſt perfect account, however, any where given of this diſeaſe, is that of Mr. Maloet, of the Paris Academy, in the caſe of a poor invalid ſoldier, whom he had attended through all the ſtages of it. He had a very great difficulty of reſpiration, accompanied with a ſlow fever. When in bed he could neither lie with eaſe on either ſide, nor on his back; but was forced to lie upon his belly, and conſequently, as that was a very troubleſome poſture, he uſually took his reſt in a chair. His hands and arms were much ſwelled, as were alſo his legs and feet, and his urine was of a brick colour. Mr. Maloet, from all theſe circumſtances, ſuſpected water in the breaſt, but was never able to perceive any fluctuation, into whatever change of poſture he made the patient go, nor could he find that the man himſelf ever perceived any ſuch ſenſation within him. The unhappy creature died, after two years illneſs; and his body being opened, there was no water found looſe in the breaſt, but on each ſide of the lungs there was obſerved an oval tumor of ſix inches long, and four inches broad, they were both of the ſame ſize, and on touching them with the hand, there was a very ſenſible fluctuation obſerved. On opening theſe, water run out in a large quantity; and on examining their ſtructure, they were found encyſted tumors, with conſiderably thick membranes, compoſed of ſeveral beds, or coats of matter, but with no blood-veſſels diſtinguiſhable in them. Examining the liver, there was found another encyſted tumor there, the contents of which were a lymph, tinged to a yellowiſh green by gall. Mem. Acad. Par. 1732.

This diſorder may be relieved by a briſk mercurial cathartic, and liberal doſes of the ſeneka root, and other diuretics and ſudorifics. In a deſperate caſe an opening may be tried, as in the operation for the EMPYEMA, and a puncture may be made into the lungs for diſcharging its morbid contents. Edinb. Med. Eſſ. vol. vi. p. 126. Percival's Eſſ. Med. and Exp. p. 172. Motherby.

DROPSY *of the ovaries, Hydrops Ovarii*, is of the encyſted kind, and ſometimes happens to pregnant women, but moſt frequently to the barren and ſuperannuated. The patient in the commencement and firſt progreſs of this diſeaſe has neither bad health nor pain. It is not perceptible, while ſmall, except in particular ſituations. At firſt it is commonly ſituated towards one ſide, in the lower part of the belly, and is moveable under the hand; then it becomes gradually more fixed, more extended both forwards and upwards in the belly, and more painful and oppreſſive to the patient. When the cyſt is ſingle, and extended over the whole abdomen, it cannot be diſtinguiſhed by feeling from a common *aſcites*; but when there is a number of cyſts, the inequalities in the ſwelling are generally ſenſible from firſt to laſt. Dr. Hunter obſerves, that the *dropſy* of the ovarium is an incurable diſeaſe, and that a patient will have the beſt chance of living longeſt under it, who does the leaſt to get rid of it. He is of opinion, that the *trochar* is almoſt the only palliative; and that a radical cure by the exciſion of the cyſt can hardly be attempted: and that inciſion and ſuppuration are operations which cannot be recommended, but under very particular circumſtances, and that they change the *dropſy* into an incurable *fiſtula* in the belly. The diſorder generally terminates in an univerſal *leucophlegmatia*. However, Dr. Percival gives an inſtance of a cure being effected by a ſpontaneous vomiting. Lond. Med. Obſ. &c. vol. ii. p. 41, &c. Percival's Eſſ. Med. and Exp.

DROPSY *of the ſcrotum and teſtis*. See HYDROCELE.

DROPSY *of the womb, Hydrops Uteri*, is ſeated in the cavity of the womb. It is diſtinguiſhed from the *aſcites*, by being confined to the region of the uterus, and by the thinneſs of the *os tincæ*. When it proceeds from a ſcirrhus, it is never in the middle, nor is it round, as in the common *dropſy*. A *canula* introduced into the womb promiſes the beſt and ſpeedieſt remedy; but this is ſometimes prevented by a ſcirrhus, cicatrix, or tubercles; in which caſe recourſe may be had to hard riding, emetics, ſternutatories, and briſk cathartics. Borax may be given from ten to twenty-five grains twice a day as a deobſtruent, and a peſſary may be alſo tried. Motherby, and James, *art.* HYDROPS.

DROPWORT, in *Botany*. For the characters, ſee SPIRÆA.

The common *dropwort* grows plentifully upon chalky grounds in many parts of England. The roots conſiſt of a great number of oval knobs or glandules, which are faſtened together by ſlender fibres, from whence it had the name of *dropwort*. The leaves are winged, and compoſed of many ſawed lobes, which are almoſt placed alternately along the mid-rib. Thoſe near the baſe are the ſmalleſt; the others increaſe in ſize to the middle; and decreaſe afterward again to the point. The flower-ſtalk riſes a foot or more in height, and has ſeldom more than one leaf upon it; the top is garniſhed with looſe bunches of ſmall white flowers, ſtanding upon ſlender foot-ſtalks, which are ſucceeded by ſeveral capſules ranged circularly. The roots of theſe plants are uſed in medicine, and are accounted diuretic. It is rarely kept in gardens; but there is a variety with double flowers, which was found growing naturally in the north of England, that is kept in gardens for the ſake of variety.

They are propagated either by ſuckers, which they produce in great abundance, or by laying down the tender branches of the old plants. When they have taken root they ſhould be removed into the nurſery for two or three years, and will then be fit for tranſplanting in the places where they are to remain.

DROPWORT *Water, Oenanthe*, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe: it is a plant with an umbelliferous flower; the principal umbel has but few rays, but the particular umbels have many ſhort ones; the rays of the principal umbels are diffuſe; thoſe flowers in the diſk are hermaphrodite, and are compoſed of five heart-ſhaped inflexed petals, which are almoſt equal; the germen is ſituated under the flower, ſupporting two awl-ſhaped permanent ſtyles, crowned by two obtuſe ſegments; the germen afterward becomes an oval fruit, divided into two parts, containing two almoſt oval ſeeds, convex on one ſide, and plain on the other. There are five ſpecies.

One of the ſpecies of this plant, diſtinguiſhed by its yellow juice, and growing near waters, is a very terrible poiſon. Many accounts have been given of people dying by it, but none which ſets its terrible effects in ſo juſt a light, as one which happened very lately to ſome French priſoners with us, and which is recorded in the Philoſophical Tranſactions, N° 481.

It is extremely neceſſary that this dangerous plant ſhould be well known, as it grows very pleniſully with us all about the banks of the Thames; and Mr. Watſon has cauſed a fine drawing, both of this, and of another poiſonous plant, which is often confounded with the cicuta aquatica, or water hemlock of Wepfer, to be preſixed to that number of the Tranſactions where this account is given; and this ſeems the more neceſſary, as the plant ſeems to have been miſtaken in a manner by all the world, not only by the common people, but the more verſed in plants having miſtaken it at times for ſeveral very different things. The ſame gentleman informs us, from various authors, that eight laſs in Ireland had been poiſoned by it, miſtaking it for the root of the water parſnip; two men died by miſtaking it for the Macedonian parſley; and Wepfer, who wrote an expreſs treatiſe on the poiſonous nature of the water-hemlock, has confounded this plant with it, ſaying, that Lobel had deſcribed the water-hemlock under the name of this *ananthe*, or *dropwort*; and the generally accurate Hoffman, when treating of the vegetable poiſons, makes no mention of the difference between theſe two plants.

Neither the roots of this *ananthe*, nor thoſe of the cicuta aquatica, or water hemlock of Wepfer, have any diſagreeable flavour to deter thoſe who taſte of them from eating; and they both occaſion violent convulſions, and death, if not timely prevented. The intention of cure ſeems in both the ſame; firſt by emptying the ſtomach and inteſtines as ſoon as poſſible, and then cauſing the patient to drink largely of oleaginous fluids: there is great difficulty, however, in getting the patient to ſwallow any thing, the jaws being faſtened together by the

fra'm. After the ſtomach has been freed from this pernicious vegetable, the ſymptoms have generally abated by degrees, and the patient has recovered.

Threlkeld mentions this plant as growing in Cumberland, where the people call it *dead tongue*, and uſe it as a poultice to the galled backs of their horſes. The German botaniſts do not mention it as growing among them, nor Hallèr in his Enumeratio Stirpium Helvetiæ; whence it ſeems to be ſeldom met with, except in England, Holland, and ſome parts of France.

DROSERA, *in Botany*. See SON-DEW.

DROSOLITHUS, in *Natural Hiſtory*, the name of a ſtone to which many great virtues are attributed, by the writers of the middle ages, but the accounts they have left us of it, are too imperfect to give us any juſt idea of what ſtone it was. They ſay it was variegated with many colours; and that when laid upon the fire it ſweat or oozed out large drops of clear water, all over its ſurface.

DROVERS, are perſons that buy cattle in one place, and drive them for ſale to another. They are to be married men, and houſeholders, and to be licenſed by ſtatute 5 Eliz. cap. 12. And if they drive their cattle on the Lord's day, they ſhall forfeit 20s. by 1 Car. I. cap. 1.

DROUGHT, in the *Natural Hiſtory of the Air*, is a long continuance of dry weather. Great *droughts* are very prejudicial to the farmer and his paſture; and ſuch years aſford but very little reward for the labour and expence of keeping it in order. The only remedies are high enclоſures, and plenty of water at hand. The firſt of theſe is always in the farmer's power, and ſhould be carefully provided by planting hedges in a proper manner, in counties moſt ſubject to ſuffer by this diſadvantage. The other is not always ſo eaſy, but may be managed ſeveral ways, as by ſinking wells; but theſe, when deep, are very expenſive; or by bringing the water in pipes, gutters, or other conveyances; and this is eaſily done where there is a ſpring or brook in the neighbourhood higher than the lands. Pumps, wheels, and ſuch other engines are alſo uſed in ſome places to bring on the water: and in others, ponds, ciſterns, and receptacles, are made to take in the rains and winter floods, and retain the water till ſummer, when it is wanted.

The farmers of England are very deficient in this laſt method, which they might uſe to their great benefit in many places. In Spain they have no water in many parts but what they preſerve in this manner. And at Amſterdam and Venice they have whole cellars made into ciſterns, which receive the water that falls in rains, and preſerve it all the year. Want of water for the cattle in ſummer in many places might be eaſily remedied by ſome care of this kind; and many thouſand acres of land made uſeful which are now left as waſte, by this means alone. The practicability of thus obtaining water is evinced by its being done in places where there falls much leſs rain annually than with us, and yet by this the inhabitants have always freſh water enough for the uſe of their houſes, cattle, and gardens, none of which ever fail. See CISTERN.

DROWNING, the act of ſuffocating, or being ſuffocated, by water.

People not accuſtomed to diving, Dr. Halley obſerves, begin to *drown* in about half a minute's time.

Drowning was anciently a kind of puniſhment. In the time of Louis XI. of France, the chronicle aſſures us, that they frequently *drowned* their criminals, inſtead of hanging them. Chron. Scand. See FOSSA and FURCA. Natural hiſtorians and phyſicians furniſh us with divers well atteſted inſtances of ſurpriſing recoveries of perſons *drowned*; which, if maturely conſidered, might perhaps let a little light into the dark notions of life and death.

We ſhall not particularly recite the improbable ſtories mentioned by Pechlin, De Aer. & Alim. Def. cap. 10. of one who was under water fifteen hours, of another who was under water three whole days, and of a third who was in this ſtate ſeven weeks, and recovered. *Sed ponos ipſum finis.* But there are ſeveral unqueſtionable facts, though they have rarely occurred, in every country, which ſhew the poſſibility of a recovery from ſudden death, whether by apoplexy, convulſive fits, ſuffocation by noxious vapours, ſtrangulation by the cord, or *drowning*. However, inſtances of this kind merely excited tranſient attention and ſurprize, and many perſons were loſt for want of proper attempts for their recovery. This was particularly the caſe in Holland, where, from the great abundance of canals and inland ſeas, the inhabitants are much expoſed to accidents by water; and where many perſons were *drowned* every year for want of aſſiſtance. In 1767, a ſociety was formed at Amſterdam, which offered premiums to thoſe who ſhould ſave the life of a citizen in danger of periſhing by water; and which propoſed from time to time, to publiſh the treatment, and method of recovery, obſerved in ſuch caſes. This inſtitution was every where encouraged through the United Provinces, by the magiſtrates, and by the ſtates general, and has been attended with very conſiderable ſucceſs; and it appears that no leſs than two hundred perſons have been recovered from death, by this inſtitution, in the ſpace of about ſix years. In ſeveral of theſe caſes, the recovered patients had continued upwards of an hour, without any ſigns of life, after they had been taken out of the water. Inſtigated by this example, the magiſtrates of health at Milan and Venice iſſued orders, in 1768, for the treatment of *drowned* perſons. The city of Hamburgh appointed a ſimilar ordinance to be read in all their churches, extending their ſuccour not only to the *drowned* but to the ſtrangled, to thoſe ſuffocated by noxious vapours, and to the frozen. The firſt part of the Dutch Memoirs was alſo tranſlated into the Ruſſian language, by command of the empreſs. In 1769, an edict was publiſhed in Germany, extending its directions and encouragement to every *accident*, like death, that afforded a poſſibility of relief. In 1771, the magiſtrates of the city of Paris alſo founded an inſtitution in favour of the *drowned*; and in France they have been inſtrumental in ſaving forty-five perſons out of ſixty-nine, in about ſixteen months. In 1773, Dr. Cogan, and Mr. afterwards Dr. Hawes, of London, propoſed a plan for the introduction of a ſimilar inſtitution into theſe kingdoms. The plan was ſo well received and encouraged, that they were ſoon, viz. in 1774, enabled to form a ſociety, ſince called the Humane Society, for promoting its laudable deſigns.

The following abſtract of the plan of this ſociety, and method of treatment recommended by it, will not, we apprehend, be unacceptable to our readers. This ſociety has undertaken to publiſh, in as extenſive a manner as poſſible, the proper methods of treating perſons in the unfortunate circumſtances, to which they extend their relief; to diſtribute a premium of two guineas among the firſt perſons, not exceeding four in number, who attempted to recover any perſon, taken out of the water for dead, within thirty miles of the cities of London and Weſtminſter, provided they have not been longer than two hours under the water, and provided the aſſiſtants perſevere in the uſe of the means recommended for the ſpace of two hours, whether their attempts are ſucceſsful or not. Theſe rewards are alſo to include every other inſtance of ſudden death, whether by ſuffocation from noxious vapours, hanging, ſyncopies, freezing, &c. They propoſe to diſtribute in like manner four guineas wherever the patient has been reſtored to life; to give to any publican, or other perſon, who ſhall admit the body into his houſe without delay, and furniſh the neceſſary accommodations, the ſum of one guinea, and to ſecure them from the charge of burial in unſucceſsful caſes; and to preſent an honorary medal to thoſe medical gentlemen, or others, who give their aſſiſtance *gratis*, and who are provided with a fumigator, and other neceſſaries always in readineſs, in all thoſe caſes in which they may prove inſtrumental of ſucceſs. The device on one ſide of their medal is a boy, who is repreſented blowing an extinguiſhed torch, with the hope, as the legend, *Lateat ſcintillula forſan*, imports, that a little ſpark may ſtill remain. The reverſe exhibits a civic wreath, which was the Roman reward for ſaving the life of a citizen, with a blank for the name of a perſon to whom the medal may be given; the inſcription round the wreath, *Hoc ſpectatum civi ſervato cuivis*, expreſſes the merit which obtained it.

The following is the method of treatment recommended by the ſociety.

1. In removing the body to a convenient place, great care muſt be taken that it be not bruiſed, nor ſhaken violently, nor roughly handled, nor carried over the ſhoulders with the head hanging downwards, nor rolled upon the ground, or over a barrel. For experience proves, that all theſe methods are injurious, and often deſtroy the ſmall remains of life. The unfortunate object ſhould be cautiouſly conveyed by two or more perſons, or in a carriage upon ſtraw, lying as on a bed, with the head a little raiſed and kept in as natural and eaſy a poſition as poſſible.

2. The body being well dried with a cloth, ſhould be placed in a moderate degree of heat, but not too near a large fire. The windows or door of the room ſhould be left open, and no more perſons be admitted into it than thoſe who are abſolutely neceſſary; as the life of the patient greatly depends upon having the benefit of a pure air. The warmth moſt promiſing of ſucceſs is that of a bed or blanket, properly warmed. Bottles of hot water ſhould be laid at the bottom of the feet, in the joints of the knees, and under the arm pits; and a warming pan moderately heated, or hot bricks wrapped in cloths, ſhould be rubbed over the body, and particularly along the back. The natural and kindly warmth of a healthy perſon lying by the ſide of the body has been found in many caſes very efficacious. The ſhirt or cloaths of an attendant, or the ſkin of a ſheep freſh killed, may alſo be

be uſed with advantage. Should theſe accidents happen in the neighbourhood of a warm bath, brew-houſe, baker, glaſs-houſe, ſaltern, ſoap-boiler, or any fabrick where warm lees, aſhes, embers, grains, ſand, water, &c. are eaſily procured, it would be of the utmoſt ſervice to place the body in any of theſe, moderated to a degree of heat, but very little exceeding that of a healthy perſon.

3. The ſubject being placed in one or other of theſe advantageous circumſtances as ſpeedily as poſſible, various ſtimulating methods ſhould next be employed. The moſt efficacious are, to blow with force into the lungs, by applying the mouth to that of the patient, cloſing his noſtrils with one hand, and gently expelling the air again by preſſing the cheſt with the other, imitating the ſtrong breathing of a healthy perſon. The medium of a handkerchief, or cloth, may be uſed, to render the operation leſs indelicate. If the lungs cannot be inflated in this manner it may be attempted by blowing through one of the noſtrils, and at the ſame time keeping the other cloſe. Dr. Monro for this purpoſe recommends a wooden pipe, fitted at one end for filling the noſtril, and at the other for being blown into by a perſon's mouth, or for receiving the pipe of a pair of bellows, to be employed for the ſame purpoſe, if neceſſary. Whilſt one aſſiſtant is conſtantly employed in this operation, another ſhould throw the ſmoak of tobacco up by the fundament into the bowels, by means of a pipe, or FUMIGATOR, ſuch as are uſed in adminiſtering clyſters; or by a pair of bellows till the other inſtrument can be procured. A third attendant ſhould, in the mean time, rub the belly, cheſt, back, and arms, with a coarſe cloth, or flannel, dipped in brandy, rum, or gin, or with dry ſalt, ſo as not to rub off the ſkin; ſpirits of hartſhorn, volatile ſalts, or any other ſtimulating ſubſtance, muſt alſo be applied to the noſtrils, and rubbed upon the temples very frequently. Electrical ſhocks, made to paſs in different directions through the body and particularly through the heart and lungs, have been recommended as very powerful *ſtimuli*; and from the trials that have already been made, promiſe conſiderable ſucceſs. The body ſhould at intervals be ſhaken alſo, and varied in its poſition.

4. If there be any ſigns of returning life, ſuch as ſighing, gaſping, twitching, or any convulſive motions, beating of the heart, the return of the natural colour and warmth, opening a vein in the arm or neck may prove beneficial; but the quantity of blood taken away ſhould not be large; nor ſhould an artery ever be opened, as profuſe bleeding has appeared prejudicial, and even deſtructive to the ſmall remains of life. The throat ſhould be tickled with a feather, in order to excite a propenſity to vomit; and the noſtrils alſo with a feather, ſnuff, or any other ſtimulant, ſo as to provoke ſneezings. A tea-ſpoon full of warm water may be occaſionally adminiſtered, in order to learn whether the power of ſwallowing be returned; and if it be, a table-ſpoon full of warm wine, or brandy and water, may be given with advantage; but not before, as the liquor might get into the lungs, before the power of ſwallowing returns. The other methods ſhould be continued with vigour, until the patient be gradually reſtored.

When the patient has been but a ſhort time ſenſeleſs, blowing into the lungs or bowels has been, in ſome caſes, found ſufficient; yet a ſpeedy recovery is not to be expected in general. On the contrary, the above methods are to be continued with ſpirit for two hours, or upwards, although there ſhould not be the leaſt ſymptoms of returning life. The ſame means of reſtoration are applicable to the various other caſes of ſudden death, recited in the beginning of this article.

When theſe meaſures prove unſucceſsful, the ſurgeon's laſt reſource is BRONCHOTOMY, or opening the *arteria trachœa*; for perhaps the air entering freely into the lungs, through the aperture made in the canal, through which they received it in their natural ſtate, will reſtore the play of the lungs, and all the motions of the breaſt.

Mr. Hunter, F. R. S. has, at the requeſt of a member of the Humane Society, publiſhed propoſals for recovering perſons apparently *drowned*. In the caſe of apparent death by *drowning*, he conſiders that a ſuſpenſion of the actions of life has taken place, owing to the loſs of reſpiration, and the immediate effects which this has on the vital motions of the animal; at leaſt, he ſays, this privation of breathing appears to be the firſt cauſe of the heart's motion ceaſing; therefore, moſt probably, the reſtoration of breathing is all that is neceſſary to reſtore the heart's motion. The loſs of life in *drowned* people has been accounted for, by ſuppoſing that the blood, damaged by want of the action of the air in reſpiration, is ſent, in that vitiated ſtate, to the brain, and other vital parts; by which means the nerves looſe their effect upon the heart, and the heart in conſequence its motion. But Mr. Hunter concludes from experiments on a dog, in which a large column of bad blood, viz. all that was contained in the heart and pulmonary veins, was puſhed forward, without producing any ill effect, and alſo from the recovery of *drowned* perſons, and ſtill-born children, that the heart's motion muſt depend immediately on the application of air to the lungs, and not on the effects which air has on the blood, and which that blood has on the vital parts. Therefore blowing air into the lungs, ſoon after the immerſion, may be ſufficient to effect a recovery; and the *dephlogiſticated* AIR of Dr. Prieſtley may prove more efficacious than common air. But if a conſiderable time, as an hour has been loſt, it may be neceſſary to apply ſtimulating medicines, as the vapour of volatile alcali, mixed with the air; and theſe are beſt thrown in by the noſtrils, as applications of this kind to the olfactory nerves rouſe the living principle, and put the muſcles of reſpiration into action, while ſome applications to the mouth rather depreſs than rouſe, by producing ſickneſs. The larynx ſhould be at the ſame time preſſed againſt the œſophagus and ſpine, which will prevent the ſtomach and inteſtines from being too much diſtended by the air; however, the trachæa, and the aperture into the larynx, ſhould be both left perfectly free. Heat is alſo congenial with the living principle, which by increaſing the neceſſity of action, increaſes action; and to a due proportion of heat the living principle owes its vigour. Bed-cloths properly heated ſhould, therefore, be gently laid over the patient, and the ſteam of volatile alcali, or of warm balſams, and eſſential oils may be thrown in, ſo as to come in contact with many parts of his body. The ſame ſteam may alſo be conveyed into the ſtomach by means of a hollow bougie, and a ſyringe; together with the ſpirits of hartſhorn, pepper-mint water, juice of horſe-raddiſh, and alſo balſams and turpentines, in ſuch ſmall quantities, as not to produce ſickneſs. Theſe may alſo be thrown up by the anus. When the heart begins to move, Mr. Hunter adviſes to leſſen the application of air to the lungs, he abſolutely forbids bleeding, becauſe it weakens the animal principle, or that principle which preſerves the body from diſſolution, and is the cauſe of all its actions, and which Mr. Hunter ſuppoſes to be inherent in the blood, and conſequently leſſens both the power and diſpoſition to action. Nothing ſhould be adminiſtered that ordinarily produces a naufea or vomiting, or by the anus, that has a tendency to produce an evacuation that way; becauſe every ſuch evacuation tends to leſſen the animal powers. On this account he does not particularly recommend the fumes of tobacco, becauſe they always produce ſickneſs or purging, according to the mode of their application. He recommends the following apparatus, with a view to the purpoſes of this ſociety. Firſt, a pair of bellows; ſo contrived with two ſeparate cavities, that by opening them, when applied to the noſtrils or mouth of a patient, one cavity may be filled with the common air, and the other with air ſucked out from the lungs; and by ſhutting them again, the common air may be thrown into the lungs, and that ſucked out of the lungs diſcharged into the room. The pipe of theſe ſhould be flexible, in length a foot or a foot and a half, and at leaſt three eighths of an inch in width; by this the artificial breathing may be continued, while the other operations, the application of the ſtimuli to the ſtomach excepted, are going on, which could not conveniently be the caſe, if the muzzle of the bellows were introduced into the noſe. The end next the noſe ſhould be double, and applied to both noſtrils. Secondly, a ſyringe with a hollow bougie, or flexible catheter, of ſufficient length to go into the ſtomach, and to convey any ſtimulating matter into it, without affecting the lungs. Thirdly, a pair of ſmall bellows, ſuch as are commonly uſed in throwing fumes of tobacco up the anus. Phil. Tranſ. vol. lxvi. part. ii. p. 412. 475.

The Humane Society, ſince its firſt eſtabliſhment, to the beginning of the year 1779, has been inſtrumental in recovering two hundred and eighty-ſeven perſons out of the number of caſes, to which their attempts have been applied. See Reports of the Society for the Recovery of Perſons apparently *drowned*.

Societies of a ſimilar nature have been lately formed at Norwich, Briſtol, Liverpool, Colcheſter, and Hull; and likewiſe at Corke, in Ireland. The board of police in Scotland has alſo intereſted itſelf in favour of the ſame benevolent deſign.

DRUG, in *Commerce*, a general name for all ſpices, and other commodities, brought from diſtant countries, and uſed in the buſineſs of medicine, and the mechanic arts. The *drugs* uſed in medicine are very numerous, and ſcarce the greateſt part of the commerce of our druggiſts. Some of them grow in England, France, &c. but the greateſt part are brought from the Levant, and the Eaſt Indies.

A list of all of them would be endless. Some of the principal are aloes, ambergris, amber, assa-fœtida, antimony, bezoar, borax, benjoin, camphor, cantharides, cardamom, cassia, castoreum, coloquintida, civet, coral, cubebs, coffee, cocoa, gum animæ, armoniac, adragath, elemi, gamboge, labdanum, opopanax, sagapenum, sandarac, lacca, jalap, manna, mastic, myrrh, musk, opium, pearls, quinquina, hellebore, galanga, zedoary, rhubarb, sarsaparilla, storax, galbanum, sanguis draconis, senna, spermaceti, spica nardi, scammony, sal ammoniac, tamarinds, tea, turpentine, turbith, tutia, &c.

The natural history, &c. whereof, see under their respective articles. ALOES, AMBERGRIS, &c.

The *drugs* used by dyers are of two kinds: the *colouring*, which give a dye or colour; and *non-colouring*, which only dispose the stuffs to take the colours the better, or to render the colours more shining. Of the first kind are pastels, woad, indigo, kermes, cochineal, madder, turmeric, &c. Of the second kind are, alum, tartar, arsenic, real-gal, salt-petre, common salt, sal gemmæ, sal ammoniac, crystals of tartar, agaric, spirit of wine, urine, pewter, iron, bran, starch, lime, ashes, &c.

There is a third sort of *drugs*, which answer both intentions; as the root, bark, and leaf, of the walnut-tree, galls, copperas, &c.

DRUGGET, in *Commerce*, a sort of stuff, very thin, and narrow, sometimes all wool, and sometimes half wool, and half thread; having sometimes the whale, but more usually without.

Those without the whale in the plain *druggets* are woven, on a loom with two treddles, after the same manner as linen, camblet, &c. Those with the whale, or the corded *druggets*, are wrought on a loom with four treddles. Those are called threaded *druggets*, that have the woof of wool, and the warp of thread. M. Savery invented a kind of gold and silver *druggets*; the warp being partly gold and silver thread, and the woof linen.

DRUIDS, or DRUIDES, or DRUIDÆ, the priests or ministers of religion, among the ancient Celtæ, or Gauls, Britons, and Germans.

Some authors derive the word from the Hebrew דרושים, *derusim*, or *drusim*, which they translate, *contemplatores*. Picard, Celtopæd. lib. ii. p. 58, believes the *Druids* to have been thus called from *Drui*, or *Dryus*, their leader, the fourth or fifth king of the Gauls, and father of Saron, or Naumes. Pliny, Salmasius, Vigenere, &c. derive the name from δρυς, *oak*; on account of their inhabiting, or at least frequenting, and teaching in forests; or perhaps, because, as Pliny says, they never sacrificed but under the oak. But it is hard to imagine, how the *Druids* should come to speak Greek. Menage derives the word from the old British *drus*, *daimon*, *magician*. Borel, from the Saxon *dry*, *magician*; or rather from the old British *dru*, or *deru*, *oak*; whence he takes δρυς to be derived, which is the most probable supposition. Goropius Becanus, lib. i. takes *druis* to be an old Celtic, and German word, formed from *trwais*, or *trwais*, a doctor of the truth and the faith; which etymology Vossius acquiesces in.

The *Druids* were the first, and most distinguished order among the Gauls and Britons; they were chosen out of the best families; and the honours of their birth, joined with those of their function, procured them the highest veneration among the people. They were versed in astrology, geometry, natural philosophy, politics, and geography; and had the administration of all sacred things; they were the interpreters of religion, and the judges of all affairs, indifferently. Whoever refused obedience to them, was declared impious and accursed.

We know but little as to their peculiar doctrines; only that they believed the immortality of the soul; and, as is generally also supposed, the metempsychosis; though a late author makes it appear highly probable they did not believe this last, at least not in the sense of the Pythagoreans.

The chief settlement of the *Druids* in Britain was in the isle of Anglesey, the ancient *Mona*, which they might chuse for this purpose, as it was well stored with spacious groves of their favourite oak.

They were divided into several classes, or branches; viz. the *vacerri*, *bardi*, *eubages*, *semnothei*, or *semnothei*, and *saronidæ*. The *vacerri* are held to have been the priests; the *bardi*, the poets; the *eubages*, the augurs; and the *saronidæ*, the civil judges, and instructors of youth. As to the *semnothei*, who are said to have been immediately devoted to the service of religion, it is probable, they were the same with the *vacerri*.

Strabo, however, lib. iv. p. 197, and Picard after him, in his Celtopædia, do not comprehend all these different orders under the denomination of *Druids*, as species under their genus, or parts under the whole; but make them quite different conditions, or orders.

Strabo, in effect, only distinguishes three kinds; *bardi*, *vates*, and *Druids*. The *bardi* were the poets; the *vates*, ναται (apparently the same with the *vacerri*), were the priests and naturalists; and the *Druids*, beside the study of nature, applied themselves likewise to morality.

Diogenes Laertius assures us, in his Prologue, that the *Druids* were the same, among the ancient Britons, with the sophi, or philosophers, among the Greeks; the magi, among the Persians; the gymnosophists, among the Indians; and the Chaldeans, among the Assyrians.

The *Druids* had one chief, or *arch-druid*, in every nation, who acted as high-priest, or *pontifex maximus*. He had absolute authority over the rest; and commanded, decreed, punished, &c. at pleasure. At his death he was succeeded by the most considerable among his survivors; and if there were several pretenders, the matter was ended by an election, or else put to the decision of arms.

The *Druids*, we have observed, were in the highest esteem. They presided at sacrifices, and other ceremonies; and had the direction of every thing relating to religion. The British and Gaulish youth flocked to them in crouds, to be instructed by them. The children of the nobility, Mela tells us, they retired with into caves, or the most desolate parts of forests, and kept them there, sometimes for twenty years, under their discipline.

Beside the immortality and metempsychosis, they were here instructed in the motion of the heavens, and the course of the stars; the magnitude of the heavens and the earth; the nature of things; the power and wisdom of the gods, &c. They preserved the memory and actions of great men in their verses, which they never allowed to be wrote down, but made their pupils get them by heart. In their common course of learning, they are said to have taught them twenty-four thousand such verses.

They held the plant misletoe in singular veneration. Pliny relates the ceremony wherewith they gathered it every year, lib. xvi. cap. 44. They placed great confidence also in serpent's eggs, gathered after a peculiar manner, and under a certain disposition of the moon, described by Pliny; and imagined them effectual means for the gaining of law-suits, and procuring the good graces of princes. And hence the same author concludes it is, that the caduceus, or rod encompassed with two serpents interwoven, has been assumed as a symbol of peace. Suetonius, in his life of Claudius, assures us, they sacrificed men; and Mercury is said to be the god to whom they offered these victims. Diod. Siculus, lib. vi. observes, it was only upon extraordinary occasions they made such offerings: as, to consult what measures to take, to learn what should befall them, &c. by the fall of the victim, the tearing of his members, and the manner of his blood gushing out. Augustus condemned the custom; and Tiberius, and Claudius, punished and abolished it. See Cæsar, lib. vi. cap. 13. and Mela, lib. iii. cap. 2.

We learn from Cæsar, that the *Druids* were the judges and arbiters of all differences and disputes, both public and private; they took cognizance of murders, inheritances, boundaries, and limits, and decreed rewards and punishments. Such as disobeyed their decisions, they excommunicated, which was their principal punishment, the criminal being hereby exclnded from all public assemblies, and avoided by all the world; so that no body durst speak to him for fear of being polluted. Strabo observes, they had sometimes interest and authority enough to stop armies upon the point of engaging, and accommodate their differences.

They held an assembly, every year, at a certain season, about the middle of the country; and there, in a place consecrated for the purpose they kept their assizes, and terminated the differences of the people, who flocked thither from all parts.

Cæsar, who had seen some of the *Druids* in Britain, was of opinion, they had come thence into Gaul: divers among the moderns take this for a mistake, and believe the very contrary. In effect, it appears pretty probable, that the ancient Britons were originally Gauls; that some of the Celtæ, or Belgæ, Gaulish nations, were the first that entered our island, and peopled it; and that the *Druids* went along with them.

Hornius, in his History of Philosophy, lib. ii. cap. 12. believes all the learning and philosophy of the *Druids* to have been derived from the Assyrian magi; who are still called in Germany, *trutten*, or *truttner*; and that, as magus has lost its ancient signification, which was honourable, and now signifies a magician, or sorcerer; so *Druid*, which had the same sense, has likewise degenerated, and now signifies no other than a person who has commerce with the devil, or is addicted to magic. And,

accordingly, in Friesland, where there anciently were *Druidi*, witches are now called *Druidi*. Gale, Dickenson, and some others, vainly contend, that the *Druids* borrowed all their philosophy, as well as religion, from the Jews.

There were also women who bore the appellation *Druides*, or *Druidæ*, among the Gauls, &c. The authors of the Historia Augusta, particularly Lampridius, and Vopiscus, make mention of these.

Salmasius, in his notes on Lampridius, is a little in doubt who these women were; but he gives into the most easy and plausible opinion, that they were either the wives or the children of the *Druids*.

DRUM, *Tympanum*, a military musical instrument, said by Le Clere to be an oriental invention, and brought by the Arabians, and perhaps the Moors, into Spain; of use, both among the foot and dragoons, serving to call the soldiers together, and to direct their march, attack, retreat, &c.

The body of the *drum* is made of very thin oak, which is bent into a cylinder, and covered at each end with parchment, which is strained, or braced more or less, according to the height or depth of the sound required, by small cords and sliding leathers; and is then struck with sticks. The depth of the *drum* is equal to its breadth, which does not exceed two feet and a half, because no skins can be had to cover bigger. Every troop of dragoons, and every company of foot or artillery, has two or more *drums*, according to the number of men.

There are also *drums* whose body is of brass, which are of use principally among the horse. See KETTLE-*drums*.

DRUM, or DRUMMER, also denotes a soldier appointed to beat the *drum*. When a battalion is drawn up, the *drums* are on the flanks; and when it marches by divisions, they march between them.

There are divers beats of the *drum*; as the *general march*, *double march*, *assembly*, *charge*, *retreat*, *alarm*, *chamade*, *retraite*, *reveille*, *tattoo*, &c. See ASSEMBLY, CHAMADE, &c.

DRUM-*major*, is that person in a regiment who beats the best *drum*, commands the others, and teaches them their duty. Every regiment has a *drum-major*.

DRUM, in *Anatomy*, or *Ear*-DRUM, denotes a cavity in the inner ear; thus called from the resemblance it bears to the figure of a war-*drum*. See EAR.

Its outer extreme is covered with a membrane, by anatomists called also *tympanum*, *drum*; but, more properly, *membrana tympani*.

The office of this *drum*, or *membrana tympani*, has been greatly controverted by anatomists. The account best warranted is, that being a medium for the conveyance of the sound of the auditory nerve, by its different degrees of tension, it serves to modify the sound, and propagate it to the nerve well proportioned, and commensurate thereto. See HEARING and SOUND.

DRUM, *String of the*. See CHORDA *Tympani*, and EAR.

DRUM *head of a capstan*. See CAPSTAN.

DRUM, *in Architecture*. See TAMBOUR.

DRUM is used to signify a kind of fish in Virginia. The oil of this fish is said to cure pains in the limbs, frequent in that country. See Phil. Trans. N° 454. § 1.

DRUM, *Mire*. See BITTERN.

DRUNGUS, δρυγγος, a body, or company of forces; thus called in the latter times of the Roman empire.

The name *drungus*, as appears from Vegetius, lib. iii. cap. 16. was at first only applied to foreign, and even enemies troops; but, under the Eastern empire, it came in use for the troops of the empire itself; where it amounted, pretty nearly, to what we call a regiment, or brigade.

The same author notes, that δρυγγος, among the modern Greeks, signifies a *staff*, or *rod*, the badge of a dignity, or office, as *ogla* among the Turks; and he thinks, that the name may be formed from the Latin *truncus*. But it appears from Vegetius, that *drungus* is a barbarous, not a Latin word. Spelman takes it for Saxon; because, at this day, *throng*, in English, signifies a *multitude*. Salmasius derives it from δυγγος, *book*; on account of the *drungus*'s being disposed beak-wise, or terminating in a point.

Leunclavius observes, that the *drungus* was not less than one thousand men, nor more than four thousand.

DRUNKENNESS, *Ebriety*, physically considered, consists in a preternatural compression of the brain, and a discomposure of its fibres; occasioned by the fumes, or spirituous parts of liquors. It is accounted for thus: an immoderate quantity of wine taken into the stomach, is there heated, and undergoes a kind of effervescence; which arises the more readily, as the liquor abounds the more in sulphur. By this action it becomes attenuated and rarefied; so that the grosser parts being left behind, its finer parts are fitted to penetrate, and shoot through the veins to the brain, or are conveyed through the veins to the heart; whence, after a farther heat and rarefaction, they are sent through the carotid arteries, &c. to the brain: hence necessarily arises a repletion of the meninges of the brain, and a compression of the fibres of the brain itself, from the fresh stock of rarefied sulphur continually ascending into them: hence, also, arise obstruction of the pores or passages of the brain, a frequent and disorderly pulsation of the fibres, and the other symptoms of this distempered state.

Hence it is, that all liquors will not give *drunkenness*; but only such as, by their sulphur, or spirit, are disposed for an effervescence in the stomach and heart, to diffuse their subtle attenuated parts plentifully to the brain.

It is a popular mistake, that the only remedy for gluttony, is *drunkenness*; or that the cure of a surfeit of meat, is a surfeit of wine; than which nothing can be more contrary to nature. Cheyne.

The ancient Lacedæmonians used to make their slaves frequently *drunk*, to give their children an aversion and horror for this vice. The Indians hold *drunkenness* a species of madness; and, in their language, the same term *ramjam*, that signifies *drunkard*, signifies also a *phrenetic*.

Drunkenness is punishable by the laws of England. The penalty is five shillings fine, or the stocks in case of non-payment. For a second offence the guilty person may be bound to his good behaviour. And an alehouse-keeper convicted of the same offence, shall be disabled to keep any such alehouse for three years. All flag officers and persons belonging to his majesty's ships of war, being guilty of *drunkenness*, are liable to such punishment, as a court martial shall think fit to impose. See stat. 4 Jac. I. cap. 5. 21 Jac. I. c. 7. 22 Geo. II. c. 33.

Hobbes makes voluntary *drunkenness* a breach of the law of nature, which directs us to preserve the use of our reason. The law of England also does not allow it to be an excuse in any case whatsoever.

DRUPE, among *Botanists*, a species of pericarpium, consisting of a soft, fleshy, and succulent pulp, without valves, in the centre of which there is a nucleus. See PERICARPIUM.

DRUSA, in *Natural History*, a name given by some of the Saxon miners to the common pyrites, and by others to some peculiar kinds of it. But in general it is understood to signify both the pyrites and the marcasite.

DRUSES, or DRUSIANS, in *Ecclesiastical History*, a people of Palestine, inhabiting the environs of mount Lebanon, who call themselves Christians, and occasionally profess themselves Mahometans; but all their Christianity consists in speaking with respect of Jesus Christ and the Virgin Mary. They are somewhat jealous of their wives, who only among them know how to read or write. They consider men as destined by their strength, courage, and understanding, to more useful and exalted pursuits than tracing characters upon paper; and are not able to conceive how a man who is capable of bearing arms, can amuse himself with turning over the leaves of a book. They carry on a trade in wine, silk, corn, and saltpetre. They have had several disputes with the Turks, who govern them by emirs, that have several times been strangled by them.

The *Druses* are probably the remains of the Christian armies in the holy war; and they themselves now say, that they are descended from the English; though others say, they are descended from the Franks, whom Godfrey of Bulloign brought with him to the holy war. Pococke's Def. of the East, vol. ii. book i. chap. 1.

DRY. A *dry* air, *cæteris paribus*, lessens the weight of the human body, and the contrary quality increases it. See MOISTURE.

DRY *Baths*, *Confetti*, *Dock*. See the substantives.

DRY *Exchange*, *Cambium siccum*, a soft appellation, anciently used to disguise usury under, intimating something to pass on both sides; whereas, in truth, nothing passed but on one: in which respect it might be called *dry*. See INTEREST and USURY.

Cambium siccum, says Lud. Lopez, de Contract & Negot. *sit cambium non habens existentiam cambii, sed apparentiam, adinstar arboris exsiccatæ, &c.*

DRY *Fish*, *Fruits*, *Meats*, *Measures*. See the substantives.

DRY *Meats*, in the *Manege*, is used for corn and hay. After taking the horse from grass, or house him, he is frequently put to *dry meat*.

DRY *Mount*, *Rent*, *Steran*, *Suture*, *Sporn*. See the substantives.

DRYADES, DRYADS, in the *Heathen Theology*, the nymphs of the woods; a sort of imaginary deities, which the ancients believed to inhabit the woods and groves, and to hide themselves under the bark of the oak, called by the Greeks δρυς.

The

The *dryades* differed from the *hamadryades*, in that these latter were attached to some particular tree, with which they were born, and with which they died; whereas the *dryades* were the goddesses of the trees and woods in general, and lived at large, in the middle thereof. For, though Δρυς properly signifies an oak, it was also used for tree in general.

We likewise find mention made, in divers authors, of a kind of prophetesses, or witches, among the Gauls, called *dryades*, or rather *druides*. See DRUIDS.

DRYERS, in *Painting*, are substances so called from their use in remedying the fault of oils, which dry too slowly. See *Drying* OIL.

DRYAS, in *Botany*, the name of a genus of plants of the *icosandria polygynia* class; called also by some *dryodea*, and by Tournefort and others made a species of the *coryophyllata*. The characters are these: the perianthium is composed of one leaf divided into eight straight, obtuse, equal segments, somewhat shorter than the petals of the flower; the flower consists of eight oblong, expanded, emarginated petals, inserted into the cup: the stamina are numerous, very short capillary filaments inserted into the cup; the antheræ are simple and small; the germina are numerous, small, and set close together; the styles are capillary, and are inserted into the sides of the germina, and the stigmata are simple; there is no fruit, but the seeds stand naked together, and are numerous, and of a roundish compressed figure, and sustain a number of hairy styles. There are two species.

DRYINUS, *Oak-snake*, a species of serpent, so called from its being usually found about hollow oaks. Bellonius, who has mentioned it, says, that scarce any serpent grows to a larger size, or makes a more terrible hissing. Authors in general seem however so little agreed about its description that it is not easy to ascertain the name to any peculiar species of snake.

DRYITES *lapis*, in *Natural History*, a name given by authors to a substance but ill deserving the name of a stone; it being only fossile wood found in detached masses. There is much of this fossile wood found in Italy, in the banks and on the shores of rivers. We know also by what we see of the fossile wood of England, that it may be found in all degrees of petrifaction, from that of almost unaltered wood to absolute stone or mineral matter, with only the superficial grain of wood. See *Fossile* WOOD.

DRYOPEIA, Δρυοπεια, in *Antiquity*, an anniversary day observed in memory of Dryope, one of Apollo's sons.

DRYPIS, in *Botany*, a genus of plants of the *pentandria trigynia* class: the calyx is cut into five segments: the petals are five; and the fruit is a covered capsule, containing a single seed. There is one species.

DS JERENANG, a name by which some authors have called a species of palm-tree, from the fruit of which is procured dragon's blood. Kæmpfer, Amœn. Exot. p. 552.

DUALISM, or DITHEISM, an opinion which supposes two principals, two gods, or two independent uncreated beings, of which one is the first cause of good, the other of evil. See MANICHEES.

DUBBING a *cock*, cutting off his comb and wattles.

DUBIOUS *Acids*. See ACIDS.

DUBITATIVE *Conjunctions*. See CONJUNCTION.

DUCAL. The letters patent granted by the senate of Venice, are called *ducals*: so also are the letters wrote, in the name of the senate, to foreign princes.

The denomination of *ducal* is derived hence; that, at the beginning of such patents, the name of the duke, or doge, is wrote in capitals, thus, *N*—— *Dei Gratia Dux Venetiarum*, &c. The date of *ducals* is usually in Latin, but the body is in Italian. A courier was dispatched with a *ducal* to the emperor returning him thanks for renewing the treaty of alliance (in 1710) against the Turks, with the republic of Venice.

DUCAT, a foreign coin, either of gold or silver, struck in the dominions of a duke; being about the same value with a Spanish piece of eight, or a French crown, or four shillings and sixpence sterling, when of silver; and twice as much when of gold. See COIN.

The origin of *ducats* is referred to one Longinus, governor of Italy; who, revolting against the emperor Justin the Younger, made himself duke of Ravenna, and called himself *Exarcha*, i.e. *without lord or ruler*; and, to shew his independence, struck pieces of money of very pure gold, in his own name, and with his own stamp, which were called *ducati*, *ducats*; as Procopius relates the story.

After him, the first who struck *ducats* were the Venetians, who called them also *Zecchini*, or *sequins*, from Zecca, the place where they first were struck. This was about the year 1280, in the time of John Danduli: but we have pretty good evidence that Roger king of Sicily had coined *ducati* as early as 1240. And Du-Cange scruples not to affirm, that the first *ducats* were struck in the duchy of Apulia, in Calabria. The chief gold *ducats* now current, are, the single and double *ducats* of Venice, Florence, Genoa, Germany, Hungary, Poland, Sweden, Denmark, Flanders, Holland, and Zurich. The heaviest of them weighs five penny-weights seventeen grains, and the lightest five penny-weights ten grains; which is to be understood of the double *ducats*, and of the single in proportion.

The Spaniards have no *ducats* of gold; but, in lieu thereof, they make use of the silver one; which with them is no real species, but only a money of account, like our pound. It is equivalent to eleven rials. See RIAL. The silver ducats of Florence serve there for crowns.

DUCATOON. a silver coin, struck chiefly in Italy; particularly at Milan, Venice, Florence, Genoa, Lucca, Mantua, and Parma: though there are also Dutch and Flemish *ducatoons*.

They are all nearly on the same footing; and, being a little both finer and heavier than the piece of eight, are valued at two pence or three pence more, viz. at about four shillings and eight pence sterling.

There is also a gold *ducatoon*, struck and current chiefly in Holland: it is equivalent to twenty florins, on the footing of one shilling and eleven pence halfpenny the florin.

DUCENARIUS, in *Antiquity*, an officer in the Roman army, who had the command of two thousand men.

The emperors had also *ducenarii* among their procurators, or intendants, called *procuratores ducenarii*. Some say, that these were such whose salary was two hundred sesterces; as in the games of the circus, horses hired for two hundred sesterces, were called *ducenarii*. Others hold, that *ducenarii* were those who levied the two hundredth penny, the officers appointed to inspect the raising of that tribute. In the inscription at Palmyra, the word *ducenarius*, in Greek Δουκηνος, occurs very often.

DUCENTESIMA, in *Antiquity*, a tax of the two hundredth penny, exacted by the Roman emperors.

DUCES *tecum*, a writ commanding one to appear at a day in chancery, and to bring with him some evidences, or other things, which the court would view.

DUCES *tecum licet languidus*, a writ directed to a sheriff, who, having in his custody a prisoner, in a personal action, returns, upon a *habeas corpus*, that he is *adeo languidus*, that, without danger of death, he cannot have his body before the justices.

DUCK, *Anas*, in *Ornithology*, the name of a very large genus of birds, of the order of *anseres*; the characters of which are these: the beak is shorter in proportion than that of the goose, strong, flat or depressed, and commonly furnished at the end with a nail, and the edges divided into sharp lamellæ; and the feet proportionably larger, with the middle toe the longest: the legs are shorter, and are placed farther backward; and the back is flatter, and the body more compressed; the nostrils are small and oval; and the tongue broad, with the edges near the base fringed. Some of these love the fresh waters, others are found only at sea, and of both there are very numerous species. See ANAS.

This fowl is furnished with a peculiar structure of vessels about the heart, which enables it to live without respiration a considerable time under water, as is necessary for it in diving. This made Mr. Boyle think it a more proper object for experiments by the air-pump, than any of the other birds. A full-grown *duck* being put into the receiver of the air-pump, of which the filled one third part, and the air exhausted, the creature seemed to bear it better, for the first moments, than a hen or other such fowl; but after about a minute the gave great signs of discomposure, and in less than two minutes her head fell down, and she appeared dying, till revived by letting in the air. Thus whatever facility of diving, this and other water-fowl may have, it does not appear, that they can subsist without air for respiration, any longer than other animals. A young callow *duck* was afterwards tried in the same manner, and with the same success, being reduced very near death in less than two minutes. But it is observable, that both birds swelled extremely on the pumping out of the air, so as to appear much larger to the spectators, especially about the crop. It not being intended that any water-fowl should live in an exceedingly rarefied air, but only be able to continue on occasion some time under water, nature, though she has provided them with the means of this, has done nothing for them in regard to the other.

The strongest influence of this creature's being calculated to live any where, we have in the accounts of the blind *ducks* of the Zirchnitzer lake in Carniola. It is now well known, that this lake communicates with another lake

lake under ground in the mountain Savornick, and fills or empties itſelf according to the fullneſs or emptineſs of that lake; the waters of the upper lake running off at the time of its emptying by large holes in the bottom, and that in vaſt quantities, the *ducks* which are very plentiful in the water, are often carried down with it, and forced into the ſubterraneous lake the waters retire to. In this unnatural habitation, many of them doubtleſs periſh, but ſome remain alive; theſe become blind and loſe all their feathers, and in the next filling of the lake, both they and vaſt numbers of fiſh are thrown up with the water. They are fat at this time but make a ſtrange appearance in their naked ſtate, and are eaſily caught, for want of ſight to avoid the danger. In about a fortnight they recover their ſight and their feathers, and are then of the ſize of a common wild *duck*, but of a black colour, having a white ſpot upon their forehead. When opened on being taken at their firſt coming up in their blind ſtate, their ſtomachs are found full of ſmall fiſhes, and ſomewhat reſembling weeds. It ſeems from this that they cannot be abſolutely blind, but that the degree of light to which they ſeem accuſtomed in their dark habitation, had formed their eyes to ſee by that ſmall quantity, ſo well as to get their food by it; and their blindneſs on coming into broad day-light again, is no other than that of a man who has been long in the dark, on having in an inſtant a large blaze of candles ſet juſt under his eyes. The eye in neither caſe can bear the ſudden change, and muſt be habituated to it, before it can ſee objects by it. Theſe blind *ducks* are not only caſt up in this lake, but after great rains they are frequently thrown up at a hole in the mountain Storſeg, near the town of Laus. The water guſhing out at this hole with great force on theſe occaſions, brings away with it theſe blind and bald *ducks*; and their frequency on theſe occaſions in theſe places, makes them be eſteemed no rarity: but the common people underſtand that there are under ground lakes, which they inhabit, and out of which they are thus thrown. Phil. Tranſ. N° 191.

There are two ſorts of *ducks* common with us, the tame, and the wild; the *anas boſchas* of Linnæus, and *œconomica* of other authors. The mallard of this ſpecies has its bill of a yelloviſh green; the head and neck are of a deep and ſhining green; more than half round the lower part of the neck is an incompleate circle of white; the upper part of the breaſt is of a purpliſh red, and the beginning of the back of the ſame colour; the breaſt and belly of a pale grey, marked with tranſverſe ſpeckled lines of a duſky hue. The ſcapulars are white, barred with brown; the ſpot on the wing is of a rich purple; the tail conſiſts of twenty-four feathers, the four middle ones of which are black and ſtrongly curled upwards, which diſtinguiſhes the male of this ſpecies from all others: but the females have not this mark. Their plumage is of a pale reddiſh brown, ſpotted with black: the legs are of a ſaffron colour. The common tame ſpecies take their origin from theſe. the drakes, however they vary in colours, always retain the curled feathers of the tail; and both ſexes the form of the bill of the wild kind. Pennant.

The firſt ſort is very beneficial to the huſbandman, and at the ſame time requires no charge to keep, as living on loſt corn, worms and ſnails, &c. Indeed once a year, this fowl is a great layer of eggs; and when ſhe ſits, muſt be carefully fed with barley or other grain. As to the ducklings, they are fed in the ſame manner as goſlins; and may be fattened in three weeks time with any kind of pulſe or grain, and plenty of water.

For preſerving wild *ducks*, a place with a pond in it, muſt be walled in, and covered with a ſtrong net; the pond is to be ſet with tufts of oziers, and have many ſecret holes and creeks; whereby they will be induced to feed freely, though confined. Teal, widgeons, ſheldrakes, and green plovers, may alſo be ordered in the ſame manner. See DECOY.

Of exotics or foreign *ducks*, authors deſcribe many ſpecies; as,

DUCK, *the Black*, or *Velvet*, *Anas nigra*, or *fuſca*. The male of this ſpecies is larger than the tame *duck*. The bill is broad and ſhort, yellow on the ſides, black in the middle, and the hook red: the head and part of the neck is black tinged with green; behind each ear is a white ſpot; and in each wing is a white feather; all the reſt of the plumage is of a fine black, and ſoft as velvet: the legs and feet are red; the webs black. The female is entirely of a deep brown colour, the marks behind each ear and on the wings excepted: the bill wants the protuberance to the baſe which Linnæus gives to the male. This ſpecies is common on the coaſt of Norway, but ſeldom appears with us except in hard winters. Ray and Pennant.

DUCK, *Broſſican*, is about the ſize of a gooſe. Its beak, legs and feet are brown, and its body wholly black, with a green gloſs, except the upper part of the wings, which is white. It has a creſt compoſed of black feathers on its head, and a large red fleſhy tubercle over the origin of the bill, and a naked red membrane round its eyes. It ſits to the top of the higheſt trees, and is a very fleſhy and delicately-taſted bird. Margrave.

DUCK, *St Cuthbert's*, *Anas molliſſima* of Linnæus, and *Eider* of Wormius, is a ſpecies of duck found in the Weſtern iſles of Scotland, and in the Farn iſles, but in greater numbers, in Norway, Iceland, and Greenland, from which a great quantity of ſoft down, called *eider* or *edder*, produced from the breaſt of the bird in breeding ſeaſon, is annually imported. It is much valued for ſtuffing beds, coverlets, &c. The male and female differ very much in this ſpecies: the male very much reſembles the common *duck*, but is about twice its ſize; its bill is black; the feathers of the forehead and cheeks advance far into the baſe, ſo as to form two very ſharp angles; the forehead is of a full velvet black; from the bill to the hind part of the head is a broad black bar, paſſing acroſs the eyes on each ſide. On the hind part of the neck, juſt beneath the ends of theſe bars is a broad pea-green mark, that appears like a ſtain; the crown of the head, the cheeks, the neck, back, ſcapulars and coverts of the wings are white; the lower part of the breaſt, the belly, tail, and quill-feathers, are black, and the legs are green. The female is a duſky brown, ſpotted with black. This ſpecies forms its neſt in the holes of rocks, and among the ſtones on the ſea-ſhore, and lays a number of eggs, which are of a pale olive colour, large, gloſſy, and ſmooth, and well taſted. Ray and Pennant.

DUCK, *Decoy*. See DECOY.

DUCK, *The Fly Catching*, *Anas Muſcaria*, is a name given to a kind of *duck* from its catching flies which play about the waters. This is deſcribed as a diſtinct ſpecies by Mr. Ray ſuppoſes it to be the ſame with our wild *duck*. Linnæus makes it the *Anas Clypeata*, or ſhoveler.

DUCK, *Anas Strepera*, is a ſpecies of *duck* which frequents freſh water, uſually called the *gadwall* and *gray*. It is about the ſize of the widgeon. The bill is black and flat; the head and upper part of the neck are of a reddiſh brown, ſpotted with black; the lower part, the breaſt, the upper part of the back, and the ſcapulars, are beautifully marked with black and white lines; the belly is of a duſky white; the rump above and below is black; the tail aſh-coloured, edged with white; the coverts on the ridge of the wing are of a pale reddiſh brown; thoſe beneath are of a purpliſh red, the loweſt of a deep black; the greater quill-feathers are duſky; the inner web of three of the leſſer quill-feathers is white, which forms a conſpicuous ſpot; the legs are orange-coloured. The breaſt of the female is of a reddiſh brown, ſpotted with black; the back of the ſame colour; and though it has the ſame marks on the wings, they are much leſs bright than thoſe of the male. Ray and Pennant.

DUCK, *Anas Clangula*, or *Platyrynchos*, a ſpecies of *duck* commonly called *golden-eye*, found about the ſea-coaſts, and frequently freſh waters. Its body is ſhort and thick; its head large, of a deep black, gloſſed with green, and its neck ſhort; its beak is ſhort and broad at the baſe, and black; at each angle of the beak there is a large white ſpot, whence the Italians call this bird *quatt' occhi*, or *four-eyes*; the *irides* are of a bright yellow; the neck, ſhoulders, breaſt, and belly, are white, and the back black; the wings are black and white, and the tail is wholly black; the legs are very ſhort, the feet broad, and both of an orange-colour; the hinder toe is ſmall, but is edged on each ſide by a membrane which adds much to its breadth. The head of the female is of a deep brown, tinged with red; the neck grey; breaſt and belly white, coverts and ſcapulars duſky and aſh-coloured; the legs duſky. See *Tab.* IV. *Birds*. N° 50. Ray and Pennant.

DUCK, *broad-beaked*, *Anas Clypeata*, or *Latiroſtra*, a ſpecies of ſea *duck*, known with us by the name of *ſhoveler*. It is ſomewhat ſmaller than the common *duck*; the beak is remarkably broad, whence its name, and grows broader and rounder toward the end, where it is hollowed like a ſhield, and the edges of each mandible are pectinated or ſupplied with thin laminæ, that lock into each other when the mouth is cloſed. The irides are of a bright yellow; the head and upper part of the neck of a blackiſh green; the lower part of the neck, the breaſt, and the ſcapulars are white; the back brown; the coverts of the wings of a fine ſky-blue; thoſe near the quill-feathers tipt with white: the greater quill-feathers are duſky; the exterior webs of thoſe in the middle are of a gloſſy green; the tail is ſhort and variegated with black and white; the belly of a bay colour; the vent-feathers

feathers black, and the legs and feet red. The female has the same marks in the wings as the male, but the colours are less bright. The rest of the plumage resembles that of the common wild *duck*. Ray and Pennant.

DUCK, *Hook-billed*, *Anas adunca*, *rostro incurvato*, is of the shape and size of the common *duck*, but differs from it in the shape of the bill, which is somewhat longer and hooked downwards; and in the head, which is smaller and slenderer. Ray.

DUCK, *Horn*, *Anas cornicenfis*, an American *duck*, described by Nieremberg, and named from the similitude of its note to that of a huntsman's horn. It is very imperfectly described. Ray.

DUCK, *Indian and Lybian*. See *Muficovy* DUCK.

DUCK, *Morillon*, or *Grey-headed*, *Anas glaucion*, is a small species of *teal-duck*, somewhat larger than the teal. The bill is of a yellowish brown; the irides gold-coloured; the head of a dusky ruft colour; round the upper part of the neck is a collar of white; beneath that a broader of grey; the back and coverts are dusky, with a few white lines; the greater coverts dusky, with a few large spots of white; the breaft and belly are white; the tail is dusky; the fide above the thighs black; the legs yellow. This is fuppofed to be the fame with the *capo roffo*. Ray and Pennant.

DUCK, *Muficovy*, *Anas Mofchata*, is the largeft fpecies of the *duck* kind. The general colour both in the male and female is a purplifh black, variegated with white, though the female is fometimes quite white. The beak and feet are red. It has red fleshy protuberances about its beak and eyes; its voice is hoarfe, and fcarce audible, unlefs when it is angry. Its eggs are remarkably round. Ray and Linnæus.

DUCK, *black*, *Anas nigra*. See SCOTER.

DUCK, *Burrough*, *Anas Tadorna*. See TADORNA.

DUCK, *Northern*, *Anas arctica* of Clufius. See PUFFIN.

DUCK, *Scaup*, *Anas marila*, is a fpecies of *duck* fomewhat fmaller than the common *duck*, and of a ftrange diverfity of colours, even in the different birds of the fame fpecies, infomuch, that it is not eafy to find two perfectly alike in a flock of forty or fifty. The beak is blue, and the moft common colours of the other parts are thefe: the head, and part of the neck, are of a greenifh black; the lower part of the neck has fome whitenefs, and the breaft is black; the belly is white, with a mixture of yellow in the lower part, and near the anus it becomes black. The upper part of the neck is a footy black; the middle of the back is white, variegated with dufky browniih lines, and the rump and tail are brown, as are alfo the wings, with fome tranverfe ftreaks of white; the tail is not above two inches long; the legs are bluifh. Thefe birds take their name from feeding on *fcaup*, or broken fhell-fifh.

DUCK, *Long-tailed*, *Anas glacialis*, is a fpecies of *duck* which breeds in the moft northern parts of the world, and only vifits our coafts in the fevereft winters. The bill of this fpecies is fhort, black at the tip and bafe, and orange-coloured in the middle; the feet are red; the head, throat, breaft, and belly, are white; the four middle feathers of the tail are black, and longer than the other, which are white. Linnæus and Pennant.

DUCK, *Pintail*, or *fharp-tailed*, *Anas acuta*, or *caudacuta*, a fpecies of *duck*, fometimes called the *cracker* and *fea-pheafant*, is of the fize of the common wigeon. Its head is all over of a ferruginous brown, but behind the ears there is a flight tinge of purple; its neck is fomewhat longer than that of the wigeon, and its beak of a bluifh black; the head is fmall, and on each fide of it is a white ftreak which reaches down to the throat; the throat is grey, variegated with tranfverfe lines, as is alfo the back; but the fhoulder-feathers are, in a great meafure, black; the tail is grey, with a mixture of white about the edges of the feathers; the two middle feathers are black, and longer than the others, and run out into narrow points, whence this bird has the name of fea-pheafant; the feet are of a lead colour. The female is of a light brown colour, fpotted with black. Ray.

DUCK, *Tufted*, *Anas fuligula*, is fometimes called *capo negro*, *querquedula criftata*, and the little *morillon*. The bill is broad, of a bluifh grey, and the hook black; the irides are of a fine yellow; the head is adorned with a thick but fhort pendent creft; the belly and under coverts of the wing are of a pure white; the quill feathers dufky without; and at their extremities, and part within, white, and the fecondaries are white tipt with black. The reft of the plumage is black, varied about the head, with purple; the tail is very fhort, and conifts of fourteen feathers; the legs of a bluifh grey; the webs black. The female has no creft. Ray and Pennant. For other fpecies of *duck*, See TEAL and WIGEON.

DUCK's *foot*, or *May apple*, *podophyllum*, in *Botany*, a genus of the *polyandria monogynia* claſs. Its characters are theſe: the bud of the flower is enclofed in a large three-leaved empalement, in form of a fpatha or fheath; it has nine roundifh concave petals, plaited on their borders, and fmaller than the empalement; and a roundifh germen, without a ſtyle, crowned by a plaited obtufe ſtigma. The germen turns to an oval capſule of one cell, crowned by the ſtigma, and filled with roundifh ſeeds. There is but one ſpecies, a native of North America.

DUCK's *meat*, *Lemna*, or *Lenticula*, in *Botany*, a genus of the *monoecia diandria* claſs, whoſe characters are theſe: it grows in the water, and is feated at the ſuperficies; its appearance is quite ſimple and foliaceous, and its roots ſlender, capillaceous, and peltated. This genus produces male and female flowers, neither of which have any *corolla*. The calyx is ſingle leaved; the fruit is an unilocular capſule. Boerhaave mentions three ſpecies of this plant.

This is a ſmall plant which frequently covers the whole ſurface of the ponds and ditches, conſiſting only of ſmall round green leaves, having neither flower nor ſeed perceivable; only from the middle of the under ſide of each leaf, ſmall white thready roots.

Duck's meat, is of a cooling, mollifying nature, good to be applied to inflammations, St. Anthony's fire, or the ſhingles; alſo for the gout, either applied by itſelf, or mixed with barley meal. Six ounces of a ſtrong infuſion made in white wine, taken for nine days together, is commended as a cure for the jaundice.

The *duck's meat* is thought to be very cooling and lenifying; ſome apply it as a cataplaſm to eaſe the gout and inflammation of the parts; but the repelling of the humours is to be feared in theſe ſorts of remedies; for which reaſon, to aſſuage the pain of the haemorrhoids, powder two handfuls of *duck's meat* with half an ounce of myrrh; put it all in a linen bag, and bathe the piles with the water which drops through the bag.

DUCK's *meat*, *Starry*, in *Botany*. See CALLITRICHE.

DUCKING, or plunging in water. Olaus Magnus tell us, this was a diverſion anciently practiſed among the Goths, by way of exerciſe; but among the Celtæ, and Franks, it was a ſort of puniſhment. Tacitus likewiſe aſſures us, that it was executed among the ancient Germans, on the lazy and infamous. At Marſeilles, and Bourbon, their men and women of ſcandalous life are condemned to the *cole*, as they call it; that is, to be ſhut up, naked to the ſhift, in an iron cage, faſtened to the yard of a ſhalop, and *ducked* ſeveral times in the river. The ſame is done alſo at Tholouſe, to blaſphemers.

DUCKING is alſo a puniſhment for ſeamen; who are thrown into the ſea from the top of the yard of the main-maſt ſeveral times, according to the quality of their offence. Sometimes a cannon-ball is faſtened to their feet, to make the fall the more rapid.

There is alſo a kind of *dry ducking*, wherein the patient is only ſuſpended by a rope, a few yards above the ſurface of the water: this is a ſpecies of ſtrapada.

The puniſhment is uſually made public by the diſcharge of a cannon.

DUCKING is alſo a penalty, which veteran ſailors pretend to inflict on thoſe, who, for the firſt time, paſs the tropic of Cancer, the equator, or the ſtraights of Gibraltar, in conſequence of their refuſal or incapacity to pay the uſual fine levied on this occaſion.

DUCKING-*Stool*, in our *Cuſtoms*. See CUCKING-*Stool*.

DUCKUP, a word uſed at ſea by the ſteerſman, or him that is at the helm, when either main-ſail, fore-ſail, or ſprit-ſail hinder his ſight ſo that he cannot ſee to ſteer by a land mark, or the like; for then his word is, *duckup* the clew lines of thoſe ſails; and as to the ſprit-ſail, when a ſhot is to be made by a chaſe-piece, and the clew of that ſail hinders the ſight, they ſay, *duckup* the clew lines of the ſprit-ſail; that is, hale the ſail out of the way.

DUCT, DUCTUS, in *Anatomy*, is applied in a general ſenſe to all the canals, or tubes, in the animal body, as veins, arteries, &c. through which the humours or juices are conveyed.

DUCT has alſo a more immediate application to ſeveral particular veſſels: as the

DUCTUS *Alimentalis*, a name given by Dr. Tyſon to the gula, ſtomach, and inteſtines; all which make but one continued canal, or *duct*. This *duct* he makes the proper characteriſtic of an animal.

DUCTUS *Adipoſi*, are little veſſicles in the omentum, which either receive the fat ſeparated from the adipoſe loculi, or cells, or elſe bring it to them; for the extreme fineneſs of theſe veſſels renders it very difficult to trace their origin, or courſe.

Indeed it remains ſomewhat doubtful, whether they be hollow, and real *ducts*; or, whether they be not real

fibres, fuch as are obſerved in the ſpleen, along which the liquid fat does, as Dr. Drake expreſſes it, ſtrill its way, as the eaſieſt it can find. Malpighi, their firſt diſcoverer, inclines to the former opinion. All we know for certain, is, that they terminate in little globules of fat, concerning the uſe and progreſs whereof, much remains to be conſidered.

Malpighi ſtarts a doubt, whether the adipoſe *ducts* may not be propagated from fibres which abound in the ſpleen, or thoſe fibres from them? As alſo, whether there be not yet an undiſcovered communication between the adipoſe membrane and the omentum.

DUCTS, *Aqueous*. See AQUEOUS *Humour*.

DUCTUS *Chyliferus*, or *Roriferus*; the ſame as *ductus thoracicus*. See THORACIC.

DUCTUS *Communis Choledochus*, a large canal, formed by an union of the *ductus* cyſticus, and hepaticus. This *duct*, deſcending about four inches, diſcharges itſelf into the duodenum, by an oblique inſertion, which does the office of a valve, in preventing the regreſs of the bile, conveyed hereby into the inteſtines. See *Tab. Anat. (Splanch.) fig.* 5. *lit.* k. See BILE, and CHOLEDOCHUS.

The *ductus communis* ſometimes opens into the duodenum at the ſame aperture with the pancreatic *duct*.

DUCTUS *Cyſticus*, or *Meatus Cyſticus*, a large canal, about the bigneſs of a gooſe-quill, which ariſing from the neck of the gall-bladder, about two inches diſtance therefrom, joins the porus biliarius; and, together with it, conſtitutes the *ductus* communis. See *Tab. Anat. (Splanch.) fig.* 1. *lit. d. fig.* 5. *lit. g g.*

DUCTS, *Excretory*. See EXCRETORY.

DUCTS, *Galactophorous*. See GALACTOPHOROUS.

DUCTUS *Hepaticyſticus*. See CYST-HEPATIC.

DUCTUS *Hepaticus*, called alſo *Meatus Hepaticus*, and *Biliary Pore*. See *Porus* BILIARIUS.

DUCTUS *Lachrymales*, the excretory veſſels of the glandulæ lachrymales, ſerving for the effuſion of tears. See LACHRYMALIS.

DUCTUS *Pancreaticus*, a little canal, ariſing from the pancreas, and opening into the duodenum; ſerving to diſcharge the pancreatic juice into the inteſtines. See PANCREAS, and PANCREATIC *Juice*.

This *duct*, being firſt diſcovered by Wirſungus, is frequently called *ductus* WIRSUNGIANUS.

DUCT, *Pequets*. See PECQUETS.

DUCTUS *pneumaticus*, in *Ichthyology*, the name of a certain *duct* or canal, found in all thoſe fiſh which have an air-bladder, reaching from that bladder to the orifice of the ſtomach, or ſome other part of it. This *duct* is variouſly ſituated in the different kinds. Artedi Ichthology. See AIR BLADDER.

DUCTUS *Salivales*, the excretory tubes of the ſalival glands; ſerving to diſcharge the ſecreted ſaliva into the mouth. See SALIVAL *ducts*.

DUCTUS *Thoracicus*. See THORACIC *duct*.

DUCTUS *Umbilicales*. See UMBILICALIS *Funiculus*.

DUCTUS *Urinarius*; the ſame as URETHRA.

DUCT, Ductus, in *Building*. See CALIDUCTS, VENTIDUCTS, SEWERS, CLOACA, &c.

DUCTILITY, in *Phyſics*, a property of certain bodies, whereby they become capable of being beaten, preſſed, drawn, or ſtretched forth, without breaking; or whereby they are capable of great alterations in their figure and dimenſions; and of gaining in one way as they loſe in another.

Such are metals, which being urged by the hammer, gain in length and breadth what they loſe in thickneſs; or, being drawn into wire through the holes in iron, grow longer as they become ſlenderer.

Such, alſo, are gums, glues, reſins, and ſome other bodies; which, though not malleable, yet may be denominated *ductile*; inaſmuch as, when ſoftened by water, fire, or ſome other menſtruum, they may be drawn into threads.

Some bodies are *ductile* both when they are hot and cold, and in all circumſtances; ſuch are metals, and particularly gold and ſilver; other bodies are *ductile*, only when they have a certain degree of heat; ſuch as wax, and ſubſtances of the ſame kind, and glaſs; and others again, as ſome kinds of iron, viz. thoſe called by workmen *red-ſhort*, braſs, and ſome other metallic allays, are *ductile* only when cold, and are brittle, when hot.

So that we have two claſſes of *ductile* bodies; the one hard, and the other ſoft; on each of which we ſhall beſtow ſome conſiderations.

The cauſe of *ductility* is very obſcure; as depending, in great meaſure, on hardneſs; than which there is nothing in nature we know leſs of. It is true, we uſually account for hardneſs, from the force of attraction between the particles of the hard body; and for *ductility*, from the particles of the *ductile* body being, as it were, jointed, and entangled with each other.

Inſtead of fanciful hypotheſes to account for *ductility*, we ſhall here entertain the reader with ſome truly amazing circumſtances and phenomena thereof, in the inſtances of gold, glaſs, and ſpider's webs.

Obſerving, however, that the *ductility* of metals decreaſes in the following order: gold, ſilver, copper, iron, tin, lead.

DUCTILITY *of gold*. One of the properties of gold is, to be the moſt *ductile* of all bodies; of which the gold-beaters, and gold wire-drawers, furniſh us with abundant proof. Fa Merſenne, M. Rohault, Dr Halley, &c. have made computations thereof: but they truſted to the reports of the workmen. M. Reaumur, in the Memoires de le'Academie Royale des Sciences, an. 1713, took a ſurer way; he made the experiment himſelf. A ſingle grain of gold, he found, even in the common gold-leaf, uſed in moſt of our gildings, is extended into thirty-ſix and a half ſquare inches; and an ounce of gold, which, in form of a cube, is not half an inch either high, broad, or long, is beat under the hammer into a ſurface of 146 and a half ſquare feet; an extent almoſt double to what could be done in former time. In Fa. Merſenne's time, it was deemed prodigious, that an ounce of gold ſhould form 1600 leaves; which, together, only made a ſurface of 105 ſquare feet.

But the diſtenſion of gold under the hammer (how conſiderable ſoever) is nothing to that which it undergoes in the drawing iron. There are gold leaves, in ſome parts, ſcarce the $\frac{1}{282000}$ part of an inch thick; but $\frac{1}{1130000}$ part of an inch is a conſiderable thickneſs, in compariſon of that of gold ſpun on ſilk in our gold thread.

To conceive this prodigious *ductility*, it is neceſſary to have ſome idea of the manner wherein the wire-drawers proceed. The wire, and thread we commonly call gold-thread, &c. which is only ſilver wire, &c. covered over with gold, is drawn from a large rod of ſilver, uſually about thirty pounds weight, round into a cylinder, or roll, about an inch in diameter, and twenty-two inches long, and covered with the leaves prepared by the gold-beaters, laid over another, till the cover is a good deal thicker than that in our ordinary gilding: and yet, even then, it is very thin; as will be eaſily conceived from the quantity of gold that goes to gild the thirty pounds of ſilver: two ounces ordinarily do the buſineſs; and, frequently, little more than one. In effect, the full thickneſs of the gold on the ingot rarely exceeds $\frac{1}{1000}$, or $\frac{1}{1200}$ part; and, ſometimes not $\frac{1}{2000}$ part of an inch.

But this thin coat of gold muſt be yet vaſtly thinner: the ingot is ſucceſſively drawn through the holes of ſeveral irons, each ſmaller than the other, till it has fine, or finer than a hair. Every new hole leſſens its diameter; but it gains in length what it loſes in thickneſs; and, of conſequence, increaſes in ſurface: yet the gold ſtill covers it; it follows the ſilver in all its extenſion, and never leaves the minuteſt part bare, not even to the microſcope. Yet, how inconceivable muſt it be attenuated while the ingot is drawn into a thread, whoſe diameter is 9000 times leſs than that of the ingot!

M. Reaumur, by exact weighing, and rigorous calculation, found, that one ounce of the thread was 3232 feet long; and the whole ingot 1165520 feet, Paris meaſure, or 96 French leagues; equal to 1264400 Engliſh feet, or 240 miles Engliſh; an extent which far ſurpaſſes what Fa. Merſenne, Furetiere, Dr. Halley, &c. ever thought of.

Merſenne ſays, that half an ounce of the thread is 100 toiſes, or fathoms long; on which footing, an ounce would only be 1200 feet: whereas, M. Reaumur finds it 3232. Dr. Halley makes ſix feet of the wire one grain in weight, and one grain of the gold ninety-eight yards; and, conſequently, the ten thouſandth part of a grain, above one third of an inch. The diameter of the wire he found one 286th part of an inch; and the thickneſs of the gold one 154500th part of an inch. But this, too, comes ſhort of M. Reaumur; for, on this principle, the ounce of wire would only be 2680 feet.

But the ingot is not yet extended to its full length. The greateſt part of our gold thread is ſpun, or wound on ſilk; and, before they ſpin it, they flat it, by paſſing it between two rolls, or wheels of exceedingly well poliſhed ſteel; which wheels in flatting it, lengthen it by above one ſeventh. So that our 240 miles are now got to 274. The breadth, now, of theſe laminæ, or plates, M. Reaumur finds, is only one 8th of a line, or one 96th of an inch; and their thickneſs one 30720. The ounce of gold, then, is here extended to a ſurface of 1190 ſquare feet; whereas, as the utmoſt the gold-beaters can do was, as obſerved, is to extend it to 146 ſquare feet. But the gold, thus exceedingly extended, how thin muſt it be? Fa. M. Reaumur

M. Reaumur's calculus, it is found to be one 175000th of a line, or one 2100000th of an inch; which is fcarce one 13th of the thickneſs of Dr. Halley's gold. But he adds, that this ſuppoſes the thickneſs of the gold everywhere equal, which is no-ways probable; for in beating the gold-leaves, whatever care they can beſtow, it is impoſſible to extend them equally. This we eaſily find, by the greater opacity of ſome parts than others; for, where the leaf is thickeſt, it will gild the wire the thickeſt.

M. Reaumur, computing what the thickneſs of the gold muſt be where thinneſt, finds it only one 315000th part of an inch. But what is the one 315000th part of an inch? Yet this is not the utmoſt *ductility* of gold; for, inſtead of two ounces of gold to the ingot, which we have here computed upon, a ſingle one might have been uſed; and, then, the thickneſs of the gold, in the thinneſt places, would only be the 6300000th part of an inch.

And yet, as thin as the plates are, they might be made twice as thin, yet ſtill be gilt; by only preſſing them more between the flatter's wheels, they are extended to double the breadth, and proportionably in length. So that their thickneſs, at laſt, will be reduced to one thirteenth, or fourteenth millionth part of an inch.

Yet, with this amazing thinneſs of the gold, it is ſtill a perfect cover for the ſilvers the beſt eye, or even the beſt microſcope, cannot diſcover the leaſt chaſm, or diſcontinuity. There is not an aperture to admit alcohol of wine, the ſubtileſt fluid in nature, or even light itſelf, unleſs it be owing to cracks occaſioned by repeated ſtrokes of the hammer. Add, that if a piece of this gold-thread, or gold plate be laid to diſſolve in aqua-fortis, the ſilver will be all excavated, or eat out, and the gold left entire, in little tubules.

It ſhould be obſerved, that gold, when it has been ſtruck for ſome time by a hammer, or violently compreſſed, as by gold wire drawers, becomes more hard, elaſtic, and ſtiff, and leſs *ductile*, ſo that it is apt to be crackt or torn: the ſame thing alſo happens to the other metals by percuſſion and compreſſion. But *ductility* and tractability may be reſtored to metals in that ſtate, by ANNEALING them, or making them red hot. Gold ſeems to be more affected by percuſſion and annealing, than other metals.

As to the DUCTILITY *of ſoft bodies*, it is not yet carried to that pitch. The reader, however, muſt not be ſurpriſed, that, among the *ductile* bodies of this claſs, we give the firſt place to the moſt brittle of all other, glaſs.

DUCTILITY *of Glaſs*. We all know, that, when well penetrated with the heat of the fire, the workmen can figure and manage *glaſs* like ſoft wax; but what is moſt remarkable, it may be drawn, or ſpun out into threads, exceedingly fine and long.

Our ordinary ſpinners do not form their threads of ſilk, flax, or the like, with half the eaſe, and expedition, as the glaſs-ſpinners do threads of this brittle matter. We have ſome of them uſed in plumes for children's heads and divers other works, much finer than any hair, and which bend and wave like it with every wind.

Nothing is more ſimple and eaſy than the method of making them: there are two workmen employed; the firſt holds one end of a piece of glaſs over the flame of a lamp; and, when the heat has ſoftened it, a ſecond operator applies a glaſs hook to the metal thus in fuſion; and, withdrawing the hook again, it brings with it a thread of glaſs, which ſtill adheres to the maſs: then, ſitting his hook on the circumference of a wheel about two feet and a half in diameter, he turns the wheel as faſt as he pleaſes; which, drawing out the thread, winds it on its rim; till, after a certain number of revolutions, it is covered with a ſkain of glaſs-thread.

The maſs in fuſion over the lamp, diminiſhes inſenſibly; being wound out, as it were, like a peloton, or clue of ſilk, upon the wheel, and the parts, as they recede from the flame, cooling, become more coherent to thoſe next to them; and this by degrees: the parts neareſt the fire are always the leaſt coherent, and of conſequence, muſt give way to the effort the reſt make to draw them towards the wheel.

The circumference of theſe threads is uſually a flat oval, being three or four times as broad as thick: ſome of them ſeem ſcarce bigger than the thread of a ſilk-worm, and are ſurprizingly flexible. If the two ends of ſuch threads be knotted together, they may be drawn and bent, till the aperture, or ſpace in the middle of the knot, doth not exceed one 4th of a line, or one 48th of an inch diameter.

Hence M. Reaumur advances, that the flexibility of glaſs increaſes in proportion to the fineneſs of the threads; and that, probably, had we but the art of drawing threads as fine as a ſpider's web, we might weave ſtuffs and cloths hereof, for wear. Accordingly, he made ſome experiments this way; and found he could make threads fine enough, as fine, in his judgment, as any ſpider's web; but he could never make them long enough to do any thing with them.

DUCTILITY *of ſpider's-webs*. See WEB.

DUEL, a ſingle combat, at a time and place appointed, in conſequence of a cartel, or challenge.

The word is uſually derived from *duellum*, uſed by the barbarous Latin writers, *quaſi duorum bellum*.

Duels were anciently allowed by common law, in caſes where proof could not be had. In which view, Fleta defines *duel*, *ſingularis pugna inter duos ad probandum veritatem litis; & qui vincit, probaſſe intelligitur*. Stat. de Finib. Levat. 27 Edw. I.

This *duelling* was ſo general a method of terminating differences among the nobility, that even eccleſiaſtics, prieſts and monks, were not excuſed from the ſame; only, to prevent their being ſtained with blood, they obliged theſe to procure champions to fight in their ſtead; as is ſhewn at large by father Dacheri, in his Spicilegium, tom. viii.

None were excepted from theſe legal *duels*, but women, ſick people, and cripples; and ſuch as were under twenty-one years of age, or above ſixty.

The cuſtom was, for the two champions to enter a liſt, or ſmall incloſure, appointed by the authority of the ordinary judge, not only on criminal occaſions, but on ſome civil ones, for the maintenance of their right.

The monk Sigebert even relates, that a queſtion on a point of law being preſented to the emperor Otho I. viz. whether repreſentation had place in direct ſucceſſion? and the doctors finding themſelves embarraſſed in the reſolution thereof; the emperor remitted the deciſion of ſo critical a point to the judgment of arms, and pitched on two bold fellows to maintain the *pro* and the *contra*. The victory fell to him who contended for repreſentation; in favour of whom a law was immediately made, which is in force to this day.

This cuſtom came originally from the northern nations; among whom it was uſual to end all their differences by arms, as we are aſſured by Paterculus. It afterwards paſſed as a law among the Germans, Danes, and Franks; eſpecially after Gondebaud, king of the Burgundians, admitted it in lieu of ſwearing. Towards the concluſion of the fifth century, M. Godeau, in his hiſtory of the church, VII. cent. ſays, it was the Lombards who firſt introduced into Italy the barbarity of ſingle combats, whence the cuſtom ſpread throughout the reſt of Europe. This mode of trial was introduced into England, among other Norman cuſtoms, by William the Conqueror; but was only uſed in three caſes, viz. one military, in the court-martial, or court of chivalry and honour; the ſecond, criminal, in appeals of felony; and the third, civil, upon iſſue joined in a writ of right, which was the only deciſion of ſuch writ of right after the Conqueſt, till Henry II. with conſent of parliament introduced the alternative of the grand aſſize, or a peculiar ſpecies of trial by jury. See BATTEL.

The preparation for the combat, and the proceſs of it, are deſcribed under the article CHAMPION. We ſhall only farther obſerve, that when the day of combat was come, they made choice of four cavaliers to guard the field; and performed diverſe ceremonies, prayers, oaths, &c. deſcribed by Paſquier, and other authors, and quoted by Du-Cange, who mentions an ordonnance of king Philip the Fair, in 1306, preſcribing the ſeveral rules, conditions, and ceremonies, to be obſerved herein.

The method of trial by *duel* was inſtituted as a way of conſulting Providence, to learn who was the criminal; and it was imagined, that God, thus interrogated, would not fail to declare himſelf in favour of the innocent. But it happened ſo often, that the unjuſt accuſer came off victorious; that they at length began to be convinced, they muſt not preſcribe to his wiſdom, the neceſſity of interrupting the courſe of ſecond cauſes. This was giving rules to murder, and diſguiſing aſſaſſinations under method and meaſure.

Saxo-Grammaticus obſerves, that as early as the year 981, the kings of Denmark had abrogated the proof by *duel*; and in lieu thereof, appointed the proof by red-hot iron, which was alſo annulled in its turn.

But *duels* were condemned before by a council held at Valentia, in 855, where the perſon who killed his enemy, was excommunicated; and the perſon killed was pronounced unworthy of burial. Afterwards, the popes Nicolas I. Celeſtine III. and Alexander III. likewiſe interpoſed; and Frederick I. and II. prohibited them in Germany; Louis VII. began to reſtrain them in France, in the year 1168; and St. Louis proceeded to aboliſh them, but his ordonnance, A. D. 1260, only took place in his own territories, and not in thoſe of his vaſſals. After his example, the counts d'Auvergne and Poictou, and ſeveral other lords, forbad them likewiſe. Philip the Fair following the footſteps of his grandfather, St. Louis, at one time forbad all gages, or pledges of battle; and

and yet be permitted them in four cafes, in the ordonnance above mentioned of the year 1306. The laft *duel* of note was in the year 1547, before king Henry II. between Jarnac and Chaftaignerie, mentioned by Thuanus, and de Serres.

In England, the trial by *duel* is difufed; though the law on which it is founded be ftill in force. It appears from Madox's Hiftory of the Exchequer, that trials of this kind were fo frequent in England, that fines paid on thefe occafions, made no inconfiderable branch of the king's revenue, vol. i. p. 349. The laft trial of this kind was appointed in the year 1631, between Donald lord Rey, or Rhee, appellant, and David Ramfay, efq. defendant, in the painted chamber at Weftminfter. But that quarrel terminated without bloodfhed, being accommodated by Charles I. as was alfo another of the fame kind in 1571, by the interpofition of Queen Elizabeth. Another inftance occurs feven years after that in 1631. Ruffhworth's Obfervations on the Statutes, &c. p. 266. See BATTLE and COMBAT.

DUEL is alfo ufed for a fingle combat on fome private quarrel or occafion. See CHALLENGE.

The *duel* muft be premeditated; otherwife it is only a rencounter.

The folly, or rather madnefs, of *dueling* reigned for fome ages in France; where the flower of the nobleffe perifhed thereby. It is one of the glories of the late Louis XIV. to have ufed all his power and authority for abolifhing *duels*. The fevere edicts and laws he made againft *duelliffs*, have, in a great meafure, put a ftop to the cuftom.

Deliberate *dueling* is by the law of England a fpecies of murder; and accordingly, it charges both the crime and punifhment of murder on the principals; and as fome fay, on their feconds alfo. Blackft. Com. vol. iv. p. 199. And yet, as Dr. Robertfon obferves, fo powerful is the dominion of faffiion, that neither the terror of penal laws, nor reverence for religion, have been able entirely to abolifh a practice unknown among the ancients, and not juftifiable by any principle of reafon; though, at the fame time, it muft be admitted, that, to this abfurd cuftom we muft afcribe, in fome degree, the extraordinary gentlenefs and complaifance of modern manners, and that refpectful attention of one man to another, which, at prefent, render the focial intercourfes of life far more agreeable and decent than among the moft civilized nations of antiquity. Hift. Ch. vol. iii. p. 16, &c. 8vo.

DUKE, DUX, a fovereign prince, without the title, or quality, of king. Such are the *duke* of Lorraine, *duke* of Holftein, &c.

The word is borrowed from the modern Greeks, who call *douces* what the Latins call *dux*.

There are alfo two fovereigns, who bear the title of *grand-dukes*; as, the *grand-duke* of Tufcany, and the *grand-duke* of Mufcovy, now called the *czar*, or emperor of Ruffia. The heir of the throne of Ruffia is now called *grand-duke* of Ruffia. The emperor of Germany is *arch-duke* of Auftria. The king of Poland affumes the title of *grand-duke* of Lithuania.

DUKE, DUX, is alfo a title of honour, or nobility, the next below princes.

The *dukedom*, or dignity of *duke*, is a Roman dignity, denominated *a ducendo*, leading, or commanding. Accordingly, the firft *dukes*, *duces*, were the *duftores exercituum*, commanders of armies. Under the late emperors, the governors of provinces in war-time were intitled *duces*. In after-times the fame denomination was alfo given to the governors of provinces in time of peace. The firft governor under the name of *duke*, was a *duke* of the Marchia Rhætica, or Grifons, whereof mention is made in Caffiodorus; and there were afterwards thirteen *dukes* in the eaftern empire, and twelve in the weftern. The Goths, and Vandals, upon their over-running the provinces of the weftern empire, aboliffied the Roman dignities wherever they fettled. But the Franks, &c. to pleafe the Gauls, who had long been ufed to that form of government, made it a point of politics, not to change any thing therein; and accordingly they divided all Gaul into duchies and counties; and gave the names fometimes of *dukes*, and fometimes of counts, *comites*, to the governors thereof.

In England during the Saxons time, Camden obferves, the officers and commanders of armies were called *dukes*, *duces*, after the ancient Roman manner, without any addition. After the Conqueror came in, the title lay dormant, till the reign of Edward III. who created his fon Edward, firft called the Black Prince, *duke* of Cornwall, which hath ever fince been the peculiar inheritance of the king's eldeft fon, during the life of his father, fo that he is *dux natus, non creatus*. After whom, there were more made; in fuch manner as that their titles defcended to their pofterity. They were created with much folemnity, *per cinctorum gladii, cappaque, & circuli aurei in capite impofitionem*. However, in the reign of queen Elizabeth, A. D. 1572, the whole order became utterly extinct; but it was revived about fifty years afterwards, by her fucceffor, in the perfon of George Villiers, *duke* of Buckingham.

Though the French retained the names, and form of the ducal government, yet, under their fecond race of kings, there were fcarce any fuch things as *dukes*; but all the great lords were called *counts*, *peers*, or *barons*: excepting, however, the *dukes* of Burgundy, and Aquitain; and the *duke* of France, which was a dignity Hugh Capet himfelf held, corresponding to the modern dignity of maitre de palais, or the king's lieutenant.

By the weaknefs of the kings, the *dukes*, or governors, fometimes made themfelves fovereigns of the provinces trufted to their adminiftration. This change happened chiefly about the time of Hugh Capet; when the great lords began to difmember their kingdom, fo that that prince found more competitors among them than fubjects. It was even with a great deal of difficulty they could be brought to own him their fuperior, or to hold of him by faith and homage.

By degrees, what with force, and what by marriages, thefe provinces, both duchies and counties, which had been rent from the crown, were again united to it. But the title *duke* was no longer given to the governors of provinces. From that time *duke* became a mere title of dignity, annexed to aperfon, and his heirs male, without giving him any domain, territory, or juriffiction over the place whereof he is *duke*. All the advantages thereof now conffift in the name, and the precedence it gives.

The *dukes* of our days retain nothing of their ancient fplendor, but the coronet on their efcutcheon; which is the only mark of their departed fovereignty. They are created by patent, cincture of the fword, mantle of ftate, impofition of a cap, and coronet of gold on the head, and a verge of gold in their hand.

The eldeft fons of *dukes* are by the courtefy of England ftyled *marquiffes*, though they are ufually [illegible] their fathers fecond title, whether it be [illegible] or earl; and the younger fons, *lords*, with the [illegible] their chriftian name, as lord James, lord [illegible] and they take place of vifcounts, though not fo privileged by the laws of the land.

A *duke* has the title of *grace*; and being writ to, he is ftyled, in the heralds language, *moft high, potent, and noble prince*. *Dukes* of the blood royal are ftyled, *moft high, moft mighty, and illuftrious princes*.

DUKE, among Hebrew grammarians, is an appellation given to a fpecies of accents, anfwering to our comma. See ACCENT.

DUKE-DUKE, a quality given in Spain to a grandee of the houfe of Sylva, on account of his having feveral duchies from the uniting of two confiderable houfes in his perfon. Don Roderigo de Sylva, eldeft fon of Don Ruy Gomez de Sylva, and heir of his duchies and principalities, married the eldeft daughter of the *duke* de l'Infantado; in virtue of which marriage, the prefent *duke* de Paftrana, who is defcended therefrom, and is grandfon of Don Roderigo de Sylva, has added to his other great titles, that of *duke-duke*, to diftinguifh himfelf from the other *dukes*, fome whereof may enjoy feveral duchies, but none fo conffiderable ones, nor the titles of fuch eminent families.

DULCIFYING. See EDULCORATION in *Chemiftry*.

DULCIMER, a mufical inftrument in the fhape of a fmall cheft or box, with ftrings on the lid of it.

DULCINISTS, in *Eccleffiaftical Hiftory*. See APOSTOLICI.

DULCINO, in the *Italian Mufic*, a wind inftrument, otherwife called *quart fagotto*. It ferves for tenor to the hautboy, and is no more than a little baffoon. Broff. Dict. Muf. in voc.

DULCIS *Affa*, or *Aſa*. See ASA.

DULEDGE, in *Gunnery*, a peg of wood which joins the ends of the fix fellows, which form the round of the wheel of a gun-carriage; and the joint is ftrengthened on the outfide of the wheel by a ftrong plate of iron called the *duledge plate*.

DULIA, *Δουλεια, Service*. See WORSHIP, LATRIA, and HYPERDULIA.

DULKAK, among Arabian writers, a fabulous fea monfter, in form of a man, riding on an oftrich, which is faid to attack fhips, and fight with the men on board. Hoffm. Lex. in voc.

DULMA, a Turkiffh difh, made of any vegetable, as cucumbers, onions, cabbage leaves, &c. ftuffed with forced meat. Pococke's Egypt, p. 183.

DULNESS *of hearing*. See HEARING.

DULWICH *Water*, a well-known mineral water near London. It contains a kind of cathartic bitter falt: it feems not to have any iron in it. Phil. Tranf. N° 461. § 22.

DUM *non fuit compos mentis*, in *Law*, a writ that lies for one, who aliens any lands or tenements while not of found memory or judgment, in order to recover the same from the *alienee*, againſt whom the writ is taken.

DUM *fuit infra ætatem*, in *Law*, a writ which lies for him, who, before he came to full age, made a feoffment of his land, to recover it again of the *vendee*. Fitz. Nat. Br. fol. 202.

DUMBNESS, the ſtate of a perſon who wants the natural uſe of ſpeech.

People born deaf, are ſaid to be all naturally *dumb*, as not being able to learn words.

Dumbneſs is ſometimes the reſult of the want, or even the ill conformation, of the tongue. Yet in the third tome of the Ephem. German. we have an account of a book intituled, Jac. Rolandi Agloſſoſtomographia, ſive Deſcriptio Oris ſine Lingua, quod perfecte loquitur. See TONGUE and MUTE.

When this diſorder ariſes from deafneſs, it ſometimes admits of a cure. See Phil. Tranſ. N° 61, where Dr. Wallace gives an account of two perſons deaf and *dumb*, who were taught to underſtand and ſpeak a language. And in N° 245, the doctor gives an account of his method for this purpoſe.

DUN, in the *Manege*, a colour partaking of brown and black.

DUNDIVER, in *Ornithology*, the name of a water-fowl, eſteemed a diſtinct ſpecies of birds, not only by the vulgar, but by the generality of authors, but being in reality no other than the female MERGANSER or gooſander. This is leſs than the male; the head and upper part of the neck are ferruginous; the throat white; the feathers on the hind part are long, and form a pendent creſt: the back, coverts of the wings, and tail, are of a deep aſh-colour; the greater quill-feathers are black, and the leſſer white; the breaſt and middle of the belly are white, tinged with yellow. The wings, both in this and in the male, are very ſhort in proportion to the ſize of the body; yet they fly along the ſurface of the water very ſwiftly. Ray and Pennant.

DUNG, in *Agriculture*, &c. All kinds of *dung* contain ſome matter, which, when mixed with the ſoil, ferments therein, and by that fermentation, diſſolves the texture of the earth, and divides and crumbles its particles very much. This is the real uſe of *dung* in agriculture; for as to the pure earthy part of it, the quantity is ſo very ſmall, that after a perfect putrefaction, it bears an extremely inconſiderable proportion to that of the earth it is intended to manure.

The fermenting quality of *dung* is principally owing to the ſalt it contains; and yet thoſe, or any other ſalts, applied immediately to the roots of plants, always deſtroy them. This proves, that the buſineſs of the dung is not to nouriſh, but to divide and ſeparate the terreſtrial matter, which is to afford the nouriſhment to vegetables through the mouths of their roots. And the acrimony of the ſalts of *dung* is ſo great, that the niceſt managers of vegetables we have, the floriſts, have wholly baniſhed the uſe of it from their gardens. The uſe of *dung* ſhould be alſo forbid in kitchen-gardens; for it is poſſible to ſucceed full as well without it; and it gives an ill taſte to all the roots and plants that are to ſtand in the earth, in which it is an ingredient. The water of a cabbage raiſed in a garden manured with *dung*, if boiled, is of an intolerable ſtink; but this is not ſo much owing to the nature of the plant, as of the manure uſed to it; for a field cabbage being boiled, the water has ſcarce any ſmell, and what it has, is not diſagreeable.

It is alſo a well known fact in the country, that a carrot raiſed in a garden has nothing of that ſweet flavour, that ſuch as grow in the fields have; but inſtead of this natural reliſh, the garden one has a compound taſte, in which the matter of the manure has no ſmall ſhare. And there is the ſame ſort of difference in the taſte of all roots nouriſhed with ſuch different diet. *Dung* not only ſpoils the flavour of the eſculent vegetables, but it ſpoils the drinkables into the original compoſitions of which it enters: they are obliged to uſe *dung* to the poor vineyards in Languedoc; and the conſequence is, that the wine is naſeous. The poor, who only raiſe a few vines for the wine they drink themſelves, and cannot be at the expence of this manure, have the leſs of it, but then it is better, by many degrees, than the other; and it is a general obſervation which the French expreſs in theſe words, that the poor people's wine in Languedoc is the beſt, becauſe they carry no *dung* into their vineyards. Tull's Horſehoeing Huſbandry, p. 20. Another diſadvantage attending the uſe of *dung* is, that it gives riſe to worms. It is for this reaſon that garden carrots are generally worm-eaten, and field-carrots ſound; and the ſame obſervation will hold good in other vegetables, in the field and in the garden. Vegetable and animal *dung* are, in fact, only the putrefaction of earth, after it has been altered, by paſſing through vegetable or animal veſſels. Vegetable *dung*, unleſs the vegetable be buried alive in the ſoil, makes a much leſs ferment in it than animal *dung* does; but the *dung*, or putrid matter of vegetables, is much more eligible and wholeſome for the eſculent roots and plants, than that of animals is. Venomous animals are found to be very fond of *dung*, and are brought into gardens by the ſmell of the *dung* uſed in them as manure. The ſnakes uſually frequent *dung*-hills, and lay their eggs in them; and gardens where *dung* is much uſed, are always frequented by toads; whereas the fields where roots are planted, are much leſs infeſted by them.

However unneceſſary and prejudicial *dung* is in gardens, it is, however, very neceſſary in the corn-fields; and little can be done without it in the old method of huſbandry. *Dung* is not ſo injurious in fields as in gardens, becauſe it is uſed in much ſmaller quantities, in proportion to the quantity of ſoil; and cabbages, turneps, potatoes, and other things growing in fields, and intended only for the food of cattle, will not be injured by *dung*, tillage, and hoeing all together; for the crops will by this means be the greater, and the cattle will like the food never the worſe. *Dung* is very beneficial in giving very large crops of wheat; and it is found by experience, that the country farmer, at a diſtance from a large town, can never have ſo good crops by all his tillage, as thoſe who live in the neighbourhood of cities, where dung is produced in great plenty, and eaſily had.

The *dung* uſed in fields, beſides its diſſolving and dividing virtue, is of great uſe in the warmth its fermenting gives to the young plants of the corn in their weakeſt ſtate, and in the moſt ſevere ſeaſons; the laſting of this ferment is not eaſily determined, becauſe the degrees of heat are very difficult to be judged of when they become ſmall.

The farmers uſually underſtand by the term *dung*, not only the excrements of animals, with the litter, but every thing that will ferment with the earth; ſuch as the green ſtalks and leaves of plants buried under ground, and the like; and every thing they add to it, except fire.

The uſes of the *dungs* of ſeveral animals are ſufficiently proved every day. They are uſed to repair the decays of exhauſted and worn-out land, and to cure the ſeveral defects in different natural bad ſoils; the faults of which are as different as the nature of the different *dungs* uſed to improve them. Some land is too cold, moiſt, and heavy, and the other too light, and dry; and to improve and meliorate theſe, we have ſome *dung* hot, and light, as ſheep's, horſe's, pigeon's, &c. and others fat and cooling, as that of oxen, hogs, &c. There are two remarkable qualities in *dung*; the one is to produce a ſenſible heat, capable of bringing about great effects; the other is to fatten the ſoil, and render it more fertile. The firſt of theſe is ſeldom found in any but the *dung* of horſes or mules; the great effects of which, when newly made, and a little moiſt, are ſeen in the kitchen-garden, where it invigorates, and gives a new life to every thing, ſupplying the place of the ſun; and to this, in a great degree, we owe all the vegetable delicacies of the ſpring. Beſides, Horſe-*dung* is the richeſt of all improvements that can be had in any quantity for poor hungry lands; yet, when either too new, or when uſed alone, it is very prejudicial to ſome lands; and if ſpread too thin on dry lands in ſummer, it becomes of very little ſervice; the ſun ſoon exhaling all its riches, and leaving it little more than a heap of ſtubble or dry thatch.

Horſe-*dung* is always beſt for cold lands, and cow-*dung* for hot ones; but being mixed together, they make a very good manure for both ſorts of ſoils, and for ſome they are very properly mixed with mud.

Sheep's *dung*, and deer's nearly differ very little in their qualities, and are eſteemed by ſome the beſt of all *dung* for cold clays; for this purpoſe, ſome recommend the beating of them to powder, and ſpreading them thin over the autumn or ſpring crops, at about four or five loads to an acre, after the ſame manner as aſhes, malt-duſt, &c. are ſtrewed. And in Flanders, and ſome other places, they houſe their ſheep at nights in places ſpread with clean ſand, laid about five or ſix inches thick; which, being laid on freſh every night, is cleared out once a week, and with the dung and urine of the ſheep is a very rich manure, and ſells at a very conſiderable price. It is principally uſed for ſtubborn lands. But Mr. Quinteney is of opinion, that it is the beſt of all manure for land in general.

Hog's *dung* is by many recommended as the fatteſt and richeſt of all *dungs*; and is found on experience, to be better than any other kind for fruit trees, apples, pears, and the like. It is alſo a very rich *dung* for graſs; and is

ſaid to do as much good in one load, as any other *dung* whatever in two.

The *dung* of pigeons, hens, and geeſe, are great improvers of meadow and corn land. That of pigeons is unqueſtionably the richeſt that can be laid on corn land; but before it is uſed, it ought to be expoſed for ſome time out of the dove-houſe to the open air, to take off its fiery heat. It is in general very proper for cold clay lands; but then it always ſhould be well dried before it is laid on, becauſe it is apt to clod in the wet. It is beſt alſo to mix it with ſome dry earth, to break its parts, that it may be ſpread the more regularly; and it is in itſelf ſo very rich and hot, as to bear ſuch an admixture without greatly impoveriſhing it. This *dung* is alſo by ſome recommended as better than any other for aſparagus, and ſtrawberries, and for the propagation and culture of the tender garden flowers. The *dung* of pigeons is alſo particularly recommended by Mr. Gentil for thoſe trees whoſe leaves are apt to turn yellow, if they grow in cold ſoils: but for this uſe, it ſhould firſt lie three years in a dunghill, and then be applied ſparingly in autumn, laying about an inch thickneſs of it at the root of the tree, and ſuffering it to remain there till the March following.

The *dung* of poultry being hot, and full of ſalts, tends much to facilitate vegetation, and is abundantly quicker in its operation than the *dung* of animals which feed on the leaves of plants. It is an obſervation of ſir Hugh Plat, that one load of grains will enrich ground more than ten loads of common *dung*; and it is eaſy to infer from hence, that the ſame grain muſt needs be of greatly more virtue, when it has paſſed through an animal body. Human *dung* is alſo a great improver of all cold and ſour lands, but ſucceeds beſt when mixed with other *dungs* or earths, to give it a fermentation.

But for all ſtubborn clayey ſoils, there is no manure ſo good as the cleaning of London ſtreets; the parts of tough land will be more expeditiouſly ſeparated by this than by any other compoſt; and where it is to be had, it is of the greateſt value both for field and garden land. Miller's Gard. Dict.

DUNG, *Geeſe.* This is a very valuable manure, and as uſeful to the farmer as pigeon's *dung*, or that of any other fowl. The ancients thought otherwiſe, and condemned it as prejudicial both to corn and graſs; and many are of the ſame opinion ſtill, but without any foundation in fact. Indeed where corn is high, and when graſs is ready to be mown, theſe birds, if they get among it, will do great damage, by treading it down with their broad feet; but their *dung*, inſtead of being hurtful to the land, does it great ſervice. Near Sutton, in Nottinghamſhire, there is a barren piece of land given by the town for a gooſe-paſture; the geeſe have been kept in it many years; and their dung has ſo enriched it, that it is one of the moſt fruitful pieces of ground in the whole country. There has been an opinion alſo, that cattle feeding on graſs, where theſe creatures had much dunged the ground, would ſuffer by it; but it appears from trial, that cattle are moſt fond of all of thoſe parts of paſtures where the geeſe have dunged moſt; and that they ſuffer no alteration by it, except the growing fat upon it. The *dung* of fowls in general is very enriching to land. And Fowley Iſland, in Lancaſhire, a place ſo called from the abundance of wild fowl continually found on it, is ſo enriched with their *dung*, that it fattens ſheep in a ſurpriſing manner. See COMPOST and MANURING.

DUNG *in Medicine, the properties of.* The following properties are attributed by medical writers to the ſeveral kinds of *dung*.

Neat's *dung*, applied freſh, mitigates inflammations in wounds. The *dung* of goats, eſpecially of ſuch as live on the mountains, drank in wine, cures the jaundice; and exhibited with ſpices, provokes the menſes, and expels the dead feetus. The *dung* of ſheep, applied as a cataplaſm, with vinegar, cures *erpyſipelas*, corns, *thymi*, and *ſcrophæ domes*; burnt and ſpread upon cerate of roſes, it ſerves for the ſame purpoſe. The *dung* of ſwine, dried, and drank in wine or water, ſtops vomiting of blood, and eaſes inveterate pains of the ſides; drank in vinegar, it is effectual in ruptures and ſpaſms; and applied in cerate of roſes, it cures luxations. The *dung* of houſes and aſſes, mixed with vinegar, repreſſes hæmorrhages. The *dung* of cattle, which feed on herbs, dried, infuſed in wine, and drank, is an excellent remedy for the poiſon of the ſcorpion. The *dung* of ſtorks, drank in water, is ſuppoſed to be good for the epilepſy; and the *dung* of a vulture, in a ſuffumigation, is ſaid to expel the dead fœtus. The *dung* of mice, pounded in vinegar, and rubbed on the part, cures an *alopecia*; and drank in muſtum, with frankincenſe, expels the ſtone; uſed in a ſuppoſitory for children, it ſtimulates the belly to excretion. The *dung* of dogs, evacuated in the canicular ſeaſon, dried, and drank in wine, or water, ſtops a looſeneſs. Human *dung*, applied freſh, preſerves wounds from inflammation, and at the ſame time conglutinates them: dried, and rubbed on the parts with honey, it is reported to give relief in a quinſey. The *dung* of the land crocodile, ſerves the women as a coſmetic, to render the ſkin of the face of a lively colour, and ſhining. James Med. Dict.

DUNG-*meets*, or *dung-hills*, in *Huſbandry*, places where ſoils and *dungs* are mixed and digeſted together. For this purpoſe, it is uſual to dig a pit, ſufficient to hold the ſtock of ſoil the huſbandman is capable of making; and to prepare it at the bottom with ſtone and clay, that it may hold the water and moiſture of the *dung*; and it ſhould be ſo ſituated, that the drips of houſes or barns may run into it. Into this pit they caſt refuſe fodder, litter, *dung*, weeds, &c. where they lie and rot together, until the farmer has occaſion for it. Where ſuch a pit is wanting, it is neceſſary to cover the *dung* with turf, or other ſtuff to prevent the ſun and wind from drawing off its virtues. Compoſt *dung-hills*, which are formed by a mixture of earth with *dung*, lime, and other manure, are made with leaſt expence on the field for which they are intended.

DUNG-WORMS, a ſpecies of fly-worms, of a ſhort and ſomewhat flat body, found in great plenty among the cow-*dung* in the months of September and October. Theſe have all their metamorphoſes into the fly ſtate, performed within a ſhell of their own ſkin.

The fly produced from this worm is one of Reaumur's firſt claſs of the two-winged flies; it has a trunk with lips, and has no teeth; it is of the claſs of thoſe with the elliptoid bodies; but its body is remarkably long for one of thoſe, and is compoſed of ſix rings: its head is very round, and nearly of a ſpherical form, and is large in proportion to its body; it has antennæ of the lenticular or battledore form; its reticular eyes are of a deep cheſnut brown; and its three ſmall eyes are placed in the common manner. Its corcelet is of a fine [illegible] green; and its back is not eaſily to be deſcribed as to colour, for it is changeable, and ſeems compoſed of a vio[illegible] and of a deeper and a paler copper colour. The [illegible] part, or belly, is of a pale yellow, and the legs and [illegible] lancets of a yet paler yellow. Reaumur's Hiſt. Inſect. vol. iv. p. 350.

DUNGEON, DONJON, in *Fortification*, the higheſt part of a caſtle built after the ancient mode: ſerving as a watch-tower, or place of obſervation: and alſo for the retreat of a garriſon, in caſe of neceſſity, ſo that they may capitulate with greater advantage.

The word comes from the French, *donjon*, which ſignifies the ſame: and which Fauchet derives from *dominium*, becauſe the dungeon, being the ſtrongeſt part of the caſtle, was uſually the lord's apartment. Menage derives it from *dominus*, or *dominicus*, which in ſome ancient writings we find uſed in the ſame ſenſe. Du-Cange derives the appellation from *duno aut colle ædificatum*, which the barbarous writers have altered into *dunjo*, *dungeo*, *dungio*, *dungio*, *demgio*, and *demnio*.

In ſome caſtles, as that of Vincennes, &c. the *donjon* ſerves as a priſon for perſons they would have the moſt ſecurely kept; whence the general uſe of our word *dungeon*, for a dark cloſe priſon under ground.

DUNKERS, in *Eccleſiaſtical Hiſtory*, a religious ſect at Ephrata or *Dunkir* town, near Lancaſter, in Penſylvania, which took their riſe about fifty years ago, and conſiſting moſtly of Germans. Their name is ſaid to be derived from their mode of baptizing new converts, which is by dipping, after the manner of the Anabaptiſts. Their habit is a kind of long coat or tunic, made of linen, for the ſummer, and woollen for the winter, reaching down to the heels, with a ſaſh or girdle round the waiſt; and a cap, or hood, hanging from the ſhoulders, reſembling the dreſs of the Dominican friars. The men ſhave neither the head nor beard. The men and women have diſtinct habitations and governments: they have for this purpoſe erected two wooden buildings; in each of which there is a banqueting-room, and an apartment for public worſhip; ſo that they never meet together even at their devotions. They live chiefly on roots and vegetables, and eat no fleſh, except on occaſion of their love-feaſts, when the brethren and ſiſters dine together. The *Dunkers* allow of no intercourſe between the brethren and ſiſters, not even by marriage; a regulation not very favourable to their ſubſiſtence and increaſe; and if any break through this reſtraint, and marry, they are removed from communion with the unmarried, to a place about a mile diſtant, called Mount Sion. Their principal tenet is ſaid to be, that future happineſs is only to be obtained by penance and mortification in this life; and that as Jeſus Chriſt, by his meritorious ſufferings, became

became the redeemer of mankind in general, ſo each individual of the human race, by a life of abſtinence and reſtraint, may work out his own ſalvation.

DUNLIN, in *Ornithology*, an Engliſh name of a bird of the ſnipe-kind, or the TRINGA *alpina* of Linnæus. It is of the ſize of the ſmaller ſnipe; its beak is furrowed; its belly is white, variegated with large black ſpots; the head, back, and upper part of the neck, are ferruginous, marked with black ſpots; and the lower part of the neck is white, marked with ſhort duſky ſtreaks; the tail is aſh-coloured; the legs black; and the toes divided to their origin. It is common in watery places, and on the ſea-coaſts in the northern counties of England, and picks up its food out of the mud. They are eſteemed a great delicacy. Ray's Ornitholog. p. 226.

DUNNAGE, in *Sea-Language*, a quantity of faggots, boughs of trees, or other looſe wood, laid in the bottom of a ſhip, either to raiſe the heavy goods which might make her too ſtiff, or to keep the cargo ſufficiently above the bottom, that it may receive no damage from the water, if the ſhip ſhould prove leaky.

DUNTER-*Gooſe*, a ſpecies of the wild gooſe, found in Zeatland. Phil. Tranſ. N° 473. § 8. See *Cuthbert* DUCK.

DUO, in *Muſic*, a ſong, or compoſition, to be performed in two parts only; the one ſung, and the other played on an inſtrument; or by two voices alone.

Duo is alſo when two voices ſing different parts, accompanied with a third, which is a thorough baſe. Uniſons and octaves are rarely to be uſed in *duos*, except at the beginning and end.

DUOBUS, *Pilula ex*, in *Medicine*. See PILLS.

DUODUS, *ſal de*, is *vitriolated* NITRE.

DUODENA *Arteria*, and *Vena*, a branch of an artery, which the duodenum receives from the cœliac; to which anſwers a vein of the ſame name, returning the blood to the porta.

DUODENUM, in *Anatomy*, *the* firſt of *the inteſtina tenuia*, or ſmall guts; being *that* which receives the food half chyliſied from the ſtomach. See *Tab. Anat. (Splanch.) fig. . lit. b and i. fig. 2. lit. c.*

It has its name *duodenum*, as being above twelve fingers breadth long; on which account, ſome call it *dodecadactylum*.

The *duodenum* ariſes from the pylorus, or right oriſice of the ſtomach; whence deſcending towards the ſpine, from right to left, quite ſtraight, it terminates where the circumvolution of the reſt begins.

Its coats are thicker, and its cavity or canal is leſs than any of the other inteſtines. At its lower end are two canals opening into its cavity, one from the liver, and gall-bladder, called the *ductus communis choledochus*; and the other from the pancreas, called *pancreaticus*.

The *duodenum* is quite ſtraight; but the inteſtinum jejunum makes divers windings and inflexions: the reaſon is, that the bile and pancreatic juice, mixing at the beginning thereof, or at the end of the *duodenum*, would otherwiſe precipitate not only the groſs parts of the excrements, but alſo the chyle itſelf, too haſtily. Brunnerus diſcovered a number of ſmall glands in the *duodenum*, which diſcharge a menſtruous lymph; ſo that the digeſtion of the aliment begun in the ſtomach is completed in the *duodenum*.

The deſcription and draughts of the *duodenum*, as given by moſt anatomiſts, appearing faulty, Mr. Monro has endeavoured to rectify their omiſſions and miſtakes in the Med. Eſſ. Edinb. vol. iv. art. 11.

This inteſtine is ſometimes found ſo large, as to be called *ventriculus ſuccenturiatus*.

Authors ſeldom take notice of the *duodenum* as the ſeat or cauſe of any particular diſeaſe; but its diſtention and preſſure on the many veſſels to which it is contiguous, may diſturb the functions of the animal œconomy; and accordingly it is the ſource of many diſorders, which may be relieved by emetics and purgatives.

DUPLA, DUPLE *Ratio*, is where the antecedent term is double the conſequent; or, where the exponent of the *ratio* is 2:—thus 6 : 3 is in a *duple ratio*. See RATIO.

DUPLE, SUB, *Ratio*, is where the conſequent term is double the antecedent; or, the exponent of the ratio is $\frac{1}{2}$: Thus, 3 : 6 is in a *ſub-duple ratio*.

DUPLA *Seſquialtera* } *Ratio*. See RATIO.
DUPLA *Superbipartiens tertias* }

DUPLE *Time*. See TIME.

DUPLICATE, a ſecond inſtrument, or act in writing; or a tranſcript, or copy of another.

The word is formed from the Latin *duplona*, or *duplum*, double.

It is uſual to ſend a *duplicate*, when it is apprehended the firſt diſpatch, &c. is loſt.

DUPLICATE, in *Chancery*, is particularly uſed for a ſecond letter patent granted by the lord chancellor, in a caſe where he had formerly done the ſame. See PATENT.

DUPLICATE *Ratio*, the *ratio* between the ſquares of two quantities. Thus the duplicate *ratio* of *a* to *b* is the *ratio* of a^2 to b^2, or of the ſquare of *a* to the ſquare of *b*.

In a ſeries of geometrical proportions, the firſt term to the third is ſaid to be in a *duplicate ratio* of the firſt to the ſecond; or as its ſquare is to the ſquare of the ſecond: thus in 2, 4, 8, 16, the *ratio* of 2 to 8, is *duplicate* of that of 2 to 4; or as the ſquare of 2 to the ſquare of 4: wherefore, *duplicate ratio* is the proportion of ſquares; as triplicate is of cubes, &c. and the ratio of 2 to 8, is ſaid to be compounded of that of 2 to 4, and of 4 to 8.

DUPLICATE *Root*, among *Botaniſts*, one compoſed of two coats. See ROOT.

DUPLICATION, DOUBLING, in *Arithmetic*, and *Geometry*, the multiplying of a quantity, either diſcrete or continued, by two.

DUPLICATION *of a cube*, is the finding of the ſide of a cube that ſhall be double in ſolidity to a given cube; which is a famous problem cultivated by the geometricians two thouſand years ago.

It was firſt propoſed by the oracle of Apollo at Delphos; which, being conſulted about the manner of ſtopping a plague then raging at Athens, returned for anſwer, that the plague ſhould ceaſe when Apollo's altar, which was cubical, ſhould be doubled. Upon this they applied themſelves in good earneſt, to ſeek the *duplicature* of the cube, which henceforward was called the *Delian problem*.

The problem is only to be ſolved by finding two mean proportionals between the ſide of the cube, and double that ſide; the firſt whereof will be the ſide of the cube doubled, as was firſt obſerved by Hippocrates Chius.

Thus let *x* and *z* be two mean proportionals between *a* and $2a$; then $a : x :: x : z = \frac{x^2}{a}$; and $x : \frac{x^2}{a} :: \frac{x^2}{a} : 2a$; therefore $x^3 = 2a^3$. Suppoſing the ſide of the given altar *a* to be 10, then the cube root of 20, or 2000, found by approximation, will be the ſide of the altar required, nearly.

Eutochius, in his comments on Archimedes, gives ſeveral ways of performing this by the meſolabe. Pappus Alexandrinus, and his commentator Commandine, give three ways: the firſt, according to Archimedes; the ſecond, according to Hero; and the third, by an inſtrument invented by Pappus, which gives all the proportions required.

The ſieur de Comiers has likewiſe publiſhed an elegant demonſtration of the ſame problem, by means of a compaſs with three legs; but theſe methods are all only mechanical.

Re DUPLICATION. See REDUPLICATION.

DUPLICATUM *Arcanum*. See ARCANUM.

DUPLICATURE, in *Anatomy*, a doubling or folding of membranes, or other like part.

Such are the *duplicatures* of the peritonæum, and the omentum, of the pleura, &c.

In the hiſtory of the French academy, for the year 1714, an account is given of a young man, who died at the age of twenty-ſeven years, in the *duplicature* of whoſe meninges there were found little bones, that ſeemed to proceed out of the inner ſurface of the dura mater, and with their acute points ſtimulated the pia mater.

That *duplicature* of the peritonæum, wherein the ancients placed the bladder, is not found by the modern anatomiſts. Dionis.

Fabricius ab Aquapendente firſt diſcovered the *duplicature* of the cuticula.

DUPLODES. See GAMBEZON.

DUPONDIUS, in *Antiquity*, a weight of two pounds; or a money of the value of two aſſes. See AS.

As the as, at firſt, weighed a juſt pondo, or libra; the *dupondius* then weighed two. And hence the name.

And though the weight of the as was afterwards diminiſhed, and of conſequence that of the *dupondius* alſo; yet they ſtill retained the denomination. See POUND, and LIBRA.

DURA *Mater*, or *Meninx*, a ſtrong thick membrane, which lines or covers all the inner cavity of the cranium, and includes the whole brain; being itſelf lined on its inner, or concave ſide, by the pia mater, or meninx tenuis. See *Tab. Anat. (Oſteol.) fig. 4. lit. ee. fig. 6. lit. cc.*

The *dura mater* ſticks very cloſe to the baſis of the ſkull, and its ſutures, by the fibres and veſſels it ſends to the pericranium.

It is faſtened to the pia mater, and the brain, by the veſſels which paſs from one to the other. It gives a coat, or covering, to all the nerves which riſe from the brain; and to the medulla ſpinalis, and all the nerves, which riſe from it.

Its ſurface is rough towards the ſkull, and ſmooth towards the brain. It is a double membrane, woven of ſtrong

ſtrong fibres, which may be plainly ſeen on its inſide, but very little on its outſide next the ſkull; it has three proceſſes made by the doubling of its inner membrane. The firſt reſembles a ſickle, and is therefore called *falx*. The ſecond ſeparates the cerebrum from the cerebellum, down to the medulla oblongata, that the weight of the cerebrum may not offend the cerebellum, which lies under it. This proceſs is very ſtrong and thick, and in ravenous beaſts for the moſt part it is bony, becauſe of the violent motion of the brain. The third is the ſmalleſt, and ſeparates the external ſubſtance of the hind parts of the cerebellum into two protuberances.

In the *dura mater* are ſeveral ſinuſſes, or channels, which run between its internal and external membranes; the four principal ones are the ſinus longitudinalis; the ſecond and third ſinuſſes are called *lateroles*; and the fourth, *torcular*. Beſides theſe there are more of inferior note, mentioned by anatomiſts, as Du Verney, Dr. Ridley, &c. Their uſe is to receive the blood of the adjacent parts from the veins, to which they ſerve as ſo many trunks, and to diſcharge it into the internal jugulars.

The veſſels of the *dura mater* are, firſt, a branch from the carotid, while it is in its long canal, which is diſperſed in the fore and lower part of the *dura mater*; ſecondly, an artery, which enters the hole of the ſkull, called *foramen arteriæ duræ matris*: it is diſperſed on the ſides of this membrane, and runs as high as the ſinus longitudinalis; the vein which accompanies the branches of this artery goes out of the ſkull, by the foramen lacerum. Thirdly, a branch of the vertebral artery, and vein, which laſt paſſes through the hole behind the occipital apophyſes, where they are diſperſed in the hind part of the *dura mater*. It has alſo nerves from the branches of the fifth pair, which give it an exquiſite ſenſe. It has a motion of ſyſtole, and diaſtole, which is cauſed by the arteries which enter the ſkull. No doubt, the great number of arteries in the brain contribute more to it, than thoſe few peculiar to itſelf: theſe may aſſiſt a little, though not very ſenſibly, becauſe of their ſmallneſs and paucity.

The uſe of the *dura mater* is to cover the brain, the ſpinal marrow, and all the nerves; to divide the cerebrum into two, and hinder it from preſſing the cerebellum.

DURA *Portio*. See PORTIO.

DURABLE *Fortification*. See FORTIFICATION.

DURALE, or DURO, in the *Italian Muſic*, ſignifies hard, harſh, or, more properly, ſharp. This name is given to B natural, becauſe its ſound is ſharp, when compared with B mol, or flat.

DURANTA, in *Botany*, a genus of the *didynamia angioſpermia* claſs. Its characters are theſe: the flower is of the ringent kind, with one petal, which is erect and concave, and hath an empalement divided into five equal ſegments; it hath four ſhort ſtamina, the two middle ones ſhorter than the others; the germen which is ſituated under the flower, afterwards becomes a globular berry, with one cell, incloſing four angular ſeeds. There are two ſpecies, which being natives of warm countries, require a ſtove to preſerve them in winter.

DURATION, an idea we get by attending to the fleeting, and perpetual periſhing parts of ſucceſſion.

The idea of ſucceſſion we get by reflecting on that train of ideas, which continually follow one another in our minds, while awake. The diſtance between any parts of this ſucceſſion is what we call *duration*; and the continuation of the exiſtence of ourſelves, or any thing elſe commenſurate to the ſucceſſion of ideas in the mind, is called our *own duration*, or that of the thing co-exiſting with our thinking. So that we have no perception of *duration* when that ſucceſſion of ideas ceaſes.

Duration, in Mr. Locke's philoſophy, is a mode, or modification of ſpace.

The ſimple modes of *duration* are any length, or part thereof, of which we have diſtant ideas; as hours, days, weeks, months, *years*, time, eternity, &c.

Duration, as marked by certain periods and meaſures, is what we properly call *time*.

1. By obſerving certain appearances at regular, and ſeemingly equidiſtant periods, we get the ideas of certain lengths and meaſures of *duration*, as minutes, hours, &c. 2. By being able to repeat thoſe meaſures of time as often as we will, we come to imagine *duration* where nothing really endures, or exiſts: thus we imagine to-morrow, next year, yeſterday, &c. 3. By being able to repeat ſuch idea of any length of time, as of a minute, year, &c. as often as we will, and add them to one another, without ever coming to an end, we get the idea of eternity.

Time is to *duration*, as place is to ſpace, or expanſion. They are ſo much of thoſe boundleſs oceans of eternity and immenſity, as is ſet out, and diſtinguiſhed, from the reſt; and thus they ſerve to denote the poſition of finite, real beings, in reſpect of each other, in thoſe infinite oceans of *duration* and ſpace.

DURATION *of action*. See ACTION.

DURATION *of an eclipſe*. See ECLIPSE.

DURATION, *ſcruples of*. See SCRUPLE.

DURATION *of a total eclipſe*. See ECLIPSE.

DURATI *N of ſound*, in *Muſic*. See SOUND.

DURE, Door. See SOUTH-*Dore*.

DURESSE, *Herefhip*, in *Law*, is where a perſon is kept in priſon, or reſtrained of his liberty, contrary to order of law; or is threatened to be killed, maimed, or beaten. In which caſe, if a perſon ſo in priſon, or in fear of ſuch threats, make any ſpecialty, or obligation, by reaſon of ſuch impriſonment, or threats, ſuch deed is void in law; and in an action brought on ſuch ſpecialty, the party may plead, that it was brought by *dureſs*.

DURION, in *Natural Hiſtory*, the name of a fruit common in China and the Eaſt Indies, and eſteemed by the Indians the ſweeſt of all fruits; but the Europeans do not eſteem it ſo highly, becauſe of its diſagreeable ſmell. The tree which bears it is large and much branched, and its wood is like that of the beech. The leaves are of a very ſingular figure, being about ſix inches long, and ſixteen or eighteen inches broad; they terminate in a long and ſlender point. The upper ſide of the leaves is of a duſky green, the under ſide is whitiſh, with ſome yellow ſpecks. The leaves grow on ſhort pedicles, which are joined to the ſtalks by a protuberance or oblong knot. The fruit grows to the large bunches, adhering to their middles by a ſtrong wood ſtalk. It is of the ſize of an ordinary melon, and of a conic ſhape, pointed at the extremity, and is all over beſet with prickles reſembling thoſe of a hedge-hog; they are green, and very large and thick. When thoroughly ripe, the fruit opens at the extremity into five parts, and the cracks or openings running by degrees up to the top, the inner ſurface or pulp is diſcovered. This is of a whitiſh colour, and of a very agreeable flavour, which may not unaptly be compared to that of cream and ſugar; but it is of a moſt intolerable ſtiffence. This fruit contains in every compartment five large ſeeds, perfectly reſembling the common cheſtnut, but that they have no other covering than their own ſkin. The fruit itſelf, were the ſmell as agreeable as the taſte, would vie with any fruit in the world; but its exceeding agreeable ſcent requires time and cuſtom to enable any one to bear it; but uſe makes the natives wholly diſregard it. The ſmell is very like that of onions, that have lain in heaps till they are very rotten. The fruit is not only agreeable to the taſte, but of a very cordial virtue; but it will intoxicate if eaten in a large quantity, eſpecially ſuch of the fruits as are of a yellowiſh colour. The natives make debauches with it, as our poorer people do with ſpirituous liquors. But it is not ſo eaſily come at as thoſe, and therefore is very fatal to many families among them, who will ſell their liberties for a time to purchaſe enough of it for a debauch. Mem. Acad. Sc. Par. 1699.

DURSIANS, or DURSIANS, in *Eccleſiaſtical Hiſtory*. See DUTCH.

DURUNEGI, in the *Materia Medica*, a name given by the Arabian writers to the root of the doronicum, which is ſo well deſcribed by Avicenna, that we are very well informed of its nature, and find it to be the root of the ſame plant, which we at this time know by that name. He ſays it came to them in pieces, looking like the ſhort joints of a woody root; and that it was either yellow or white on the inſide, and of a greyiſh colour on the ſurface, and that it was conſiderably hard and ponderous. The doronicum we know at this time has a root that very well anſwers theſe characters; and though yellow, when freſh, is very apt to become whitiſh in decaying.

The name *durunegi* is a very plain copy of the Greek name of the ſame plant, which is not doronicum, as might be ſuppoſed from the Latin doronicum, but *doraxacus*, or *taraxacum*. The change of the ζ into γ, or the γ into a ζ, is very common in the turning of Greek into Arabic, or Arabic into Greek names. Thus the ardour of the Greeks, is the gehur of the Arabians, and ſo in a thouſand other inſtances.

The word *durunegi*, or, as it is ſometimes written *durenegi*, is however ſometimes made to expreſs another plant, whoſe ſhape, as well as virtues, are very different from that above mentioned.

We have at this time two plants of the doronicum kind, the one called thora, and the other antithora, the one allowed to be a poiſon, the other by many eſteemed an alexipharmic. The thora, or poiſonous kind, is yellow within, and the antithora is white. Theſe may probably be the two kinds of *durunegi* mentioned by the Arabians; and if ſo, the poiſonous qualites of the one, and the virtues of the other, ſtand on a higher record than many have ſuppoſed. Theſe two roots were lately ſent over

into England among our parcels of gentian, and did much mischief, many people suffering greatly by the bitter infusions in which they made a part. This was probably owing wholly to the thora, or yellow root, which has a poisonous smell; not to the other, which has all the appearances of being innocent.

DUST, minute and almost insensible particles broken off from any hard body.

Those broken from stones, or formed of extremely small stones, are more properly called SAND.

The subtle matter of Des Cartes is a sort of *dust* produced by the collision of the matter of the second element.

DUST, *Gold*, and *Lead*. See the respective articles.

DUST, *magic*. See BYSTUS.

DUTCH *Cures, Fortification, Pens, Pitch, Telescope, Tyles, Treacle Companies, Metaphors*. See the substantives.

DUTCHY, in *Geography*, an appellation given to the dominions of a duke. See DUKE.

DUTCHY-*Court*. See COURT.

DUTY, in a moral sense. See OFFICE.

DUTY *of marriage*. See MARRIAGE.

DUTY, in *Policy*, and *Commerce*, an impost laid by authority of a prince &c. on merchandizes and commodities, either of his own country, or brought from abroad; towards supporting the expences of the government. See CUSTOMS, FUND, and TAXES.

The general principle on which all *duties* and customs should be laid on foreign merchandizes, which are imported into these kingdoms, are such as tend to cement a mutual friendship and traffic between one nation and another; and therefore due care should be taken in laying them, that they may answer this end, and be reciprocal in both countries; and they should be laid in such a manner, that the exports of this nation may, at least, be equal to our imports from those nations with which we trade; so that a balance of money should not be ifsued out of Great Britain to pay for the goods and merchandizes of other countries; to the end that no greater number of our land-holders and manufacturers should be deprived of their revenues arising from the product of the lands, and the labour of the people, by foreign importations, than by exportations to such countries. Dict. of Commerce, art. DUTIES.

The *duties* on various kinds of commodities are infinite.

The principal are, the

DUTIES *of exportation*, and *importation*, paid upon the bringing in, or carrying out, of the diverse kinds of goods, animals, and even persons; agreeable to the tariffs settled between the several nations. See EXPORTATION, &c.

There is no state in Europe, or perhaps in the world, where the *duties* of exportation and importation are so many, and so considerable, as in England. The two principal are the *duties* of tonnage and poundage. The first charged on liquors, in proportion to their measure, and contents. See TONNAGE. The second on the other commodities, and paid according to their value, settled in a tariff. See POUNDAGE.

These two *duties*, which have a long time been on foot in England, were re-established at the restoration of king Charles II. in 1660, upon the parliament's annulling all the laws made under Cromwell, and decreeing the execution of the ancient ordinances.

To these there have been several new *duties* added since that time; some of them for liquids, and the others on other kinds of commodities.

The DUTIES *on liquids*, are the ancient *duty* of tonnage, or old subsidy; the additional *duty*; *duty* of excise, *duty* of coinage, the old imposition, the additional imposition, the orphans money, the *duty* on French wines, the new subsidy, the *duty* on Hungary wines, and the one third, and two third subsidies, &c. See COINAGE, EXCISE, ORPHAN's *Money*, SUBSIDY, &c.

The DUTIES on other commodities, are the ancient *duty* of poundage, the additional *duty* of 1660, on linens and silks; the new imposition of poundage, called the *impost of* 1690; another imposition of four fifths in 1693; the *duty* of 25 *per cent* on French goods, imposed in 1695; the new subsidy of poundage in 1697; another additional subsidy of a third of poundage in 1703; another third in 1704; a *duty* on fish, oils, and whale-fins, in 1709; another on leather, vellum, and parchment, in 1711; a second on the same goods, in 1712; and lastly, in the same year, a *duty* on paper, paste-board, and soap. See IMPOST, POUNDAGE, &c. and the principal articles of commerce.

The English merchants, it is to be observed, are not obliged to pay these several *duties* before twelve months; nor foreigners before nine; giving security for the same. Or if they pay ready money, there is a deduction made them of 5 *per cent.* on the old new third, and two third subsidy, and on the other *duties* six, and one fourth *per cent.* Add, that if these merchandizes be again exported into other countries, after they have been entered in England, the *duties* are returned; though this only within the compass of a year to natives, and of nine months to foreigners. See ALIEN *Duty*.

In Spain, the *duties* of export and import are called *duties of alcavala*, and amount to about 5 *per cent.* of the value of the goods; for instance, the piece of velvet of forty Spanish varas, or yards, pays twenty rials; hats of Vigonia, five rials a-piece; linens, 224 rials *per* 100 varas; gold and silver laces, 2 rials 3 quarters the mark weight. The *duties* of exportation are nearly on the same footing.

In Portugal, the *duties* of importation were anciently the same on all kinds of goods, viz. 18 *per cent.* of the value. But since the year 1667, silks have been excepted out of the general tarif, and reduced to 13 *per cent.* For exportation the *duties* are only 6 *per cent.*

In Holland, the *duties* of *exportation* and *importation*, are nearly alike; both of them being about the rate of 5 *per cent.* on the value of the goods. At Hamburgh and Bremen, the *duties* are but 1 *per cent.* At Lubeck, three aths *per cent.* In Muscovy, they are 5 *per cent.*

At Venice, their *duties* at 6¾ *per cent.* for what the natives import; and 10¾ to Strangers; the *duties* of exportation at 9 *per cent.* At Leghorn, the *duties* of exportation and importation are very inconsiderable; but, with the addition of a number of petty dues, they become as great as at Venice.

In the ports of the Levant, Constantinople, Smyrna, Aleppo, &c. the *duties* of *exportation* and *importation* are nearly on an equal footing, viz. 3 *per cent.* except to the Venetians and Jews, who pay 5 *per cent.* The consuls *duties* are likewise to be added for Smyrna, &c. which are about 2 *per cent.*

At Cairo, Alexandria, and some other cities of Egypt, the *duties* are of two kinds: one for goods brought in ships from Europe; the other for those brought by the caravans from Asia. The first are fixed at 20 *per cent.* the second are arbitrary, but they are always very high. Beside the ordinary *duty*, they here pay the golden *duty*, which is the tenth part of what is paid for the first *duty*. As to *duties* of exportation, they may be said to pay none, the 1¼ *per cent.* being rather the custom-house fee, than any *duty* paid the sovereign.

DUTY, in the *Military Art*, is the exercise of those functions that belong to a soldier; with this distinction, that mounting guard, and the like, where there is no enemy directly to be engaged, is called *duty*; but marching to meet and fight an enemy is called going on service.

DUUMVIR, a general appellation among the ancient Romans, given to magistrates, commissioners, and officers, where *two* were joined together in the same function. So that they had almost as many *duumviri*, as they had officers joined two by two in commission.

There were *duumviri* to direct the building, repairing, and consecrating of temples and altars; *capital duumviri*, who took cognizance of crimes, and condemned to death; *duumviri* of the marine, or navy, &c. But the most considerable of the *duumviri*, and those usually thus called by way of eminence, were the

DUUMVIRI *Sacrorum*, created by Tarquin, for the performance of sacrifices, and keeping of the Sibyla books. These were chosen from among the nobility, or patricians; and held their office for life: they were exempted from serving in war, and from the offices imposed on the other citizens; and without them the oracles of the sibyla could not be consulted.

The commission lasted till the year of Rome 388, when, at the request of C. Licinius, and L. Sextius, tribunes of the people, they were changed into *decemviri*; that is, in lieu of *two* persons, the trust was committed to *ten*, who were half patricians, half plebeians.

Sylla added five more to their number, upon which they became denominated *quindecemviri*; their body was afterwards much increased, and at length amounted to sixty; yet still it retained the denomination of *quindecemviri*.

They were entirely abolished under the emperor Theodosius, along with the rest of the heathen superstitions.

DUUMVIRI, *the capital*, *Duumviri Perduellionis*, were not ordinary magistrates; but created only on certain occurrences. The first commissioners of this kind were those appointed to judge the surviving Horatius, for killing his sister, after vanquishing the Curiatii.

There were also *duumviri* in the Roman colonies; who held the same rank and authority in their respective colonies, that the consuls held at Rome. They were chosen out of the body of decurions, and wore the prætexta, or robe bordered with purple.

We also read of *municipal duumviri*, whom Vigenere compares

parts to our sheriffs, or rather mayors of towns, whose authority lasted only five years.

DUUMVIRATE, DUUMVIRATUS, the magistrature, office, or dignity, of the *duumviri*. See DUUMVIR.

DUYT, in *Commerce*, a Dutch copper coin.

DWALE, or DWAL, in *Heraldry*, the herb-night-shade; used by such as blazon with flowers and herbs, instead of colours and metals, for sable, or black.

DWARF. See PYGMY, and STATURE.

Dwarfs were called *nani* and *nanæ* amongst the Romans; and were held in such request, that artificial methods were used in order to prevent the growth of boys designed for *dwarfs*, by enclosing them in a box, or binding them with bandages. Augustus's niece Julia was very fond of one of these *dwarfs* called Sonopas, who was only two feet and a hand-breadth high.

In the Philosophical Transactions we have well authenticated accounts of two *dwarfs*; one born in Norfolk, who, at the age of twenty-two, weighed no more than thirty-four pounds with all his clothes on, and whose height, including hat, wig, and shoes, was only thirty-eight inches; and another in Wales, who, at the age of fifteen, measured no more than two feet seven inches, and weighed only thirteen pounds; and who, at that early period of life, laboured under all the infirmities and calamities of very old age. Phil. Trans. vol. xlvi. p. 67. and vol. xlvii. p. 379.

DWARF-*trees*, a sort of diminutive fruit-trees, frequently planted in the borders of gardens; thus called from the lowness of their stature.

Dwarf-trees were formerly very much in request in gardens, but since the introducing of espaliers, they are much neglected. The manner, however, of propagating *dwarf* pears, which have been found to succeed the best of any *dwarfs*, is this: they are to be grafted on a quince stock, and that at about six inches above the ground; and when the bud has shot so far as to have four eyes, it is to be stopped, to give rise to lateral branches. Two years after the budding, the trees will be fit to transplant to the spot where they must remain. They should be set at five and twenty, or thirty feet square distance, and the ground between may be sown or planted for kitchen use, while the trees are young, only observing not to plant too near their roots. There should be stakes driven down all round the tree, to which the branches must be nailed with list while they are young, training them into a horizontal direction, and no branches are to be suffered afterwards to cross one another; and in shortening the shoots, the uppermost eye must always be left outwards. The summer and autumn pears are those which do best in *dwarfs*, for the winter ones never succeed well on them.

Apples are also sometimes planted as *dwarfs*, and are for this purpose most commonly grafted on paradise stocks. These spread much less than the pears, and therefore need only be set at about eight feet distance. Some also plant apricots and plums for *dwarfs*; but these being of a more tender constitution seldom succeed well. Miller.

See ESPALIER.

DWARF-*fern*. See *Dwarf*-FERN.

DYADIC *Arithmetic*. See ARITHMETIC.

DYE, in *Architecture*, the trunk of the PEDESTAL; or that part between the base and the cornice; being so named, because it is frequently made in the form of a cube, or *die*. See *Tab. Archit. fig.* 24, 25, 26, 27, 28. It is also called *dado*, by the Italians; and by Vitruvius, *truncus*.

DYE is also used for a cube of stone, placed under the feet of a statue, and over its pedestal, to raise it, and shew it the more.

DYER'S *Bluck*. See BLACK.

DYER'S *Blue*. See BLUE.

DYER'S *Broom*, the name of a species of genista. See BROOM.

DYER'S *Green*. See GREEN.

DYER'S *Weed* in *Botany*, the *luteola* of Tournefort, and a species of the *reseda* in the Linnæan system. For the generic character, see *Bale* ROCKET.

It grows in most parts of the world. The Greeks, of old, used it in dying yellow, as we do at this time, and called it *cynoreæ*, and sometimes *thapsos*, that word signifying, with them, several different things which had the property of dying yellow. It was called also by some *rubia*, or *rubia*; but those who gave it this name have always distinguished it by some peculiar epithet from the common *rubia*, or madder. Paulus Ægineta mentions it as an herb used in dying cloths; and Neophytus, and several others, give it a place among the things used to tinge the hair. See WELD.

DYER'S *Yellow*. See YELLOW.

DYING, the art, or act, of tinging cloth, stuff, or other matter, with a permanent colour, which penetrates the substance thereof.

Dying differs from bleaching, or whitening, which is not the giving of a new colour, but the heightening of an old one. It also differs from painting, gilding, marbling, and printing, or stamping; because the colours in these only reach the surface.

Dying may be defined, the art of colouring wool, linen, cotton, silk, hair, feathers, horn, leather, and the threads, and webs thereof; with woods, roots, herbs, seeds, and leaves; by means of salts, fumes, lixiviums, waters, heats, fermentations, macerations and other processes.

Dying, with regard to the manner of applying the colours, is divided into *hot*, and *cold*.

DYING *hot*, Ὀπταξις, is that wherein the liquors and ingredients are boiled, before the cloth be dipped therein; or even where the cloths themselves are boiled in the *dye*.

DYING *cold*, Ψυχρόβαφον, is where the ingredients are dissolved cold, or at least suffered to grow cold, before the stuffs be put into them. Vide Savar. D. Comm. tom. ii. p. 1667. voc. *Tinture*. Salmas. Exerc. ad Solin. tom. ii. p. 1167.

DYING, *origin and progress of*. The *dying* art is of great antiquity, as appears from the traces of it in the oldest sacred as well as profane writers. The honour of the invention is attributed to the Tyrians; though what lessens the merit of it is, that it is said to have owed its rise to chance. The juices of certain fruits, leaves, &c. accidentally crushed, are supposed to have furnished the first hint. Pliny assures us, that, even in his time, the Gauls made use of no other *dye*. It is added, that coloured earths, and minerals washed and soaked with rain, gave the next dying materials. But the purple, an animal juice, found in a shell-fish called *murex*, *conchylium*, and *purpura*, seems from history to have been prior to all of them. This, indeed, was reserved for the use of kings and princes; private persons were forbidden, by sumptuary laws, to wear the least scrap of it. The discovery of this valuable quality is said to have been taken from a dog, which, having caught one of the purple fishes among the rocks, and eaten it up, stained his mouth and beard with the precious liquor; which struck the fancy of the beautiful nymph Io strongly, that she refused her lover Hercules any favours, till he had brought her a mantle of the same colour.

Pliny seems to ascribe the invention of the art of *dying* wools to the Lydians of Sardis: *Inferre lanis Sardibus Lydi*; where the word *inseperre* must be understood. But a modern critic suspects a false reading here; and not without reason, for *Lydi*, substitutes *Lydos*, the name of a city on the coast of Phœnicia, where the chief mart of the *purpurdæ* was. Plin. Hist. Nat. lib. ix. cap. 60. Hardou. not. ad loc. Nunez, in Sch. Chald. tom 22. p. 193, seq.

After the Phœnicians, the Sardinians seem to have arrived at the greatest perfection in the *dying* art; insomuch that βαφαι Σαρδιανικαι, *Sardianæ dyæ*, passed into a proverb among the Greeks. Aristophanes in two places, to express a thing red as scarlet, compares it to the βαφαι Σαρδιανικαι. Salmasius, Palmerius, and Spanheim, instead, for Σαρδιανικαι substitute Σαρδονικαι; which they suppose a peculiar sort of Sardis, and to denote *Sardian dye*; but Nunez, in a dissertation expressly on the subject, has strenuously supported the pretensions of his country against this innovation. Aristoph. in Acharnan. v. 112. item Pax. v. 1174. L. Paul. Nunez Diss. de Varia Lectione Adagii ΒΑΜΜΑ ΣΑΡΔΙΝΙΑΚΟΝ, tinctura Sardinica, *Flor.* 1709. 4to. Le Clerc. Bibl. Choif. tom. 22. p. 187, seq.

Till the time of Alexander we find no other sort of *dye* in use but purple and scarlet. It was under the successors of that monarch, that the Greeks applied themselves to the other colours, and invented, or at least perfected, blue, yellow, green, &c. As to the ancient purple, it has been long lost; but the perfection to which the moderns have carried the other colours, abundantly indemnifies them for the loss. In this, particularly in the scarlet and black colours, the French, under the auspices of that excellent minister M. Colbert, seem to have out-stripped most of their neighbours. See GOBELINS.

Among the Romans, the *vestes holosericæ*, *purpuræ*, were all under the direction of the *comes sacrarum largitionum*; though they had each their peculiar *purpuræ*, as at Alexandria, Tyre, &c. The method of dying and dressing woollen cloths was very imperfectly understood in England, in the year 1608; before which period they were first white into Holland, where they were *dyed* and dressed, and from thence brought back for sale. In this year, Sir William Cockayne, an alderman of London, obtained a patent for *dying* and dressing of colours at home; but great confusion arising from this grant, it was revoked in 1615. But in 1667, workmen were introduced into this country from the Netherlands, under whose

whose direction the art was brought to a conſiderable degree of perfection.

The dyers of London make the thirteenth company of the city, incorporated under Henry VI. conſiſting of a maſter, wardens, and livery. At Paris, and in moſt of the great cities in France, the *dyers* are divided into three companies; viz. thoſe of *the great dye*, *du grand & bon teint*, who are only to uſe the beſt ingredients, and ſuch as ſtrike the fureſt and moſt laſting colours. *Dyers of the leſſer dye*, *du petit teint*, who are allowed to uſe the inferior ſorts of drugs, which only yield falſe and fading colours. And ſilk, wool, and thread *dyers*. All the higher-priced cloths and ſtuffs are reſerved to the *dyers* of the firſt ſort: thoſe of leſs value, particularly ſuch as are not rated at above forty ſols the all in white, are committed to the maſters of the *petit teint*. Blue, red, and yellow, are reſerved more peculiarly to thoſe of the *grand teint*; browns, fallows, and blacks, are common to both ſorts. As to black, it is begun by the *dyers* of the *grand teint*, and finiſhed by thoſe of the *leſſer*. It ſeems there is a tradition among *dyers*, that Jeſus Chriſt was of their profeſſion; which we alſo find delivered in the *Goſpel of the infancy of Jeſus*, though on what grounded we know not; but it is hence that the Perſian *dyers*, notwithſtanding all their Mahometaniſm, have choſen Jeſus for the patron of their art; inſomuch that, among them, a *dye-houſe* is called *Chriſt's ſhop*. Hilſcher De Stud. Chriſt. in Miſc. Lipſ. Obſ. 96. § 10. tom. v. p. 34.

DYING, *requiſites to*. There are three things demanded by the Greek chemiſts to a good *dye*; viz. Ἀραιωσις, opening, or rarefying, of the body to be *dyed*, to diſpoſe it to imbibe the colour. Βαφη, the tincture, or *dye*, itſelf. Κατοχη, or Στυψις, by the Romans called *aliligatio*, the binding or fixing of the colour, to prevent its fading, or being diſcharged. Some add a fourth condition, viz. Στιλβος, by the Latins called *lumen*, by us *luſtre*, or *brightneſs*.

Among ſome, theſe three were done ſeverally at three different operations, in different liquors, or decoctions: by the firſt, the ſtuff was prepared to receive the *dye*; this was called ἀραιωσις, and ὀπτησις; by the ſecond, the deſired colour was given it; and by the third, the colour was fixed on it. But others did all three at once, with one decoction, and at one dip. Vide Salmaſ. Exerc. ad Solin. tom. ii. p. 1146. ſeq.

DYING, *theory of*, is ſtill far from being thoroughly known, or eſtabliſhed; though many facts and obſervations, and particular proceſſes, have been offered for this purpoſe. We ſhall collect the principal of them in the ſequel of this article.

The baſis of a juſt hiſtory of *dying*, muſt be a theory of light and colours. Two things, it may be obſerved, are chiefly aimed at in the inquiry of colours: the firſt, to increaſe the *materia tinctoria*, the ſecond, to fix thoſe colours we have.

In order to theſe, it may be remembered, that ſome colours are *apparent*; as thoſe of flowers, the juices of fruits, and thoſe of animals. Others are *latent*, and only diſcovered by the effects which the ſeveral ſpecies of ſalts, and other things, have on them.

Concerning the *apparent* colours of vegetables and animals, and the effects of different ſalts in changing them from one colour to another, we have many inſtances in Mr. Boyle, collected and ranged in a new order by Dr. Hillery: as, 1. That acid ſalts advance the colours of flowers and berries; thus they make the infuſions of bugloſſa, or pompion-flowers, red roſes, clove-july-flowers, ſcarlets, pea-bloom, violets, and cyanus-flowers, of a very fine red; and the juices of the berries of liguſtrum, of black-cherries, and buckthorn berries, of a much fairer red. To the ſame purpoſe it is obſerved, that acid ſalts make no great alterations upon the white flowers of ſaffron and ſnow-drops.

2. Urinous ſalts and alkalis, on the contrary, quite alter the colours of the flowers laſt named, as well as the juices of the berries above mentioned, from red to green.

3. Urinous ſalts and alkalis advance, at leaſt they do not hurt, the colours of the juices of vegetable leaves, woods, and roots. Thus urinous ſpirits and alkalis make the yellow infuſions of madder-roots, red; of braſil wood, purpliſh; of lignum nephriticum, blue; the red infuſion of log-wood, purple; and that of the leaves of lena, red.

4. Acid ſalts quite alter the ſaid infuſions from red, or blue, to yellow.

5. Cochineal, which of itſelf is red, upon the affuſion of oil of vitriol, an acid ſalt, ſtrikes the moſt vivid crimſon that can be imagined; and with urinous ſalts, and alkalis, it will be again changed into an obſcure colour between a violet and a purple.

6. All red, blue, and white flowers, are immediately, upon the affuſion of an alkali, changed to a green colour; and thence, in no long proceſs of time, they turn yellow.

7. All the parts of vegetables which are green, will, in like manner, ſtrike a yellow with an alkali.

8. What flowers are already yellow, are not much changed, if at all, by an alkali, or urinous ſpirit.

9. The blue ſeed-husks of glaſtum ſylveſtre, old gathered, and dry, diluted with water, ſtrike a blue, which, upon the affuſion of ley, ſtrikes a green; which ſaid green, or blue, being touched with the oil of vitriol, *eyes* a purple; and all theſe three colours ſtand.

10. On the tops of the fungus tubuloſus are certain red knots, which upon the affuſion of a ley, will ſtrike a purple, and ſtand.

As for the *latent* colours in animals and vegetables, diſcovered to us by the affuſion of ſalts, they likewiſe are very numerous. We will only mention a few. 1. The milky juice of the lactuca ſylveſtris colla ſpinoſa, & ſonchus aſper & levis, upon the affuſion of ley, will ſtrike a vivid flame-colour, or crimſon; and, after ſome time, quite degenerate into a dirty yellow.

2. The milk of the carapoda major, upon the affuſion of ley, eſpecially if it be drawn with a knife, and have any time ſtood upon the blade thereof, will ſtrike a purple or blood-red colour, and ſoon after will change into a dull yellow.

3. The common hawthorn-caterpillar will ſtrike a purple, or carnation, with ley, and ſtand.

4. The heads of beetles, pismires, &c. will, with ley, ſtrike the ſame carnation colour, and ſtand.

5. The amber-coloured ſcolopendra will give, with ley, a moſt beautiful and pleaſant azure, or amethyſtine, and ſtand.

It remains to be obſerved, 1. That in all the inſtances above mentioned, whether vegetable or animal, there is not one colour truly fixed; though there may be ſome uſe made of them as they are. *By not truly fixed*, we mean, not proof againſt ſalt and fire; for what ſeem to ſtand, and be ley-proof, are either wholly deſtroyed by a different ſalt, or changed into a much different colour; which muſt needs prove a ſtain and blemiſh, when it ſhall happen in the uſe of any of them.

2. That both the apparent and latent colours of vegetables are fixable; an inſtance whereof we may obſerve in the ſeed-husks of glaſtum, and the uſe *dyers* make of the leaves of that plant, after due preparation.

3. It is probable, from the ſame inſtance, that we may learn from the colour of ſome part of the fruit, or ſeed, what colour the leaves of any vegetable, and the whole plant, might be made to yield for our uſe.

4. That the latent colours of vegetables are pre-exiſtent, and not produced from the ſame influence on wood, and likewiſe from this, that the milky juice of lactuca ſylveſtris affords of itſelf a red ferum.

5. That the change of colours in flowers is gradual and conſtant.

6. That the colours of flowers which will not ſtand with ley, ſeem to be wholly deſtroyed by it, and irrecoverable. Thus one part of a violet leaf, upon the affuſion of ley, is changed very ſoon into yellow, and will never be revived into a red by an acid ſalt; but if another part of the ſame leaf be ſtill green, it will be revived.

7. The dryneſs ſeems to be a means, if not of fixing, yet of bringing the vegetable colour into a condition of not wholly and ſuddenly periſhing by the otherwiſe deſtroying alkali.

8. That thoſe plants, or animals, which will ſtrike different, yet vivid colours, upon the affuſion of different ſalts, and ſtand as the cochineal, and glaſtum, are of all others to be reckoned the beſt. Vide Laſt. in Phil. Tranſ. N° 70. p. 2192. See alſo Boerh. Elem. Chem. part ii. tom. ii. p. 467. edit Lugd.

Many more valuable colours may be drawn from the vegetable kingdom, if the world would be at the pains of enquiring more minutely into the properties of plants. Mr. Juſſieu obſerved in the drying of plants between ſheets of paper, in order to the making of a hortus ſiccus in the common way, that ſome plants tinged the paper with colours the ſame with thoſe they naturally poſſeſs, and others with different ones; and that many plants in drying aſſumed a colour which was not natural to them. Alkanet, woad, the ſeveral ſorts of gallium, and ſome of the ſpecies of anonis, tinge the papers between which they are dried to a yellowiſh or reddiſh colour, becauſe their ſtalks, or ſome other part of them, are of that colour. The common ros ſolis, or ſun-dew, whoſe leaves are red, tinges the paper red alſo; and the ros ſolis of Portugal diffuſes this tinge through three or four ſheets of

of paper. The alpine veronica, though green in itſelf, leaves its mark in red upon the paper; and many of the common leguminous plants always become black in the drying. The common mercury, which is green while growing, becomes blue in the drying; and turnefol has the ſame change, though it is white in its natural ſtate.

One great reaſon of theſe changes of colour is, that all paper is impregnated with alum; and this ſalt may very eaſily extract, or even alter the colour of plants, whoſe juices it receives; and in ſuch caſes, where the alum is not in ſufficient quantity to do this, it is no wonder that it ſhould, however, ſo far affect the leaves as to turn them black.

On this principle Mr. Juſſieu attempted, by means of alum, to ſeparate colours from ſeveral plants, not known or uſed at preſent among the dyers, which might prove ſerviceable to them. The firſt experiments made on this occaſion proved, that there were many plants not uſed at preſent, which afford colours not at all inferior to thoſe in common uſe. The experiments the ſame gentleman tried on the drugs uſed for *dying* in the Indies, proved very plainly, that they were no way ſuperior in many caſes to vegetables of our own growth; and that in order to have the moſt lively colours from ſuch ſubſtances, it is always neceſſary to have recourſe to ſome ſalt.

Among the other drugs uſed abroad in *dying*, there were ſent over to France, on this occaſion, certain yellow flowers of the radiated kind, which afforded on trial a very beautiful yellow *dye*; and Mr. Juſſieu found on trying parallel experiments, that there were alſo yellow flowers in Europe of a like radiated kind, which were capable of affording a like beautiful yellow *dye*.

The flower which Mr. Juſſieu tried theſe experiments upon, was the common yellow corn marygold, the chryſanthemum ſegetum of Lobel. This plant flowers in the middle of July; and Mr. Juſſieu drying its flowers between papers at that time of the year, found that they did not loſe their colour, as moſt others do in the operation, but became of a deeper yellow than before. Hence it was eaſy to judge, that this flower contained a matter proper for colouring: and decoctions being made of it of different ſtrengths, cloths of different kinds, dipped into them, became tinged to a light pale yellow, and kept this colour after being boiled in fair water. A little alum was after this added to the decoctions, and cloths dipped in theſe became much more finely *dyed*, the colour being much ſtronger and more lively. They alſo imbibed the colour much more ſpeedily from theſe decoctions; and on boiling afterwards in water, they loſt no part of it, but remained as ſtrongly and as lively tinged as before. This experiment was afterwards tried by a *dyer*, under whoſe hands it ſucceded much better than before with Juſſieu, who was unacquainted with the regular methods of the trade. The decoction of the flowers gave a ſort of ſulphur colour; but linen, woollen, and ſilken things, which had the day before been ſteeped in alum water, received from this decoction a very beautiful and ſufficiently ſtrong yellow. Another decoction of the flowers made ſtronger than the firſt, tinged a woollen cloth to a greeniſh lemon colour; and the ſame decoction gave a bright gold yellow to ſilk; and a piece of woollen cloth before *dyed* blue with indigo, on dipping it in this decoction, became of a beautiful deep green. A ſmall quantity of chimney-ſoot added to the decoction made it tinge cloth to a yellowiſh brown; and a ſmall quantity of roucou added to the ſimple decoction produced an olive yellow.

The mixture of ſeveral other drugs uſed to be added to the decoction of the common luteola, or dyer's weed, to vary its tinge, produced the ſame changes with the decoction of this flower, and abundantly teſtified its value and uſe in the *dying* trade. Mem. Acad. Par. 1724.

With reſpect to the theory of *dying*, it is farther to be obſerved, 1. That all the materials, which of themſelves give colour, are either red, yellow, or blue; ſo that out of them and the primitive fundamental colour, white, all that great variety, which we ſee in dyed ſtuffs, ariſes. 2. That few of the colouring materials (as cochineal, ſoot, woad-wax, or woad) are in their outward and firſt appearance, of the ſame colour, which by the ſlighteſt ſolutions in the weakeſt menſtrua, they dye upon cloth, ſilk, &c. 3. That many of the colouring materials will not yield their colours without much grinding, ſteeping, boiling, fermenting, or corroſion by powerful menſtrua; as red wood, weld, woad, arnotto, &c. 4. That many of the ſaid colouring materials will of themſelves give no colouring at all, as copperas, or galls, or with much diſadvantage, unleſs the cloth, or other ſtuff to be dyed, be firſt covered or incruſtated as it were, with ſome other matter though colourleſs, aforehand; as madder, weld, and brazil, with alum. That ſome of the colouring materials, by the help of other colourleſs ones, do ſtrike different colours from what they would alone, and of themſelves; as cochineal, and brazil. 6. That ſome colours, as madder, indigo, and woad, by reiterated tinctures, will at laſt become black. 7. That though green be the moſt frequent and common of natural colours, yet there is no ſimple ingredient, which is now uſed alone, to dye green with upon any material; ſap-green, the coddenſed juice of the rhamnus or buckthorn-berry, being the neareſt; and this only uſed by country people. 8. There is no black thing in uſe which dyes black, though both the coal and ſoot of moſt things burnt, or ſcorched, be of that colour; and the blacker, by how much the matter, before it was burnt, was whiter, as in the famous inſtance of ivory black. 9. The tincture of ſome *dying* ſtuffs will fade even with lying, or with the air, or will ſtain even with water; but very much with wine, vinegar, urine, &c. 10. Some of the dyers materials are uſed to bind and ſtrengthen a colour; ſome to brighten it; ſome to give luſtre to the ſtuff; ſome to diſcharge and take off the colour, either in whole or in part; and ſome out of fraud, to make the material dyed, if coſtly, to be heavier. 11. Some *dying* ingredients, or drugs by the coarſeneſs of their bodies, make the thread of the dyed ſtuff ſeem coarſer; and ſome by ſhrinking them, ſmaller; and ſome by levigating their aſperities, finer. 12. Many of the ſame colours are dyed upon different ſtuffs with different materials; as red-wood is uſed in cloth, not in ſilks; arnotto in ſilks, not in cloth; ſo that they may by dyed at ſeveral prices. 13. Scowering, and waſhing of ſtuffs to be dyed, is to be done with appropriate materials; as ſometimes with ox-galls, ſometimes with fullers earth, ſometimes with ſoap: this latter, however, is pernicious in ſome caſes, where pot aſhes will ſtain or alter the colour. 14. Where great quantities of ſtuff are to be dyed together, or where they are to be done with great ſpeed, and where the pieces are very long, broad, thick, &c. they are to be differently handled, both in reſpect to the veſſels and ingredients. 15. In ſome colours and ſhades the tingent liquor muſt be boiling; in other caſes only warm, in ſome it may be cold. 16. Some tingent liquors are fitted for uſe by long keeping; and in ſome the virtue wears away by the ſame. 17. Some colours, or ſtuffs, are beſt dyed by reiterated dippings over into the ſame liquor at ſeveral intervals of time; and ſome by continuing longer, and others for a ſhorter time therein. 18. In ſome caſes, the matter of the veſſels wherein the liquors are heated, and the tinctures prepared, muſt be regarded; as that the kettles be pewter for blow-dye. 19. Little regard is had how much liquor is uſed in proportion to the *dying* drugs; the liquor being rather adjuſted to the bulk of the ſtuff, as the veſſels are to the breadth of the ſame: the quantity of *dying* drugs being proportioned to the colour higher or lower, and alſo to the ſtuffs; as likewiſe the ſalts are to the *dying* drugs.

Concerning the weight which colours give to ſilks, for in them it is moſt taken notice of, as being ſold by weight, and being a commodity of great price; it is obſerved, that one pound of raw ſilk loſes four ounces by waſhing out the gums, and natural ſordes. That the ſame ſcowered ſilk may be raiſed to above thirty ounces from the remaining twelve, if it be dyed black, with certain materials. That the reaſon why black colour may be dyed the heavieſt is, that all ponderous drugs may be dyed black, being all of colours lighter than it; whereas, perhaps, there ſeem to be few or no materials wherewith to increaſe the weight of ſilk, which will conſiſt with fair light colours; ſuch as will having been uſed, as white arſenic to carnations.

Of things uſed in *dying*, eſpecially black, nothing increaſes weight ſo much as galls; by means whereof black ſilks recover the weight which they loſt by waſhing out their gum. Nor is it counted extraordinary, that blacks ſhould gain about four or ſix ounces in the *dying* upon each pound. Next to galls, old ruſtic increaſes the weight about 1½ in 12. Madder about an ounce in the pound. Weld half an ounce. The blue fat, in deep blues of the fifth ſtaff, adds no conſiderable weight. Neither do logwood, cochineal, or arnotto; nor even copperas of itſelf, where galls are not uſed. Sipp adds much to the weight, and gives a deeper black than copperas, which affords a good excuſe for the dyers that uſe it. Petty's Appar. to Hiſt. of Dying, ap. Sprat. Hiſt. R. S. p. 302.

There is great reaſon to believe, that the art of *dying* might be carried to much greater perfection than it is at preſent, if the attempts to improve it were in proper hands, and the perſons employed in it could be enabled to ſet out with all the knowledge there is at preſent in regard to its ſeveral materials, and their manner of uſe, as a fund of real facts on which to ground future diſcoveries. This, however, ſeems difficult to be brought about; for

for the people who exercise the art generally are acquainted only with a certain set of rules, which though they know not why they follow, yet they will not depart from them, and esteem every thing a loss of time that can be proposed to them as improvements. They keep their knowledge also a close secret from those who might be expected to improve upon it; and usually one man trades only in some one part of it, without any knowledge of the rest. Hence the difficulties attending the acquiring of a knowledge of the first principles of the art are very discouraging, but they are not insurmountable. The idea which presents itself most naturally to us, as to the manner in which stuffs are dyed, is, that the colouring particles which swim in the liquor, immediately attach themselves to the surface of the body that is plunged into it, and there adhere in a firm manner, that there is no removing many of them without wholly taking off the surface of the body. The barely plunging a white substance into a coloured liquor is not however sufficient for the dying of it in many cases. Indeed there are only a few colours which will strike with this ease and facility; and the others require that the matter to be dyed should have first received the particles of another fluid, which is in most cases a solution of alum and tartar in common water. And, according to the nature of the colour that is to be given the stuff afterwards, the alum is put in in large quantities, or the stuff boiled in the liquor a longer or a shorter time. After boiling in this liquor, a stuff is in the proper condition to receive the greater part of the common colours; but for blue, stuffs require no preparation at all; and for scarlet, the liquor in which they are first boiled is made without alum.

The nature of the stuff to be dyed makes it necessary also to change the liquor in which it is to be boiled, or to vary the ingredients; and the greatest naturalist, without a mechanical knowledge of *dying*, would be amazed to see, that if a skein of white wool, and another of white cotton, be plunged together into the scarlet dye, and the even after they have both received the same previous boiling and preparation, the skein of cotton would come out of the liquor as white as it was put in, while the wool comes out tinged to a beautiful fire colour. The dyer, however, sees this every day, without any admiration of the cause, and never troubling his thoughts about the manner in which it is done. He uses it daily to dye any thing woollen to a scarlet colour, leaving a part white; in order to which, he knows there requires no more than that the part to be left white should be of cotton.

Mr. Dufay supposing this to be owing to the cotton's imbibing much more slowly than the wool, the liquor in which they are both previously boiled to make them receive the colour, as the cotton is well known not to take wet so soon as wool, ordered a skein of cloth to be wove, the warp of which was wool, and the woof cotton; and sending this to the fuller's, the two fullmoners were to well blended together, that it became impossible for the one to receive the impregnation of any liquor without the other. With all these precautions, however, the whole came out of the scarlet dye in the same condition as if nothing had been done, the cotton remains wholly white, and the wool being marked with fine colour and white; so that it may be choosed a certain fact, that the colour of cochineal cannot be given to cotton by the means of acids; the same also holds good of kermes and gum lac, both which are used instead of cochineal to dye in scarlet; but neither of these, any more than the cochineal, will dye cotton. It is not to be concluded from hence, however, that cotton cannot be dyed scarlet by these substances: the whole is, that it requires a different treatment; and as wool, to take the scarlet dye, requires only to be first impregnated with tartar, cotton requires to be first impregnated with alum, as wool does, for the generality of the other colours. The acid of sea-salt, of vitriol, vinegar, and verjuice, all serve to dye wool to a scarlet with cochineal, but none of these will make it give any tinge to cotton, to which alum alone can serve.

The same dye will give very different colours to the different parts of a cloth, which have been differently prepared. And this gentleman showed before the academy a piece of cloth, which he had carefully prepared in a different manner in the different parts, which being all plunged together in the dye, when taken out and dried, was found to be of a dirty red in that part where it had not been impregnated with any thing; and in the other parts, where it had been differently impregnated, was found of all the degrees of red, from a pale damask rose colour to the deepest scarlet, and this while it had in every part been dipt an equal time in the same dye. This equally holds good of the other colours. And in these experiments the dirty colours given to such parts of the cloth as have received no previous impregnation, will be washed away, and quite carried off, while the others remain in all their perfection.

Another circumstance very worthy attention in the *dying* of scarlet is this, that the dye is evidently composed of a clear or common water, in which the colouring particles are suspended, and from which it is easy to suppose that they are separated and applied to the stuff in *dying*. As this is naturally supposed to be the case in regard to all colours, so it appears very evidently to be a fact in this, since the colouring particles adhere in such quantities to the matter, and separate themselves so readily and perfectly from the water, that after an hour and half's boiling of the dye with a proper quantity of the stuff in it, the whole coloured matter shall be attached to the stuff, and the remaining liquor be only clear water; and what might appear wonderful is, that all the boiling in the world will never dislodge any of the colour from the stuff, on occasion its being received into the water again. It might be supposed that this was wholly owing to the particles of salts, which had been imbibed into the stuff in its prior preparation; that these attracting the particles of the colour to the stuff, while the water of the dye had none of them to exert such an attraction in it, they did not remain in it. But this appears not to be the case, but that the stuff will attract the colour, whether it be previously prepared, or the preparation and the *dye* be all one act; since the skein lomething dye scarlet at once in this manner, only plunging the stuff into a dye made of cochineal, a solution of tin mixed in a large quantity of water, with a small quantity of sal ammoniac, and cream of tartar. All these ingredients are mixed together before the stuff is put in; yet after it has boiled about an hour and a half, all the colour is in the stuff, and the liquor is become colourless as water. The event is the same in the dyes made of wood and indigo for the *dying* blue, and indeed in the greater part of other colours; but as the ingredients of these are not so pure as the cochineal, and there are usually many heterogene particles among them, the liquor does not become so wholly colourless in these, as in the case of the former. But the dyers, who well know that so long as there is any colour left in the liquor, so long the stuff will be profited by remaining in it, always take small quantities out of it, and examining it by pouring it gently down against the light, they know when it is that the stuff has received all the tincture it can, by there being no more colouring matter suspended in the dye.

Experience shows, that all colours do not attach themselves with equal readiness to the stuff, or remain equally firmly united to it. Wood, indigo, cochineal, kermes, and many other colours, never reach further than the surface of the stuff. The liquor of the dye penetrates indeed perfectly through the body of it, but the colouring particles stopping at the surface become entangled there, and never penetrate, at least not in any great quantity, to the central part, which remains either quite white, or only very slightly tinged. This however only happens to such stuffs as are thick, and of a very close texture; others are coloured throughout. And this is only the case in regard to some dyes, not to all sorts, since the most of the wood colours penetrate wholly through the stuff be it ever so thick, and colour it equally every where. Whence it seems probable, that the colouring particles of the woods are either more minute and fine, or much more intimately blended with the water, than those of cochineal, indigo, and such others as do not penetrate beyond the surface.

It might seem strange, that the stuffs which are thus readily coloured on the surface, should not afterwards, by the continual boiling of the water, have the colouring particles carried further down into the body, as the water continually penetrates the whole from each surface to the centre, and might naturally be expected to carry a part of the colouring particles in along with it. But if we consider the whole process from the beginning, we find that the colouring particles are strongly attracted by the stuff, and fierce at all by the water. Whence they almost immediately leave the water, and attach themselves to the first part of the stuff they come in contact with, which is its surface; and when once fixed there, it is no wonder that the particles of water, ever so long pulling by them, do not attract or take them away from this surface, as they must do in order to carry them in; since we have before had proof, that their attraction to the water is greatly weaker than that to the stuff. And the difference between the wool and the cotton, the one receiving, and the other not receiving at all the coloured particles in its natural state, or with the same impregnation, by means of which the other does, seems resolvable into the same principle, that though the attraction in the wool be much greater in regard to the coloured

particles than that of the water, and therefore it robs the water of them; yet the attraction in cotton being less than in water, the colouring particles remain in the water without any tendency to attach themselves to the cotton. Mem. Acad. Sc. Paris. 1737.

M. Hellot's theory of *dying* is, that the colouring particles are fixed into the pores of stuffs chiefly by means of a vitriolated tartar, which he believes to exist in each process, to be produced by the acid of alum and alkaline salts of tartar in the process for red and yellow dyes, to exist originally in the pot-ash employed in the blue dye, and in the nuts and roots employed in the root-coloured dye. He supposes the pores of the stuff are cleansed and enlarged by the preparatory salts, and by the boiling water, so as to receive the colouring particles, which particles are afterwards detained by the contraction of the pores occasioned by cold; and farther, that these pores are lined with a saline crust of vitriolated tartar, or of tartar; which salts being difficultly soluble in water, remain firmly the colouring particles. But this theory, says the ingenious translator of the Dictionary of Chemistry, cannot be admitted, when we consider that vitriolated tartar does not exist in any of the materials used in some of the processes for *dying*, as in the root-coloured materials, from which no vitriolated tartar can be obtained, unless by accident, till they have been by burning reduced to ashes, and even then the quantity is exceedingly small; that although common pot-ash generally contains some vitriolated tartar, yet M. Heller has not shewn, that pure fixed alkali is incapable of producing the same effect; and lastly, that vitriolated tartar, and tartar, although they require much water to be dissolved, are yet soluble by water; and therefore if the colouring particles were fixed chiefly by means of these salts, they might be washed out by a large quantity of water, which is contrary to experience. The above mentioned writer suggests the following conjectural observations on this subject; that the colorific particles of most substances used in *dying* seem to be unsoluble in water, in spirit of wine, and even in alkaline lixiviums; that their diffusion through these liquids is caused merely by their adhesion to certain gummy and resinous particles; and that they may be disengaged from these gummy and resinous matters, by applying a piece of stuff, to which they have a greater adhesive power; and this seems to be the case of the root-coloured and blue dyes; or by applying another substance, to which these particles have a greater power of adhesion; such as the earth of alum, in those dyes where that salt is used, together with some other substance, as acid or volatile alkali, capable of decomposing alum; or as the ferruginous earth of the green vitriol in black dyes, to which the colorific particles of the galls adhere; which earths are capable of stripping themselves, and of adhering to the stuff. The separation of the colouring particles from the gummy and resinous matters is peculiarly facilitated by the addition of acids and neutral salts, which may congluate in some measure the vegetable matters, and leave the colouring particles disengaged; so that they may apply themselves to the stuff, or to the above mentioned earths. These salts are also useful by brightening certain colours; all acid salts and alum having the property of brightening the red colours of vegetables. The metallic salts used in the scarlet dye, consisting of a decoction of cochineal, to which a solution of tin in aqua regia, and some tartar, are added, has the effect of changing the crimson colour of cochineal into a vivid scarlet; and probably has also the other effects of alum, of affording an earth, namely that of tin, to which the colouring particles may adhere, and of congulating the vegetable matters, so that they shall leave the colouring particles detached and suspended in the water. The chief difference then between the false and true dyes is, that the colouring particles in the former dyes are applied to stuffs, together with some gummy or resinous matter to which they adhere, and are therefore liable to be washed out along with those matters by any liquid capable of dissolving gums or resins; while the colouring particles of the true dyes are applied to stuffs, either alone, or adhering to some fine earth, as that of alum, or of tin; and as both the colouring and the earthy particles are unsoluble in any liquids, to which they are exposed, as water, soap-lees, &c. they are capable of resisting the action of such liquids, and are therefore durable. The above conjectures are confirmed by observing, that when the colouring particles of vegetables and animals are diffused in an alkaline lixivium, by means of gummy, resinous, or oily matters, to which they adhere, they may be separated from their adhesive matters by adding alum, the acid of which unites with the alkali of the lixivium; while the colouring particles apply themselves to the basis or earth of the alum, now disengaged, with which they form what are called by painters LAKES, the colouring matters of which is not now soluble in water or spirit of wine; although these liquids are capable of extracting that colouring matter from the animal and vegetable substances which contain it, by the intervention, as above supposed, of some gummy or resinous matters. Dict. Chem. Eng. ed. 8vo. art. DYING, note.

DYING *Ingredients*, or the *Materia Tinctoria*, are best reduced under two heads. *Colorate*, or those which properly give the colour. And *Non-colorate*, used to prepare the stuffs for better taking the dye, and to heighten the lustre of the colours.

As to the *colouring ingredients*, *colorantia materia*, we have, 1. Iron and steel, of which is made from them, which are used in some blacks; though how they contribute thereto is not so obvious: we know that green oaken boards become black by the affrition of a few; a green four apple, cut with a knife, turns of the same colour; the white grease wherewith the wheels of coaches are anointed, becomes likewise black, by means of the iron boxes wherewith the nave is lined, and the friction between the nave and the axle-tree; and that an oaken stick becomes black by a violent friction against other wood in a turning lathe: and the black colour on earthenware is given with scrapings of iron vitrified. From all which it seems to follow, that the basis of all blacking lies in the iron, and particularly in its solution or affrition. Be this as it will, copperas, the most usual ingredient for *dying* black, is the ust of the former, when with old iron is incorporated. And where-ever iron is used, some of the astringents are to accompany it. 2. Redwood chipped, and ground in a mill, is used for *dying* cloth, rugs, &c. of the coarser sort. It is a native, which is a sort of black colour, is got out by long boiling it with galls, and the cloth with it. It stands better than brazil. 3. Brazil chopped small, and ground, gives a pale-colour, or carnation, nearest approaching scarlet with alum; with pot-ashes it also gives a [illegible] easily fades. 4. Madder gives a colour [illegible] ing the *brown dye*, or new scarlet: those [illegible] scarlets are dyed with it. It endures [illegible] is used both with alum and argol, and holds well. The brightest dyes with madder are made by first *dying* the stuff, and then discharging part of it, by boil-boiling in argol. It is used with bran water instead of white liquor. 5. Cochineal, used with brandi-liquor, in a pewter vessel, with aqua fortis, gives the dye called among us, though improperly, *Spanish* or *true* scarlet. Too much acid takes off the intense redness of the colour, and turns it towards an orange, or flame colour. With this colour the Spanish leather and wool, used by ladies, are dyed. Cochineal, gives an orange colour, especially to tin, linens, and cottons; for it does not penetrate cloth: it is used with pot-ashes. 7. Weed, by the steeps of pot-ashes, yields a deep azure-colour; though it is used to give all sorts of yellows. 8. Wood-soot, or green-wood, called also *genista tinctoria*, and the *dyers weed*, has the like effect as weld, though its use is chiefly confined to coarse cloths. It is set with pot-ashes, or urine. 9. Fustic is of two sorts, young and old: the former, chopped and ground, yields a kind of reddish orange-colour: the latter, a buff-colour, distant several degrees of yellow from the former. It spends with or without salts, works either hot or cold, and holds fast. 10. Wood-soot, containing not only a colour, but a salt, needs nothing to extract its dye, or make it strike on the stuff. The natural colour it yields is that of honey; but it is the foundation of many other colours, on wool and cloth only. 11. Weed, ground, or chopped with a mill for the purpose, is made up into balls; which being broken, or brewed on hot or urine, is used with pot-ashes, or sea-weed, and gives a lasting blue. The lime or chalk accelerates the fermentation of the weed, which in three or four days will work like a guile of beer, and be covered with a greenish froth or flower. An intense wood-colour is almost black; that is, of a flame-colour. It is the foundation of so many colours, in different degrees or shades, that the dyers have a rule whereby to compute the lightness and depth of the colour. See Woad. 12. Indigo is of the like nature, and used for the same purpose as woad, only that it is stronger. 13. Log-wood, chopped and ground, yields a purplish blue: it may be used with alum. Formerly it was of ill-repute, as a most false and fading colour; but since it has been used with galls, it is less complained of. V. Percy's Apparat. to Hist. of Dying, in Spra's Hist. Roy. Societ. p. ii. p. 288. Mer. Nat. en Neri, c. ex. p. 335.

The *dying* materials are generally applied in decoctions made in water, more or less strong, according to the occasion; sometimes by only dipping the stuff in the vat of dye, sometimes by boiling it therein; and sometimes by

by leaving it a day or more to ſteep. As to the alum, in *dying* ſilks, it is always applied cold, in which ſtate alone it contributes to the brightneſs of the dye.

The *non-colouring ingredients* are, certain *reſtringent*, or *binding materials*, as galls, ſumac, alder-bark, pomegranate-peel, walnut-rinds and roots, ſapling-bark, and crab-tree-bark. Certain *ſalts*, as alum, argol, ſalt petre, ſal armoniac, pot-aſhes, lime, and urine. *Liquors*, as well water, river water, aqua vitæ, vinegar, lemon-juice, aqua-fortis, honey, and melaſſes. *Gums*, as tragacanth, arabic, muſtic, and ſanguis draconis. *Smectics*, or *abſterſives*, as ſoap, fullers earth, liſeed-oil, ox-gall, &c. *Metals*, and *Minerals*, as ſteel filings, ſuppe, and pewter; to which add copperas, vendigriſe, antimony, litharge, and arſenic. Laſtly, bran, wheat-flower, yolks of eggs, leaven, cummin-ſeed, fenugreek ſeed, agaric and ſena.

Of the moſt of theſe ingredients, ſome account may be found under their reſpective articles, in the courſe of this book; but with regard to their uſe and effect in *dying*, it will be neceſſary to conſider them more particularly, and to bring them together in one view.

Among the *ſtaining-drugs*, then, from the mineral kingdom come, 1. Copperas, ſteel filings, and ſuppe, (the ſtuff found in the troughs of old grind-ſtones, whereon edge-tools have been ground); theſe are uſed for all true or Spaniſh blacks, though not for the Flanders blacks. 2. Pewter, diſſolved in aqua fortis, uſed for the new leaſlet or aſh-wedge. 3. Litharge, though not owned or allowed, is uſed to add weight to dyed ſilks. 4. Antimony, uſed chiefly for the ſame purpoſe, though it alſo contains a tingent ſulphur; which, by precipitation, &c. affords a great variety of colours. 5. Arſenic, uſed in dying crimſon, on pretence of giving a luſtre. 6. Vendigriſe, uſed by linen-dyers, in their yellow and green colours. 7. Alum, much uſed, though with what intent is not agreed on; whether to fix the dye, to render water a proper menſtruum to extract the pungent particles of certain hard drugs; or to ſcower the pores, which may interpoſe between the cloth and the dye, and hinder their due adheſion; or to intenerate the hairs of wool, and hair ſtuffs, that they may better imbibe their colours; or to contribute to the colour itſelf, as copperas does to galls, in making black, or juice of lemons to cochineal, in carnations, or aqua fortis impregnated with pewter in the boſs-dye; or, which ſeems moſt probable, to ſerve as a vinculum between the cloth and the dye, and hinder their due adheſion; or to intercept the pores of wool, and hair ſtuffs, that they may better imbibe their colours; or to contribute to the colour itſelf, as copperas does to galls, in making black, or juice of lemons to cochineals, in carnations, or aqua fortis impregnated with pewter in the boſs-dye; or, which ſeems moſt probable, to ſerve as a vinculum between the cloth and the colour, as chamber lye and gum waters do in painting; alum being a ſubſtance whoſe ſulphureous particles, diſſolved with hot liquors, will enter the pores of ſtuffs, and on which the particles of dying drugs will eaſily catch; though it may alſo ſerve another uſe, viz. to fix by certain particles which diſagree with the colour to be ſuperinduced; to which add, that it may alſo ſerve to brighten a colour, by incraſſating the ſtuff to be dyed with its cryſtals, on which the dye coming to be applied, has a finer effect, than if it were applied on a ſcabrous matter, ſuch as an unalumed cloth is. 8. Bran, and bran-water, whoſe ſour entering the pores of the ſtuff, levigates its ſurface, and thus renders the colour laid on it more beautiful; much as woods to be gilded, are firſt ſmoothened over with the white colours. 9. Salt-petre, uſed chiefly in aqua fortis, in the boſs-dye, to brighten colours by back-boiling. For which purpoſe, 10. Argol is more commonly uſed. 11. Lime, or chalk, uſed in the working of blue wore.

Non-colouring ingredients of the animal kind are, 1. Honey. 2. Yolks of eggs. 3. Ox-gall: though this, and the two laſt, are only uſed by a few particular dyers, to ſcower, promote fermentation, and increaſe weight. 4. Stale urine, uſed as a *menſtruum* to ſcower, alſo to help the fermenting and heating of wood; though it is alſo uſed in the blue vat inſtead of lime. In reality as it abounds more than other urines, or cold-meal of pitling-places, will dye a well-ſcowred piece of ſilver of a golden colour; it being with the hot Bathwater, as imagined) that the Rathſingerians, &c. are prepared.

To the claſs of non-colouring ingredients, may alſo be added water, by dyers called *white liquor*, which is of two ſorts. 1. Well-water, uſed in reds, and in other colours wanting reſtringency, as well as in dying ſtuffs of a looſe conteſture, as callico, ſuſtian, and the ſeveral ſpecies of cottons; but ſtraight for blues, and making yellows and greens look ruſty. 2. River-water, ſofter and ſweeter than the former, and diſſolving ſoap better, uſed in moſt cafes by the dyers, for waſhing, rinſing, &c. their cloths after dying. 3. Liquor abſolutely ſo called, which is bran liquor made of one part bran, and five of river-water, boiled an hour, and put in a leaden ciſtern to ſettle four or five days in ſummer (turn it two four, and render it unfit for uſe. Its office is to contribute to the building of the colour. It is known, that ſtarch, which is only the flour of bran, makes a clinging paſte, which will congluttinate paper, though not wood or metals. Accordingly bran liquors are uſed to make dying ſtuffs, as to madder, which is rendered clammy and glutinous by being boiled in bran water, and thus made to ſtick the better to the dyed ſtuff. 4. Gums tragacanth, arabic, muſtich, and ſanguis draconis, are uſed in dying ſilk, chiefly to give it a gloſſineſs, which may make it ſeem finer, ſtiffer, and to increaſe its weight. Petty, ubi ſupra.

DYING, *the Art of*, may be divided into as many branches as there are different colours to be communicated, and ſorts of different ſtuffs to be the ſubjects of it.

DYING *of Cloth, Serges, Draggets, and other woollen Manufactures*. With reſpect to *colour*, to ſhew the ſtuffed price, it is begun with a ſtrong decoction of woad and indigo, which gives a deep blue. The uſe aſſigned for this blue ground is that the cloth, having already a conſiderable body of colour, may require leſs of the blackening ingredients, and conſequently be leſs weakened, than if it was dyed directly from white to black; beſides, blue is eſſential to the production of the black dye; for without either a blue ground, or a blue ſuperinduced to the vitriol and galls, no other than brown dyes are obtained. Study, whoſe price will not admit of blue dyes, are ſaid, by the French and German writers to be grounded with a deep brown, by boiling them with walnut peels, or walnut-tree roots; but this practice is never followed by our dyers. However it ſhould ſeem, that any deep colour, which does not hurt the cloth, is preferable to white. After blueing, the ſtuffs being boiled with alum and tartar, or pot-aſhes, are to be maddered with common madder. This practice of maddering is one of the regulations for the French dye, publiſhed by the order of M. Colbert. It has not been found, however, on fair trials, to be abſolutely neceſſary, or to contribute any thing either to the beauty or duration of the black. M. Hellot obſerves, that having dyed a piece of cloth of deep blue, he maddered one half, and dyed both the maddered and unmaddered halves black in one copper; and that the unmaddered half was the beſt black, without that ruſty hue which the other had. The moſt plauſible reaſon in ſupport of this practice is this, that it prevents the black cloth from ſtaining the ſkin or linen; but, according to M. Hellot, all that the madder can do in this reſpect is to diſtinguiſh the ſuperfine blue, which is owing not to the madder itſelf, but to the boiling with alum and tartar preparatory to the madder dye: an advantage which may be obtained by ſufficiently ſcowring the cloth in the fulling mill after the dye. Dr. Lewis adds, that this is evident from the ſuperfine cloths dyed by our dyers, among whom the injudicious and unfrugal practice of maddering is unknown. They have indeed a colour called madder black, dyed on baize, for exportation to Spain and Portugal, which is a kind of black dye, very durable, without any vitriol or other preparation of iron, from a combination of blue dye, with the madder red. Cloth is then dyed black with alleppo galls, copperas, and ſumach, and finiſhed by back-boiling in weld or log-wood. Logwood is the material which adds blackneſs to the various ſhades of brown produced by vitriol and galls; and thus black dye, though not of the moſt durable kind, is the moſt common. On blue cloth, a good black may be dyed by vitriol and galls alone; but even here, an addition of logwood contributes much to improve the colour. A hundred pounds of woollen cloth, dyed faſt to a deep blue, require for the black dye about five pounds of vitriol, five of galls, and thirty of logwood. The galls, beaten into moderately fine powder, and tied up in a bag, are boiled for a little time in a copper of water ſufficiently for working the cloth in. The blued cloth, after being ſteeped in river water, and drained, is in this ſtate put into the boiling decoction of the galls, and kept turning therein for two hours or more; the bag of galls being now and then ſqueezed, in order to extract their virtues. The logwood, being raſped or ſhaved into ſmall chips, or pulverized, is boiled in another copper for ſeveral hours; and this liquor is uſually prepared a conſiderable time before it is uſed, as its colour improves by keeping. When this liquor is made of a ſcalding heat, the vitriol is thrown into it; and as ſoon as it is diſſolved, the galled cloth is put in. A boiling heat ſhould never be uſed after the vitriol is added to the liquor, becauſe it would augment the corroſive power of the ſalt, and impair the beauty of the colour, by haſtily extricating part of the ferruginous matter of the vitriol in an ochery form, before it can come ſufficiently in contact with the aſtringent ſubſtance with which the cloth is impregnated. The cloth is continually turned about in the liquor, and occaſionally taken out and aired, which operation contributes

tributes to secure the colour. After two hours continuance in the dye, the cloth, having received a good black, is taken out, washed with cold water, and pulled through the fulling-mill. Superfine cloth is fulled three times with warm lotution of soap, by which the superfluous colour is discharged, and the cloth softened. The cloth is improved neither in beauty nor durableness of colour, by being repeatedly pulled through the *dying* liquor, or by increasing the quantity of ingredients first uſed, after it has once acquired a full black colour. Our dyers uſe a ſmall quantity of verdigriſe for ſome of the ſuperfine black-cloths; but this is more frequently uſed by the French. M. Hellot gives the following proceſs, as the beſt, and as that, which, producing the fineſt velvet black on cloth, is followed in the beſt dye-houſes in France. For a hundred pounds of blue cloth, ten pounds of logwood chips, and the ſame quantity of Aleppo galls, in powder, are tied up together in a bag, and boiled in a middling copper, with a ſuitable quantity of water, for twelve hours. One-third of this decoction is taken out into another copper, and two pounds of powdered verdigriſe added to it. In this mixture, kept gently boiling, or rather ſcalding hot, the cloth is dipped, and conſtantly turned for two hours; after which it is taken out and aired. Another third of the decoction is added out into the ſame copper, eight pounds of green vitriol added, and the fire ſtockened about half an hour. The vitriol being diſſolved, the cloth is put in and worked for an hour, and then taken out and aired again. The remaining third of the decoction is then put to the other two, the bag of galls and logwood being well preſſed out. Fifteen or twenty pounds of ſumac are now added, and as ſoon as the copper begins to boil, two pounds more of vitriol are thrown in with ſome cold water to freſhen the heat. The cloth is kept in for an hour, then taken out and aired, ripped a ſecond time, and kept turning for an hour longer. This cloth now completely dyed, is waſhed in a river, and ſcowered in the fulling-mill till the water comes from it colourleſs. It is then pulled through a copper of weld, which is ſuppoſed to freſhen the cloth and confirm the colour; but it is obſerved in this proceſs, that the quantities of vitriol and galls may be diminiſhed, and the time of boiling much ſhortened; and that the weld liquor only ſupplies the place of ſoap, and is altogether unneceſſary, after ſcowering with ſoap; the liquor remaining after both theſe proceſſes retains, and will communicate a dilute black, or a grey colour, to as much cloth as can be conveniently worked in it.

As galls are an expenſive article in the operation of *dying*, other cheaper aſtringents have been recurred to as a ſubſtitute; ſo that they have been uſed in leſs quantity than in the proportion already ſtated, and weaker aſtringents have been taken in larger quantity. In the Swediſh Tranſactions for the year 1753, a fine black is ſaid to be *dyed*, without galls or logwood, by means of a plant called in Sweden, *myrica* or *mackra tri*, which Linnæus has ſhewn is no other than the *arca arſa*. This plant is gathered in autumn, while the leaves are green, and carefully dried, that they may retain their green colour. A hundred pounds of woollen cloth are directed to be boiled with ſixteen pounds of green vitriol, and eight pounds of white tartar, for two hours; and the cloth the next day to be rinſed out: then one hundred and fifty pounds of the dried plant, cut a little, are boiled in water for two hours; and when the plant is taken out, a ſmall quantity of madder is added to the liquor. The cloth is put in along with it, and boiled for an hour and a half, or an hour and three quarters, and afterwards rinſed in water. This dyed cloth is ſaid to be chiefly uſed for fine cloth, and to give leſs hardneſs than the common black: Dr. Lewis purſued theſe directions with the German aſh-tree ſtuff both on white and blue cloth; the colour in the former was only a dark brown, as with other aſtringents, and the latter a tolerably good black. From ſome other experiments on oak-bark, Dr. Lewis concludes, that it deſerves the attention of dyers, and that this duſt, or the heart of the oak reduced to powder in mills, will be found an aſtringent of ſufficient efficacy, and ſupply with advantage the place of galls.

It has been generally obſerved, that cloth is weakened by the black dye, on account of the corroſive quality of the vitriol more than by any other; and the finer the black the more it has been thought to injure the cloth; and therefore the beauty and durability of the cloth have been thought incompatible with one another. But a German writer on *dying*, diſtinguiſhed by the appellation of the celebrated Stahl, alleges, that the vitriol is corroſive only ſo far as it is not ſaturated with galls; and he propoſes, in order to determine the quantity of galls ſufficient for complete ſaturation, to mix a decoction of galls and ſolution of vitriol in different proportions, and to drop theſe liquors much diluted on white paper; and the proportions which give the deepeſt black colour, are thoſe which ſhould be followed by the dyer, and in which the vitriol is made harmleſs. This proportion, Dr. Lewis ſhews, is about equal parts of the one and the other; and as the dyers generally uſe theſe proportions, he concludes, that the common black dye cannot hurt the cloth; and this concluſion is farther confirmed by the teſtimony of a judicious dyer, who aſcribes the rottenneſs or periſhableneſs often complained of in black cloths, to the damage it has received before *dying*. It is well known, that all colours receive a black dye, though black will not receive any other, whence it happens, that black is the laſt reſource for cloths that have been damaged, or that have had their colour ſtained, or impaired by different accidents: beſides, vitriol is uſed in greater quantities for ſome coffee colours than the black; and the aqua fortis employed in ſcarlets, orranges, &c. is certainly more corroſive. Wood is dyed black in the ſame manner with cloth, after having been ſcowered by a mixture of ſtale urine, with twice or three its quantity of water made ſcalding hot; in which operation it is ſaid to loſe between one-fifth and one-fourth of its weight. Dict. of Commerce. Hellot's Art of Dying, and Lewis's Comm. Phil. Techn. p. 401, &c.

It appears by ſome experiments lately made, that lime-water, though it tends to deepen the colour produced by ſome aſtringents and martial vitriol, by no means adds to the duration of thoſe colours; and that either by trituration or coction, it entirely deſtroys the property in logwood of ſtriking black with martial vitriol, and therefore can be of no ſervice in the black dye, where logwood is a material ingredient. It is alſo inferred from the ſame experiments, that ſlight boiling is preferable to trituration, for the purpoſes of *dying*, when a durable colour is wanted. Phil. Tranſ. xxii. 1111.

Simple dyes, which are no other than the ſeveral colours are dyed nearly in the ſame manner as the black, only by uſing a leſs proportion of the *dying* ingredients, and continuing the cloth in the liquor for a ſhorter time. Theſe ſimple *greys are dyed from white* with a ſmaller proportion of galls than the black, and from the previous ground of blue on other colours. There are alſo a multitude of compound greys and browns, produced from cloth dyed blue, red, yellow, brown, or of colours compounded of theſe, by darkening them with the black dye. *Scarlet* is dyed with kermes and cochineal, with which may alſo be uſed agaric and arſenic. *Crimſon ſcarlet* is given with cochineal, mallich, aqua fortis, ſal armoniac, ſublimate, and ſpirit of wine. *Fine-ſcarlet, purple, amaranth, and pan-ſcarlet*, are given with woad, cochineal, indigo, brazeletto, lycarl, and archil. See ARCHIL, COCHINEAL, CRIMSON, &c. &c. For common *reds*, pure madder is uſed, without any other ingredients. *Crimſon-reds, carnations, flames, and ſcarlet-reds*, are dyed according to their ſeveral hues, with cochineal, mallich, without madder or the like. *Crimſon-red* is prepared with Roman alum, and finiſhed with cochineal. *Peach-colour* muſt be back-boiled a little with galls and copperas or the like. *Orange-tawneys*, or *golden-yellows*, *brick-colours*, and *cinnamon colour*, are given with wood and madder, tempered according to their reſpective ſhades. *For blues*, the *dark* are given with a ſtrong tincture of woad: the *bright*, with the ſame liquor, as it weakens in working. *Dark-browns*, *purples*, and *lead-colours*, are given with woad, weaker in decoction than for black, with alum and pot-aſhes; after which, they are madder'd higher than black: for tan colours, a little cochineal is added. *Dark-reds* are given with galls and copperas; ſome are begun with walnut-tree roots, and finiſhed with the former; though, to make them more ſerviceable, they uſually dip them in a weak tincture of cochineal. *Greens* are begun with woad, and finiſhed with weld. *Pea-greens*, *lemon-colour*, and *ſap-green*, are given with weld only. *Olive-colours* of all degrees are firſt put in green, and taken down again with ſoot, more or leſs, according to the ſhade required. *Fleabane*, *hair-colour*, *mode*, and *cinnamon-colour*, are given with weld and madder. *Nacarat*, or *bright orange-red*, is given with weld, and goats-haur, boiled with pot-aſhes. Further here is forbid, as a falſe colour. V. Savar. Dict. de Comm. ii. p. 1690. See alſo le Teinturier Parfait. Lond. 1708. 12°. Salm. Polygraph. lib. iii. cap. 37. See the ſeveral colours with the ſubſtances above enumerated in the courſe of this Dictionary.

DYING *of woods for toppings*, is performed after the ſame manner as cloths, excepting blacks, which are only to be waniſhed, and then put in black, as above.

Black woods for elutes and forges, may be begun with walnut-tree root, and walnut-ſtones, and finiſhed by dipping in a tub of black.

DYING *of fiſh* is begun by boiling it with ſoap, &c. in which proceſs it loſes about one fourth part of its weight;

weight; then scouring and washing them out in soft water, and steeping them in alum-water cold. For *crimson* they scour them a second time before they put them in the cochineal vat.

Red crimson is dyed with pure cochineal maſtich, adding galls, turmeric, arſenic, and tartar, all put together in a copper of fair water almoſt boiling: with theſe the ſilk is to be boiled an hour and a half; after which it is ſuffered to ſtand in the liquor till next day. *Violet crimſon* is alſo given with pure cochineal arſenic, tartar, and galls; but the galls in leſs proportion than the former. When taken out, it is to be well waſhed, and put in a vat of indigo. *Cinnamon crimſon* is begun like the violet, but finiſhed by back-boiling, if too bright, with copperas; if dark, with a dip in indigo. *Light blues* are given in a back of indigo. *Sky blues* are begun with archil, and finiſhed with indigo. For *ſtone colours*, the ſilk is firſt alumed, then welded with a little indigo. *Pale yellows*, after aluming, are dyed in weld alone. *Pale* and *brown auroras*, after aluming, are welded ſtrongly, then taken down with rocou diſſolved with pot-aſhes. *Flame-colour* is begun with rocou, then alumed and dipped in a vat or two of brazil. *Carnation*, and *roſe-colours*, are firſt alumed, then dipped in brazil *Cinnamon-colour*, after aluming, is dipped in brazil and brazilетto. *Lead-colour*, is given with ſuſtic, or with weld, brazilетto, galls, and copperas; but the galls, on theſe and other occaſions, are not to be overdoſed, which increaſes the weight to the damage of the purchaſer; for which reaſon, it is puniſhed in France as a fraud; and in reality few but black ſilks need galls.

Black ſilks of the *coarſer* ſort, are begun by ſcouring them with ſoap, as for other colours; which done, they are waſhed out, wrung, and boiled an hour in old galls, where they are left to ſtand an hour or two; after which, they are waſhed again with fair water, wrung, and put in another vat of new and fine galls; then waſhed and wrung again, and finiſhed in a vat of black. *Fine black* ſilks are only put once into galls, viz. the new and fine ſort, which has only boiled an hour; then they are waſhed, and wrung out, and dipped thrice in black, to be afterwards brought down by back-boiling with ſoap. Savar. lib. cit. p. 1603. ſeqq.

M. Macquer, in his Diſſertation on the Art of *Dying* Silk, has given the following proceſs for *dying* of black, which is followed in the manufactures of Tours and Gênes: the ſilk, waſhed with ſoap, is ſteeped in a decoction of one-third its weight of Aleppo or blue galls, or half its weight of the weaker white galls of Sicily and Romania, and afterwards waſhed with water: every twelve ounces are reduced by the cleanſing to nine, which ought to be increaſed by the galling to eleven, and no more. The *dying* liquor, for one hundred pounds of ſilk, is prepared by boiling twenty pounds of galls in about one hundred and twenty-ſix gallons of water, and adding to this decoction, after being ſettled and drawn off from the ſediment, two and a half pounds of Engliſh vitriol, twelve of iron-filings, and twenty of the gum of the cherry or plum-tree; that the gum may diſſolve the more readily, it is put into a large copper cullender, immerſed in the hot liquor, and ſtirred from time to time with a wooden rod till it is all paſſed through. This mixture is kept for ſix or ſeven days or more, a circumſtance ſuppoſed to be neceſſary to its perfection; and being then made as hot as the hand can bear, freſh parcels of the galled ſilk are dipped in it ſucceſſively, and kept in about ten minutes each; and all of them, after being aired, are dipped over again, ſeveral times, with the addition of more vitriol and iron-filings till they have acquired the requiſite blackneſs, after which they are well waſhed in water. Dr. Lewis obſerves, on this proceſs, that while five or ſix pounds of galls are ſufficient for one hundred pounds of wool, upwards of fifty pounds of galls are here allowed to the ſame quantity of ſilk; and that logwood, an eſſential ingredient in the black dye on white woollen, is not at all required for ſilk. He alſo found, in repeating this proceſs with a leſs quantity of the ſeveral ingredients, but in the ſame proportion, that by adding more and more of the vitriol, ſo that the whole amounted to one-fifth of the weight of the ſilk, and repeating the dippings thirty times or more, he obtained at laſt a good black; nor did he obſerve any difference in two blacks produced by repeating the operation with and without any iron filings: he apprehends likewiſe that the gum is rather of diſſervice, than advantage. Dr. Lewis concludes upon the whole, that a good black may be dyed on ſilk, with the ſame materials, in the ſame method, and with the ſame diſpatch, as on wool and woollen cloth. Com. Phil. Tech. p. 425, &c.

DYING *of thread* is begun by ſcouring it in a ley of good aſhes; after which, it is wrung, rinſed out in river water, and wrung again. For a *bright blue*, it is given with brazilетto and indigo. *Bright green* is firſt dyed blue, then back-boiled with brazilетto, and verditer, and laſtly woaded. For a *dark green*, it is given like the former, only darkening more before woading. *Lemon*, or *pale yellow*, is given with weld, mixed with rocou. *Orange* and *ſcarlet*, with ſuſtic, weld, and rocou. *Red*, both *bright* and *dark*, with *flame-colour*, &c. are given with brazil, either alone, or with a mixture of rocou. *Violet*, *dry roſe*, and *amaranth*, are given with brazil, taken down with indigo. *Puſlemort* and *olive-colour* are given with galls and copperas, taken down with weld, rocou, or ſuſtic. *Black* is given with galls and copperas, taken down and finiſhed with brazilетto wood.

It is obſervable, that the black vitriolic dye, which is very durable on the ſubſtances already mentioned, is periſhable on linen and cotton. Pieces of both ſorts of cloth and ſkeins of thread boiled firſt with galls, and afterwards infuſed and dipped repeatedly in a decoction of logwood with vitriol, received a good black colour, which was in ſome meaſure diſcharged by waſhing with ſoap; and the black dye proved equally periſhable, though the linen was ſteeped for a month previous to the dye, with galls and with oak-bark. The dyers of thread obtain a colour ſomewhat more laſting, by ſteeping it firſt in alum-water for ſeveral days; and then dipping it repeatedly in the dying liquor, cold, or only lukewarm. This liquor conſiſts of the irony and aſtringent matters mixed together; and in the room of, or along with vitriol, they uſe either filings of iron or ſlippe. Dr. Lewis made ſeveral unſucceſsful trials to fix the black dye in linen and cotton. He has given us, from the diſſertation of M. l'Abbé Mazeas, on the red printed cottons of the Eaſt Indies, an account of a method practiſed by the Indians, of impregnating their cotton with animal matter, in order to its receiving a red ſtain. A ley is made from the aſhes of a certain kind of wood, and with this is mixed ſome ſheep's dung, and a quantity of the oil of ſeſamum, in want of which oil they uſe hog's lard: theſe ingredients ſtirred together are ſaid to unite into a milky liquid. The cotton is ſteeped in this liquor during the night, and expoſed to the hotteſt ſun during the day for a fortnight. He applied a ſimilar preparation to the black dye; but the reſult was not ſuch a degree of ſucceſs as to render the proceſs intereſting to the workman. He obſerves, on the credit of a ſkilful artiſt, that ſome printed linens and cottons have a durable black ſtain, which is made with madder and a ſolution of iron. For this purpoſe a quantity of iron is put into four ſtrong beer; and to promote the diſſolution of the metal, the whole is occaſionally well ſtirred, the liquor at times drawn off, the ruſt beaten from the iron, and the liquor poured on again; the ſolution is not fit for uſe in leſs than a twelvemonth. This ſolution ſtains linen yellow, and of different ſhades of buff colour, and is the only known material by which theſe colours can be fixed on linen. The cloth, ſtained deep with the iron liquor, being afterwards boiled with madder, without any other addition, becomes of the dark colour which is ſeen on printed linens and cottons; which, though not a perfect black, bears a very near reſemblance to it. He apprehends, that a better black might thus be dyed on thread, than that which the printer on linen produces; becauſe in this laſt inſtance, while ſome parts of the linen are ſtained deep with the iron liquor, in order to their being made black; others are ſtained paler, with the ſame liquor diluted with water, for making purple; and others, deſigned to be red, are prepared with a ſolution of alum and ſugar of lead; all theſe colours are dyed in the ſame copper of madder, with a heat a little below boiling; but a boiling heat, which would injure the red colour, would deepen the black, and might be advantageouſly applied, if thread, or whole pieces of linen or cotton, were to be dyed of this colour. Com. Phil. Techn. p. 429, &c.

DYING *of hats*, is done by boiling a hundred pounds of logwood, twelve pounds of gum, and ſix pounds of galls, in a proper quantity of water for ſome hours; after which about ſix pounds of verdigriſe, and ten pounds of green vitriol are added, and the liquor kept ſimmering, or of a heat a little below boiling. Ten or twelve dozen of hats are immediately put in, each on its block, and kept down by croſs bars for about an hour and a half; they are then taken out and aired, and the ſame number of others put in their room; the two ſets of hats are then dipped and aired alternately, eight times each; the liquor being refreſhed each time with more of the ingredients, but in leſs quantity than at firſt. This proceſs affords a very good black on woollen and ſilk ſtuffs as well as on hats. Com. Phil. Techn. p. 428. See HAT.

DYES, *Proof of.* There are divers ways of proving the truth of *dyes*, or examining the juſtneſs and legitimacy of their compoſition. To diſcover whether a cloth have been duly treated by the dyer, and the proper foundation laid, a white ſpot, by the French called *roſette*, of the bigneſs of a ſhilling, ought to be left; beſides a white ſtripe between the cloth and the liſt.

Farther proof is had by boiling the dyed ſtuff in water with other ingredients different according to the quality of the *dye* to be proved. If the colour ſuſtain the teſt, i. e. do not diſcharge at all, or very little, ſo that the water is not tinctured by it, the dye is pronounced good: otherwiſe it is falſe.

Some colours will for a long time reſiſt the injuries of the air; and theſe are therefore called the good or ſtanding colours, and there are others, which the bare expoſure to the air will deſtroy or deface in a very little time; theſe are therefore called the falſe or fading colours. In what manner is the action of the air upon theſe laſt to be explained? Does it take away, or carry off from the ſtuff the particles of the colours; or does it only break and deſtroy that beautiful and regular texture of each particle on which the colour depends? The dyers very often have recourſe to ſeveral ingredients, in order to produce one colour; and reaſon ſeems to urge, that one of theſe falſe or fading colours might be rendered laſting by mixing it with a permanent one: the dyers are alſo of this opinion. But it is nevertheleſs an erroneous one; for repeated experiments have proved, that one of theſe falſe colours laſts as ſoon, when it is mixed with a ſtanding or laſting colour, as when it is uſed alone. There are but few colours on which this experiment can be tried, ſo as to come to a regular deciſion. One of the principal is the mixing of a blue and a yellow, for producing a green. In this experiment, if the blue and the yellow be both ſtanding or permanent colours, the ſtuff will perfectly hold its colours, and ſucceed alike, whether it be *dyed* firſt blue, and afterwards yellow; or firſt yellow, and afterwards blue. But if one of the two colours be a falſe or fading colour, it is found that the green produced by the mixture, will not ſtand, though the other be ever ſo good or permanent a colour.

There is a ſhorter way of trying the permanence of many colours of this kind than that of expoſing them to the air, ſince in boiling only five minutes in a pint of water, in which there has been diſſolved half an ounce of alum, they will loſe as much colour as they would have done by being expoſed two days to the air in ſummer. Some colours acquire different methods of trial, but this ſerves for almoſt all. The ſhades of blue, yellow, red and green, purple and green, are the fineſt colours to experiment theſe things upon, as the ſame previous preparation or impregnation of the ſtuff ſerves for both, and both depend upon blue for their baſis, the purple being made of blue and red, and the green of blue and yellow.

It ſhould not ſeem ſurpriſing, if the ſtuff be firſt dipped into a *dye* of a ſtanding blue, and afterwards into a fading red or yellow, to turn it green or purple, that the action of the air, or boiling in alum water, ſhould carry off thoſe falſe colours, which had only been applied to the ſtuff after it was before ſaturated with a ſtanding colour. But it might be expected, that when the ſtuff was firſt impregnated with them, and afterwards had the blue added upon them, that either the blue muſt be the colour that went off, or that they muſt all remain. But in effect, nothing of this difference is found, but the blue remains, while the fading colours go off, however or in whatever manner or order they are applied. Mem. Acad. Scienc. Par. 1737.

DYES *of Silk, Proofs of the.* For red crimſon, the proof is made by boiling the ſilk with an equal weight of alum. For ſcarlet crimſon, it is boiled with ſoap almoſt of the weight of the ſilk. For violet crimſon, with alum of equal weight with the ſilk, or with citron juice, about a pint to a pound of ſilk. Theſe ingredients are to be mixed, and put in fair water when it begins to boil; after which the ſilks are alſo to be put in; and after boiling the whole for half a quarter of an hour, if the *dye* be falſe, the liquor of the red crimſon will be violet, in caſe it has been *dyed* with archil; or very red, if with brazil. That of crimſon ſcarlet, if rocou bath been uſed, will become of an aurora colour; or, if brazil hath been uſed, red. On the contrary, if the three ſorts of crimſon be truly dyed, their liquors will diſcover very little alteration.

A ſtill ſurer way to diſcover whether crimſon ſilks have been rightly dyed, is by boiling a piece of ſtandard dyed ſilk, kept for that purpoſe at Dyers-hall, after the ſame manner, and then comparing the tinctures of the two liquors.

To diſcover whether other colours have been dyed with galls, the ſilk is to be put in fair boiling water, with pot-aſhes, or ſoap, nearly of the weight of the ſilk; after ſome time, it is taken out; upon which, if it hath been dyed with galls, the colour will be all vaniſhed, and nothing but that of the galls left, which is a ſort of feuille-mort, or wood-colour.

The *dying* of ſilk with galls may alſo be diſcloſed by putting it in boiling water, with a gallon of citron juice; being taken out, and waſhed in cold water, and then dipped in a black *dye*, if galls have been uſed, it will turn black; if not, it will be of a brown-bread colour.

To diſcover whether black ſilk has been over-doſed with galls, ſteel-filings, or ſuppoſ. it is boiled in fair water with twice its weight of ſoap: if it be loaden with galls, it will turn reddiſh, otherwiſe it will keep its colour.

DYES *of Cloths, Proofs of the.* To diſcover whether black cloth has been firſt woaded, and maddered; a ſample of it, and at the ſame time, a ſimple of ſtandard black kept for that purpoſe by the Dyers company, is to be taken; and then as much Roman alum as is equal in weight to both, together with a like weight of pot-aſhes, is to be put over the fire in a pan of bran-water: when it begins to boil, the two ſamples are to be put in; and after half an hour to be taken out and compared. The piece which has only been woaded will be found bluiſh, with ſomewhat of a dull green: if it hath been both woaded and maddered, it will be of a tan, or minim colour; and if it has been neither woaded nor maddered, its colour will be dunniſh, between yellow and ſallow.

The ſame diſcovery may be made by ſteeping a ſmall bit of the black cloth for a day or two in water acidulated with oil of vitriol; or by boiling it about a quarter of an hour in a ſolution of alum and tartar, made by the proportion of one ounce of each, to a pint of water: if the cloth has had a previous blue ground, it will turn in to a bluiſh black colour; but if it has been dyed upon white, it will look of a muddy reddiſh brown. The dyers commonly leave ſome blue marks at the end of pieces of black cloth, by fixing pieces of lead on them, in order to ſhew that the piece has been regularly dyed in a blue ground, and that the colour is durable.

For cloths dyed of a minim colour, the proof is to be made after the ſame manner as that of blacks.

To know whether ſcarlet or crimſon cloth hath been dyed with pure cochineal, they are to be boiled with an ounce of alum to a pound of cloth.

For cloths of other colours, the proof is to be made in the ſame manner as that of blacks and minims. Savar. lib. cit. p. 1665, ſeqq. voc. Debouilli.

DYING, *the Laws relating to*, are as follow. Dyers ſhall dye both the cloth and the liſt, or forfeit it. 1 R. III. cap. 4. No dyer may dye any cloth with archil, or with brazil, to make a falſe colour in cloth or wool, &c. on pain of twenty ſhillings. Stat. 3 & 4 Edw. VI. cap. 2. Dyers are to fix a ſeal of lead to cloths, with the letter *M*, to ſhew that they are well maddered, &c. or forfeit three ſhillings and four pence; and not to uſe logwood in *dying*, on pain of forfeiting twenty pounds. Stat. 23 Eliz. cap. 9. And penalties are inflicted on dyers, who dye any cloths deceitfully, and not being dyed throughout with woad, indigo, and madder; alſo marks ſhall be put to the cloth dyed, &c. Dyers in London are ſubject to the inſpection of the Dyers company, who may appoint ſearchers; and out of their limits, juſtices of peace in ſeſſions to appoint them: oppoſing the ſearchers incurs ten pounds penalty, by ſtat. 13 Geo. I. c. 24.

DYING, in a more extenſive ſenſe, is applied to all kinds of colourings given to bodies of any ſort.

In which ſenſe, *dying* amounts to the ſame with *coloration*; and includes ſtaining, painting, gilding, marbling, printing, &c. The Chineſe are ſaid to practiſe the *dying* of tea with catechu, which gives the worſt ſorts of green tea-leaf the colour, and its infuſion the tincture of bohea. Short. Diſſ. on Tea, pref. p. 15. See TEA and CATECHU.

The ſorts of *dying* now commonly uſed in vulgar trades, are, 1. Whitening of wax, and ſeveral ſorts of linen, and cotton cloths, by the ſun, air, and reciprocal effuſions of water. See BLEACHING. 2. Staining of wood and leather by lime, ſalt, and liquors, as in ſtaves, canes, marble, leathers, marquetry, &c. 3. Marbling of paper, by tempering the colours with ox-gall, and applying them upon a ſtiff gummed liquor. See PAPER. 4. Colouring, or rather diſcolouring ſilks, tiffanies, &c. by brimſtone. 5. Colouring ſeveral iron and copper-works into black with oil. 6. Giving leather a gold colour, or rather *dying* ſilver-leaves like gold, by varniſhes; and in other caſes by urine and ſulphur. 7. Staining of marble

and alabaſter, with heat, and coloured oils. 8. Tinging ſilver into braſs with brimſtone or urine. 9. Colouring the barrels and locks of guns blue and purple with the temper of ſmall-coal heat. 10. Colouring glaſs cryſtals, and earthen-ware, with the ruſts and ſolutions of metals. See POTTERY, &c. 11. Colouring live hair, as in Poland, both horſe and man's hair; and alſo of furs. 12. Enamelling and annealing. See ENAMELLING. 13. Application of colours, as in the printing of books and pictures; and in the making of playing-cards, japanning, &c. See PRINTING, CARDS, and JAPANNING. 14. Gilding and tinning with mercury, block-tin, and ſal armoniac. See GILDING and TINNING. 15. Colouring metals, as copper with calamine into braſs, and with zinc or ſaltpetre into falſe gold, or into falſe ſilver with arſenic. See CALAMINE, BRASS, ZINC, ARSENIC, &c. 16 Making painters colours, by preparing of earth, chalk, and ſtone, as in umber, oker, Cologn earth, &c. out of the calces of lead, as ceruſs and minium; by ſublimates of mercury and brimſtone, as in vermilion; by tinging of white earths variouſly, as in verditer, and ſome of the lakes; by concrete juices or faeculæ, as in indigo, pinks, ſap-green, and lakes; and by ruſts, as in verdigriſe, &c. See CERUSS, MINIUM, VERMILION, INDIGO, &c. 17. The applying of theſe colours by the adheſion of ox-gall, as in the marbled paper aforeſaid; or by gum-waters, as in ſtaining; or chimmy drying oils, as the oils of linſeed, nuts, ſpike, turpentine, &c. See PAINTING, LIMNING, &c. 18. Watering of tabbies. See WATERING. CALENDAR, TABBY, &c. Petty Appar. Hiſt. of Dying, ap. Spratt.

Glaſs *dyed* in the common manner of artificial jewels: the tinctures are given with zaffer, manganeſe, ſcoria, crocus martis, &c. The proceſſes are deſcribed at length in Antonio Neri, de Re Vitraria, lib i. cap. 12, 13, 14, ſeqq. See GLASS, GEM, &c.

The Peruvian women, when grown old, *dye* their grey hairs black by a very untoward operation, viz. boiling the head ſome hours with the hair ſopped in a boiling tincture of the root of a tree called *cachua*, by the Spaniards *magney*.

DYING *of leather, ſkins*, &c. A black colour is eaſily given to tanned leather, by rubbing it over three or four times with a ſolution of vitriol, or with a ſolution of iron in the vegetable acids. For leathers that have not been tanned, ſome galls or other aſtringents are added to the ſolution of iron; and in many caſes, particularly for the finer parts of leather, and for renewing the blackneſs, ivory or lamp-black are uſed. See CURRYING. A *blue* colour is given by ſteeping the ſubject a day in urine and indigo, then boiling it with alum; or it may be given by tempering the indigo with red wine, and waſhing the ſkins therewith. *Red* is given by waſhing the ſkins, and laying them two hours in galls; then wringing them out; dipping them in a liquor made with liguſtrum, alum, and verdigriſe in water; and laſtly, in a dye made of brazil wood boiled with lye. *Purple* is given by wetting the ſkins with a ſolution of roch allum in warm water, and when dry again, rubbing them with the hand with a decoction of logwood in cold water. *Green* is given by ſmearing the ſkin with ſap-green and alum-water boiled; to darken the colour, a little more indigo may be added. *Dark green* is alſo given with ſteel-filings, and ſal armoniac ſteeped in urine till ſoft, then ſmeared over the ſkin; which is to be dried in the ſhade. *Sky-colour*, is given with indigo ſteeped in boiling water, and the next morning warmed and ſmeared over the ſkin. *Yellow*, by ſmearing the ſkin over with aloes and linſeed oil diſſolved and ſtrained; or by infuſing it in weld. *Orange-colour*, is given by ſmearing with ruſtic berries boiled in alum-water; or for a deep orange, with turmeric. Salm. Polygr. lib. iii. cap. 34. p. 272.

The following proceſſes for *dying* leather red and yellow, as practiſed in the Eaſt, for that kind called Turky leather, were lately communicated by Mr. Philips, a native of Armenia, to the Society of Arts, &c. The ſkins are prepared for both dyes, by dreſſing them in time. For this purpoſe, after having been dried with the hair on, they are firſt laid to ſoak in clean water for three days; they are then broken over the fleſh ſide, put into freſh water for two days longer, and afterwards hung up to drain half an hour. They are then broken again on the fleſh ſide, limed with cold lime on the ſame ſide, and doubled together with the grain ſide outward. In this ſtate, they are hung up within doors for five or ſix days, till the hair be looſe, which is then taken off; and the ſkins are returned into the lime pit for about three weeks. They are then taken out and well worked, fleſh and grain, every ſixth or ſeventh day during that time; after which they are waſhed ten times in clean water, and the water is changed at each waſhing. The next operation is drenching: in order to which, a liquor is prepared, by mixing bran and water, and new milk, warm, allowing about three pounds of bran for five ſkins, and about a gallon of water to each pound of bran: the ſkins are left to lie in this drench three days, when they muſt be well worked, and returned into it for two days longer. They are then taken out and rubbed between the hands; the water is ſqueezed from them, and the bran ſcraped off clean from both ſides; after which they are waſhed ten times in clean water, and the water ſqueezed out of them. The ſkins that are to be dyed red are then prepared by honey and bran in the following manner: a pound of honey is diſſolved in three pints of lukewarm water; to which are added, two double handfuls of bran; and then four ſkins are well worked in this quantity of mixture, one after another. They are then folded ſeparately in a round form, with the fleſh ſide outward, and laid in an earthen pan, or other proper veſſel, by the ſide of each other in ſummer, and upon each other in winter; and the veſſel is placed ſloping, ſo that the liquor may drain from them. In this operation the liquor will ferment, and the ſkins ſwell; in which ſtate they remain about ſeven or eight days, the liquor that drains from them being poured on as occaſion requires. On the eighth or ninth day, they are taken out of this mixture, and rubbed with dry common ſea-ſalt, in the proportion of about half a pound to each ſkin; by which they are contracted, and the remaining moiſture is to be ſqueezed out, by drawing each ſkin ſeparately through the hands. They are then ſcraped clean on both ſides from the bran and ſuperfluous ſalt and moiſture; and freſh ſalt is ſtrewed over the grain ſide, and well rubbed in with the hands. They are now doubled, with the fleſh ſide outward, lengthwiſe, from tail to tail, and more ſalt is thinly ſtrewed over the fleſh ſide and rubbed in. About one pound and a half of ſalt for each ſkin will ſuffice for both theſe operations. In this ſtate they are folded on each other, and laid between two clean boards, under a heavy weight, and continued in this graining ſtate for two days or more, when they will be fit for *dying*. The red dye is prepared by boiling ſeven ounces of ſhenan, tied up in a linen bag, in eight gallons of water for about an hour; and by putting into the boiling mixture two drams of pomgranate bark, three-fourths of an ounce of turmeric, three ounces of cochineal, and two ounces of loaf ſugar, and letting the mixture afterwards boil for ſix minutes: this is the proportion for four ſkins. N. B. The ſhenan is eaſily to be obtained from any of the ports in the Levant: it is the eaſtern jointed kali, called by botaniſts *ſalſola tragus*, but different from the ſmall ſpecies met with on the Engliſh ſea-coaſt. Two pints of the above liquor are to be meaſured out in a flat earthen pan; and when it is as cool as new milk, one ſkin folded lengthwiſe, with the grain ſide outwards, is to be dipped in it, and rubbed gently with the hand: then it is hung up to drain; and the ſuperfluous dye is thrown away. The ſame proceſs muſt be obſerved with reſpect to the other three ſkins; and the ſame operation muſt be repeated on each ſkin ſeparately eight times before each freſh dipping; then let the ſkins be ſqueezed and laid in a ſloping pan to drain for about two hours, or till they are cold. They are next to be tanned, by working them well for half an hour or more in a mixture, made by powdering four pounds of the beſt white galls in a marble mortar, ſifting and mixing them with about three quarts of water: the ſkins are folded in four folds, and left to lie in the ſun twenty-four hours; after which they are again to be worked, ſcraped clean from the firſt galls, and put into the like quantity of freſh galls and water: they muſt be well worked in this for three quarters of an hour, folded up as before, and left in it three days. On the fourth day they muſt be waſhed clean from the galls in ſeven or eight freſh quantities of water, and hung up to dry. When they are almoſt dry, they are to be ſcraped on the fleſh ſide with the ſcraper, in order to reduce them to a proper thickneſs; they are then to be laid on a ſmooth board, and glazed, by rubbing them with a ſmooth glaſs. Afterwards they muſt be oiled, by rubbing them with olive oil, in the proportion of one ounce and a half of oil to four ſkins, and then grained on a graining board lengthwiſe, breadthwiſe, and croſswiſe, from corner to corner.

The ſkins that are deſigned for the yellow dye, after having been drenched, muſt be well worked for half an hour or more, in a mixture of one pound and a half of the beſt white galls, powdered with two quarts of clean water: this is the proportion for four ſkins. They muſt then be ſeparately doubled lengthwiſe, rolled up with the fleſh ſide outwards, laid in the mixture, and cloſe preſſed on each other; in which ſtate they are to remain

two

two whole days. On the third day they muſt be again well worked in the tan, and afterwards ſcraped clean from the galls with an ivory or braſs inſtrument; and then put into a freſh tan made of two pounds of galls, with about three quarts of water, and well worked in it fifteen times. After this they muſt be doubled, rolled up as before, and remain in the ſecond tan for two days. On the third day, a quarter of a pound of white ſea-ſalt muſt be worked into each ſkin, and the ſkins be doubled and rolled, and laid in the tan till the following day, when they are to be waſhed ſix times in cold water, and four times in lukewarm water. The ſkins muſt then be well preſſed between two boards, and drained.

The yellow dye, for which they are now ready, muſt be prepared by mixing ſix ounces of caſſian gehira, or the berries of an eaſtern rhamnus, or buck thorn-tree, with the ſame quantity of alum; theſe are to be pounded together in a marble or braſs mortar, with a braſs peſtle: this is the proper quantity for four ſkins. The berries may be obtained at Aleppo, or other parts of the Levant; or the Avignon berries, though they yield a weaker dye, may be ſubſtituted in their room. The powdered materials may be divided into three equal parts; and one of theſe parts is to be ſtirred in about a pint and a half of hot water, in a china or earthen veſſel. When the liquor has been boiled and ſtood to cool, ſo as not to ſcald the hand; a fourth part of it is poured on the grain ſide of one of the ſkins laid flat on a table in a warm room, with this ſide uppermoſt, and well rubbed over the ſkin. The ſame proceſs is to be purſued with the other three ſkins. The ſame operation muſt be repeated twice more, ſeparately on each ſkin, with the remaining eight ounces of the pulveriſed berries and alum, mixed with the ſame proportion of hot water. When the ſkins are dyed, they are to be hung up looſely, with the grain ſide outwards, for about three quarters of an hour to drain, and then well waſhed ſix times or more in running water. They muſt then be preſſed for about an hour, till the water is well ſqueezed out, and hung to dry in a warm room. And laſtly, they muſt be dreſſed and grained, in the manner already preſcribed for thoſe dyed red, except that they muſt not be oiled. Doſſie's Mem. of Agriculture, vol. i. p. 400, &c.

DYING *or ſtaining of wood, for inlaying, veneering, &c. Red*, is done by boiling the wood in water and alum; then taking it out, adding brazil to the liquor; and giving the wood another boil in it. *Black*, by bruſhing it over with logwood boiled in vinegar, hot; then waſhing it over with a decoction of galls and copperas till it be of the hue required. *Any other colour* may be given by ſqueezing out the moiſture of horſe-dung through a ſieve, mixing it with diſſolved roch alum and gum arabic; and to the whole adding green, blue, or any other colour deſigned. After ſtanding two or three days, pear-tree, or other wood, cut to the thickneſs of half a crown, is put into the liquor boiling hot, and ſuffered to remain till it be ſufficiently coloured. Park. Treat. of Japann. cap. xxvii. p. 82.

DYING *of bone, horn, or ivory. Black* is performed by ſteeping braſs in aqua fortis till it be turned green: with this the bone, &c. is to be waſhed once or twice; and then put in a decoction of logwood and water, warm. *Green*, is begun by boiling the bone, &c. in alum water; then with verdigriſe, ſal armoniac, and white-wine vinegar; keeping it hot therein till ſufficiently green. *Red*, is begun with boiling it in alum water, and finiſhed by decoction in a liquor compounded of quicklime ſteeped in rain water, ſtrained, and to every pint an ounce of brazil wood added: the bone, &c. to be boiled herein till ſufficiently red. Other methods are given by Salmon. And from him by Houghton. Park. lib. cit. p. 87. Salm. Polygraph. lib. iii. cap. 35. p. 275. Hought. Collect. N° 138. tom. i. p. 361. See BONES, HORN, IVORY, &c. The reſuſe of the bow-dye given to hogs to feed on, is ſaid to tinge their very bones red.

DYING *of marble and ſtones.* See STAINING.

DYKE-*Reeve*, a bailiff, or officer, that has the care and over ſight of the *dykes* and drains in deepening ſens, &c. We find mention made of this officer anno 16 & 17 Car. II. cap. 11. See DIKE.

DYNA, in *Commerce*, a kind of Eaſt Indian coin, worth about thirty ſhillings of Engliſh money.

DYNAMICS, from *δυναμις*, *power*, is the ſcience of moving powers; more particularly of the motion of bodies which mutually act on one another. See MECHANICS, MOTION, COMMUNICATION *of Motion*, OSCILLATION, PERCUSSION, &c.

DYNASTY, a term in *Hiſtory*, ſignifying a race or ſucceſſion of kings of the ſame line, or family. The word is formed from the Greek *δυναστια*, of *δυναστευω*, *to be powerful*, *to be king*.

We find frequent mention in ancient hiſtory of *dynaſties* of Perſians, Aſſyrians, Medes, &c. The ancient Chronicon of Egypt mentioned by Syncellus, gives us an account of three different *dynaſties*; that of the gods, that of the demi-gods or heroes, and that of men or kings. The two former are preſumed as continuing thirty-four thouſand two hundred and thirty-one years, in order to favour the high antiquity of the Egyptians: the laſt as commencing with the reign of Menes the firſt king of Egypt, and terminating with Nectanebus II. under whom the kingdom was conquered by Artaxerxes Ochus; and this is ſaid to have laſted two thouſand three hundred and twenty-four years. Manetho has left us an hiſtorical chronology of Egypt, divided into thirty *dynaſties*, comprehending a ſpace of more than five thouſand three hundred years to the reign of Alexander: but it is certain that theſe were collateral and not ſucceſſive.

DYOTA, in *Chemiſtry*, from *δις*, *bis*, and *ους*, *ear*, a pelican, or circulating veſſel with two ears, in ſhape reſembling a man ſtanding with his arms bent outwards, and with his hands on his ſides.

DYPTYCHA, or rather DIPTYCHA. See DIPTYCHA.

DYSAS, in *Mythology*, inferior goddeſſes among the Saxons, being the meſſengers of the great Woden, whoſe province it was to convey the ſouls of ſuch as died in battle to his abode; called *Valhall*, i. e. the hall of ſlaughter; where they were to drink with him and their other gods, *ertocopa*, or a kind of malt liquor, in the ſculls of their enemies. The *Dyſe* conveyed thoſe who died a natural death, to *Hela*, the goddeſs of hell, where they were tormented with hunger, thirſt, and every kind of evil.

DYSCRASY, from *δυς* and *κρασις*, an ill temperament or habit of the blood and humours, as in a jaundice or the like.

DYSENTERY, *Δυσεντερια*, in *Medicine*, a bloody diarrhœa; or a flux of blood by ſtool, attended with pains and griping. Dr. Akenſide calls this diſeaſe a rheumatiſm of the bowels.

The word *dyſentery* is formed from the Greek, *δυς*, *difficulty*, and *εντερον*, *inteſtine*; and properly ſignifies that kind of flux of the belly, characterized by the frequency of ſtools, or evacuations, mixed with blood, and accompanied with gripes. The fever, ulcers, &c. which attend it, are not eſſential to the diſeaſe; though many both of the ancients and moderns, think the latter are.

The *dyſentery*, Sydenham obſerves, begins with a chilneſs and ſhivering; which is followed by a heat: then gripings of the belly enſue, with mucous, or ſanious ſtools, which in progreſs of time are found interſperſed with ſtreaks of blood, and attended with vehement pain.

The ſtools are ſometimes void of blood; and yet if they be frequent, and attended with gripes, and a mucous colluvies, the ſame author ſays, it is a proper *dyſentery*.

Along with the excrements, beſides a whitiſh mucoſity, frequently there come ſcrapings of the guts in form of little ſkins. If pure blood be evacuated, the patient's life is in great danger. Vomiting and hiccupping are alſo bad ſigns, becauſe they indicate an inflammation of the ſtomach. A feeble pulſe, coldneſs of the extremities, with difficulty of ſwallowing, and convulſions, are ſigns of approaching death.

Etmuller makes three kinds of *dyſenteries*. 1. When a ſandable blood is evacuated, from a mere plethora, or plenitude, without any diſorder of the inteſtines; as in the hæmorrhoidal flux.

2. When a thin watery blood is evacuated, called the *hectic flux*, though really ariſing from the hæmorrhoidal veſſels.

The third kind, which is that we more peculiarly call *dyſentery*, is, when blood is caſt out mixed with a purulent matter in the excrements. See FLUX.

This is either *benign*, i. e. without a fever, and not contagious; or *malignant*, which is attended with a peſtilential fever, and frequently ravages whole cities and provinces; happening moſt commonly in armies. In the laſt ſtage a ſort of carunculæ are frequently ejected along with the purulent matter, which are difficult to be accounted for, unleſs from an excoriation and ulceration of the inteſtines. Sometimes the inteſtines in this caſe are even gangrened.

The cauſe of the *dyſentery*, as aſſigned by ſome phyſicians, is a ſerous, or other morbid humour mixed with the maſs of blood; the conſequence of which is a too great fermentation in the blood, and a diſſolution of its parts, which are rendered too liquid. The ſecond cauſe is a vellication and irritation of the nervous fibres of the inteſtines, occaſioned by ſharp acid humours ſeparated

from

from the blood, which occasion the spiral fibres that produce the peristaltic motion of the guts to move too fast and thus to expel the matters too hastily out of the intestines. The medicine cause, in the ephysicians language, is some foreign body adhering strongly to the intestines; and, by its sharp points, vellicating the nervous fibres of the intestines, and at length ulcerating them. The remote causes are any thing that corrupts the mass of blood, as viscid and crude sharp juices; all foods, autumnal fruits, grapes, new wine drank in excess, poisons, violent medicines, waters that have corroded leaden pipes; rainy weather in the spring, with a dry winter, and a hot summer and autumn.

The *dysentery* is owing to causes little different from those which produce the bilious & putrid fever. Accordingly it is agreed on all hands, that it chiefly proceeds from two causes, different in appearance, but in effect the same, one from acrimony, generated within the body; and the other from foul vapours, which being received into it, act as a ferment, and suddenly produce the same disorder that arises more slowly from an internal cause.

As to the acrimony, it appears to be of the putrid kind, the *dysentery* being most frequent in hot, close, and moist seasons, when bodies are most subject to putrefaction; and besides, it prevails chiefly among those of a scorbutic habit, or the meanest and poorest people, who, from foul air, bad diet, and naftiness, are most liable to putrid diseases.

There is likewise an old observation, that such seasons as produce most flies, caterpillars, and other insects (the increase whereof depends so much upon heat, moisture, and consequently upon corruption) have likewise been the most productive of *dysenteries*.

Lastly, it is beyond dispute, that the infection is communicated by putrid effluvia from the bodies; but more especially the feces of those who are ill of the distemper. See Pringle, Observations on the Diseases of the Army, p. 224, seq.

This disease is the same in camps as in other places; its greater fatality in the former, arising more from want of necessaries than from any extraordinary virulence in the *dysentery* itself.

The seat of the disease is in the intestines, either the large or the small, or both. When the disease is in the small ones, the gripes begin long before the stools, and are felt about the navel; and the blood and excrements are more blended, as being longer together. When the large intestines are seized, the pain is less vehement, and is felt lower, &c.

Physicians distinguish three states of the *dysentery*; the first, when recent; the second, when it has continued some time, and has much impaired the strength, weakened the tone of the intestines, and abraded their villous coat; and the third, when, either from the putrid fumes within, or the foul air of an hospital, a malignant fever is joined, and a mortification threatened.

In the first stage bleeding is proper, though not in the subsequent ones; also vomiting with *specacuanha*, in small quantities, and repeated several times. *Pitrum ceratum antimonii* is also recommended as the most efficacious emetic for relieving the stomach and bowels, provided it be given in the beginning of the distemper. After vomiting, a purge of rhubarb, to which are added a few grains of salt of wormwood, may be given. In winter, indeed, and vernal fluxes, bleeding and rhubarb have been found sufficient, without vomits. In regard to diet the common practice is to confine the patient in the beginning to rice-gruel, panado, mutton-broth, and the like; and for drink, rice or barley-water, or the white-decoction, are recommended. In the convalescent state, they may be allowed meat, but no small beer; and never any milk unless diluted with lime-water. Pringle, Observations on the Diseases of the Army, p. 230, seq.

In the second stage, the same diet, with small doses of the bark; to which has been added the extract of logwood, or the *rhatania Japonica*, is recommended. The following electuary, prepared with the *Japonic* confection, two ounces; Locatelli's balsam, one ounce; powdered rhubarb, half an ounce; and syrup of marshmallows, may be given in the quantity of a nutmeg, twice or thrice a day, as the symptoms may require.

In a putrid *dysentery*, the patient may be allowed to eat freely of most kinds of good ripe fruit, as apples, grapes, currants, strawberries, &c. these being excellently calculated to counteract putrefaction; and with the same intention fixed air, administered both by way of drink and clyster, may be highly useful. They also may be taken both ways; and camomile tea is also an exceeding proper drink, both for strengthening the stomach, and by its antiseptic qualities preventing a mortification of the bowels.

The *dysentery*, after a seeming cure, is apt to recur upon any cold, or error in diet: however it is to be observed, that for the most part, relapses are not attended with such acrimony as at first. When relapses are apprehended, or the cure imperfect, the patient must still use a soft mucilaginous diet, and continue to take some mild astringent; which last intention may be answered by lime water, given to a pint a day, and softened with half that quantity of boiled milk. Sometimes small doses of the bark have been no less effectual. Ll. ibid.

Gripes always attend the *dysentery*, and are relieved by opiates; by fomenting the belly, and drinking camomile-tea; for carminatives, in this case, instead of mitigating, increase the pains. The tea produces this effect not only by its antiseptic virtue. The fomentations, which are made of herbs, adding some spirits, must be frequently repeated; and when these are found ineffectual, the pains may be relieved with a bolter, or only a warm platter, with a fourth or fifth part of the *emplastrum opiophlycticum* added to it.

As to the third stage of this distemper, it coincides with the malignant or hospital fever. See HOSPITAL-*fever*.

Purgatives have rarely any good effect in *dysenteries*, as increasing the fermentation of the blood, and irritating the fibres of the intestines more and more. Nor are emetics in general much better, as tending to draw the peccant humours into the stomach; or at least into the higher intestines, and thus cause more frequent stools.

Ipecacuanha, however, is excellent on this occasion: not so much as a vomitory, Dr. Fothergill observes, as a sudorific; having this faculty beyond all other emetics, that it corrects the *dysentery* ferment in proportion as it evacuates it. In the Philosophical Transactions, we have an express discourse on the subject; where it is asserted to be infallible in all *dysenteries* and looseneſſes, how dangerous and inveterate soever; except in polysomnic and hydropic patients, whose fluxes are indications of approaching death.

Sydenham commends phlebotomy; but Willis says, no evacuation is good, and prefcribes hot cardiac, as spirit of wine a little burnt, &c. Balsamic and hypnic medicines are also to be used, according to the diverse causes and symptoms of the disease.

Borri, in a letter to Bartholine, affirms there is no better medicament in *dysenteries* than rose-water wherein gold has been extinguished.

Dulcus relates, that he cured above a hundred persons with oil of sweet almonds, mixed with orange-juice.

In this disorder, some, after bleeding and vomiting, give their patients small doses of calomel once a day, till their breath begins to be tainted; the purging being moderated by opiates, glutinous food, drink, and anodyne clysters, which is the more necessary, as the guts in this case are easily irritated. Medic. Eſſ. Edinb. abridg. vol. i. p. 72.

The vitrum antimonii ceratum has been found a most efficacious remedy in this distemper. See VITRUM *Antimonium ceratum*.

Repeated doses of ipecacuanha, and of rhubarb with calomel, with opiates in the evening, have also been found successful. Medic. Eſſ. Edinb. abridgm. vol. i. p. 65. where it is observed, that astringent medicines, without gentle revulsions and evacuations, generally retard the cure. For Dr. Fothergill's Observations on the Cure of Fluxes, by small Doses of Ipecacuanha, see Lond. Med. Obſ. vol. vi. p. 186.

Ipecacuanha, and the simarouba, have often had great effects in this distemper. See Jussieu in Mem. Acad. Scienc. ann. 1719. This gentleman says, that the simarouba may be compared to, and substituted for the *macer* of the ancients, which is by some supposed to have been a species of this distemper. See SIMAROUBA.

DYSESTHESIA, from δυς, *difficult*, and αισθησις, *sensation*, in *Medicine*, is used for a difficulty of, or fault in sensation.

DYSEPULOTICA, from δυς, ρυς, and ουλος, *cicatrix*, of ουλος, *sound*, in *Medicine*, great ulcers beyond cure. See ULCER.

DYSOREXIA, from δυς and ορεξις, *appetite*, in *Medicine*, a want of appetite, proceeding from an ill disposition, or diminished action of the stomach. See APPETITE.

DYSPEPSY, δυσπεψια, from δυς and πεπτω, *coquere, to concoct*, in *Medicine*, a difficulty or weakness of DIGESTION.

The *dyspepsy* may arise from the too great weakness of the ferment of the stomach, or its being too sparing in quantity; from a relaxation of the fibres of the stomach; the want of a proper heat in the stomach, &c. Bitters and subastringents are its proper remedy.

DYSPHONIA, from δυς and φωνη, *voice*, in *Medicine*, a difficulty of speech from an ill disposition of the organs.

DYSPNOEA, δυσπνοια, from δυς and πνεω, *I breathe*, in *Medicine*, a difficulty of breathing.

The *dyſpnœa* admits of three degrees: a ſhort breath, an aſthma, and an orthopnœa. The ſhort breath is the firſt and lighteſt degree. The aſthma is more violent, and is accompanied with a wheezing.

The orthopnœa is the higheſt of all; the patient affected therewith not being able to lie down, but obliged to keep erect, without which he could not reſpire.

The moſt uſual cauſes of *dyſpnœas* are phlegm lodged in the bronchia, or the too ſtrong conſtriction of the bronchia themſelves; which prevents the eaſy ingreſs of the air into the lungs. See ASTHMA and ORTHOPNŒA.

DYSTHANATOS, from δυς and θανατος, *dying*, a word uſed by the ancient writers, ſometimes to ſignify any diſeaſe which occaſions a painful and ſlow death, and ſometimes for the perſon dying in ſuch a lingering manner.

DYSURIA, Δυσουρια, from δυς and ουρον, *to make urine*, in *Medicine*, a difficulty of making urine, accompanied with pain, and a ſenſe of heat.

It is alſo called *ardor urinæ*, becauſe the urine ſeems to burn the urethra as it iſſues forth.

The *dyſuria* differs chiefly from the ſtrangury in this, that in the ſtrangury the urine only oozes out, as it were drop by drop, whereas in the *dyſuria*, when it is made, it ſtreams out without any interruption, and frequently in the proper quantity: thus it alſo differs from the *iſchuria*, which is a total ſuppreſſion of urine.

The ordinary cauſes of the *dyſuria* are, the acrimony, or ſharpneſs of the urine, and the exporiation or exulceration of the neck of the bladder, or of the urinary paſſage.

The uſual remedies in this caſe are cooling laxatives and mucilaginous medicines, as gum arabic, diſſolved in barley-water; decoctions of marſhmallow-root, with or without nitre; camphor, and ſmall doſes of laudanum. See ISCHURIA and STRANGURY.

DYTISCUS, in *Zoology*. See *Water*-BEETLE.

E.

E, The fifth letter of the alphabet, and the second vowel.

E is a letter that admits of some variety in the pronunciation, in moſt languages; whence grammarians uſually diſtinguiſh ſeveral *E*'s, or kinds of *E*. In Engliſh, *E* has two ſounds; long, as *ſcene*, and ſhort, as *men*. *E* final has the peculiar quality of lengthening the preceding vowel, as *cān*, *cāne*; yet there are ſome inſtances in which it has not this effect; as *gīve*, &c. It ſerves alſo to modify the foregoing conſonants; as *ſince*, &c. It is alſo founded at the end of proper names, as *Penelope*, and in monoſyllables that have no other vowel, as *the*; but in every other caſe it is mute. It was formerly uſed much more generally at the end of words than at preſent, and had probably a ſoft ſound like the French *E* feminine; and afterwards was made vocal or ſilent in poetry, as the verſe required, till at laſt it became univerſally ſilent. Camden calls it the ſilent *E*. Johnſon.

The Greeks have their ſhort and long *E*, viz. ε and η, epſilon and eta. The Greek η, or H, *eta*, or *ita*, was no original letter; but was added to the alphabet in after times. Of this we have proofs ſtill extant in the ancient monuments; particularly, the Farneſe columns, brought to Rome from the Via Appia, where the *epſilon*, E, is uſed in lieu of the H: e. gr. ΔΕΜΕΤΡΟΣ ΚΟΡΕΣ, for ΔΗΜΗΤΡΟΣ ΚΟΡΗΣ. This letter is ſaid to have been added by Simonides.

The pronunciation of the η ſeems to have been varied; it having been ſometimes the ſame with the Latin *E*, ſometimes with *I*. Terentianus aſſures us of the former; and the Greeks themſelves for many ages have only uſed the latter.

The Latins have an opener *E*, called *apertus*; ſuch was the ſecond *E*, in the word *here*, *miſer*; and another cloſer, as that in the adverb *here*, *yeſterday*. This latter *E* they frequently uſed promiſcuouſly with *I*. Thus for *here*, they wrote *heri*; and, in divers places, we meet with *ſine*, *quoſe*, &c. for *ſibi*, *quoſi*, &c.

The Roman *E* was likewiſe ſometimes written, by corruption, æ; for which reaſon, F. Hardouin takes that medal of Gallienus, GALLIENÆ AUGUSTÆ, not to be any fatirical medal, as others have imagined; nor to be a dative feminine, but a vocative maſculine, *Galliene Auguſte*, wrote with the æ.

It has been much diſputed how the Latins render the η in their language. The common opinion is, that they render it by an *E*; as in Δημητρος, Βοτα, Ηαγια, Θησευς, Θυγατηρ, &c. which they rendered *Demetrius*, *Beta*, *Hemera*, *Theſeus*, *Theſaurus*, &c. Though there are perſons exceedingly well verſed in antiquity, who hold that they pronounced it like an *I*. Lud. de Dieu, one of the moſt learned grammarians of his age, obſerves as much in his animadverſions on Geneſis vi. 24. Adding, that it is for this reaſon, that the Hebrews, e. gr. the paraphraſt Jonathan, expreſſes it by a *Hireſ*; נשרים. J. Rod. Wetſtein proves the ſame in his learned oration on the true pronunciation of the Greek tongue, from an infinity of inſtances. To this purpoſe he gives a manuſcript Pſalter of the eighth century, where all the η's are expreſſed by *i*'s. In effect, Wetſtein ſhews, not only that the Latins pronounced and wrote it as an *i*, which might happen from its being ſo eaſily confounded in writing with an *i*; but alſo that they rendered it by an æ, and *ae*; that it was often uſed for Τ and ΕΙ; and that in the time of Plato this letter had a kind of intermediate ſound between the ε and ι. See that author, and Voſſius de Idolol. lib. i. cap. 16.

The French have, at leaſt, ſix kinds of *E*'s; the firſt pronounced like æ; as in *empereur*, *orient*, &c. The ſecond, a final mute, in the laſt ſyllable of diverſe words not pronounced at all; as in *bonne*, *donne*, &c. The third, an imperfect mute, pronounced much like the diphthong *ea*, &c. as in *je*, *de*, *te*. The fourth, *e ferme*, or *e maſculine*, marked at the ends of words with an accent, é. The fifth, is *e ouvert*, or *long e*, having the ſame ſound with *ai*, as in *mere*, *fete*, &c. In the middle of words it is ſometimes marked with a circumflex, and in the end, with an accent, è. The ſixth, is an intermediate *e*, between the *ouvert* and *fermé*; as in *caheret*, *lettre*, &c. Some add a ſeventh kind of *e*, not reducible to any of the former, as that in *grammarien*, *hiſtorien*, &c. And others admit of only three kinds, viz. the mute, open, and ſhut; but they make variations threein, which amount to the ſame thing.

As to the figure of the letter *E*, we borrow it from the Latins, who had it from the Greeks, and they from the Phœnicians, by Cadmus, who firſt brought it thems Now the Phœnicians had the ſame characters with the Hebrews. Accordingly, the form of the ancient Hebrew *He* was the ſame with that of our *E*, as may be ſeen in the Hebrew medals, and the Jeſuit Souciet's Diſſertation thereon, p. 143. All the difference between them conſiſts in this, that the Hebrews, reading from right to left, turn their letters that way; whereas the moderns, reading from left to right, write their letters accordingly.

The little *e* was formed of the great one, by writing it faſt, and making the croſs ſtrokes at top and bottom without taking pen off paper, and then adding the ſtroke in the middle.

E, on the keys of an organ, or harpſichord, denotes the tones, *E*, *mi*, &c.

On the compaſs, in ſea-charts, &c. it marks the eaſt point, or wind. E. eaſt; E. S. E. eaſt-ſouth-eaſt, N. E. north-eaſt, &c.

In the calendar, *E* makes the fifth of the Dominical letters.

Among authors, *e. gr.* ſtands for *exempli gratia*, *for inſtance*. In ſeveral dictionaries we find it noted, that the letter *E* among the ancients, was a numeral letter, ſignifying 250, according to the verſe,

E quoque ducentos & quinquaginta tenebit.

But it has already been obſerved, that this uſe of numeral letters was unknown among the eaſtleſt people. Iſidore Hiſpalenſis, an author of the ſeventh century, ſays as much in expreſs terms, in the firſt book of his Origines, cap. 3. In effect it was firſt introduced in the times of barbariſm and ignorance.

EADISH. See RADISH.

EAGER. *Vine.* See WINE.

EAGLE, *Aquila*, Aerog, in *Ornithology*, the largeſt, ſtrongeſt, and ſwifteſt, of all the birds that live by prey.

In the Linnæan ſyſtem it is a ſpecies of the FALCON. See *Tab. of Birds*, N° 1.

It has a long beak, hooked almoſt from the root; yellow legs, which are feathered to the toes; and the toes are covered with large ſcales; thick, crooked talons, and a ſhort tail, of a deep brown, with ſtreaks of aſh-colour, and uſually white at the roots of the feathers. Its plumage is chefnut-coloured, brown, ruddy, and white. Its beak black at the tip, and in the middle blue, though in ſome yellow. The *eagle* is diſtinguiſhed from the hawk by his bigneſs; and from the vultur, by the crookedneſs of his beak.

This is the *golden eagle* of ſome authors, the *falco chryſaetos* of Linnæus, and the *royal eagle* of others.

Its aery, or neſt, is uſually on the higheſt rocks, ſometimes on the tops of old trees. It feeds its young till ſuch time as they are able to fly, and then drives them out of the neſt.

Its

Its food is birds, hares, lambs, kids, and fawns; nay, Sir Robert Sibbald aſſures us, children too, when it can catch them; of which he gives an inſtance in the Orcades iſlands. Prod. Nat. Hiſt. Scot. lib. iii. p. 2. and 14.

Ray mentions an *eagle's* neſt found near the river Derwent, in 1668. It conſiſted of large ſtrong ſticks, one end whereof was laid on the crag of a rock, and the other on two beech trees; it was two yards ſquare; in it was found one *eaglet*, with the carcaſe of a lamb, one hare, and three grygalis. Synopſ. Methpd. Av. p. 6.

The *eagle* frequently watches the fiſhing hawk, and as ſoon as it perceives it to have ſtruck a fiſh, takes wing, and purſues the bird till it lets fall its prey, and often catches it before it reaches the earth or water. Phil. Tranſ. N° 201.

Eagles are remarkable for their longevity, and for their faculty of ſuſtaining a long abſtinence from food. Keyſler relates, that an *eagle* died at Vienna after a confinement of a hundred and four years, which juſtifies the alluſion of the Pſalmiſt. Pſalm ciii. 5.

Its ſight is quick, ſtrong, and piercing, to a proverb. Job xxxix. 29. The reaſon why the *eagle*, the fibres of whoſe optic nerves are not ſtronger than thoſe of other animals, is able to face the ſun, and endure its brighteſt rays, the Jeſuit Angelus, in his Optics, aſſures us, is, that it has two ſets of eye lids, the one thick and cloſe, and the other thinner and finer, which laſt it draws over the eye, when it looks at any luminous body, and thus breaks the force of its rays.

The falconers have trained up *eaglet* to the game; but they only ſucceed in mountainous countries. On plains they cannot keep any time on the wing; and when they ſtoop, or light, are weak, ſo that the faker beats them.

Ariſtotle, and Pliny, reckon up ſix kinds of *eagles*, to which they give names correſponding to the difference of their plumage: as the *eagle-royal*, called by Ariſtotle *πυγαργος*, and *aureus*, from the ruddy, golden colour of its feathers, which are likewiſe ſpotted as it were with ſtars. The *black-eagle*, *valerius*, the ſmalleſt and moſt vigorous of all. The *white-tailed eagle*, or *pygargus*. The *middle-ſized eagle*, with a large tail, living in moraſſes, *morphnus*. The *ſea-eagle*, *haliaetus*. And the *bearded-eagle*, a kind of *offraga*.

EAGLE, *black*, a ſpecies called alſo *aquila valeria* by ſome authors. It is a ſmall *eagle*, of twice the bigneſs of a crow. Its jaws and eye-brows are deſtitute of feathers, and look reddiſh; its head, neck, and breaſt, are black, and in the middle of its back it has a large triangular ſpot, of a pale brownith red, with ſomething of whiteneſs intermixed. His romp is a reddiſh brown, and his wings variegated with black, white, and grey. His beak is not large, black at the end; the ſkin, covering the noſtrils, red; and the iris of his eyes hazel-coloured. His legs are feathered a little below the knee, and below that are red; and the claws very ſharp. Willughby's Ornithology, p. 30.

EAGLE, *crefted*, in *Ornithology*, a name under which Nieremberg has deſcribed an American ſpecies of bird, of the *eagle* kind, called by the Indians *yaxuthli*. It is, by much, the largeſt of all the *eagles*, yet it is eaſily tamed, and fitteſt for the diverſions of hawking. This is placed by Mr. Ray among the birds, the deſcriptions of which he is very ſuſpicious of. Ray's Ornithol. p. 290.

EAGLE, *fea*, in *Ornithology*, a name uſed by ſome authors for the HALIAETUS, or oſprey.

EAGLE, *ſea*, in *Ichthyology*, the name o a ſpecies of cartilaginous flat fiſh, of the paſtinaca marina kind. It is generally found ſmall, but ſometimes grows to a very large ſize. Its head is large for a fiſh of this genus, and ſomewhat reſembles a toad's in ſhape; its eyes are large and prominent; its mouth is placed in the under part of the head, and is large, and furniſhed with ſtrong teeth. Its ſides are broad and thin, and repreſent the expanded wings of an eagle whence it had its name. See *Tab. of Fiſhes*, N° 3.

EAGLE, *white-tailed*, *Falco fulvus* of Linnæus, is a ſpecies common to the northern parts of Europe and America. This is called in Scotland the *black-eagle*, from the dark colour of the plumage. It is about the ſame ſize with the golden *eagle*; the bill is of a blackiſh horn colour, the cere yellow, and the whole body is of a deep brown, ſlightly tinged with ruſt colour; but its diſtinguiſhing characteriſtic is a band of white on the upper part of the tail. The legs are feathered to the feet, the toes are yellow, and the claws black. The white tailed *eagle* of Canada is a variety of this, differing only in ſome white ſpots on the breaſt. See PYGARGUS.

EAGLE, in *Heraldry*, is the ſymbol of royalty, as being, according to Philoſtratus, the king of birds; and for that reaſon dedicated, by the ancients, to Jupiter.

The *eagle* is the arms of the emperor, the king of Poland, &c. It is accounted one of the moſt noble bearings in heraldry, and, according to the learned in that art, ought never to be given, but in conſideration of ſingular bravery, generoſity, &c. On which occaſions either a whole *eagle*, or an *eagle naiſſant*, or only the head, or other parts, agreeable to the exploit, may be granted.

The *eagle* is ſometimes repreſented with one head, and ſometimes with two, though never more than one body, two legs, and two wings opened, or ſtretched out, in which poſture it is ſaid to be *ſpread* or *diſplayed*: ſuch is that of the empire, which is blazoned a *ſpread eagle*, *ſable*, *diadomed*, *langued*, *beaked and membered*, *gules*.

The reaſon why *eagles* are generally given in heraldry diſplayed, is partly, becauſe in that poſture they fill up the eſcutcheon better, and partly becauſe it is imagined a poſture natural to the *eagle*, when it plomes its feathers, or faces the ſun. However, there are *eagles* borne in other poſtures; and ſome monſtrous ones, with human or wolves heads, &c. The late authors only ſay *diſplayed* to expreſs the two heads; and *ſay an eagle*, without any addition, when it has but one. The kingdom of Poland bears *gules*, *an eagle argent*, *crowned and membered*, *or*.

The *eagle* has been borne, by way of enſign, or ſtandard, by ſeveral nations. The firſt who ſeem to have aſſumed the *eagle* were the Perſians, according to the teſtimony of Xenophon. Afterwards it was taken by the Romans; who, after a great variety of ſtandards, at length fixed on the *eagle*, in the ſecond year of the conſulate of C. Marius: till that time they uſed indifferently wolves, leopards, and *eagles*, according to the humour of the commander.

Several among the learned maintain, that the Romans borrowed this cuſtom from Jupiter, who had appropriated the *eagle* as his own badge, in commemoration of its ſupplying him with nectar, while he lay concealed in Crete, for fear of being devoured by his father Saturn. Others hold that they borrowed it from the Tuſcans, and others from the Epirots.

The Roman *eagles*, it muſt be obſerved, were not painted on a cloth, or flag; but were figures in relievo, of ſilver or gold, borne on the tops of pikes; the wings being diſplayed, and frequently a thunderbolt in their talons. Under the *eagle*, on the pike, were piled bucklers, and ſometimes crowns. Thus much we learn from the medals. See Feſchius in his Diſſert. de Inſignibus, And Lipſius, De Militia Romana, lib. iv. dial. 5.

Conſtantine is ſaid to have firſt introduced the *eagle* with two heads, to intimate, that though the empire ſeemed divided, it was yet only one body. Others ſay, that it was Charlemagne, who reſuming the *eagle*, as the Roman enſign, added to it a ſecond head; but that opinion is deſtroyed by an *eagle* with two heads, noted by Lipſius, on the Antonine column; as alſo by the *eagle's* only having one head on the ſeal of the golden bull, of the emperor Charles IV. The conjecture, therefore, of F. Meneſtrier appears more probable, who maintains, that as the emperors of the Eaſt, when there were two on the throne at the ſame time, ſtruck their coins with the impreſſion of a croſs, with a double traverſe, which each of them held in one hand, as being the ſymbol of the Chriſtians; the like they did with the *eagle* in their enſigns; and inſtead of doubling their *eagles*, they joined them together, and repreſented them with two heads. In which they were followed by the emperors of the Weſt.

F. Papebroche wiſhes, that this conjecture of Meneſtrier were confirmed by ancient coins; without which, he rather inclines to think the uſe of the *eagle* with two heads to be merely arbitrary; though he grants it probable, that it was firſt introduced on occaſion of two emperors in the ſame throne.

The *eagle* on medals, according to M. Spanheim, is a ſymbol of divinity, and providence; and, according to all other antiquaries, of empire. The princes on whoſe medals it is moſt uſually found, are the Ptolemies and the Seleucides of Syria. An *eagle* with the word CONSECRATIO, expreſſes the apotheoſis of an emperor.

EAGLES, a name found very frequently in the ancient hiſtories of Ireland, and uſed to expreſs a ſort of baſe money that was current in that kingdom in the firſt years of the reign of Edward the Firſt, that is, about the year 1272. There were, beſides the *eaglet*, ſhonines, roſades, and many other coins of the ſame ſort, named according to the figures they were impreſſed with. Simon's, Hiſt. Coins.

The current coin of the kingdom was at that time a compoſition of copper and ſilver, in a determined proportion, but theſe were ſo much worſe than the ſtandard proportion of that time, that they were not intrinſically worth quite half ſo much as the others. They were imported out of France, and other foreign countries. When this

prince

prince had been a few years eſtabliſhed on the throne, he ſet up mints in Ireland for the coining of ſufficient quantities of good money, and then decried the uſe of theſe *eagles*, and other the like kinds of baſe coins, and made it death, with confiſcation of effects, to import any more of them into the kingdom.

EAGLE, *Aquila*, in *Aſtronomy*, is a conſtellation of the northern hemiſphere, having its right wing contiguous to the equinoctial.

For the ſtars in this conſtellation, their number, longitude, latitude, &c. See AQUILA.

There are alſo three ſeveral ſtars, particularly denominated among the Arab aſtronomers, *Noſr*, i. e. *eagle*. The firſt, *Noſr Sohail*, the *Eagle of Canopus*, called alſo *Sitareh Jemen*, the ſtar of Arabia Felix, over which it is ſuppoſed to preſide; the ſecond, *Noſr Althair*, the *Flying Eagle*, and the third, *Noſr Alvaki*, the *Reſting Eagle*.

EAGLE, *White*, is a Poliſh order of knighthood, inſtituted in 1325, by Uladiſlaus V. on marrying his ſon Caſimire with a daughter of the great-duke of Lithuania.

The cavaliers of this order were diſtinguiſhed by a gold chain, which they wore on the ſtomach, whereon hung a ſilver *eagle* crowned.

EAGLE, *Black*, was a like order, inſtituted in 1701, by the elector of Brandenburgh, on his being crowned king of Pruſſia.

The knights of this order wear an orange-coloured ribbon, to which is ſuſpended a black *eagle*.

EAGLE, in *Architecture*, is a figure of that bird anciently uſed as an attribute, or cognizance of Jupiter, in the capitals and friezes of the columns of temples conſecrated to that god.

EAGLE-*ſtone*. See BALSAMINE.

EAGLE-*ſtone*, in *Natural Hiſtory*, a ſtone, by the Greeks, called *aëtites*, and by the Italians, *pietra d'aquila*, as being ſuppoſed to be ſometimes found in the *eagle's* neſt. It is of famous traditionary virtue, either for forwarding, or preventing, the delivery of women in labour, according as it is applied above, or below, the womb.

Matthiolus tells us, that birds of prey could never hatch their young without it, and that they go in ſearch for it as far as the Eaſt Indies. Bauſch has an expreſs Latin treatiſe on the ſubject. See ÆTITES.

EAGLET, or EAGLON, a diminutive of *eagle*, properly ſignifying a young *eagle*.

The *eagle* is ſaid to prove his *eaglets* in the brightneſs of the ſun; and if they ſhut their eye-lids, he diſowns them.

In *Heraldry*, when there are ſeveral *eagles* on the ſame eſcutcheon, they are called *eaglets*.

EALDERMAN, or EALDORMAN, among the Saxons, was of like import with *earl* amongſt the Danes. Camden's Britan. p. 107.

The word was alſo uſed for an elder, ſenator, or ſtateſman. Hence, at this day, we call thoſe *aldermen*, who are aſſociates to the chief officer in the common-council of a city or corporate town.

EAR, *Auris*, the organ of hearing; or that part whereby animals receive the impreſſion of ſounds.

The *ear* is generally divided into *internal* and *external*. The *external*, or *outer ear*, in moſt animals, conſiſts of two principal parts, viz. that which appears prominent from the head, called the *auricle*; and an inner part, which enters the ſkull by a narrow paſſage, called the *meatus auditorius*; and leads to the *auris* or *ear*, properly ſo called.

The *auricle*, or outer part of the *external ear*, is ſemicircular, and contains divers ſinuoſities. Its upper part, which is the broadeſt, is called *pinna*, and ſometimes *ala*; and the lower, which is narrower, ſofter, and pendant, the *lobe*, or *fibra*, being that to which ladies hang their ear-rings, &c. The outer area, or extent of the *auricle*, is called the *helix*; and the inner, oblong prominence, ſurrounded by it, the *anthelix*; the little protuberance of the ſide next the face, is called the *tragus*, or *tiricus*; and the ridge juſt above, and oppoſite to it, the *antitragus*; and the cavity, leading to the beginning of the *meatus*, the *concha*. See each part deſcribed under its proper article.

The *auricle* ſtands out from the head, and is furrowed with divers winding canals, which receive and collect the wandering circumambient impreſſions, and undulations of ſound, and modify and forward them to the inner *ear*. It is formed of a thin cartilage, covered with a ſkin. It has two muſcles, which in men are very ſmall, whence ſome anatomiſts deny there are any at all, though others increaſe their number to three, one attollent, and two retrahent; and others to four. But in brutes, which move and prick the *ears*, as horſes, aſſes, &c. they are very large and conſiderable. Thoſe who have loſt their *auricles*, M. Dionis obſerves, have but a confuſed way of hearing; and are obliged either to form a cavity round the *ear* with their hands, or to make uſe of a horn, applying the end of it to the *meatus auditorius*.

The inner part of the *external ear* is poſſeſſed by the *meatus auditorius*, or auditory paſſage, which commences from the bottom of the concha, called the *alvearium*, and is continued in a winding direction, turning ſometimes this way, and ſometimes that, to the *membrana tympani*. The *meatus* is dug out of the *os temporis*, and lined with a ſkin, or membrane, which is furniſhed with divers little glands, that ſeparate a thick, yellow, glutinous humour, called *cerumen*, or *ear-wax*, ſerving to defend the *ear* from the ingreſs of vermin, and other extraneous bodies, and cellular membrane. This *meatus* is all the *external ear*, in diverſe animals, as reptiles, birds, moles, divers fiſhes, &c. The farther end thereof is cloſed by a thin, dry, round, tranſparent membrane, called the *membrana tympani*, and improperly *tympanum*, or drum, which ſeparates the *external ear* from the *internal*. The arteries of the external *ear* come anteriorly from the *arteria temporalis*, and poſteriorly from the *occipitalis*, which is a branch of the external carotid. The veins are rami of the *jugularis externa*.

Behind the *membrana tympani*, is a cavity called, by different authors, the *tympanum*, *cavitas tympani*, *concha interna*, and *meatus auditorius internus*. In this cavity are five conſiderable parts; viz. four little bones; two apertures, called *feneſtræ*; as many meatuſes, or paſſages; four muſcles, and a branch of a nerve.

The firſt of the bones, or oſſelets, is the *malleus*, *mallet*, or hammer; the ſecond, is called the *incus*, or anvil; the third, the *ſtapes*, or *ſtirrup*; and the fourth, the *orbiculare*. Theſe bones are nearly of the ſame bigneſs at the birth of the child, as when arrived at maturity, ſo that all that age does is to harden them.

To give motion to theſe bones, is the office of the four muſcles of this cavity; three of them belonging to the *malleus*; viz. the *externus*, *obliquus*, and *internus*; and the fourth to the *ſtapes*, called the *muſculus ſtapedis*.

The two meatuſes are ſituated at the ſides of the cavity; the one opening into the palate, called *æquæductus*, or Euſtachian tube; the other, ſhorter and bigger, opening into the ſinus, in the mamillary proceſs.

The two apertures, or *feneſtræ*, of the tympanum, are in the ſurface of the *os petroſum*, which is oppoſite to the membrane of the tympanum. The firſt, called *feneſtra ovalis*, becauſe of its figure, is ſituate a little higher than the other, and receives the baſis of the *ſtapes*. The other is called *rotunda*, notwithſtanding its figure is oval, like the former, and is cloſed by a thin, dry, tranſparent membrane, reſembling that of the tympanum.

The laſt thing conſidered in the cavity of the tympanum is a fine chord, which runs over the inner ſurface of the membrane, called *chorda tympani*. Anatomiſts have long diſputed, whether it was an artery, a vein, or nerve, or the tendon of one of the muſcles of the malleus; but it is now diſcovered to be a branch of the fifth pair of nerves, which meets the *portio dura* of the auditory nerve.

The two *feneſtræ* above mentioned open into a cavity dug out of the *os petroſum*, called the *labyrinth*, as being perplexed with divers windings and meanders: in this cavity is ſuppoſed to be contained the *innate* AIR. It is divided into three parts, which are lined by a fine periofteum, in which, and alſo through the whole extent of the periofteum of the inner *ear*, may be diſcovered a great number of blood-veſſels; the firſt is called the *veſtibule*, becauſe it leads into the other two; in it are obſerved nine apertures, or foramina. The ſecond, placed on one ſide of the veſtibulum, towards the back of the head, comprehends three round canals, diſpoſed in a ſemicircular form, and thence called *canales ſemicirculares*. The third is the *cochlea*, which conſiſts of two parts, viz. a ſpiral ſemi-oval canal; and a lamina, formed into a ſpiral flight. The canal makes two turns and an half round a newel, or axis, ſtill growing leſs as it aſcends; the ſpiral lamina divides this cavity into two, being faſtened by its baſe to this newel; and, by its other extremity, to the ſurface of the canal oppoſite to the newel, by means of a very fine membrane. The cavity of the cochlea, thus divided, forms, as it were, two winding ſtair-caſes, both formed on the ſame newel, one over the other, but without any communication between them. In the aqueduct is the auditory nerve; which conſiſts of two branches, or parts; the one ſoft, called *portio mollis*; and the other harder, *portio dura*; the ſoft part is ſpent on the organ of hearing, being divided into five branches, which form a delicate web, that lines the veſtibulum, cochlea, &c. The hard part paſſing through the whole bony duct called *æqueductus Fallopii*, out of the cranium, is diſtributed among the parts of the external *ear*, &c.

The other veſſels of the internal *ear* are arteries and veins from the carotids and jugulars. Particular deſcriptions of

each part of the ear, see under FENESTRA, FORAMEN, MALLEUS, STAPES, ORBICULARE, LABYRINTH, VESTIBULE, COCHLEA, AUDITORY *Nerve*, &c. The immediate organ of hearing has been generally ſuppoſed to be the membrane of the *tympanum*; but later anatomiſts ſhew this to be a miſtake, from divers inſtances, wherein that membrane has been abſolutely deſtroyed, and broken, without the leaſt diminution of the ſenſe of hearing.

The parts that bid the faireſt for this prerogative, are thoſe which compoſe the labyrinth; viz. the cochlea, lamina ſpiralis, veſtibule, and ſemicircular canals; the porrio mollis of the auditory nerve, ramified and diffuſed through theſe parts, receives the impreſſions of ſounds, and propagates them to the brain.

The commiſſaries of the Royal Society of Phyſicians at Paris, appointed to examine the work of M. Geoffroy, entitled Diſſertations ſur l'Organe de l'Ouie de l'Homme, des Reptiles, des Poiſons, publiſhed in 1778, infer, from the facts and obſervations which he has recited, that the impreſſion made on the branch or part of the auditory nerve, called the *portio mollis*, is ſufficient to produce the perception or ſenſation of ſound; that the ſemicircular canals render this perception more lively and intenſe; that the cochlea adds little to the intenſity of the impreſſion, but the ſmall bones, or oſſicles, conſiderably; and that the human ſpecies, quadrupeds, and cetaceous fiſhes, form the firſt claſs of animals, whoſe organ of hearing is the moſt ſubtile, and of the moſt perfect conſtruction; that birds are to be placed in the ſecond; reptiles, who have the external marks of a tympanum, in the third; cartilaginous fiſhes in the fourth; ſpinous or prickly fiſhes in the fifth; fiſhes of the eel-kind, which ſeem to have only two ſemicircular canals completely formed, in the ſixth; and ſerpents, who appear to have no ſemicircular canals, in the ſeventh.

Behind, and under the external *ear*, are a number of large glands, called *parotides*, wherein is ſeparated a great deal of ſaliva; which is conveyed, by the excretory ducts, into the mouth.

Diſtempers incident to the ear, and adjacent parts, are noiſes, OTALGIA, DEAFNESS, &c.

EAR, *wounds of the*. Wounds of the external *ear* are eaſily united by ſticking-plaſters, unleſs the cartilage is entirely divided, and then it will require the help of the needle, and the application of vulnerary balſams, with the proper compreſſes and bandages. When the *ear* is wounded in the neighbourhood of the meatus auditorius, great care muſt be taken to prevent the diſcharge of blood and matter into that paſſage, which would do great miſchief to the tympanum; but this may be done only by filling the internal *ear* with lint or cotton. Heiſter's Surgery, p. 8.

M. Le Cat, in his Treatiſe of the Organ of Sound, has new figures of ſeveral parts of the *ear*. Med. Ed. Edinb. abr. tom. ii. p. 481.

We have alſo ſome treatiſes on the *ear* by Dr. Caſſebhom, containing very minute deſcriptions of the parts. Ibid.

EARS, *running of the*, in infants. See INFANT.

The comparative anatomy of the *ear* furniſhes abundant inſtances of the Creator's wiſdom. In birds, the outer *ear* is of a form proper for flight; not protuberant, as that would obſtruct their progreſs, but cloſe and covered. In quadrupeds, its form is agreeable to the poſture and motion of the body, but admirably varied, according to their various occaſions: in ſome, as the hare, it is large, open, and erect; by which means that timorous, defenceleſs creature, is warned of the leaſt approach of danger: in others, it is covered, to keep out noxious bodies. In the ſubterraneous quadrupeds, who are forced to mine and dig for their food and habitation, as a protuberant *ear* would obſtruct them, and be liable to injuries, their *ears* are very ſhort, and are lodged deep, and backwards in the head.

Thus moles have no auricle at all, but only a round hole, between the neck and ſhoulder. Some authors obſerve, that this meatus, or paſſage, is cloſed with a little ſkin, which opens and ſhuts like an eye-lid. The ſea-calf, and the ſeveral ſpecies of lizards and ſerpents, are likewiſe without any external *ear*. And the tortoiſe, cameleon, and generality of fiſhes, have the paſſage of the *ear* quite ſtopped, or covered over. And there is a ſort of whale, which has the aperture of the *ear* under the ſhoulder.

Among all the varieties in the ſtructure of this organ, none, as Dr. Grew obſerves, are more remarkable than thoſe in the paſſage into the os petroſum; for in an owl, which perches on a tree, or beam, and hearkens after the prey beneath her, it is produced farther out above, than below, for the better reception of the leaſt ſound: in a fox, which ſcouts underneath the prey at rooſt, it is, for the ſame reaſon, produced farther out below: in a pole-cat, which hearkens ſtraight forwards, it is produced behind, for the taking of a forward ſound; whereas in a hare, which is very quick of hearing, and thinks of nothing but being purſued, it is ſupplied with a bony tube, directed backwards, ſo as to receive the ſmalleſt and moſt diſtant ſound that comes behind her.

Schelhammer denies the exiſtence of the innate air, ſo much talked of, in the labyrinth; and with good reaſon, as there is a paſſage out of the labyrinth into the throat, through which the innate air muſt eſcape. This is paſt doubt; ſince, by ſtopping the breath, and ſtraining, we can force the external air into the *ear*, and even hear it ruſhing in. When the paſſage is any way ſtopped, as by a cold, &c. the hearing thereby becomes dull and obtuſe; and when, by ſtrong ſwallowing, or other motion of the throat, the paſſage is opened, we perceive it by a ſudden crack, and immediately hear very clearly; the load of feculent air being then diſcharged from the inner *ear*.

Several naturaliſts and phyſicians have held, that cutting off the *ear* rendered perſons barren, and unprolific; and this idle notion was what firſt occaſioned the legiſlators to order the *ears* of thieves, &c. to be cut off, leſt they ſhould produce their like.

The *ear* has its beauties, which a good painter ought by no means to diſregard; where it is well formed, it would be an injury to the head to be hidden. Suetonius inſiſts particularly on the beauties of Auguſtus's *ears*; and Ælian, deſcribing the beauties of Alexander, obſerves ſhe had ſhort ears.

Martial alſo ranks large *ears* among the number of deformities. Feliben.

Among the Athenians, it was a mark of nobility to have the *ears* bored, or perforated. And among the Hebrews and Romans, this was a mark of ſervitude.

Loſs of one *ear* is a puniſhment enacted by 5 and 6 Ed. VI. cap. 4. for fighting in a church-yard: and by 2 & 3 Ed. VI. cap. 15. for combinations to raiſe the price of proviſions, labour, &c. if it be the third offence, beſide pillory, and perpetual infamy, or a fine of 40*l*.

By a ſtatute of Henry VIII. maliciouſly cutting off the *ear* of a perſon is made a treaſon, for which treble damages ſhall be recovered; and the offender is to pay a fine of ten pounds to the king. 37 Hen. VIII. cap. 6. § 4. In the Index to the Statutes at Large, it is ſaid, that this offence may be puniſhed as felony, by 22 & 23 Car. II. cap. 1. § 7. commonly called Coventry's act; but *ear* is not mentioned in that ſtatute.

EAR, *tingling of the*. See TINNITUS.

EAR, in *Muſic*, denotes a kind of internal ſenſe, whereby we judge of muſical ſounds and harmony; they who poſſeſs this ſenſe are ſaid to have a good *ear*. And the like diſtinction we ſhould, probably, acknowledge in other affairs, had we got diſtinct names to denote thoſe powers of perception by.

Thus, a greater capacity of perceiving the beauties of painting, architecture, &c. is called a *fine eye*. See TASTE.

EAR-*ach*. See OTALGIA.

EAR *of fiſhes*. All the cetaceous fiſhes have external meatus auditorii, or paſſages for hearing; but other fiſh have nothing of theſe external appearances, and ſeem neither to be intended by nature to make any ſounds, or to hear any. Though ſound being a tremulation in the air, it may be felt by them as motion, though not diſtinguiſhed as ſound. It may eaſily be proved, that they do not hear our voices in ſpeaking, by walking near the ſide of a pond or river well ſtored with fiſh about the edges: if the body and its ſhadow be kept out of their ſight, they will never ſtart at the voice.

Yet how far fiſhes are deaf and dumb, ſeems a queſtion not yet perfectly decided. See FISH.

EAR, in *Gardening*, a name given to the ſeminal leaves of plants, or thoſe two green and ſucculent leaves which firſt appear from the ſeed, and are very different, in all reſpects, from thoſe which follow. Thus in the melon plants, the two firſt leaves are called *ears*, and the leaves, with their ſtalks, which ſhoot out afterwards, are called knots, and denominated the firſt, ſecond, and third knot, according to their place, and time of growing. The cutting off every third knot in this plant, is the great means of procuring the fineſt and largeſt fruit. Phil. Tranſ. N° 451.

EAR, in *Botany*, is alſo applied to a long cluſter of flowers, or ſeeds, produced by certain plants; and uſually called, by botaniſts, *ſpica*. The flowers and ſeeds of wheat, rye, barley, &c. grow in *ears*. The ſame holds of the flowers of lavender, &c.

We ſay, the ſtem of the *ear*, i. e. its tube, or ſtraw: the knot of the *ear*; the lobes, or cells, wherein the grains are incloſed; the beard of the *ear*, &c. great numbers of *ears* of wheat have been known to ariſe from the ſame root.

EAR, *Jews*. See AURICULA *Judæ*.

EAR-*ſticks*, are inſtruments of ivory, ſilver, and other metal,

tal, somewhat in form of a probe, for cleaning the *ear*. The Chinese are particularly fond of entertaining themselves with picking and tickling their *ears*; this they do either for themselves, or interchangeably for one another, and have a great number of instruments of peculiar shapes and structure, invented for this purpose. But Sir Hans Sloane very judiciously observes, that the use of them seems very prejudicial; for that, among many people in England who had applied to him on account of deafness, the far greater part were thrown into their complaints, by too often picking their *ears*, and thereby bringing humours, or ulcerous dispositions, on them. Phil. Trans. N° 246. p. 406.

EAR-*ring*. See PENDANT.

EAR-*wax*. See CERUMEN.

EAR-*wig*, *Forficula*, in *Zoology*, the name of a genus of insects, of the order of *coleoptera*, the tail of which forms a kind of forceps, capable of pinching: the exterior wings are very short, but dimidiated; and the antennæ are setaceous. It has six feet: its body is about the thickness of a small worm, and very smooth.

It is a very troublesome creature, frequently introducing itself into the ears, and causing a great deal of pain by its biting: it likewise burrows in other parts of the body, which it bites in the same manner.

They are likewise very pernicious in gardens, especially where carnations are preserved. In order to prevent the mischief attending them, it is usual to erect stands, supporting basons of water, or to hang the hollow claws of crabs or lobsters on sticks in different parts of the garden, in which they lodge.

The dried powder of *ear-wigs* is esteemed good for deafness; and the oil prepared from them, in convulsions and spasms. Vide Lemery, Dict. des Drog. in voc. *Forficula*.

EAR-*wig*, *Sea*. See FORFICULA *Marina*.

EAR *shell*, *Auris Marina*, in *Natural History*, the name of a genus of shells-fish, the characters of which are these: it consists only of one shell, or valve, and is of a flatted shape, in some measure resembling that of the human *ear*, and has an extremely wide mouth, or aperture, at its base, the widest of that of all shells, except only the patella or limpet, which is all mouth below. See *Tab. of Shells*, N° 3.

In the Linnæan distribution this is a species of the HALIOTIS.

Aldrovand and Rondeletius have given this genus the name of *patella fera*, the wild limpet; but in this they have been followed by no author, as it confounds the *auris marina* and *patella*, which are two absolutely distinct genera. These authors have also ranked both this and the limpet among the bivalve shells, but nothing can be more absurd than this.

This genus of shells sometimes yields small pearls, the rudiments of which are very frequently seen in those shells which have not perfect ones, and the whole inside of the shell is of the colour of the finest mother of pearl. This also appears on the outside, when the rough coat is so far eaten away by acids, as to leave this pearly surface bare; in this case it makes a very elegant appearance, being of the splendor of the most perfect mother of pearl both within and without, and it is frequently preserved in cabinets in that state.

The inside and outside of this shell are both rigid with very high ribs, which run from one side to the other; and there is in all these shells a row of holes near one edge, of which six are usually open, and there are beyond these the marks of three or four others, which do not go through the shell. These are formed in the growth of the fish, which, as it enlarges, enlarges also the shell; and when a new rim is formed, in which there is an open hole, one of the hinder ones is always closed up by the growth of fresh shelly matter over it. Aldrovand. de Aquat. Rondelet de Aquat.

There is one very singular species of *auris marina*, which differs from all the others in its length; it is large, and brought from the East Indies, but is not found in the European seas. The general species of *aures marinæ* are four; those with six holes; those with seven, and which are more pearly than the rest; those of an oblong form; and those which have no mark of aperture at all. Hist. Nat. Eclaire. part ii. p. 243, 244.

EAR *of corn*, in Rome. See *Tab. of Fossils, Cloth* 6.

EARING, *vestis*, from *ear*, *spring*, among the ancient Greeks, a habit worn in the spring, which was made of wool, and dyed green. The custom of wearing green vestments in this season, has not been unknown in modern times.

Dempster says, it was customary, in his time, for the king, and nobility of England, to go a-hunting in the spring, dressed in green, that they might be of a similar colour with the season.

EARING, in a ship, that part of the bolt-rope, which, at the four corners of the sail is left open, in the shape of a ring. The two uppermost parts are put over the ends of the yard-arms, and so the sail is made fast to the yard; and into the lowermost *earings* the sheets and tackles are seized, or bent at the clew.

EARING *Third*, in *Husbandry*. See THIRD.

EARL, an English title of honour, or degree of nobility, next below a marquis, and above a viscount.

Earls were anciently attendants or associates of the king in his councils, and martial expeditions; much as comites, counts, were of the magistrates of Rome, in quality of deputies, to execute their offices for them. Hence, also, *earls* are called, in Latin, *comites*; in French, *comtes*, counts, &c. The Germans call them *graves*, as landgrave, markgrave, palsgrave, &c. The Saxons, *ealdormen*; the Danes, *eorlas*; and the English, *earls*.

Earl was a considerable title among the Saxons: it is observed to be the most ancient of any of the peerage; and that there is no other title of honour in use among the present nobility, which was likewise used among the Saxons, beside it. The original titles of honour among the Saxons, were *athling*, *ealdorman*, and *degen*, or *degn*. The first appropriated to those of the royal family; the other two to the rest of the nobility; only the thani were afterwards distinguished into majores and minores.

Originally the title *earl* always died with the man. William the Conqueror first made it hereditary; giving it in fee to his nobles, and annexing it to shires or counties; for the support of the state thereof, he allotted the third penny out of the sheriff's court, issuing out of all pleas of the shire from which the *earl* took his title. But, of later days, the matter is much altered.

Earls are now created by patent, without any authority over, or particular relation to, their counties; and without any profit arising thence, except some annual stipend out of the exchequer, for honour-sake. The number of *earls* being of late much increased, and no more counties being left for them, several of them have made choice of some eminent part of a county, as Lindsey, Holland, Craven, &c. Others of some town, as Marlborough, Exeter, Bristol, &c. And others, of some village, or their own seat, park, &c. as Godolphin, Bolton, Danby, &c.

Some *earls* we have who are not local, i. e. not dignified from any places, but from noble families, viz. *earl* Rivers, and *earl* Paulet. A third is denominated from his office, viz. the *earl* Marshal.

Earls are created by cincture of sword, mantle, a cap, and a coronet put on his head, and a charter in his hand. Their title is *most potent and noble lord*. Their coronet has the pearls raised on points, with leaves between. Their place is next to a marquis, and before a viscount; and as in very ancient times, those who were created counts or *earls*, were of the blood royal; our British monarchs to this day call them in all public writings *our most dear cousin*; an appellation as ancient as the reign of Henry IV. They also originally did, and still may, use the style of *my*.

EARL-*marshal* is one of the great officers of the crown; who takes cognizance of all matters relating to honour and arms, determines contracts that respect deeds of arms out of the realm upon land, and matters concerning war within the realm, which cannot be determined by common law, in which he usually proceeds according to the civil law. He had, anciently, several courts under his jurisdiction, as the court of chivalry, now almost forgotten; and the court of honour.

He has also some pre-eminence in the court of marshalsea, where he may sit in judgment against criminals offending within the verge of the court; whence the chief officer under him is called *knight-marshal*. Under him is also the heralds office, or college of arms. See COLLEGE and COURT.

The office of *earl-marshal* is hereditary in the family of Howard; and enjoyed by the duke of Norfolk, the principal branch thereof; though now, on account of the religion of the duke of Norfolk, which renders him incapable of administering it in person, it is discharged by deputation; but yet it is to be observed, it is not given out of the name and family of Howard.

EARNEST, *Arrha*, money advanced to complete or assure a verbal bargain, and bind the parties to the performance thereof.

By the civil law, he who recedes from his bargain, loses his *earnest*; or, if the person who received the *earnest* give back, he is to return the *earnest* double. But, with us, the effect of *earnest* is more: the person who gave it is, in strictness, obliged thereby to abide by his bargain: and, in case he decline it, is not discharged upon forfeiting his *earnest*; but may be sued for the whole money stipulated. And by 29 Car. II. cap. 3. no contract for sale of goods, to the value of 10*l.* or more, shall be valid, unless the buyer receives part of the goods sold by way of *earnest* on his part, or unless he gives part of the

the price to the vender by way of *earneſt*, to bind the bargain, &c.

EARNING, or YEARNING, a name uſed in ſeveral parts of the kingdom for rennet. See RUNNET.

EARSH. See EDDISH.

EARTH, *Terra*, in *Natural Philoſophy*, one of the four vulgar, or peripatetical elements; defined a ſimple, dry, and cold ſubſtance; and, as ſuch, an ingredient in the compoſition of all natural bodies.

It ſhould be well obſerved, that the element *earth* is a very different matter from the *earth* whereon we tread. Ariſtotle, having laid down cold and dry as his firſt element, to give it a ſuitable name, looked among the diverſe bodies for that which ſhould come the neareſt thereto; which being *earth*, he gave his firſt element that denomination; though thus borrowing a word that had been uſed for a different thing, occaſioned a great part of his followers to run into an extravagant error, and to ſuppoſe, that this habitable foſſil *earth* was an element.

EARTH, in *Chemiſtry*, is the fourth of the chemical elements, or principles, into which all bodies are reſolvable by fire.

After drawing off the ſpirit, ſulphur, and phlegm, and ſalt, c. gr. of wine, what remains in the retort is a taſteleſs, ſcentleſs, duſty matter, not ſaluable, either of being raiſed by diſtillation, or diſſolved by ſolution; and is called *earth*, or *terra damnata*, or *caput mortuum*. See CAPUT *Mortuum*.

This *earth* is ſuppoſed to be the baſis, or ſubſtratum of all bodies; and that wherein the other principles reſide. It is all that is ſolid, c. gr. in an animal, or vegetable body, i. e. all the real vaſcular parts; the reſt being juices.

There is plainly a ſubtile *earth*, which may be ſeparated from all animal and vegetable ſubſtances, and is the ſame in all, and is the baſis of all. This remains after the ſeparation of the other principles by chemiſtry, from all animal and vegetable ſubſtances, and neither coheres together, nor ſuffers any change in the fire. The aſſayers acknowledge no difference between the *earths* of animals and vegetables, but make their teſts for the moſt uſes equally of both. If water be poured on theſe aſhes, they acquire ſome degree of tenacity, ſo as to become capable of being formed into veſſels; but if oil be added, they cohere into a much ſtronger and more compact maſs; hence it ſhould appear, that oil and *earth* are the principles which give conſiſtence and tenacity to plants.

This oil, as well as this *earth*, ſeems the ſame in all, and poſſeſſes nothing of the poiſonous or medicinal virtues of this peculiar plant, they being all ſeparable by decoction, diſtillation, and other proceſſes of that kind, and not remaining in the caput mortuum, which conſiſts of the *earth*, and this connecting oil. Long drying will diveſt plants of all their virtues; ſo that nothing but theſe principles ſhall remain in them, theſe giving ſolidity and figure, the plant retains its former appearance; but only theſe remaining, it poſſeſſes none of its virtues. Boerhaave's Chemiſt. part ii. p. 21.

To obtain this chemical principle pure and unmixed from the common analyſis of vegetables, and other bodies, let the remaining maſs, after diſtillation, be thoroughly calcined, then boiled in ſeveral waters, to get out all its ſalt, and after this dried in a clear fire, or in the ſun, and the dried maſs will be the pure earth. Shaw's Lectures, p. 151.

EARTH *of dew*, an *earth* much valued by many of the chemical experimenters, and prepared in the following manner: a large quantity of dew is to be collected, and ſet in a wooden veſſel, in a cool ſhady place, covered with a canvas, to keep out duſt and flies, there will in three weeks, and ſometimes longer, come on a putrefaction in the liquor. During the time of this putrefaction, certain films are daily formed on the ſurface of the liquor, and theſe falling down to the bottom, one after the other, form, by degrees, a ſediment of a ſort of mud. This is to be thrown away, and the dew, when ſeparated from it, is to be filtred clear, and evaporated to a drineſs, the remainder is a greyiſh *earth*, which is the true *earth* of dew; this is very light and friable, and is of a foliated ſtructure in the maſs, looking like ſo many leaves of brown paper, ſpread very thin and even over one another. Phil. Tranſ. N° 3.

This *earth*, expoſed to a ſmart fire, loſes its foliated texture, and runs into a maſs, reſembling a mixture of ſalt and brimſtone melted together, but it is not at all inflammable. This, ground on a levigating ſtone, tinges the water to a purpliſh colour. A pound of this *earth*, properly treated by calcination and elixiviation, will yield an ounce of a pure and white ſalt, ſomewhat reſembling nitre. The chemiſts have been at great pains to procure this *earth*, but they do not ſeem yet to have made any very important uſe of it; and, in all probability, it is no other than that common ſpar which we know to be contained in all water, and which encruſts the ſides of our tea-kettles, and other veſſels, in which water is often boiled. We know, by manifold inſtances, that ſpar is rarefiable into vapour with water, and therefore it would be a greater wonder if dew were found not to contain it than that it does.

EARTH, in *Natural Hiſtory*, is a foſſil or terreſtrial matter, whereof our globe principally conſiſts. It is either ſimple, or compoſed of entirely ſimilar particles; or compound, having a mixture of ſuch as are heterogeneous, as ſand, or the like, among them.

Earths are defined to be friable, opake, inſipid bodies; not inflammable, vitrifiable by extreme heat, diffuſible in water, and ſeparable from it by filtration.

The ſimple *earths* are divided into two orders; and under thoſe, into five genera. Of the firſt order are thoſe *earths* which are naturally moiſt, of ſmooth ſurfaces, and of a firmer texture; and of the ſecond are thoſe which are naturally dry, of rough duſty ſurfaces, and of a looſer texture. Of the firſt of theſe orders, there are three genera, the boles, the clays, and the marles; and of the ſecond there are two, the ochres, and the tripelas, according to Hill's diſtribution; and chalks according to Da Coſta. The ſeveral diſtinguiſhing characters of which are theſe.

Of the firſt order. 1. *Boles* are *earths* moderately coherent, ponderous, ſoft, not ſtiff or viſcid, but, in ſome degree, ductile while moiſt, compoſed of fine particles, ſmooth to the touch, eaſily breaking between the fingers, readily diffuſible in water, and freely and eaſily ſubſiding from it. See BOLE.

2. *Clays* are *earths* firmly coherent, weighty, and compact, very ſtiff and viſcid, ductile to a great degree while moiſt, ſmooth to the touch, not eaſily breaking between the fingers, nor eaſily diffuſible in water, and, when mixed in it, not readily ſubſiding from it. See CLAY.

3. *Marles* are *earths* but ſlightly coherent, not ductile, ſtiff, or viſcid, while moiſt, moſt eaſily diffuſible in, and diſunited by water, and by it reduced to a ſoft, looſe, incoherent maſs. See MARLE.

Of the ſecond order are, 1. *Ochres*. Theſe are *earths* ſlightly coherent, compoſed of fine, ſmooth, ſoft argillaceous particles, rough to the touch, and readily diffuſible in water. See OCHRE.

2. *Tripelas* are *earths* firmly coherent, compoſed of fine, but hard, particles, and not readily diffuſible in water, M. Da Coſta, inſtead of *tripelas*, ſubſtitutes the genus of chalks, which he diſtinces to be earths generally hard and dry, harſh and rough to the touch, and readily diffuſible in water. See CHALK. Hiſt. of Foſſils, p. 75.

The compound *earths* are a claſs of foſſil bodies, uſually confounded with the genuine and ſimple *earths*, as if ſubſtances of the ſame kind, but being of a very different nature and origin. They are foſſils compoſed of argillaceous and marly particles, ſeparated and divided by adventitious matter, and never found free from thoſe admixtures, or in the ſtate of pure ſimple marles or clays.

Of this claſs of foſſils there are two general orders; thoſe of the one are known by the name of loams, and are compoſed of ſand and clay: and thoſe of the other are called moulds; theſe are the *earths* that vegetables grow in, and are compoſed of argillaceous and marly particles, ſeparated by ſand, ſmall pebbles, and the gritt of ſtone, and uſually intermixed with, and enriched by, the putrefied remains of animal and vegetable ſubſtances. Of each of theſe there are ſeveral genera. Hill's Hiſt. of Foſſils. See LOAM, MOULD, and TERRA.

The ancient naturaliſts contented themſelves with diſtributing *earths* according to their uſes, into medical *earths*, and ſuch as are uſed for pottery, painting, and other mechanical purpoſes. Dr. Woodward, in his Method of Foſſils, divides *earths* into two claſſes, viz. thoſe that are ſmooth or unctuous, ſubdivided into ſuch as do and do not adhere to the tongue, and thoſe that are dry, harſh, and rough to the touch. Stahl divided them into the calcareous and vitrifiable earths. Pott, who is followed by Macquer, into alcaline or calcareous, argillaceous, vitrifiable, and gypſeous. Linnæus, into ochres, ſand, clay, calx, or animal *earth*, and *humus*, or vegetable *earth*. Other authors have enlarged or contracted the number of diviſions; for a general account of which, we refer to the tables at the beginning of Linnæus's Syſtema Naturæ, tom. iii. 1770. See alſo Da Coſta's Foſſils, 119, &c.

See the divers kinds of *earths* deſcribed under their proper articles, BOLE, CHALK, PUMICE, SIGILLATA *Terra*, &c.

Naturaliſts generally rank ſand as a ſpecies of *earth*, though with no great propriety; ſands being, in ſtrictneſs, a ſort of cryſtals, or little tranſparent pebbles, calcinable, and by the addition of a fixed alcaline ſalt, fuſible, and convertible into glaſs; and therefore properly reducible to the claſs of ſtones.

By means of ſand it is, that the fatty earth is rendered fertile,

fertile and fit to feed vegetables, &c. for pure *earth* is liable to coalesce into a hard coherent mass, as is clay; and *earth* thus embodied, and, as it were, glued together, would be very unfit to nourish plants. But if with such *earth*, sand, i. e. hard crystals, which are indissoluble in water, and still retain their figure, be intermixed, they will keep the pores of the *earth* open, and the *earth* itself, loose and incompact, and by that means will give room for the juices to move, ascend, &c. and for plants to be nourished thereby. Thus a vegetable planted either in the sand alone, or in the fat glebe and *earth* alone, receives no growth or increase; but is either starved or suffocated; but mix the two, and the mass becomes fertile. In effect, by means of sand, the *earth* is rendered in some measure organical: by preserving a sort of pores and interstices therein, somewhat analogous to vessels, by which the juices of the *earth* may be conveyed, prepared, digested, circulated, and at length excreted and thrown off into the roots of plants.

EARTH, *animal*, belongs to the class of chalks in the above distribution, and consists of shells of animals; or that which is obtained by calcination, or putrefaction of animal substances. To this head we may reduce the *earth* of the shells of fishes, and of eggs, which have the general properties of calcareous *earths*; the *earths* of calcined bones and horns, which are soluble by the nitrous, marine, and vegetable acids, but not capable of being converted into quicklime by calcination, and unfusible in other fusible mixtures; and the *earth* of blood, flesh, and skins of animals, which is soluble by all acids, and fusible by fire, but not calcareous.

EARTH, *mercurial*, is a substance which, according to Becher, and other chemists, enters into the composition of many bodies, chiefly the metallic, together with vitrifiable *earth* and phlogiston, called by him the inflammable *earth*. But the existence of this mercurial *earth* has not yet been satisfactorily demonstrated. Macquer.

EARTHS, *vegetable*, are distributed by Wallerius into three classes: the first class includes those which are obtained by becoming soft, spongy, and farinaceous plants; they are partly soluble by vitriolic acids, and fusible by fire, more or less, as the plant was more or less nourishing. The second class is had by burning the harder and less succulent plants: this *earth* is more soluble than the former in nitrous and marine acids, but less soluble in vitriolic acid; it is also fusible by fire. The third class is obtained by burning wood, which is calcareous, and fusible with greater difficulty, as the wood which yielded it is harder; and thus it is found that ashes of the hardest woods make the most unfusible glass. Swed. Mem. 1760.

EARTH, in *Agriculture* and *Gardening*. See SOIL, LAND, &c.

EARTH, *untried*, the soil, or *earth*, which is six or seven inches deep, where neither spade nor plough has reached. This is greatly recommended by Mr. Laurence, for amendments and improvements, both in the fruit and kitchen garden. He assures us, from his own experience, that no kind of compost, made with art, exceeds it; and adds, that if the choicest fruit trees be planted herein, they presently discover an uncommon healthfulness and vigour; and that, if any tender sort of annuals be discreetly sown in this *earth*, made fine by sifting, their looks, colour, &c. soon discover that they like the soil. Melons and cucumbers need no other compost but this *untried earth*; and asparagus itself will prosper at least as well in this *untried earth*, if laid a foot and a half deep, as with all the usual expence of dung: though for the tenderer flowers, and exotics, this *earth* is not found to have any extraordinary excellencies. For annual plants, produced from seed, a coat of this *untried earth*, two inches deep, may suffice: on other occasions a greater depth is required.

EARTH, *Japan*. See CATECHU.

EARTH, *Black*. See BLACK.

EARTH, *Fullers*. See FULLERS *Earth*.

EARTH, *Lemnian*. See LEMNIAN *Earth*.

EARTH, *Livonian*. See LIVONICA *Terra*.

EARTH *of Malta*. See MELITENSIS *Terra*.

EARTHS *of mineral waters*. All mineral waters contain *earth* of some kind, though very different in quantity and in nature. These are found in different waters, of very different colours and appearances, some white, some grey, some yellowish, some reddish, and some brown. They are also as different in their qualities as in their form; some of them are soluble in acids, others are not so; some fusible in the fire, others not; and some retain their natural colour after burning, others change it in the fire. By this we learn that some are marly, others argillaceous, others ochreous, and some sandy; others there are which are produced by the concretion of certain juices, saline or sulphureous, and others not so. Some are simply mineral; others are metallic. And as many of these are very different from any of the known *earths*, even in their pure and separate state, they are yet much less distinguishable when mixed one with another, as they very frequently are in the waters of even our common springs, much more so in the mineral medicinal ones.

The simple infusions of certain sulphureous mineral *earths* may remarkably alter the waters of wells and fountains, without having any thing of those *earths* remaining, after their distillation; in the same manner as nothing is separable, by art, from certain liquors, rendered emetic by antimony. The hot mineral waters may contract some alteration from the sulphureous and bituminous matters which they meet with in their course; for these substances all contain fusible salts, which hot water may take up, and carry away with it.

EARTH *of Portugal*. See PORTUGALICA *Terra*.

EARTH *Samian*. See SAMIA *Terra*.

EARTH, *Sealed*. See SIGILLATA *Terra*.

EARTH, *Soap*. See SOAP *Earth*.

EARTH-*bags*, *Sacs à terre*, in *Fortification*. See SACKS *of* EARTH, and SAND-*Bags*.

EARTH-*banks*, in *Husbandry*, &c. are a very common fence about London, and in several other parts of England. Where stones are not to be had cheap, these are to be preferred to all other fences, both for soundness and duration.

The best manner of making them is this: dig up some turf in a grassy place, a spit deep, or nearly to the breadth of the spade, and about four or five inches thick; lay these turfs with the grass outward, even by a line on one side, and on the backside of these, lay another row of turf, having a foot space of solid ground on the outside, to prevent the bank from slipping in, if it should be any way faulty. On the outside of this make a ditch, or else let the sides be lowered both ways with a slope two feet deep, and there will be no pasture lost by the fence, because it will bear grass on both sides.

The *earth* that is dug out of the ditches, or from the slopes, must be thrown in between the two rows of turf till the middle is made level with the rest. Then lay on two or more rows of turf in the same manner, and with more of the *earth* fill up, and make level as before. Let this method be continued till the bank is raised four feet high, or more, if necessary, only observing, that the higher it is to be carried, the wider the foundation must be made. As the bank is carried up, the sides must not be raised perpendicular, but sloping inward both ways so that at the top it may be about two feet and a half wide. This sort of fence, when made with less care, and faced with clay, is left naked, and serves very well in some places; but when it is thus managed with the turf, the joining of the several pieces are hid in a little time, by the growth of the grassy part of the turf on each side, and it makes a beautiful fence, of as green and pleasant a colour as the rest of the field.

The great improvement upon this plan, is the planting of quicksets, or young white-thorn plants, in the middle of the top of the bank. The *earth* on each side of these may be raised up with a sort of wall, and the rain that falls will wholly preserved for the plants. This plenty of water, and depth of fine *earth*, make the young plants grow quicker and more vigorously than in any other way; and the most beautiful of all hedges is formed in this manner. When this sort of hedge is young, there must be placed on each side of it a short dry hedge, of about a foot high, to keep the sheep from cropping the young plants: but this may be taken away after a little time.

There is one caution necessary in regard to the making of these banks, which is, that they must never be made in a very dry season, because, if much rain should follow, the *earth* of the bank would swell and burst out, or spoil the shape of the bank; but if this should happen, it is easily enough repaired. This beautiful fence may be made at a smaller price than those unaccustomed to these things may imagine. In good digging ground, where men work for fourteen pence a-day, it may be made and planted with quick for two shillings a pole. It may be made proper for the keeping in of deer, only by the small addition of planting, at every eight or ten feet distance, a post a little slanting, with a mortise in it; let this stand about two feet above the bank, and into the mortises all along, put a rail made of a bough of a tree, no deer will ever go over this, nor can they creep under it, as they often do when a pale tumbles down. The quick, on the top of this bank, may be kept clipped, and will grow very thick, and afford the best shelter for cattle of any fence in use with us. Mortimer's Husbandry.

EARTH-*board*, in *Husbandry*, that part of a PLOUGH which turns over the *earth*.

EARTH-*flax*. See *Plumæ* ALUM.

EARTH-*nut*, *Arachis*, in *Botany*, a genus of the *diadelphia decandria* class. Its characters are these: the empalement of the flower opens in two parts; the flower is of the butterfly-kind, and has ten ſtamina, nine of which coaleſce, and the upper one ſtands off. In the centre is ſituated an oblong germen, which turns to an oblong pod, containing two or three oblong blunt ſeeds. We have but one ſpecies of this plant, which, it is thought, came originally from Africa, though our ſettlements in America abound with it, where the negroes cultivate it for food, and eat it both raw and roaſted. It multiplies very faſt in a warm country; but being impatient of cold, cannot be propagated in the open air in England. Miller.

This plant, with ſome others of the trifoliate kind, has the property of burying its ſeeds under ground. As ſoon as the plant is in flower, it is bent towards the ground till it touches it. The pointal of the flower is then thruſt into the ground to a ſufficient depth, where it extends itſelf, and forms the ſeed-veſſel and fruit, which is brought to maturity under-ground. An oil is expreſſed from the ground-peas, which ſir Hans Sloane maintains to be as good as that of almonds, and which, it is ſaid, may be uſed, at a very cheap price, for the ſame purpoſes, both of food and phyſic, as the oil of almonds, or olives. Phil. Tranſ. vol. lix. N° 52. an. 1769.

EARTH-*nut pea*. See *Chickling* VETCH.

EARTH-*pitch*. See PISASPHALTUM.

EARTH *puceron*, in *Natural Hiſtory*, a name given by authors to a ſpecies of puceron very ſingular in its place of abode. In the month of March, if the turf be raiſed in ſeveral places, in any dry paſture, there will be found, under ſome parts of it, cluſters of ants, and, on a further ſearch, it will be uſually found, that theſe animals are gathered about ſome pucerons of a peculiar ſpecies. Theſe are large, and of a greyiſh colour, and are uſually found in the midſt of the cluſters of ants. See PUCERON.

The common abode of the ſeveral other ſpecies of pucerons is on the young branches or leaves of trees; as their only food is the ſap or juice of vegetables, probably theſe *earth* kinds draw out thoſe juices from the roots of the graſſes and other plants, in the ſame manner that the others do from the other parts. The ants that conduct us to theſe, are alſo our guides where to find the greater part of the others; and the reaſon of this is, that as theſe creatures feed on the ſaccharine juices of plants, they are evacuated from their bodies in a liquid form, very little altered from their original ſtate; and the ants, who love ſuch food find it ready prepared for them, in the excrements which theſe little animals are continually voiding. Reaumur.

EARTH, in *Geography*, this terraqueous globe, or ball, whereon we inhabit, conſiſting of land and ſea.

EARTH, *the figure of the*, is demonſtrated to be nearly ſpherical. Thus the moon is frequently ſeen eclipſed by the ſhadow of the *earth*; and, in all eclipſes, that ſhadow appears circular, what way ſoever it be projected, whether towards eaſt, weſt, north or ſouth, and howſoever its diameter vary, according to the greater or leſs diſtance from the *earth*.

Hence it follows, that the ſhadow of the *earth*, in all ſituations, is really conical; and, conſequently the body that projects it, i. e. the *earth*, is nearly ſpherical.

The natural cauſe of this ſphericity of the globe is, according to ſir Iſaac Newton, the great principle of attraction, which the Creator has ſtamped on all the matter of the univerſe; and whereby all bodies, and all the parts of bodies, mutually attract one another.

And the ſame is the cauſe of the ſphericity of the drops of rain, quickſilver, &c.

We ſay it is nearly ſpherical; for the inequalities on its ſurface prevent its being perfectly ſo: beſides that, Huygens and ſir Iſaac Newton have ſhewn, that the *earth* is higher and bigger under the equator than at the poles; ſo that its figure, nearly, is that of an oblate ſpheroid, ſwelling out towards the equatorial parts; and flatted, or contracted, towards the poles.

Though ſir Iſaac Newton in his Principia, firſt printed in 1686, had demonſtrated, from the theory of gravity, that this muſt be the real form of the *earth*, as it revolved about an axis; yet Meſſrs. Caſſini, both father and ſon, the one in 1713, and the other in 1701, attempted to prove, in the Memoirs of the Royal Academy of Sciences at Paris, that the *earth* was an oblong ſpheroid; and in 1718, M. Caſſini again undertook, from obſervations, to ſhew the contrary, or that the longeſt diameter paſſes through the poles, which gave occaſion for Mr. John Bernouilli, in his Eſſai d'une Nouvelle Phyſique Celeſte, printed at Paris in 1735, to triumph over the Britiſh philoſopher, apprehending that theſe objections would invalidate what ſir Iſaac had demonſtrated. In 1720, M. de Mairan advanced arguments, ſuppoſed to be ſtrengthened by geometrical demonſtrations, farther to confirm M. Caſſini's aſſertion. But in 1735 two companies of mathematicians were employed, one for a northern, and another for a ſouthern expedition, the reſult of whoſe obſervations and meaſurement plainly proved that the *earth* was flatted at the poles. See DEGREE.

Having found that the centrifugal force at the equator is $\frac{1}{289}$th of gravity, he aſſumes, as an hypotheſis, that the axis of the *earth* is to the diameter of the equator as 100 to 101, and thence determines what muſt be the centrifugal force at the equator to give the *earth* ſuch a form, and finds it to be $\frac{1}{578}$th of gravity: then, by the rule of proportion, if a centrifugal force, equal to $\frac{1}{578}$th of gravity would make the *earth* higher at the equator than at the poles by $\frac{1}{230}$ of the whole height at the poles, a centrifugal force that is the $\frac{1}{289}$th of gravity, will make it higher by a proportional exceſs, which by calculation is $\frac{1}{229}$th of the height of the poles; and thus he diſcovered that the diameter at the equator is to the diameter at the poles, or the axis, as 230 to 229. But this computation ſuppoſes the *earth* to be every where of an uniform denſity; for if the *earth* is more denſe near the centre, then bodies at the poles will be more attracted by this additional matter being nearer; and therefore the exceſs of the ſemidiameter of the equator above the ſemiaxis will be different.

This roundneſs of the *earth* is farther confirmed, by its having been frequently ſailed round: the firſt time was in the year 1519, when Ferd. Magellan made the tour of the whole globe in 1124 days. In the year 1557, our countryman, Drake, performed the ſame in 1056 days; in the year 1586, ſir Thomas Cavendiſh made the ſame voyage in 777 days; Simon Cordes, of Rotterdam, in the year 1590, and in the year 1598; Oliver Noort, a Hollander, in 1077 days; Will. Corn. Van Schouten, in the year 1615, in 749 days; Jac. Hereemites, and Joh. Huygens, in the year 1623, in 802 days; and many others ſince have performed the ſame navigation, particularly our own countryman, lord Anſon. All of whom, ſailing continually from eaſt to weſt, at length arrived in Europe, whence they ſet forth; and in the courſe of their voage, obſerved all the phenomena, both of the heavens and earth, to correſpond to, and evince this ſpherical figure.

Thus, as we go ſouthward the northern ſtars are depreſſed, and the ſouthern ſtars elevated; and the ſun arrives at the meridian of places that are more eaſterly, ſooner than to the meridian of thoſe towards the weſt, in proportion to the diſtance of the meridians meaſured upon the equator. The ſame globular figure is likewiſe inferred from the operation of LEVELLING, in which it is found neceſſary to make an allowance for the difference between the apparent and the true level.

What the *earth* loſes of its ſphericity by mountains and vallies, is nothing conſiderable; the higheſt eminence being ſcarce equivalent to the minuteſt protuberance on the ſurface of a lemon; what it loſes by the ſwelling of the equatorial parts, on account of the diurnal rotation of the *earth* on its axis, is more ſenſible. Huygens determines the ratio of the greater diameter to the leſs to be as 578 to 577.

Sir Iſaac Newton makes the greateſt diameter 34$\frac{1}{2}$ miles longer than the leſs, fixing the ratio as 692 to 688, or as 230 to 229. If the earth were in a fluid ſtate, its revolution round its axis would neceſſarily make it put on ſuch a figure, becauſe the centrifugal force being greateſt towards the equator, the fluid would there riſe and ſwell moſt; and that its figure really ſhould be ſo now, ſeems neceſſary to keep the ſea in the equinoctial regions from overflowing the earth thereabouts.

The proportion of the equatorial diameter to the polar, as ſtated by the gentlemen employed on the northern expedition for meaſuring a DEGREE of the meridian, is as 1 to 0,9891; by the Spaniſh mathematicians as 266 to 265, or as 1 to 0,996241; by M. Bouguer as 179 to 178, or 1 to 0,99441, which colonel Roy alſo deduced from collecting the beſt experiments that have hitherto been made with the pendulum into one view, and applying the equation which the denſity of the air, in which they ſeverally vibrated, ſeemed to require; and he obſerves, that this proportion agrees very nearly with the mean reſult from the meaſurement of the degrees of the meridian. Phil. Tranſ. vol. lxvii. part ii. p. 767.

The following problem, communicated by Dr. Leatherland to Dr. Pemberton, and publiſhed by Dr. Robertſon, will ſerve for finding the proportion between the axis and the equatorial diameter, from meaſures taken of a degree

gree of the meridian in two different latitudes, supposing the *earth* to be a spheroid, with its axis less than the equatorial diameter.

Let a P A *p* (*Tab.* II. *Astronomy, fig.* 68.) be an ellipsis representing a section of the *earth* through its axis P *p*; the equatorial diameter, or the greater axis of the ellipsis, being A *a*; let E and F be two places, where the measure of a degree has been taken; these measures are proportional to the radii of curvature in the ellipsis at those places; and if CQ, CR, are conjugates to the diameters, whose vertices are E and F, CQ will be to CR in the subtriplicate ratio of the radius of curvature in E, to that in F, by Cor. 1. Prop. iv. part vi. of Milnes's Conic Sections, and therefore in a given ratio to one another. Then Q V and R Z S being drawn parallel to P *p*, and Q X Y W parallel to *a* A, the angles Q C P, R C P are the latitudes of E and F; so that these angles, and the ratio of CQ to CR being given, the rectilineal figure C V Q X R Y is given in species; and the ratio of V C — Z C (= Q X = X W) to R Z — Q V (= R X = X S) is given, which is the ratio of C A² to C P²; therefore the ratio of C A to C P is given. Hence, if the sine and cosine of the greater latitude be each augmented in the subtriplicate ratio of the measure of the degree in the great latitude to that in the lesser, then the difference of the squares of the augmented sine, and the sine of the lesser latitude, will be to the difference of the squares of the cosine of the lesser latitude, and the augmented cosine, in the duplicate ratio of the equatorial to the polar diameter. Because C *q* being taken in C Q equal to C R, and *q v* drawn parallel to Q V, C *v* and *v q*, C Z and Z R will be the sines and cosines of the respective latitudes to the same radius; and C *V*, V Q will be the augmentations of C *v* and C *q* in the ratio named. Then, in order to find the ratio between the two axes of the *earth*, let I denote the greater, and F the lesser of the two latitudes, M and N the respective measures taken in each; and let O denote $\sqrt{\frac{M}{N}}$.

And $\sqrt[3]{\frac{I, \; I - O^2 \times I, \; E}{O^2 \times I, \; E - I, \; F}}$ is $=$ $\frac{\text{lesser axis}}{\text{greater axis}}$

It also appears by the above problem, that if one of the degrees measured is at the equator, the cosine of the latitude of the other being augmented in the subtriplicate ratio of the degrees, the tangent of the latitude will be to the tangent answering to the augmented cosine in the ratio of the greater axis to the lesser. For supposing the place out of the equator to be E; if the semicircle P *l m* p be described, and *l C* joined, and *m a* drawn parallel to a C, C *n* is the cosine of the latitude to the radius C P; and C Y that cosine augmented in the expressed ratio; Y Q being to Y *l*, i. e. C *a* to C *n*, or C P, as the tangent of the angle Y C Q, the latitude of the point E, to the tangent of the angle Y C *l*, belonging to the augmented cosine. Thus if M represent the measure in a latitude denoted by E, and N the measure at the equator, let A denote an angle, whose measure is $\sqrt[3]{\frac{M}{N}} \times I, E$. Then $\frac{t, \; A}{t, \; E}$ is $=$ $\frac{\text{lesser axis}}{\text{greater axis}}$. But M, or the length of a DEGREE, obtained by actual mensuration in different latitudes, is known from the following table.

			Toises
Maupertuis and associates in lat.	66 20	found	M = 57438
Cassini and de la Caille	49 22		M = 57074
	45 0		M = 57050
Boscovich	43 0		M = 56972
De la Caille	33 18		M = 57037
Juan and Ulloa	At the Equator		M = 56768
Bouguer			M = 56753
De la Condamine			M = 56749

By comparing the first of these measures with each of the following, the second with each of the following, &c. by the problem, and its corollary, we shall obtain twenty-five results, shewing the relation of the axes or diameters; and from the arithmetical means of the several comparisons, we shall have the ratio of the greater axis to the less as 1 to 0,9946838; or as 1 to 0,9946736; or as 1 to 0,9952621; or as 1 to 0,9972818; or as 1 to 0,9947682; and from the mean of all of them as 1 to 0,9951989. If the measures of the latitudes of 49° 22', and of 45°, which fall within the meridian line drawn through France, and which have been re-examined and corrected, since the northern and southern expedition, be compared with those of Maupertuis and his associates in the north, and that of Bouguer at the equator, the ratio of the greater axis to the less will be reduced to the following fix; viz. as 1 to 0,9910994, 1 to 0,990337, 1 to 0,9952717, 1 to 0,9985342, 1 to 0,9967698, and 1 to 0,9965152; the arithmetical mean of which ratios, or that of 1 to 0,9953367, may be taken for the ratio of the greater axis to the less; which is as 230 to 228,92974, nearly the same with that assigned by sir Isaac Newton. Add, that experiments made on pendulums, which must be of different lengths, to swing equal times here and at the equator, evince the same thing. Thus, a pendulum must be 2,852 lines shorter at the equator than at the poles.

Dr. de la Hire, and Dr. Derham, indeed, have shewn, that this diversity may arise, either from the greater heat, or the greater rarity, of the air there than here; as having observed a like variation between pendulums, when heated, and cold; and when in vacuo, and open air. But, besides that sir Isaac Newton, and M. Bernouilli, have set aside these causes, as insufficient, it has been found, by actual mensuration, that the degrees of a meridian grow larger, the farther we go towards the line; which puts the spheroidfim of the *earth* beyond question. The ancients had various opinions as to the figure of the *earth's home*, as Anaximander, held it cylindrical; and others, as Leucippus, in form of a drum. But the principal opinion was, that it was flat; that the visible horizon was the bounds of the *earth*, and the ocean the bounds of the horizon; that the heavens and *earth* above this ocean were the whole visible universe; and that all beneath the ocean was hades: of which opinion were not only divers of the ancient poets and philosophers, but also some of the Christian fathers, as Lactantius, St. Auguftine, &c.

L. Tacquet draws some pretty conclusions from the spherical figure of the *earth*; as 1. That if any part of the surface of the *earth* were quite plain, a man could no more walk upright thereon, than on the side of a mountain. 2. That the traveller's head goes a greater space than his feet; and a horseman than a footman, as having equal arches of greater circles. 3. That a vessel, full of water, being raised perpendicularly, some of the water will be continually flowing out, yet the vessel still remain full; and, on the contrary, if a vessel full of water be let perpendicularly down, though nothing flow out, yet it will cease to be full: consequently, there is more water contained in the same vessel at the foot of a mountain, than on the top; because the surface of the water is compressed into a segment of a less sphere below than above. Theo. Aftronom. lib. i. cap. 2.

EARTH, *changes of the*. Mr Boyle suspects there are great, though slow internal changes, in the mass of the *earth*. He argues from the varieties observed in the change of the magnetic needle, and from the observed changes in the temperature of climates. But as to the latter, we doubt whether he could have diaries of the weather sufficient to direct his judgment. Boyle's Works abr. vol. i. p. 292, 293. See ABSORPTIONS *of the earth*.

EARTH, *magnetism of*. The notion of the magnetism of the earth was started by Gilbert; and Mr. Boyle supposes magnetic effluvia moving from one pole to the other. See Works abr. vol. i. p. 285, 290.

Dr. Knight also thinks, the *earth* may be considered as a great loadstone, whose magnetical parts are disposed in a very irregular manner; and that the south pole of the *earth* is analogous to the north pole in magnets, that is, the pole by which the magnetical stream enters. See MAGNET.

He observes, that all the phenomena attending the direction of the needle, in different parts of the *earth*, in great measure correspond with what happens to a needle, when placed upon a large terella: if we make allowances for the different dispositions of the magnetical parts, with respect to each other, and consider the south pole of the *earth* as be a north pole, with regard to magnetism. The *earth* might become magnetical by the iron ores it contains, for all iron ores are capable of magnetism. It is true, the globe might notwithstanding have remained unmagnetical, unless some cause had existed capable of making that repellent matter producing magnetism move in a stream through the *earth*.

Now the doctor thinks that such a cause does exist. For if the *earth* revolves round the sun in an ellipsis, and the south pole of the *earth* is directed towards the sun, at the time of its descent towards it, a stream of repellent matter will thereby be made to enter at the south pole, and come out at the north. And he suggests, that the *earth's* being in its perihelion in winter may be one reason why magnetism is stronger in this season than in summer.

This cause here assigned for the *earth's* magnetism must continue, and perhaps improve it from year to year. Hence the doctor thinks it probable, that the *earth's* magnetism has been improving ever since the creation, and that this may be one reason why the use of the compass was not discovered sooner. See Dr. Knight's Attempt to demonstrate, that all the Phenomena in Nature

may be explained by Attraction and Repulsion, prop. 87.

EARTH, *the magnitude of the*, and the numbers of miles its diameter contains, have been variously determined by various authors, ancient and modern. The way to arrive at it is, by finding the quantity of a degree of a great circle of the *earth*; but this degree is found very different, according to the different methods and instruments made use of, as well as the different observers.

The method observed by Mr. Norwood, and the French aftronomers, Picard, Caſſini, &c. viz. by meaſuring the diſtance between two remote places on the ſame meridian, is undoubtedly the beſt, and was performed with great accuracy, eſpecially by M. Caſſini, and ſince by others. See DEGREE *of latitude*. According to that author, the ambit, or circumference of the *earth*, is 123750720 Paris feet, or 134650777 Engliſh feet, or 25031½ of our ſtatute miles; whence, ſuppoſing the *earth* ſpherical, its diameter muſt be 7967 ſtatute miles; and conſequently its radius, or ſemidiameter may be taken in a round number, for 20000000 feet its ſurface will be 1904424206 miles; which, being multiplied into ⅓ of its ſemidiameter, gives the ſolid content of the globe of the *earth* 2648560000000 cubic miles. Theſe ſeveral dimenſions are greater or leſs, according to the aſſumed meaſure of a degree. Caſſini adopted Picard's meaſure of 57060 toiſes. But the magnitude, as well as the FIGURE of the *earth*, may be deduced from the preceding problem. For, as half the *latus rectum* of the greater axis A *a*, (*Tab.* II. *Aſt. fig.* 68.) is the radius of curvature in A, it is given in magnitude from the degree meaſured there, and thence we ſhall have the axes themſelves. Thus, the circular arch equal to the radius being 57,29578 degrees, if this number be multiplied by 56753 toiſes, the meaſure of a degree at the equator, as Bouguer has ſtated it, we ſhall have the radius of curvature there, or half the *latus rectum* of the greater axis; and this is to half the leſſer axis in the ratio of the leſſer axis to the greater, i. e. as 0,9953467 to 1: whence the leſſer ſemiaxis will be 3266910 toiſes, and the greater 3282183.

From the ſame problem and figure it appears, that if an angle be taken, whoſe tangent ſhall be to the tangent of either latitude, as the leſſer axis to the greater, the meaſure of a degree in that latitude will be to the meaſure of a degree at the equator, in the triplicate ratio of the coſine of this angle to the coſine of the latitude, e. gr. If E be one of the places meaſured, the tangent of the angle Y C *f* will be to the tangent of Y C Q, the latitude of E, as Y *f* to Y Q, i. e. as the leſſer axis to the greater; and C Q : C *f* :: S. C *f* Y : S. C Q Y :: cof. C Y : cof. Q C Y; but by the property of the ellipſe, Q C : C *f* :: (CP) : : the radius of curvature in E to the radius of curvature in A, i. e. as the meaſure of a degree in E to the meaſure of a degree in A. Therefore, if M repreſents the meaſure in a latitude B, and N the meaſure at the equator; and an angle A be found, ſo that *t*, A may be $= \frac{\text{leſſer axis}}{\text{greater axis}} \times t$, E, N will be $= \text{M} + \text{cube } \frac{\frac{1}{t}, \text{E}}{\frac{1}{t}, \text{A}}$; and hence the axes may be known as above. Thus from the fix ratios between the axes already found, ſee *Figure of the* EARTH, we may obtain nine values of the axes, by comparing each ratio with both of its reſpective latitudes and meaſures; and the means will be, for the greater ſemiaxis, 3276473 toiſes; and for the leſſer, 3260209: and theſe, proportioned again by the mean ratio of the axes above ſtated, and by their aſſigned magnitudes will give, for the greater ſemiaxis 3279328 French toiſes, and for the leſſer ſemiaxis 3264068; and allowing 6 Paris feet to a toiſe, and the proportion of the Engliſh foot to the French, as 107 to 114, the greater ſemiaxis will be 3493803 Engliſh fathoms, or, dividing by 880, the number of fathoms in an Engliſh mile, 3970,298 miles; and the leſſer ſemiaxis 3477606 fathoms, or 3951,824 miles; and the greater axis, or equatorial diameter, equal to 7940,596 miles; and the leſſer, or polar diameter, equal to 7903,648 miles; ſo that the equatorial diameter is about 36,948 miles longer than the polar or *earth's* axis. See farther on this ſubject, Suite des Mem. de l'Acad. R. ann. 1718, p. 247. Maclaurin's Fluxions, vol. ii. book i. ch. 14. Robertſon's Navigation, book viii. ſect. 8.

On the ſurface of the *earth* are conceived the ſame circles as on the ſurface of the mundane ſphere elſewhere deſcribed, viz. the EQUATOR, ECLIPTIC, TROPICS, POLAR *Circles*, MERIDIANS, HORIZON, PARALLELS, &c. which ſee; as alſo SPHERE and GLOBE. The ſeas and unknown parts of the *earth*, by a meaſurement of the beſt maps, contain 160522020 ſquare miles; the inhabited parts, 38990563; Europe, 4456065; Aſia, 10768823; Africa, 9054807; America, 14110874: in all, 199512595, which is the number of ſquare miles on the whole ſurface of our globe.

The terraqueous globe is now generally granted to have two motions, beſides that on which depends the PRECESSION of the equinoxes; the one DIURNAL, around its own axis in the ſpace of 24 hours, which conſtitutes the natural day or nycthemeron. The other annual, round the ſun, in an elliptical orbit or tract, in 365 days, 6 hours, conſtituting the year.

From the former we derive the diverſities of NIGHT and DAY. And from the latter the viciſſitudes of ſeaſons, ſpring, ſummer, &c.

See the motion of the *earth* proved, under EARTH *in aſtronomy*.

In the terraqueous globe we diſtinguiſh three parts, or regions, viz. 1. The external part or cruſt, which is that from which vegetables ariſe and animals are nouriſhed. 2. The middle, or intermediate part, which is poſſeſſed by feſſils, extending farther than human labour ever yet penetrated. 3. The internal, or central part, which is unknown to us, though by many authors ſuppoſed of a magnetic nature; by others, a maſs or ſphere of fire; by others an abyſs, or collection of waters, ſurrounded by the ſtrata of *earth*; and by others, a hollow empty ſpace, inhabited by animals, who have their ſun, moon, planets and other conveniencies within the ſame: others divide the body of the globe into two parts, viz. the external part, which they call the cortex, including the whole depth or maſs of the ſtrata of the *earth*; and the internal, which they call the nucleus, being of a different nature from the former, and poſſeſſed by fire, water, or the like.

The external part of the globe either exhibits inequalities, as mountains or vallies; or it is plain and level; or dug in channels, fiſſures, beds, &c. for rivers, lakes, ſeas, &c.

Theſe inequalities in the face of the *earth* are, by moſt naturaliſts, ſuppoſed to have ariſen from a rupture or ſubverſion of the *earth*, by the force either of the ſubterraneous fires or waters. The *earth*, in its natural and original ſtate, Des Cartes, and after him, Burnet, Steno, Woodward, Whiſton, and others, ſuppoſe to have been perfectly round, ſmooth, and equable; and they account for its preſent rude and irregular form principally from the great deluge. See DELUGE.

In the external, or cortical part of the *earth*, we meet with various ſtrata, which are ſuppoſed to be the ſediments of various floods; the waters whereof, being replete with matters of divers kinds, as they dried up, or ouſed through, depoſited theſe different matters, which in time hardened into ſtrata of ſtone, ſand, coal, clay, &c.

Dr. Woodward has conſidered the ſubject of theſe ſtrata with great attention, viz. their order, number, ſituation with reſpect to the horizon, depth, intermixtions, fiſſures, colour, conſiſtence &c. He aſcribes the origin and formation of them all, to the great flood or cataclyſmus. At that terrible revolution, he ſuppoſes all the terreſtrial bodies of all kinds to have been diſſolved and mixed with the waters, and ſuſtained therein, ſo as only to conſtitute one common maſs therewith. This maſs of terreſtrial particles, intermixed with water, he ſuppoſes to have been at length precipitated to the bottom; and that generally, according to the laws of gravity, the heavieſt ſinking firſt, and the lighter in their order. By ſuch means were the ſtrata formed, whereof the *earth* conſiſts; which, attaining their ſolidity and hardneſs by degrees, have continued to ever ſince. Theſe ſediments, he farther concludes, to have been at firſt all parallel and concentrical; and the ſurface of the *earth* formed thereby, perfectly ſmooth and regular; but that in courſe of time, divers changes happening, from earthquakes, volcanoes, &c. the order and regularity of the ſtrata was diſturbed and broken, and the ſurface of the *earth* by ſuch means brought to the irregular form in which it now appears. M. de Buffon ſuppoſes that the *earth*, as well as the other planets, are parts ſtruck off from the body of the ſun by the colliſion of comets; and that when the *earth* aſſumed its form, it was in a ſtate of liquefaction by fire. See farther particulars under DELUGE.

EARTH, in *Aſtronomy*, is one of the primary planets, according to the ſyſtem of Copernicus. Its character is ⊕.

In the hypotheſis of Ptolemy, the *earth* is the centre of the ſyſtem.

Whether the earth move, or remain at reſt, i. e. whether it be fixed in the centre, with the ſun, heavens, and ſtars moving round the ſame from eaſt to weſt; or whether the heavens and ſtars being at reſt, the *earth* moves from weſt to eaſt, is the great article that diſtinguiſhes the Ptolemaic from the Copernican ſyſtem.

EARTH, *motion of the.* The happy induſtry of the aſtronomers of our age has put the mobility of the *earth* beyond all reaſonable doubt; on which account, the names of Copernicus, Galſendus, Kepler, Hook, Flamſteed, Bradley, &c. will ever be mentioned with the higheſt honour.

Indeed, the ſame motion had been held by many of the ancient philoſophers. Cicero, in his Tuſc. Queſt. aſſures us, that Nicetas of Syracuſe firſt diſcovered that the *earth* had a diurnal motion, by which it revolved round its axis in the ſpace of 24 hours; and Plutarch, de Placit. Philoſoph. tells us, that Philolaus diſcovered its annual motion round the ſun; and about 100 years after Philolaus, Ariſtarchus, the Samian, propoſed the motion of the *earth* in ſtronger and clearer terms, as we are aſſured by Archimedes in Arenar.

But the religious opinions of the heathen world prevented the doctrine's becoming more cultivated. For Ariſtarchus being accuſed of ſacrilege by Cleanthes for moving Veſta and the tutelar deities of the univerſe out of their places, the philoſophers began to lay aſide ſo perilous a poſition.

Many ages afterwards, Nic. Cuſanus revived the ancient ſyſtem, in his Doct. de Pignorant. and aſſerted the motion of the *earth*: but the dogma gained very little ground till the time of Copernicus, who ſhewed its great uſe and advantages in aſtronomy; and who had immediately all the philoſophers and aſtronomers who dared to diſſer from the croud, and were not afraid of eccleſiaſtical cenſures, on his ſide. So that Kepler, his contemporary, made no ſcruple to exclaim, *Hodierno tempore præſtantiſſimi quique philoſophorum & oſtentatorum Copernicus additipudentiæ ſtellæ oſt hac glaciei; cæteris fuffragiis melioribus: cæteris pene ſola abſint ſuperſtitis, aut metus a Cleanthibus.* See COPERNICAN.

The arguments alleged againſt the motion of the *earth* are weak and frivolous. Such are,

1. That it is a heavy body, and very unfit for motion.

2. That if the *earth* were to move round its axis in 24 hours, all our houſes, buildings, &c. would tumble down.

3. That bodies would not fall upon the places perpendicularly under them; nor could a bullet, e. gr. ſhot perpendicularly from the ground, fall back again upon the ſame ſpot.

4. That it is contrary to the words of ſcripture. And

5. That it is repugnant to our ſenſes, which repreſent the *earth* at reſt, and the ſun in motion.

But the principal argument againſt the annual motion of the *earth*, is the want of an annual parallax in the fixed ſtars. For let TAt (*Tab.* II. *Aſt. fig.* 69.) repreſent the *earth*'s orbit about the ſun S, T X the axis of the *earth*, and *t x* parallel to T X, will repreſent the poſition of the ſame axis at the oppoſite point *t*. Suppoſe T X to be directed towards the ſtar P, and it is manifeſt, that the axis of the *earth* will not be directed to the ſame ſtar, when it comes to the ſituation *t x*, but will contain an angle *x t* P with the line *t* P, joining the *earth* and ſtar, equal to the angle *t* P T, under which the diameter T *t* of the *earth*'s orbit appears to a ſpectator, viewed from the ſtar P. It might be expected, therefore, that by obſerving the fixed ſtar P, from the different parts of the *earth*'s orbit, we might judge of the angle T P *t*, and conſequently of the proportion of T P, the diſtance of the ſtar to T *t*, the diameter of the *earth*'s orbit, or double diſtance of the ſun. Yet it is certain, that aſtronomers have not hitherto been able to diſcover any difference in the apparent ſituation of the fixed ſtars with reſpect to the axis of the *earth*, or to one another, that can ariſe from the motion of the *earth*: though, ſince the reſtoration of the Pythagorean doctrine of the *earth*'s motion, they have taken great pains to examine the matter.

The ſeeming motion of the pole-ſtar, obſerved by Mr. Flamſteed, was by ſome miſtaken for a proof of its annual parallax; but this phenomenon has ſince been accounted for in the moſt ingenious manner by Dr. Bradley, from the motion of light combined with that of the *earth* in its orbit. See PARALLAX and LIGHT.

The objection to the *earth*'s motion, from there being no diſcernible parallax of the fixed ſtars, is anſwered by obſerving, that the diſtance of the fixed ſtars is ſo great, that the diameter of the *earth*'s orbit bears no ſenſible proportion to it; ſo that the parallax is not to be diſcovered by our exacteſt inſtruments. Nor is this immenſe diſtance of the fixed ſtars advanced by the Copernicans merely as an hypotheſis for the ſake of ſolving the objection. For there ſeems great reaſon to ſuppoſe the fixed ſtars like to our ſun, and hence to conclude their diſtance to be vaſtly great, ſince they appear to us with ſo faint a light, and of no ſenſible diameter, even in the largeſt teleſcopes.

But from the diligence and accuracy of late aſtronomers we learn ſeveral curious things in confirmation of the motion of the *earth* about the ſun, and ſerving to ſolve this only material objection againſt it. See LIGHT.

The arguments for the motion of the *earth* are of a different kind to the objections againſt it, and carry other ſort of evidence with them, being deduced from actual obſervation and phenomena, and not from the fanciful ſurmiſes of timorous zealots. They are theſe: 1. The ſun will equally appear in motion, and the *earth* as ſtanding ſtill, to a ſpectator on the *earth*, whether the ſun really move round the *earth* at reſt, or the *earth* move round the ſun at reſt.

For ſuppoſe the *earth* in T (*Tab. Aſtronom. fig.* 15. N° 2.) and the ſun in 1; the ſun will then appear in ♈. And, ſuppoſe the ſun to proceed in an orbit ſurrounding the *earth* from 1 to 2, he will then appear in 8; and, if he proceed farther to 3, he will ſeem in ♊: and thus will he appear to go on, according to the order of the ſigns in the ecliptic. Suppoſe, again, the *earth* in 1, and the ſun in T, the ſun will now be ſeen in ♎: let the *earth* go on from 1 to 2, the ſun will appear to the inhabitants of the *earth* to have proceeded from ♎ to ♏; and if the *earth* proceed to 3, the ſun will appear to have advanced farther from ♏ to ♐; and ſo on, according to the ſucceſſion of the ſigns of the ecliptic.

Thus does the ſun appear alike to move, whether he really move or ſtand ſtill; ſo that the objection from ſenſe is of no force. But again,

2. If one of the planets be ſuppoſed to have moved a certain ſpace from weſt to eaſt, the ſun, *earth*, and other planets, together with the fixed ſtars, will all ſeem to an inhabitant of that planet to have moved juſt ſo far round it the contrary way.

For, ſuppoſe a ſtar M (*fig.* 16. N° 2.) in the zenith of an inhabitant of a planet placed in P; and ſuppoſe the planet to have revolved in its axis from weſt to eaſt; in a certain ſpace of time the ſun S will have arrived at the zenith of T, then the ſtar I, then N, then the *earth* L, and at length the ſtar Magain. To the inhabitant of the planet, therefore, the ſun S, with the *earth* L, and the ſtars I, N, M, &c. will appear to have moved round the planet a contrary way.

Thus, to the inhabitants of the planets (if any ſuch there be) the mundane ſphere, with the ſun, ſtars, and all the other planets, will, as to us, appear to move round them from eaſt to weſt; and accordingly, the inhabitants of our planet, the *earth*, are only liable to the ſame deluſive appearances with thoſe of the reſt.

3. The orbits of the planets include the ſun as the common centre of them all; but they are only the orbits of the ſuperior planets that include the *earth*; which, however, is not in the centre of any of them, as is ſhewn under SUN and PLANET.

4. The *earth*'s orbit being proved to be between thoſe of Venus and Mars, it follows, that the *earth* muſt turn round the ſun; for as it lies within the orbits of the ſuperior planets, their motion would appear unequal and irregular; but they would never either be ſtationary or retrograde without this ſuppoſition.

5. From the orbits and periods of the ſeveral planets about the ſun, and of the moon and ſatellites round the *earth*, Jupiter and Saturn, it is evident, that the law of gravitation is the ſame towards the *earth*, Jupiter, and Saturn, as towards the ſun: and the periodical times of the ſeveral bodies moving around each, are in the ſame ratio to their ſeveral diſtances from them.

Now it is certain, that, on the hypotheſis of the *earth*'s annual motion, her periodical time exactly ſuits this law, bearing ſuch a proportion between thoſe of Mars and Venus as the ſeveral other bodies directed by the ſame law do bear; i. e. the ſquares of the periods are, in all, as the cubes of the diſtances from the centre of their orbits. But ſuppoſing the *earth* too at reſt, this law is broken moſt exorbitantly.

For, if the *earth* does not move round the ſun, the ſun muſt move with the moon round the *earth*: now, the diſtance of the ſun to that of the moon being as 23750 ſemidiameters of the *earth* to 60, or nearly as 396 to 1; and the moon's period being leſs than 28 days, the ſun's period ſhould be found no leſs than 212775 days, or 583 years; whereas, in fact, it is but one year. Which ſingle conſideration Mr. Whiſton thinks of weight enough to determine the controverſy between the two ſyſtems, and to eſtabliſh the motion of the earth for ever.

Whereas, ſuppoſing our *earth* to have once revolved about the ſun in a circular orbit, whoſe ſemidiameter were equal to the *earth*'s original diſtance from the ſun ſix degrees paſt its perihelion, the annual period would be found exactly and ſurpriſingly equal to the lunar or the ancient ſolar year, which were exactly commenſu-

rate, containing 12 fynodical, or 13 periodical months, i. e. 365 days, 4 hours, 19 minutes.

6. The diſtances of certain of the fixed ſtars from the zenith have been obſerved to be various at various times of the year. That particularly of the pole-ſtar from the pole, has been diſcovered by Mr. Flamſteed from repeated obſervations, for ſeven years ſucceſſively, to be greater about the ſummer ſolſtice than about the winter, by about 40 ſeconds. Whence it appears, that the *earth* changes its ſituation, receding from the pole-ſtar, and returning back to it again annually.

Which argument is further confirmed from this, that the *earth* is nearer the ſun at Chriſtmas than at Midſummer, as appears, both from the ſun's apparent diameter being greater in December than in June; and from its motion being ſwifter, by one twenty fifth part in the former ſeaſon than the latter; whence it is, that there are about eight days more in the ſummer half year, viz. from March to September, than in the winter, from September to March.

7. Either the heavenly bodies revolve round the *earth* in 24 hours, or the *earth* revolves round its axis in that time. Now, the planets revolving round the ſun, perform their revolutions in greater or leſs times, as their orbits are greater or leſs, i. e. as they are more or leſs remote from the ſun. Of conſequence, if the ſtars and planets revolved round the *earth*, they would perform their revolutions in unequal times, according as their orbits or their diſtances were unequally big. At leaſt, the fixed ſtars, which are at ſuch prodigious diſtances from the *earth*, would never move round it in 24 hours, as the neareſt planet is ſuppoſed to do.

This is an inelegancy, which is avoided in the ſyſtem where the *earth* is ſuppoſed to move; and where every planet is ſo much the longer in deſcribing its annual orbit round the ſun as that orbit is greater.

8. In all the works of nature with which we are acquainted, the Creator appears to act by the ſhorteſt, eaſieſt and ſimpleſt means. Now, if the *earth* be at reſt, and the ſtars move, the velocity of theſe latter muſt be immenſe; and yet all the purpoſes thereof might have been anſwered by a moderate motion of the *earth* alone. For the moon's diſtance from the *earth* amounts to 240000 miles. Hence, the circumference of the moon's diurnal circle being 1507968 ſuch miles, the moon's horary motion muſt be 62832 miles inſtead of 2200 miles, which is really the caſe; conſequently, in each ſecond, a ſpace leſs than that of the pulſe of an artery, the moon, though the ſloweſt of all the heavenly bodies, muſt move more than 17 miles. Again, the ſun's mean diſtance from the *earth* is 23750 ſemidiameters of the *earth* or 93000000 miles; conſequently the ſun's diurnal path, which in the equator, muſt be 596064000 miles; and therefore, in the ſpace of one ſecond, i. e. in the twinkling of an eye, he muſt move more than 6900 miles.

Again, the diſtance of the ſun from the *earth* is to that of Mars, ſuppoſing the *earth*, and not the ſun to be the centre of the ſyſtem, nearly as one and a half; to that of Jupiter, as one to five and a quarter; and to that of Saturn, as one to nine; wherefore, as the diurnal ſpace, and all other things deſcribed in the ſame time, are in the ſame ratio, Mars, in one twinkling of an eye, muſt fly 10360, Jupiter 26000, and Saturn 62112 miles. Laſtly, the fixed ſtars being yet vaſtly more remote from the *earth* than Saturn, their motion in or near the equator muſt be vaſtly ſwifter than that of Saturn.

9. If the *earth* be at reſt, and the ſtars move by any common motion, the ſeveral planets muſt each day deſcribe ſeveral ſpirals running forth to a certain term towards the north, and thence returning to the oppoſite term towards the ſouth, ſometimes narrower and ſometimes broader.

For the diſtances of the ſeveral planets from the zenith alter every day, increaſing to a certain point towards the north, and thence decreaſing again towards the ſouth; conſequently, the altitude of the pole being always found the ſame, and the planets not returning to the ſame point of the meridian, they do not deſcribe circles, but ſpirals. Add, that as the ſeveral planets do not retain the ſame diſtance from the *earth*, but are ſometimes nearer, and ſometimes recede farther from it, at a greater diſtance, a greater ſpiral, and at a leſs, a leſs is deſcribed.

Further, as their motion is ſlower when the planet is farther from the *earth*, the greater ſpirals are deſcribed in more times than the leſſers; and, as the greateſt and leaſt diſtance of the planets from the *earth* is not affixed to the ſame point of the heavens, the planets have moved in different tracts every day from the beginning.

Beſides, the force by which the ſtars and planets revolve in their orbits are not directed to the centre of the *earth*, but to the centres of the ſeveral orbits which they deſcribe, or to innumerable imaginary points in the axis of the *earth*; and theſe forces tending to different and continually varying centres muſt likewiſe increaſe exactly in proportion to the diſtances from the axis; whereas the force of attraction is found to decreaſe.

10. Bodies let fall from any conſiderable height, are found by experiment, not to fall upon the ſpot perpendicularly under them, but to the ſouth-eaſt thereof.

The experiment was propoſed to Dr. Hook in the year 1679, by a perſon who ſuggeſted, that, if the *earth* had any diurnal motion, the body would fall to the eaſt of the perpendicular. Dr. Hook, on that occaſion, read a diſcourſe before the Royal Society, wherein he endeavoured, *a priori*, to aſſign what curve a falling body would deſcribe; aſſerting, particularly, that the fall of the body would not be directly eaſt, but ſouth-eaſt; which was confirmed by divers actual trials. The objection which ſuppoſes, that e. g. a ball fired perpendicularly upward in the air ſhould fall weſtward of the place from which it was projected, on the ſuppoſition of the *earth*'s revolution eaſtward, can have no weight, when it is conſidered that the gun and ball partake of the *earth*'s motion; and therefore, being carried forward with the air as quick as the *earth* and air turn, it muſt fall down on the ſame place, deſcribing in its deſcent the diagonal of a parallelogram, whoſe two ſides are proportional to the forces acquired from the *earth*'s motion and the gravity of the ball. Thus a ſtone let fall from the top of a main-maſt, if it meets with no obſtacle, falls on the deck as near the foot of the maſt when the ſhip ſails as when it does not.

11. The power of gravity is found to decreaſe as you approach nearer to the equator, which is a circumſtance that agrees to all bodies which have a motion on their axis, and to them only, as being really the neceſſary reſult of ſuch motion.

For a body, revolving on its axis, the parts or appendages thereof are continually endeavouring to recede from the centre. Conſequently, the equator being a great circle, and the parallels all decreaſing towards the poles the centrifugal force is greateſt in the equator, and decreaſes towards the poles in the ratio of the diameters of the parallels to that of the equator. Now the power of gravity determines the ſeveral parts or appendages towards the centre of the whole; conſequently, the centrifugal force, acting contrary to the power of gravity, retards the deſcent of bodies, and that moſt where it is greateſt.

Dr. Keil computes, that the force of gravity to the centrifugal force at the equator is as 289 to 1; conſequently, a body placed there, would loſe one 289th part of the weight it would have were the *earth* at reſt: conſequently, the centrifugal force at the poles being infinitely ſmall, a body will there weigh 289 pounds, which at the equator only weighs 288.

12. The following is an actual demonſtration of the *earth*'s motion, drawn from phyſical cauſe, for which we are indebted to the diſcoveries of Sir Iſaac Newton, and which Dr. Keil takes for concluſive and unanſwerable.

All planets, it is demonſtrated, gravitate towards the ſun: and obſervations fully ſhow us, either that the *earth* runs round the ſun, or the ſun round the *earth*, in ſuch a manner as to deſcribe equal areas in equal times. But it is demonſtrated farther, that whenever bodies turn round each other, and regulate their motions by ſuch a law, the one muſt of neceſſity gravitate to the other: conſequently, if the ſun in its motion doth gravitate to the *earth*, action or re-action being equal and contrary, the *earth* muſt likewiſe gravitate towards the ſun.

Again, the ſame author has demonſtrated, that when two bodies gravitate to one another, without directly approaching one another in right lines, they muſt both of them turn round their common centre of gravity; the ſun and *earth*, therefore, do both turn round their common centre of gravity: but the ſun is ſo great a body in reſpect of our *earth*, which is, as it were, but a point; that the common centre of gravity of the two bodies will lie within the body of the ſun itſelf, and not far from the centre of the ſun. The *earth*, therefore, turns round a point, which is the body of the ſun, and therefore it turns round the ſun. Q. E. D.

13. Beſides, if the ſun moves about the *earth*, the *earth*'s attractive power muſt draw the ſun towards it from the line of projection, ſo as to bend its motion with a curve; but the ſun being at leaſt 227000 times as heavy as the *earth*, it muſt move 227000 times as ſlowly toward the *earth* as the *earth* does toward the ſun; and conſequently the *earth* would fall to the ſun in a ſhort time, if it had not a very ſtrong projectile motion to carry it off.

There-

There is indeed no such thing in nature as a heavy body moving round a light one as its centre of motion. A pebble, as Mr. Ferguſon familiarly illuſtrates this matter, faſtened to a mill-ſtone by a ſtring, may, by an eaſy impulſe, be made to circulate round the mill-ſtone; but no impulſe can make a mill-ſtone circulate round a looſe pebble, for the mill-ſtone would go off and carry the pebble along with it.

14. Dr. Bradley, late aſtronomer royal, has found, by a long ſeries of the moſt accurate obſervations, that there is a ſmall apparent motion of the fixed ſtars, occaſioned by the obſervation of their light, and ſo exactly anſwering to an annual motion of the *earth*, as evinces the *ſame* even to a mathematical demonſtration. See LIGHT.

To ſay no more; to ſuppoſe the *earth*, at reſt, confounds and deſtroys all the order and harmony of the univerſe, annuls its laws, and ſets every part at variance with each other, robs the Creator of half the praiſe of his work, and mankind of the pleaſure of the contemplation thereof. In effect, it renders the motions of the planets inexplicable and uſeleſs, which otherwiſe are plain and ſimple. So that ſuch of the later aſtronomers, as have aſſerted it with the moſt zeal, have been forced to ſet it aſide, when they came to compute the motions of the planets. None of them would ever attempt to compute theſe motions in variable ſpirals; but in all their theories they tacitly ſuppoſe the *earth* to move on its axis, ſo as to turn the diurnal ſpirals into circles.

Thus, the Jeſuit Riccioius, though he, at the pope's command, oppoſed the motion of the *earth* with all his might, as ſomething contrary to holy ſcripture; yet, to frame aſtronomical tables, which ſhould tolerably agree with obſervation, he was forced to have recourſe to the motion of the *earth* as his only refuge.

This, De Chales, another of the ſame fraternity, frankly confeſſes: "P. Riccioius—*nullas tabulas optare potuit, quæ* "*eas mediocriter obſervationibus reſponderent, niſi ſecundum* "*ſyſtema terræ motæ*; notwithſtanding that he called in "all the foreign and forced aſſiſtances of moveable epi"cycles, ſo that in his Aſtronomia Reformata, where he "undertakes to give accurate tables of the celeſtial mo"tions, he gives into the hypotheſis of the motion of "the *earth*." De Chales Aſtron. Reformat. lib. x. cap. 1. See COPERNICAN.

The ſyſtem then, which ſuppoſes the *earth* at reſt, is of itſelf of no uſe or ſignificancy in aſtronomy; nor does it avail more in phyſics: for the principal phenomena are no way deducible from it; but the reaſoners of it are either forced to fly to the immediate agency of the Deity (which in phyſics is the ſame as the *reductio ad abſurdum* in *Geometry*) or to reaſons and principles unknown.

Some oppoſe the motion of the *earth* as contrary to revelation: theſe being mention made in holy ſcripture of the ſun's riſing and ſetting, of his ſtanding ſtill in the time of Joſhua, and his going back in that of Hezekiah.

Now, to take the genuine ſenſe of theſe paſſages, the laws of interpretation muſt be ſettled. 1. Then, we ſuppoſe, that the ſeveral words of ſcripture have their ſeveral ideas correſponding to them; and that a man takes their ſenſe, in whom thoſe ideas are excited by the reading. 2. That the words of ſcripture, attentively read, are ſufficient to excite thoſe ideas in a mind not prepoſſeſſed. Hence, 3. It follows, that either God muſt have exhibited the definitions of the words that occur in ſcripture; or, that he ſuppoſes prior notions, and leaves us to take their ſenſe in the ordinary way. Hence, 4. We argue, that no other ideas are to be aſſived to the words of ſcripture, but ſuch as occur to a perſon who looks or attends to the things themſelves ſpoken of.

By the ſun's riſing, therefore, is meant no more than his re-appearance in the horizon, after he had been hid below it; and, by his ſetting, an occultation of the ſun, which was before viſible in the horizon. When the preacher therefore ſays, Eccleſ. i. 5. *The ſun alſo ariſeth, and the ſun goeth down, and haſteth to his place where he aroſe*, he means, doubtleſs, no more than that the ſun, which before was hid, is now ſeen in the horizon; and after being there conſpicuous, is hid again, and at length re-appears in the eaſt. For thus much only appears to a perſon who views the ſun; and therefore thus much, and no more, is expreſſed by the ſacred writers.

In like manner, when in Joſh. x. 12, 13. the ſun and moon are ſaid to have ſtood ſtill; all meant by ſtation is, that they did not change their place with reſpect to the *earth*. For that general, by *Sun, ſtand thou ſtill upon Gibeon, and thou moon, in the valley of Ajalon*, required no more, than that the ſun, which then appeared over that city, ſhould not change its ſituation. And from his bidding the ſun to keep its ſituation, it would be unjuſt to infer, that it moves round the *earth* at reſt.

Theſe, and ſimilar expreſſions, are true and proper deſcriptions of the phenomena, as they appear to us; but as the ſcriptures were never intended to inſtruct us in philoſophy and aſtronomy, they do not at all determine by what motions theſe phenomena are occaſioned. And it has been juſtly obſerved, that part of the account recorded in the book of Joſhua is merely a deſcription of the appearance; Gibeon and Ajjalon, and the whole land of Canaan lying in too northern a latitude for the ſun or moon ever to be vertical to any part of it; and yet this was a juſt deſcription of the phenomenon as it appeared to Joſhua in the place where he then was; and if one part of the account merely deſcribe the phenomena, the other muſt likewiſe be underſtood in the ſame manner.

Gaſſendus, very pertinently to the ſame purpoſe, diſtinguiſhes "two ſacred volumes, the one written, called "the *Bible*; the other, *Nature*, or the *World*: God having manifeſted himſelf by two lights, the one of reve"lation, and the other of demonſtration; accordingly, "the interpreters of the former are divines, of the lat"ter, mathematicians. As to matters of natural knowledge, the mathematicians are to be conſulted; and as "to the objects of faith, the prophets; the former being no leſs interpreters, or apoſtles, from God to men, "than the latter. And as the mathematician would be "judged to wander out of his province, if he ſhould "pretend to controvert, or ſet aſide any article of faith "from principles of geometry; ſo it muſt be granted, "the divines are no leſs out of their limits, when they "venture to pronounce on a point of natural knowledge, beyond the reach of any not verſed in geometry and optics, merely from holy ſcripture, which "does not pretend to teach any thing of the matter.

"For inſtances, we may quote Lactantius and Auguſtine; the firſt of whom rendered himſelf ridiculous by diſputing from ſcripture, againſt the rounddneſs of the *earth*; and the latter, againſt the antipodes." See ANTIPODES.

Having thus proved the motion of the *earth*, it is to be farther obſerved, that the altitude of the pole being found at all times of the year, i. e. in all points of its annual orbit (the ecliptic) to be the ſame; it follows, that the *earth* proceeds in ſuch manner along its orbit, as that its axis is conſtantly parallel to the axis of the world, and of conſequence parallel to itſelf.

This motion, which Copernicus calls the *motion of libration*, may be well enough illuſtrated, by ſuppoſing a globe, with its axis parallel to that of the *earth*, painted on a flag, or ancient of a maſt, moveable on its axis, and continually driven by the weſt wind, while it makes the tour of an iſland; it is evident, that in every ſituation of the ſhip, the axis of the painted globe will continue parallel to the axis of the world.

According to Sir Iſaac Newton's principles, the *earth*'s axis does, in every annual revolution, incline twice towards the ecliptic, and twice return to its former poſition: on which mutation it is, that the preceſſion of the equinoctial points is ſuppoſed to depend.

EARTH, *Latitude and Longitude of the*. See LATITUDE and LONGITUDE.

EARTH, *Inclination of the Axis of the*. See INCLINATION, AXIS, and ANGLE.

EARTH, *Quantity of matter, denſity and attractive power of its ſurface*. See DENSITY and PLANETS.

EARTHED *ſugar*. See SUGAR.

EARTHEN *floors*. See FLOOR.

EARTHING, in the general ſenſe. See INTERMENT.

EARTHING, in *Agriculture* and *Gardening*, denotes the covering of vines, celery, and other ſhrubs and plants with *earth*.

EARTHQUAKE, in *Natural Hiſtory*, a vehement ſhake, or agitation of ſome conſiderable place or part of the earth, from natural cauſes, attended with a terrible noiſe like thunder, and frequently with an eruption of water or fire, or elſe of ſmoke or winds.

Earthquakes are the greateſt and moſt formidable phenomena of nature. Ariſtotle and Pliny diſtinguiſh two kinds with reſpect to the manner of the ſhake, viz. a *tremor* and a *puſe*; the firſt being horizontal, in alternate vibrations, compared to the ſhaking of a perſon in an ague; the ſecond perpendicular, up and down; which latter kind are alſo called by Ariſtotle, *hyatagon*, from the reſemblance of their motion to that of boiling.

EARTHQUAKES, *Phenomena of*. The Philoſoph. Tranſact. furniſh us with abundance of hiſtories of *earthquakes*; particularly, one at Oxford in 1665, by Dr. Wallis and Mr. Boyle. Another at the ſame place in 1683, by Mr. Pigot. And another in Sicily in 1692-3, by Mr. Hartop. Fa. Alexſandro Burgos, and Vin. Bonajutus, which laſt is one of the moſt terrible ones in all hiſtory.

This ſhook the whole iſland; and not only that, but Naples and Malta ſtirred in the ſhock. It was of the ſecond kind mentioned by Ariſtotle and Pliny, viz. a perpendicular pulſation or ſucculion. It was impoſſible, ſaid the noble Bonajutus, for any body in this country to keep on their legs on the dancing earth; nay, thoſe that lay on the ground were toſſed from ſide to ſide as on a rolling billow, and high walls leaped from their foundations ſeveral paces, &c. Phil. Tranſ. N° 207. The miſchief it did is amazing; almoſt all the buildings in the countries were thrown down. Fifty-four cities and towns, beſide an incredible number of villages, were either deſtroyed or greatly damaged. We ſhall only inſtance the fate of Catania, one of the moſt famous, ancient, and flouriſhing cities in the kingdom, the reſidence of ſeveral monarchs, and an univerſity. This once famous, now unhappy Catania, to uſe the words of Fa. Burgos, had the greateſt ſhare in the tragedy. F. Anton. Serrovita being on his way thither, and at the diſtance of a few miles, obſerved a black cloud like night, hovering over the city; and there roſe from the mouth of Montgibello great ſpires of flame, which ſpread all around. The ſea, all of a ſudden, began to roar, and riſe in billows; and there was a noiſe as if all the artillery in the world had been at once diſcharged. The birds flew about aſtoniſhed; the cattle in the fields ran crying, &c. His and his companions horſes ſtopped ſhort, trembling; ſo that they were forced to alight. They were no ſooner off, but they were lifted from the ground above two palms; when caſting his eyes towards Catania, he with amazement ſaw nothing but a thick cloud of duſt in the air. This was the ſcene of their calamity; for of the magnificent Catania, there was not the leaſt footſtep to be ſeen. S. Bonajutus aſſures us, that of 18914 inhabitants, 18000 periſhed therein. The ſame author, from a computation of the inhabitants, before and after the *earthquake*, in the ſeveral cities and towns, finds that near 60000 periſhed out of 254900. Ibid. N° 202.

Jamaica is remarkable for *earthquakes*. The inhabitants, Dr. Sloane informs us, expect one every year. This author gives us the hiſtory of one in 1687; and another horrible one in 1692, is deſcribed by ſeveral anonymous authors. In two minutes time this ſhook down and drowned nine-tenths of the town of Port-Royal. The houſes ſunk out-right, 30 or 40 fathoms deep. Phil. Tranſact. N° 209. The earth opening, ſwallowed up people; and they roſe in other ſtreets, ſome in the middle of the harbour; and yet many were ſaved, though there were 2000 people loſt, and 1000 acres of land ſunk. All the houſes were thrown down throughout the iſland. One Hopkins had his plantation removed half a mile from its place. Of all wells, from one fathom to ſix or ſeven, the water flew out at the top with a vehement motion. While the houſes on one ſide of the ſtreet were ſwallowed up, on the others they were thrown on heaps; and the ſand in the ſtreet roſe like waves in the ſea, lifting up every body that ſtood on it, and immediately dropping down into pits; and at the ſame inſtant a flood of water breaking in, rolled them over and over; ſome catching hold of beams and rafters, &c. Ships and boops in the harbour were overſet and loſt; the Swan frigate, particularly, was thrown over by the motion of the ſea and ſinking of the wharf, and was driven over the tops of many houſes. It was attended with a hollow rumbling noiſe like that of thunder. In leſs than a minute, three quarters of the houſes, and the ground they ſtood on, with the inhabitants, were all ſunk quite under water; and the little part left behind was no better than a heap of rubbiſh. The ſhake was ſo violent, that it threw people down on their knees or their faces as they were running about for ſhelter. The ground heaved and ſwelled like a rolling ſea; and ſeveral houſes, ſtill ſtanding, were ſhuffled and moved ſome yards out of their places. A whole ſtreet is ſaid to be twice as broad now as before; and in many places, the earth would crack, and open and ſhut, quick and faſt. Of which openings, two or three hundred might be ſeen at a time; in ſome whereof, the people were ſwallowed up; others, the earth cloſing, were caught by the middle, and preſſed to death; as to others, the heads only appeared. The larger openings ſwallowed up houſes; and out of ſome would iſſue whole rivers of waters, ſpouted up a great height into the air, and threatening a deluge to that part the *earthquake* ſpared. The whole was attended with ſtenches and offenſive ſmells, the noiſe of falling mountains at a diſtance, &c. and the ſky in a minute's time was turned duſky and reddiſh like a glowing oven. Yet, as great a ſufferer as Port Royal was, more houſes were left ſtanding therein than on the whole iſland beſides. Scarce a planting-houſe or ſugar-work was left ſtanding in all Jamaica. A great part of them was ſwallowed up, houſes, people, trees, and all at once; in lieu of which, afterwards, appeared great pools of water, which, when dried up, left nothing but ſand, without any mark that ever tree or plant had been thereon. Above 12 miles from the ſea, the earth gaped, and ſpouted out with a prodigious force vaſt quantities of water into the air; yet the greateſt violences were among the mountains and rocks; and it is a general opinion, that the nearer the mountains the greater was the ſhake; and that the cauſe thereof lay there. Moſt of the rivers were ſtopped up for 24 hours, by the falling of the mountains, till ſwelling up, they made themſelves new tracts and channels, tearing up in their paſſage trees, &c. After the great ſhake, many of thoſe people who eſcaped got on board ſhips in the harbour, where many continued above two months; the ſhakes all that time being ſo violent, and coming ſo thick, ſometimes two or three in an hour, accompanied with frightful noiſes like a ruſhing wind, or a hollow rumbling thunder, with brimſtone-blaſts, that they durſt not come aſhore. The conſequence of the *earthquake* was a general ſickneſs, from the noiſome vapours belched forth, which ſwept away above 3000 perſons of thoſe who were left. Ibid. After the detail of theſe horrible convulſions, the reader will have but little curioſity left for the phenomena of the *earthquake* at Lima in 1687, deſcribed by Fa. Alvarez de Toledo, wherein above 5000 perſons were deſtroyed; this being of the vibratory kind, ſo that the bells in the church rung of themſelves; or that at Batavia, in 1690, by Witzen; that in the north of England, in 1703, by Mr. Thoreſby; thoſe in New-England in 1663 and 1670, by Dr. Mather; that of Italy in 1742; that of Lima and the port of Callao in Peru, in 1746, which laſted fifteen minutes, and deſtroyed moſt of the buildings in the city, deſtroyed moſt of the inhabitants, and ſwallowed up ſeveral ſhips therein the port; that of London in 1749; thoſe in 1750, felt in many parts of England; that of 1777, felt in the north of England; or laſtly, that of Liſbon in 1755: though this deſerves a more particular account than many others of much leſs conſiderable extent and duration. The three preceding years had been remarkably dry, inſomuch, that ſome ſprings which had been plentifully ſupplied with water were totally loſt; and the predominant winds were eaſt and north-eaſt, accompanied with various, though very ſmall motions and tremblings of the earth. The ſpring of the year 1755 was very rainy and wet; the weather on the day preceding the *earthquake*, which happened on the 1ſt of November, was clear, and uncommonly warm for the ſeaſon, and had continued clear and rather warmer than uſual for ſeveral days before. The day of the *earthquake* broke with a ſerene ſky, the wind continuing at eaſt; but about 9 o'clock the ſun began to grow dim; and ſoon after was heard a rumbling noiſe, like that of carriages, which increaſed to ſuch a degree as to equal that of the loudeſt cannon; upon which the firſt ſhock was felt, which was immediately ſucceeded by a ſecond and third, the whole duration of which was about 8 minutes; about 12 o'clock another ſhock was felt. During the firſt ſhock, the greateſt part of the public edifices and other buildings of the city were thrown down; and not leſs than 60,000 of its inhabitants buried in the ruins. The earth opened in fiſſures in ſeveral parts, and ſeveral light flames of fire were obſerved to iſſue from the ſides of the mountains reſembling thoſe of kindled charcoal. Subterraneous rumblings were alſo felt, attended with a diſcharge of great quantities of ſmoke. The water in the ſea roſe ſeveral times, and in a few minutes made three fluxes and re-fluxes, riſing above the greateſt ſpring-tides no leſs than 15 Engliſh feet. The ſhock was ſo violent 50 leagues off at ſea, as greatly to injure the deck of a ſhip, and to lead the captain to apprehend, that he had miſtaken his reckoning, and ſtruck on a rock. The ſhock was alſo felt about the ſame time at Oporto, by which the whole city was ſhaken, ſeveral chimnies, ſtones, and croſſes, were thrown down, and ſome buildings opened at top; and the ſwelling in the river was ſo conſiderable, that two large ſhips, which were juſt got over the bar, were driven back into the harbour. The ſame ſhock was equally violent at Madrid, Seville, and Cadiz; and in this laſt place the ſea roſe in a wave at leaſt 60 feet higher than uſual, daſhed againſt the rocks on the weſt part of the town, and againſt the walls with ſuch violence as to beat in the breaſt-work and a great part of the walls, ſo that ſeveral perſons were drowned by it. The day when the *earthquake* happened at Cadiz was as clear and ſerene as the fineſt ſummer-day in England. Many other cities, both in Spain and Portugal, were conſiderably damaged. The effects of this *earthquake*, in violently agitating the waters, were perceived in many parts of England, Scotland, and Ireland; and the ſhock not only reached to Switzerland, Holland, and other parts

parts of Europe, but it was communicated to Africa, and deſtroyed ſeveral cities on the coaſt of Barbary: and it was alſo felt about the ſame time in the iſland of Madeira, where the water roſe full 15 feet perpendicular above high-water mark. See Phil. Tranſ. N° 462, 463. 467; or vol. xlvi. p. 601, &c. vol. xlix. art. lviii. p. 351—445.

M. Lomonoſow preſented a paper to the Royal Academy of Sciences at Paris in 1758, in which he endeavours to ſhew that the formation of metals is a neceſſary conſequence of *earthquakes*. He ſuppoſes that the fire, occaſioned by the ſulphureous matter with which the interior parts of the earth abound, acts on the foſſile ſubſtances and the vegetable ſalts contained in them, and depoſited in the cavities of the earth, and reduces the whole into a mineral ſtate; and that the minerals diſſolved by the fire are diſtributed into beds and veins, as they are found to exiſt in the mine.

We will now relieve the reader after this long account, with ſome attempts towards a theory of *earthquakes*.

EARTHQUAKES, *Cauſes of*. Naturaliſts are here divided. Some aſcribe *earthquakes* to water, others to fire, and others to air; and all of them with ſome reaſon. To conceive which, it is to be obſerved, that the earth every where abounds with huge ſubterraneous caverns, veins, and canals, particularly about the roots of mountains; that of theſe cavities, veins, &c. ſome are full of water, whence are compoſed gulfs, abyſſes, ſprings, rivulets; and others full of exhalations; and that ſome parts of the earth are replete with nitre, ſulphur, bitumen, vitriol, &c.

This premiſed, 1. The earth itſelf may be the cauſe of its own ſhaking: when the roots or baſis of ſome large maſs being diſſolved, or worn away by a fluid underneath, it ſinks into the ſame; and, with its weight, occaſions a tremor of the adjacent parts, and produces a noiſe, and frequently an inundation of water.

2. The ſubterraneous waters may occaſion *earthquakes*, by their overflowing, cutting out new courſes, &c. Add, that the water, being heated, and rarefied by the ſubterraneous fires, may emit fumes, blaſts, &c. which, by their action, either on the water, or immediately on the earth itſelf, may occaſion great ſucculſions.

3. The air may be the cauſe of *earthquakes*; for air being a collection of fumes and vapours raiſed from the earth and water, if it be pent up in the too narrow viſcera of the earth, the ſubterraneous, or its own native heat, rarefying and expanding it, the force wherewith it endeavours to eſcape may ſhake the earth: hence there will ariſe a diverſe ſpecies of *earthquakes*, according to the different poſition, quantity, &c. of the impriſoned air.

Laſtly, Fire is a principal cauſe of *earthquakes*; both as it produces the aforeſaid ſubterraneous aura or vapour; and as this aura or ſpirit, from the different matter and compoſition whereof ariſe ſulphur, bitumen, and other inflammable matters, is kindled either from ſome other fire it meets with, or from its colliſion againſt hard bodies, or its intermixture with other fluids; by which means burſting out into a greater compaſs, the place becomes too narrow for it; ſo that preſſing againſt it on all ſides, the adjoining parts are ſhaken; till, having made itſelf a paſſage, it ſpends itſelf in a volcano, or burning mountain.

But to come nearer to the point, Dr. Liſter, in Philoſoph. Tranſact. N° 157, is of opinion, that the material cauſe of thunder, lightning, and *earthquakes*, is one and the ſame, viz. the inflammable breath of the pyrites, which is a ſubſtantial ſulphur, and will take fire of itſelf. For the true theory of lightning, &c. ſee LIGHTNING.

The difference between theſe three terrible phenomena, he takes only to conſiſt in this: that this ſulphur in the former is fired in the air; and in the latter, underground; which is a notion that Pliny had long before him: *quid enim, ſays he, aliud eſt in terra tremor, quam in nube tonitrus?*

This he thinks abundantly indicated by the ſame ſulphureous ſmell being found in any thing burnt with lightning, and in the waters, &c. caſt up in *earthquakes*, and even in the air before and after them.

Add that they agree in the manner of the noiſe; which is carried on as in a train, fired; the one rolling and rattling through the air, takes fire as the vapours chance to drive; as the other fired under-ground, in like manner, moves with a deſultory noiſe.

Thunder, which is the effect of the trembling of the air, cauſed by the ſame vapours diſperſed through it, has force enough to ſhake our houſes; and it is by no means improbable that there may be thunder and lightning under-ground, in ſome vaſt repoſitories there; eſpecially if we reflect, that the matter which compoſes the noiſy vapour above us is contained in much larger quantities under-ground. Philoſophical Tranſactions, N° 202.

That the earth abounds in cavities, every body allows; and that theſe ſubterraneous cavities are, at certain times, and in certain ſeaſons, full of inflammable vapours, the damps in our mines ſufficiently witneſs; which, fired, do every thing as in an *earthquake*, only in a leſſer degree.

That the pyrites alone, of all the known minerals, yields this inflammable vapour, is highly probable: becauſe no mineral or ore whatſoever is ſulphureous, but as it is wholly or in part a pyrites; and there is but one ſpecies of brimſtone, at leaſt with us in England, which the pyrites naturally and only yields. The ſulphur vivum or natural brimſtone, which is found in and about the burning mountains, is certainly the effect of ſublimation; and thoſe great quantities of it ſaid to be found about the ſkirts of volcanos, are only an argument of the long duration and vehemence of thoſe fires. Poſſibly, the pyrites of the volcanos, or burning mountains, may be more ſulphureous than ours; and indeed it is plain, that ſome of ours in England are very lean, and hold but little ſulphur; others again very much, which may be one reaſon why England is ſo little troubled with *earthquakes*; and Italy, and almoſt round the Mediterranean ſea, ſo very much; though another reaſon is, the paucity of pyrites in England, compared with thoſe places. Comparing our *earthquakes*, thunder and lightning, with theirs, it is obſerved, that there it lightens almoſt daily, eſpecially in ſummer-time, here ſeldom; there thunder and lightning are of long duration, here they are ſoon over; there the *earthquakes* are frequent, long, and terrible, with many paroxyſms in a day, and thus renewed for many days; here they are very ſhort, only of a few minutes, and ſcarce perceptible. To this purpoſe, the ſubterraneous cavities in England are ſmall and few, compared with the vaſt vaults in thoſe parts of the world, which is evident, from the ſudden diſappearance of whole mountains and iſlands.

Dr. Woodward gives us another theory of *earthquakes*. He endeavours to ſhew, that the ſubterraneous heat or fire (which is continually elevating water out of the abyſs to furniſh the earth with rain, dew, ſprings, and rivers) being ſtopped in any part of the earth, and ſo diverted from its ordinary courſe by ſome accidental glut or obſtruction in the pores or paſſages through which it uſed to aſcend to the ſurface, becomes, by ſuch means, preternaturally aſſembled in a greater quantity than uſual, into one place, and therefore cauſeth a great rarefaction and intumeſcence of the water of the abyſs, putting it into great commotions and diſorders, and at the ſame time making the like effort on the earth, which, being expanded upon the face of the abyſs, occaſions the agitation and conculſion which we call an *earthquake*.

This effort, in ſome *earthquakes*, he obſerves, is ſo vehement that it ſplits and tears the earth, making cracks and chaſms in it ſome miles in length, which open at the inſtants of the ſhocks, and cloſe again at the intervals between them; nay, it is ſometimes ſo violent, that it forces the ſuper-incumbent ſtrata, breaks them all throughout, and thereby perfectly undermines and ruins the foundation of them; ſo that theſe falling, the whole tract, as ſoon as the ſhock is over, ſinks down into the abyſs, and is ſwallowed up by it; the water thereof immediately riſing up, and forming a lake in the place where the ſaid tract before was. That this effort being made in all directions indifferently, the fire dilating and expanding on all hands, and endeavouring to get room, and making its way through all obſtacles, acts as violently on the water of the abyſs beneath as on the earth above, forcing it forth which way ſoever it can find vent or paſſage, as well through its ordinary exits, wells, ſprings, and the outlets of rivers, as through the chaſms then newly opened, through the camini or ſpiracles of Ætna, or other neighbouring volcanos; and thoſe hiatuſes at the bottom of the ſea, whereby the abbyſs below opens into it, and communicates with it. That as the water reſident in the abyſs is, in all parts of it, ſtored with a conſiderable quantity of heat, and more eſpecially in thoſe where theſe extraordinary aggregations of this fire happen; ſo likewiſe is the water, which is thus forced out of it; inſomuch that, when thrown forth and mixed with the waters of wells, or ſprings of rivers, and the ſea, it renders them very ſenſibly hot.

He adds, that though the abyſs be liable to theſe commotions in all parts, yet the effects are no where very remarkable, except in thoſe countries which are mountainous, and conſequently ſtony and cavernous underneath; and eſpecially where, the diſpoſition of the ſtrata is ſuch that thoſe caverns open into the abyſs, and ſo freely admit and entertain the fire, which aſſembling therein is the cauſe of the ſhock; it naturally ſeeking its courſe that way where it finds the readieſt reception, which is towards thoſe caverns. Beſides that thoſe parts

of the earth which abound with ſtrata of ſtone, or marble, making the ſtrongeſt oppoſition to this effort, are the moſt furiouſly ſhattered, and ſuffer much more by it than thoſe which conſiſt of gravel, ſand, and the like laxer matter, which more eaſily give way, and make not ſo great reſiſtance; but, above all, thoſe countries which yield great ſtore of ſulphur and nitre, are by far the moſt injured and incommoded by *earthquakes*; thoſe minerals conſtituting in the earth a kind of natural gunpowder, which taking fire upon this aſſemblage and approach of it, occaſions that murmuring noiſe or ſubterraneous thunder which is heard rumbling in the bowels of the earth during *earthquakes*; and, by the aſſiſtance of its exploſive power, renders the ſhock much greater, ſo as ſometimes to make miſerable havock and deſtruction.

And it is for this reaſon that Italy, Sicily, Anatolia and ſome parts of Greece, have been ſo long and ſo often alarmed and harraſſed by *earthquakes*; theſe countries being all mountainous and cavernous, abounding with ſtone and marble, and affording ſulphur and nitre in great plenty.

It is obſerved that Ætna, Veſuvius, Hecla, and the other volcanos, are only ſo many ſpiracles ſerving for the diſcharge of this ſubterraneous fire, when it is thus preternaturally aſſembled; that where there happens to be ſuch a ſtructure and conformation of the interior parts of the earth, as that the fire may paſs freely and without impediment from the caverns wherein it aſſembles unto thoſe ſpiracles, it then readily and eaſily gets out, from time to time, without ſhaking or diſturbing the earth; but where ſuch communication is wanting, or the paſſage is not ſufficiently large and open, ſo that it cannot come at the ſpiracles, it heaves up and ſhakes the earth with greater or leſs impetuoſity, according to the quantity of fire thus aſſembled, till it has made its way to the mouth of the volcano: that therefore there are ſcarce any countries much annoyed with *earthquakes*, which have not one of theſe fiery vents, conſtantly in flames when any *earthquake* happens, as diſgorging that fire, which, whilſt underneath, was the cauſe of the diſaſter: laſtly, that were it not for theſe diverticula, it would rage in the bowels of the earth much more furiouſly, and make greater havock than it doth.

Having thus ſhewn how fire and water contribute to the phenomena of *earthquakes*; let us next conſider the effects of air.

M. Amontons, in the Memoirs de l'Acad. des Sciences, an. 1703, has an expreſs diſcourſe to prove, that on the foundation of the new experiments of the weight and ſpring of the air, a moderate degree of heat may bring the air into a condition capable of cauſing *earthquakes*. See AIR, *Elaſticity of*.

The ingenious Mr. Michell has publiſhed an elaborate paper of conjectures concerning the cauſe, and of obſervations on the phenomena of *earthquakes*. He ſuppoſes that they are occaſioned by ſubterraneous fires; which, if a large quantity of water ſhould be let out upon them ſuddenly, may produce a vapour, whoſe quantity and elaſtic force may be fully ſufficient for this purpoſe. The facts by which he ſupports this hypotheſis are the following: 1. The ſame places are ſubject to returns of *earthquakes*, not only at ſmall intervals for ſome time after any conſiderable one has happened, but alſo at greater intervals of ſome ages; and theſe, he apprehends, are very conſiſtent with the cauſe aſſigned. Since ſubterraneous fires, as well as volcanos, which they nearly reſemble, may be reaſonably ſuppoſed, and are found in fact to ſubſiſt for many ages; and may produce their effect, like the raging of volcanos, at unequal intervals, and with unequal degrees of force. 2. Thoſe places that are in the neighbourhood of burning mountains are always ſubject to frequent *earthquakes*; and the eruptions of thoſe mountains, when violent, are generally attended with them; and this is a conſideration, he ſays, which affords a ſtrong argument of their proceeding from a cauſe of the ſame kind; more eſpecially, as the earth is compoſed of ſeveral regular ſtrata, which are very extenſive, and lie more inclining from the mountainous countries, than the countries themſelves. Hence he infers, that thoſe ſtrata of combuſtible materials which break out in volcanos on the tops of hills, are to be found at a conſiderable depth under-ground in the level and low countries near them; and if the ſame ſtrata ſhould be on fire in any places under ſuch countries as well as the tops of hills, all vapours of whatſoever kind, raiſed from theſe fires, muſt be pent up, unleſs ſo far as they can open for themſelves a paſſage between the ſtrata; whereas the vapours raiſed from volcanos find a vent, and are diſcharged in blaſts from the mouths of them; and yet when they find a vent, they are capable of ſhaking the country to the diſtance of ten or twenty miles round; what then may we not expect from them when they are confined? Thus Mr. Michell accounts for the fact, that the moſt extenſive *earthquakes* take their riſe from the level and low countries; and more eſpecially from the ſeas, which are waters covering ſuch countries. 3. The motion of the earth in *earthquakes* is partly tremulous, and partly propagated by waves, which ſucceed one another ſometimes at longer and ſometimes at ſmaller diſtances; and this latter motion is generally propagated much farther than the former. Both theſe phenomena, it is obſerved, may be accounted for by the ſuppoſition, that *earthquakes* are cauſed by vapours raiſed from waters ſuddenly let out on ſubterraneous fires. As a ſmall quantity of vapour almoſt inſtantly generated at ſome conſiderable depth below the ſurface of the earth; ſo a very large quantity (whether generated inſtantly, or in any ſmall portion of time) will produce a wave-like motion. A large quantity of vapour may be conceived to raiſe the earth in a wave as it paſſes between the ſtrata, which it may eaſily ſeparate in an horizontal direction, there being, as it is ſuppoſed, little or no coheſion between one ſtratum and another. Thus, if a large quantity of vapour ſhould continue to be generated for ſome time, ſeveral waves might be produced by it. The vibratory motion, occaſioned by the firſt impulſe of the vapour, being propagated through the ſolid parts of the earth, will much ſooner become too weak to be perceived than the wave-like motion, occaſioned by the vapour inſinuating itſelf between the ſtrata, and capable of being propagated to very great diſtances. 4. *Earthquakes* generally come to one and the ſame place from the ſame point of the compaſs; and their velocity is much the ſame; whereas the velocity of *earthquakes* of different countries is very different; i. e. *earthquakes* derived from the ſame ſubterraneous fire muſt come to the ſame place in the ſame direction; and thoſe only which are derived from different fires will come from different points of the compaſs. 5. The great Liſbon *earthquake* has been ſucceeded by ſeveral local ones ſince, the extent of which has been much leſs: the vapour produced by one ſubterraneous fire diſtributing the materials overſome other fire. For a more particular account of Mr. Michell's theory, and of the various facts which he alleges in illuſtration and ſupport of it, we muſt refer to Phil. Tranſ. vol. li. art. 55. p. 566—634.

EARTHQUAKES, *the theory of*, hath received conſiderable alteration and improvement from modern electrical diſcoveries. The firſt perſon who advanced the notion, that *earthquakes* were probably cauſed by electricity, was Dr. Stukeley, on occaſion of thoſe that happened in England in the years 1749 and 1750. He urges a variety of objections againſt the common hypotheſis, which aſcribes *earthquakes* to ſubterraneous winds, fires, vapours, or any thing that occaſions an exploſion, and thus heaves up the ground. He thinks there is no evidence of the cavernous ſtructure of the earth, which this hypotheſis requires; but that on the contrary, there is reaſon to believe that it is in a great meaſure ſolid. *Earthquakes* have alſo frequently happened without any eruption of fire, vapour, ſmoke, or ſmell, which he thinks is utterly inconſiſtent with the ſuppoſition of their being occaſioned by any ſubterraneous vapours; eſpecially in caſes where the ſhock is of conſiderable extent; beſides, this is a cauſe altogether inadequate to ſuch an effect; for a ſubterraneous power, capable of moving a ſurface of earth only thirty miles in diameter, muſt be lodged at leaſt fifteen or twenty miles below the ſurface, and move an inverted cone of ſolid earth, whoſe baſe is thirty miles in diameter, and axis fifteen or twenty miles, which he judges to be abſolutely impoſſible; how much more inconceivable, then, that any ſuch power could produce the *earthquake* of 1755, which was felt in various parts of Europe and Africa, and the Atlantic Ocean; or that of Aſia Minor, A. D. 17, by which thirteen great cities were deſtroyed in one night, and which ſhook a maſs of earth three hundred miles in diameter, in order to which the moving power, if it had been internal fire, or vapour, muſt have been lodged two hundred miles below the ſurface! Farther, in *earthquakes* the effect is inſtantaneous; whereas the operation of elaſtic vapour, and the diſcharge of it, muſt be gradual, and require a long ſpace of time: and if they were owing to exploſions, they muſt alter the ſurface of the country where they happened, deſtroy the fountains and ſprings, and change the courſe of its rivers, which is contradicted by hiſtory and obſervation. To all which it is added, that the ſtrokes which ſhips receive during an *earthquake* muſt be occaſioned by ſomething that could communicate motion with a much greater velocity than any heaving of the earth under the ſea by the elaſticity of generated vapours, which would only produce a gradual ſwell, and not an impulſe of the water, reſembling a thump againſt the bottom of a ſhip, or ſtriking againſt a rock. Dr. Stukeley,

Stukeley, finding the common hypotheſis inſufficient, was led to conclude that *earthquakes* were proper electrical ſhocks; and a particular ſurvey of the phenomena that either, precede or attend them, confirmed this opinion: he obſerved, that the weather was uſually dry and warm for ſome time before an *earthquake* happened, and that the ſurface of the ground is thus previouſly diſpoſed for that kind of electrical vibration in which it conſiſts; whilſt at the ſame time, in ſome places where *earthquakes* have happened, the internal parts, at a ſmall depth below the ſurface, are moiſt and boggy; and thence he infers, that they reach very little below the ſurface. He adds, that the ſouthern regions are more ſubject to *earthquakes* than the northern, on account of the greater warmth and dryneſs of the earth and air, which are qualities ſo neceſſary to electricity. It was alſo obſerved, that before the *earthquake* at London in 1749, all vegetables were remarkably forward, and electricity is well known to quicken vegetation. They were likewiſe preceded by frequent and ſingular appearances of the *aurora borealis*, and *auſtralis*, and by a variety of other meteors which indicate an electrical ſtate of the atmoſphere. Dr. Stukeley apprehends, that, in this ſtate of the earth and air, nothing more is neceſſary to produce an *earthquake* than the approach of a non-electric cloud to any part of the earth, when in an highly electrified ſtate, and the diſcharge of its contents upon it; and that as the diſcharge from an excited tube occaſions a commotion in the human body, ſo the ſhock, produced by the diſcharge between the cloud and many miles in compaſs of ſolid earth, muſt be an *earthquake*, and the ſnap from the contact be the noiſe attending it. He ſuppoſes that a large black cloud which ſuddenly covered the hemiſphere a little before the *earthquake* of 1749, might have occaſioned the ſhock, by the diſcharge of a ſhower. The noiſe, it has been obſerved, uſually precedes the ſhock; whereas, if the concuſſion depended upon a ſubterraneous eruption, it muſt have been quite the contrary. The flames and ſulphureous ſmells, which ſometimes attend *earthquakes*, are more eaſily accounted for, as Dr. Stukeley thinks, from the ſuppoſition of their being electrical phenomena than on any other hypotheſis. The ſudden, extenſive agitation, both of land and water, occaſioned by *earthquakes*, can only be effected by electricity. The little damage generally done by *earthquakes*, and the nature of the impulſe which they give to ſhips, already taken notice of, ſuggeſt an argument, that they are owing not to any convulſion in the bowels of the earth, but to an uniform vibration along its ſurface, occaſioned by an electrical ſnap; and that they are electrical phenomena, Dr. Stukeley farther infers, from their chiefly affecting the ſea-coaſt, places near rivers, we may add alſo eminences; and finally from the effects which they produce on weak conſtitutions, ſuch as pains in the back, head-achs, colics, &c. ſimilar to thoſe occaſioned ſometimes by electrification. After all, he does not preſume to ſay, how the earth and atmoſphere are put into that electrical and vibratory ſtate, which prepares them to give or receive that ſnap and ſhock, which is called an *earthquake*; but this he thinks as difficult to account for as magnetiſm, gravitation, muſcular motion, and many other ſecrets in nature. Several circumſtances have been remarked by other writers, which confirm the theory that ſuppoſes *earthquakes* to be electrical phenomena. Signior Beccaria, whoſe name often occurs in the hiſtory of electricity, agrees with Dr. Stukeley, in ſuppoſing, that *earthquakes* are electrical phenomena; but he imagines, that the electric matter which occaſions them is lodged deep in the bowels of the earth; and if in this ſituation its equilibrium ſhould by any means be deſtroyed, ſo that the beſt method of reſtoring it ſhall be by the fluid's burſting its way into the air, and traverſing ſeveral miles of the atmoſphere to come to the place where it is wanted; it may eaſily be conceived, that violent concuſſions may be given to the earth, by the ſudden paſſages of this powerful agent; and that the electric fluid is ſometimes collected in the bowels of the earth, he thinks probable from the appearance of *ignes fatui* in mines, which ſometimes happens, and is very probably an electrical phenomenon. This ingenious philoſopher obſerves that if two pieces of glaſs, incloſing a thin piece of metal, be held in the hand, while a large ſhock is ſent through them, a ſtrong concuſſion or vibration will be felt, which ſometimes breaks them to pieces. Mr. Henly, another excellent electrician, has diſcovered a method of increaſing the effect of the exploſion upon glaſs, ſo as to afford a very natural idea of an *earthquake*. Between the ends of two wires, laid on a piece of glaſs, with their extremities pointing to each other, and about an inch diſtant, through which the diſcharge is to be made, he places a thick piece of ivory upon the glaſs, and on the ivory a weight at pleaſure, from one fourth of an ounce to ſix pounds; the glaſs is broken by an exploſion into innumerable fragments, and ſome of it is reduced into an impalpable powder: the weight is ſhook by the exploſion, and ſometimes thrown off from the ivory. In this experiment if the glaſs is very thick, ſo that the force of the exploſion is not ſufficient to break it, it will be found marked with the moſt lively priſmatic COLOURS. The appearance of an *earthquake* may be alſo repreſented by cauſing an exploſion of a battery to paſs over the ſurface of any ſubſtances on which ſmall ſticks or cards are placed, which will never fail to be ſhook, and often be thrown down by the exploſion; or, by making a diſcharge over the ſurface of water, in which caſe the report will be much louder than when the diſcharge is made through the air; and a hand plunged deep into the water will feel the concuſſion; and we may add, that the ſpark which paſſes over the ſurface of the water in this experiment, bears a great reſemblance to thoſe balls of fire that have ſometimes been ſeen over the ſurface of the ſea or land in the time of an *earthquake*. Dr. Prieſtley contrived various methods of exhibiting the phenomena of *earthquakes*. He made the electric ſtaſh to paſs over wet boards ſwimming in water, over either of theſe ſeparately, or over both at once, on which pillars, &c. were erected; and thus, whilſt the board repreſented the earth, and the water the ſea, the phenomena of both during an *earthquake* were exhibited at the ſame time. Dr. Prieſtley, the ingenious hiſtorian of electricity, after having largely recited the obſervations of Dr. Stukely and ſignior Beccaria on the ſubject of *earthquakes*, of which we have given a ſummary in the foregoing part of this article, does not abſolutely decide which of theſe two philoſophers has advanced the more probable opinion concerning the ſeat of the electric matter which occaſions *earthquakes*; but he thinks a more probable general hypotheſis than either of them may be formed out of them both. Suppoſe, ſays he, the electric matter to be ſome way or other accumulated on one part of the ſurface of the earth, and on account of the dryneſs of the ſeaſon, not eaſily to diffuſe itſelf; it may, as ſignior Beccaria ſuppoſes, force itſelf a way into the higher regions of the air, forming clouds in its paſſage out of the vapours which float in the atmoſphere, and occaſion a ſudden ſhower, which may farther promote the paſſage of the fluid. The whole ſurface then unloaded, will receive a concuſſion, like any other conducting ſubſtance, on parting with, or receiving, a quantity of the electric fluid. The ruſhing noiſe will likewiſe ſweep over the whole extent of the country. And, upon this ſuppoſition alſo, the fluid, in its diſcharge from the country, will naturally follow the courſe of the rivers, and alſo take the advantage of any eminences to facilitate its aſcent into the higher regions of the air. See farther on this ſubject, Phil. Tranſ. vol. xli. p. 641, &c. Beccaria Lettredell' Elettriciſmo, p. 216. 362. &c. or Prieſtley's Hiſt. of Electricity, Period x. ſect 12.

EARTHQUAKES, *Artificial*. Chemiſtry furniſhes us with a method of making *artificial earthquakes*, which ſhall have all the great effects of natural ones; which, as it may illuſtrate the proceſs of nature in the production of theſe terrible phenomena under-ground, we ſhall here add.

To twenty pounds of iron filings, add as many of ſulphur; mix, work, and temper the whole together with a little water, ſo as to form a maſs of the conſiſtence of a firm paſte. This being buried three or four feet under-ground, in ſix or ſeven hours time, will have a prodigious effect; the earth will begin to tremble, crack, and ſmoke, and fire and flame will burſt through.

Such is the effect even of two cold bodies, in cold ground; and there only wants a ſufficient quantity of this mixture to produce a true Ætna. If it were ſuppoſed to burſt out under the ſea, it would produce a water-ſpout; and if it were in the clouds, the effect would be thunder and lightning. However, *water-*SPOUTS and LIGHTNING are, without doubt, electrical phenomena.

EARTHWORM, *lumbricus*, in *Zoology*, a well-known inſect, belonging to the order of *inteſtina*, containing the parts of generation of both ſexes in each individual; long, deſtitute of feet, and of a reddiſh colour; of an oblong form, conſiderably thick, rounded in ſhape, and covered with a ſoft and ſlender ſkin, marked with annular ridges and furrows. When full grown, it is often ten inches or more in length, and more than a third of an inch in diameter. Its colour is a duſky red.

It is common every where, at little depths, under the ſurface of the earth; it is not unfrequently alſo met with in the human inteſtines, as well as in thoſe of other animals, in which ſtate it has been ſuppoſed a different creature, and called by a new name.

Beſides the common *earthworm*, there is found another ſpecies of *lumbricus* in the mud about the ſea ſhores, very large, growing very often to a foot or more in length; it entirely reſembles the other, only that it is of a paler red, and has its ſkin covered with little pro-

minences, which make it rough and scabrous to the touch.

Eutrophus mi are by some esteemed of great virtue in medicine, and are said to be diuretic, diaphoretic, and anodyne; as also discutient, emollient, and openers of obstructions; and are prescribed in apoplexies, spasms, and all nervous affections, and in the jaundice, dropsies, and colics.

EASE, in the *Sea-language*, signifies as much as slacken, or let go slacker.

Thus they say, *ease* the bowline, *ease* the sheet; that is, let them go slacker.

EASE *the ship*, in *Sea-language*, is the command given by the pilot to the steersman, to put the helm close to the lee-side; or *hard-a-lee*, when the ship is expected to pitch or plunge her fore-part deep in the water while close hauled.

EASE, *Chapel of*. See CHAPEL.

EASEL-PIECES, among *Painters*, such smaller pieces, either portraits or landscapes, which are painted on the *easel*, i. e. the frame whereon the canvass is laid.

They are thus called to distinguish them from larger pictures drawn on walls, cielings, &c.

EASEMENT, in *Law*, a service or convenience which one neighbour has of another by charter or prescription, without profit; as a way through his ground, a sink, or the like.

In the civil law, *easements* are called, *servitus prædii*.

EAST, in *Cosmography*, one of the cardinal points of the horizon; being the point wherein the prime vertical intersects that quarter of the horizon in which the sun rises when in the equinoctial.

The word *east* is Saxon. In Italy, and throughout the Mediterranean, the *east*-wind is called the *levante*. In Greek, ἀπηλιώτης and ἀνατολικὸς, because it comes from the side of the sun, ἀπ' ἠλίου. In Latin, *eurus*.

To find the *east* and west line points, &c. see MERIDIAN-*Line*.

EAST-*Wind*, is that which blows from the *east* point. See WIND.

EAST-*Dials*. See DIAL.

EAST-*India Companies*. See COMPANY.

EAST-*India Silk*. See SILK.

EAST, *Mooring for*. See MOORING.

EASTERN. See ORIENTAL.

EASTER, a feast of the church, held in memory of our Saviour's resurrection.

The Greeks and Latins call it Πασχα, *pascha*, originally a Hebrew word, signifying *passage*, applied to the feast of the Passover which is held among the Jews much about the same time. In English it is called *Easter*, from *Eastre*, a goddess worshipped with peculiar ceremony in the month of April.

The observation of this festival is as ancient as the time of the apostles; for it is certain that the Christians of the second century celebrated anniversary festivals in commemoration of the death and resurrection of Christ, and of the effusion of the Holy Ghost upon the apostles. The day which was observed as the anniversary of Christ's death was called the *paschal* day, because it was considered as the same with that on which the Jews celebrated their Passover. But towards the close of this century, a dispute commenced about the particular time in which this feast was to be kept. The Asiatic churches kept it on the 14th day of the first Jewish month, and three days after commemorated the resurrection of the Redeemer, pleading on behalf of this practice the authority of the apostles, Philip and John, and the example of Christ, who held his paschal feast on the same day that the Jews celebrated their passover. The western churches celebrated their paschal feast on the night that preceded the anniversary of Christ's resurrection, and thus connected the commemoration of his death, and of his resurrection; and they pleaded the authority of the apostles Peter and Paul. One principal inconvenience attending the Asiatic method was, that this great festival was commonly held on other days of the week than the *first*. Victor, bishop of Rome, toward the close of the second century, attempted to force the Asiatic churches, by the pretended authority of his laws and decrees, to follow the rule which was observed by the western churches: they refused to submit, and were excommunicated by Victor. However, in consequence of the mild interposition of Irenæus, bishop of Lyons, the disputants retained their own customs till the fourth century, when the council of Nice abolished that of the Asiatics, and rendered the time of the celebration of *Easter* the same through all the Christian churches.

Easter is one of the most considerable festivals in the Christian calendar; being that which regulates and determines the times of all the other moveable feasts.

The rule for the celebration of *Easter*, fixed by the council of Nice, in the year 325, is that it be held on the Sunday which falls upon, or next after, the full moon next after the 21st of March; i. e. the Sunday which falls upon, or next after the first full moon after the vernal equinox.

The reason of which decree was, that the Christians might avoid celebrating their *Easter* at the same time with the Jewish passover, which, according to the institution of Moses, was held the very day of the full moon.

To find *Easter* agreeable to this rule, the method that obtained throughout the church, from the time of Dionysius Exiguus to that of the reformation of the calendar under pope Gregory; and which still obtains in countries where the Gregorian correction is not admitted, is, by means of the golden numbers, duly distributed throughout the Julian calendar.

The vernal equinox, at the time of the Nicene council, happening on the 21st of March, has been, upon Dionysius's authority, affixed to the same day of the Julian year ever since; so that in the Julian way of computing, no full moon is paschal, but that immediately after the 21st of March: therefore, *Easter* can never happen earlier than the 22d of March. Now, by finding the full moons next after the 21st of March, for the several golden numbers or years of the lunar cycle, we shall have a table for finding *Easter* for ever.

Such table being of considerable use in the Julian computation, we shall here subjoin it.

Gold. Numb.	Full Moons next after Ver. Equin.		Gold. Numb.	Full Moons next after Ver. Equin.	
I	5 April,	D	XI	15 April,	G
II	25 March,	C	XII	4 April,	C
III	13 April,	E	XIII	24 March,	F
IV	2 April,	A	XIV	12 April,	D
V	22 March,	D	XV	1 April,	G
VI	10 April,	B	XVI	21 March,	C
VII	30 March,	E	XVII	9 April,	A
VIII	18 April,	C	XVIII	29 March,	D
IX	7 April,	F	XIX	17 April,	B
X	27 March,	B			

Now to find *Easter* for any given year, find the dominical letter, and the golden number of the given year, as directed under DOMINICAL *Letter* and *Golden* NUMBER.

Then in the table, seeking the dominical letter, with the day of the paschal full moon, and the Sunday letter annexed thereto; compare this letter with the dominical letter of the given year, that it may appear how many days are to be added to the day of the paschal full moon to give *Easter*-day.

E. gr. In the year 1715, the dominical letter is B, and the golden number VI; consequently the paschal full moon is fixed, by the table, to the 10th of April; whose Sunday letter being B, the dominical letter given, itself, is a Sunday; and therefore *Easter* will fall on the eighth day following, viz. on the 17th of April.

But in this computation, the vernal equinox is supposed affixed to the 21st of March; and the cycle of nineteen years, or golden numbers, is supposed to point out the places of the new and full moons exactly: both which suppositions are erroneous. Whence it follows, that the Julian *Easter* never happens at its due time, unless by accident.

For an instance of the error, it may be observed, that in the year 1715, the vernal equinox falls on the 10th of March, eleven days before the rule supposes it; and the paschal full moon on the 7th of April, three days earlier than was supposed. *Easter*-day, therefore, which is held on the 17th of April, should be held on the 10th.

This error was grown to such a pitch, in course of time, that pope Gregory XIII. thought it necessary to correct it; and accordingly, in the year 1582, by the advice of Aloysius Lilius, he ordered ten days to be thrown out of October, so to bring back the vernal equinox to its old place, viz. the 21st of March: and hence the Gregorian calendar, Gregorian year, &c.

This correction, however, did not entirely remove the error; for the equinoxes and solstices still anticipate 1 h. 55′ 20″ in every 400 Gregorian years; but the difference is so inconsiderable as not to amount to 24 hours, or to one whole day in less than 5082 Gregorian years. See BISSEXTILE.

To find *Easter* by the *Golden* NUMBER, see NUMBER *of Direction*.

In the new or Gregorian computation, in lieu of golden numbers, the time of *Easter* is found by means of epacts contrived for that purpose. See EPACT.

Having the dominical letter and the epact, *Easter*-day ma-

may be found by the two following rules: 1. For finding *Easter* limit, or the day of the paschal full moon from March the first inclusive; add 6 to the epact, and if this sum exceeds 30, 30 must be taken from it; the remainder subtracted from 50 will give the limit, which is never to exceed 49, nor fall short of 21. 2. From the limit and dominical letter, *Easter-day* may be found, by adding 4 to the number of the dominical letter, subtracting the sum from the limit, and the remainder from the next higher number, which is exactly divisible by 7; add the last remainder to the limit, and the sum will give the number of days from the first of March to *Easter-day*, both inclusive. Thus for the year 1778, the epact is 1, and the dominical letter D: 6 + 1 = 7: 50 — 7 = 43 paschal limit; 43 — 8, the sum of 4 and the dominical letter, = 35; and 42 — 35 = 7, which added to 43, the limit gives 50, or the number of days from March the 1st inclusive to *Easter-day*, or 19th of April.

The following table renders the finding of *Easter* in the Gregorian year from the year 1700 to the year 1900 very easy.

Epacts.	Paschal full Moons.		Epacts.	Paschal full Moons.	
X	13 April,	E	IX	4 April,	C
XI	2 April,	A	XX	24 March,	F
XXII	22 March,	D	I	12 April,	D
III	10 April,	B	XII	1 April,	G
XIV	30 March,	E	XXIII	21 March,	C
XXV	18 April,	C	IV	9 April,	A
VI	7 April,	F	XV	29 March,	D
XVII	27 March,	B	XXVI	17 April,	B
XVIII	15 April,	G	VII	6 April,	E
			XVIII	26 March,	A

Now, to find *Easter* for any given Gregorian year, seek the dominical letter and the Gregorian epact, as shewn under EPACT, &c. Find the epact in the table, and note the paschal full moon, with the weekly letter corresponding to the same. The rest is performed, as already taught for the Julian *Easter*.

E. g. the dominical letter of 1778 is D, and the epact I, consequently the paschal full moon falls on the 12th of April D, which is therefore Sunday, and *Easter-day* is the 19th of April, as before.

Though the Gregorian calendar be doubtless preferable to the Julian, yet it also has its defects. It cannot, for instance, keep the equinox fixed on the 21st of March, but it will sometimes fall on the 19th, and sometimes on the 23d.

Add, that the full moon happening on the 20th of March, might sometimes be paschal; yet it is not allowed as such in the Gregorian computation; as on the contrary, the full moon of the 22d of March may be allowed for paschal, which it is not. Scaliger and Calvisius have also proved other inaccuracies in this calendar. See CALENDAR. See an excellent paper on this subject by the earl of Macclesfield, in the Phil. Trans. vol. xl. p. 417. See EPACT and *Golden* NUMBER.

EASTER *Term*. See TERM.

EASTERLING *Money*. See STERLING.

EASTERN *Amplitude, Church, Horizon, Ocean*. See the substantives.

EATUAS, in *Modern History*, a name which the inhabitants of Otaheite in the South Sea give to an imaginary inferior race of deities; two of whom, they say, at some remote period of time, inhabited the earth, and were the parents of the first man. The term is derived from *eatu*, which signifies *finished*. These subordinate deities are very numerous, and are of both sexes; the male are worshipped by the men, and the female by the women, in separate MORALS, and under the direction of distinct priests. There are also *Morais* common to both. Hawkesw. Voyages, vol. ii. p. 239

EAU *de Luce*, is a kind of volatile liquid soap, of a strong, penetrating smell. The following instructions will serve for making it: take four ounces of rectified spirit of wine, and in it dissolve ten or twelve grains of white soap; filtrate this solution; then dissolve in it a dram of rectified oil of amber, and filtrate again: mix as much of this solution with the strongest volatile spirit of sal ammoniac, in a cryftal glass bottle, as when sufficiently shook, shall produce a beautiful milky liquor. If upon its surface be formed a cream, some more of the oily spirit of wine ought to be added.

EAVES, the margin or edge of the roof of a house, being the lowest tiles, slate, or the like, which hang over the walls to throw off the waters to a distance from the wall.

EAVES-LATH, a thick feather-edged board, generally nailed round the *eaves* of a house for the lowermost tiles, slate, or shingles, to rest upon.

EAVES-*Droppers*, in *Law*, are persons who listen under walls or windows, or the *eaves* of a house, to hearken after discourse, and thereupon to frame slanderous and mischievous tales. These are a common nuisance, and presentable at the court-leet, or indictable at the quarter-sessions, and punishable by fine, and finding sureties for good behaviour.

EBBING *and* FLOWING *of the Sea*. See TIDES.

EBDOMARY, *ebdomadarius*, an officer anciently appointed weekly in cathedral churches, to supervise the regular performance of divine service, and prescribe the particular duties of each person attending in the choir, as to reading, singing, and praying. To this purpose the *ebdomary*, at the beginning of his week, drew up in form, a bill or writing of the respective persons, and their several offices, called *tabulæ*, and the persons there entered were styled *intabulati*.

EBDOME, *Ἑβδόμη*, in *Antiquity*, a festival kept on the seventh of every lunar month, in honour of Apollo, to whom all seventh days were sacred, because one of them was his birth-day; whence he was sometimes called *Ebdomagetes*. For the ceremonies of this solemnity, see Pott. Archæol. Græc. lib. ii. cap. 20. tom. i. p. 385.

EBEREMORTH, or EBEREMORS, in our *Old Laws*, the same as *eberemordrum*, or *eberemurder*. See EBERE-MURDER.

EBEREMURDRUM, or EBEREMURDRUM, in our *Old Writers*. See EBEREMURDER.

EBIONITES, ancient heretics, who rose in the church in the very first age thereof, and formed themselves into a sect in the second century, denying the divinity of Jesus Christ.

Origen takes them to have been so called from the Hebrew word *ebion*, which in that language signifies *poor*; because, says he, they were poor in sense, and wanted understanding. Eusebius, with a view to the same etymology, is of opinion, they were thus called, as having poor thoughts of Jesus Christ, taking him for no more than a mere man.

It is more probable the Jews gave this appellation to the Christians in general, out of contempt; because in the first times there were few but poor people that embraced the Christian religion. This opinion, Origen himself seems to give into, in his book against Celsus, where he says, "that they called *Ebionites*, such among the Jews as believed that Jesus was truly the expected Messiah."

It might even be urged, with some probability, that the primitive Christians assumed the name themselves, in conformity to their profession. It is certain, Epiphanius observes, they valued themselves on being poor, in imitation of the apostles. The same Epiphanius, however, is of opinion, that there had been a man of the name *Ebion*, the chief and founder of the sect of *Ebionites*, contemporary with the Nazarenes and Cerinthians. He gives a long and exact account of the origin of the *Ebionites*, making them to have risen after the destruction of Jerusalem, when the first Christians, called *Nazarenes*, went out of the same to live at Pella.

The *Ebionites* are little else than a branch of Nazarites; only that they altered and corrupted, in many things, the purity of the faith held among those first adherents to Christianity. For this reason, Origen distinguishes two kinds of *Ebionites*, in his answer to Celsus: the one believed that Jesus Christ was born of a virgin; and the others, that he was born after the manner of other men. The first were orthodox in every thing, except that to the Christian doctrine they joined the ceremonies of the Jewish law, with the Jews, Samaritans, and Nazarites; together with the traditions of the Pharisees. They differed from the Nazarites, however, in several things, chiefly as to what regards the authority of the sacred writings; for the Nazarites received all Scripture contained in the Jewish canon; whereas the *Ebionites* rejected all the prophets, and held the very names of David, Solomon, Isaiah, Jeremiah, and Ezekiel, in abhorrence. They also rejected all St. Paul's Epistles, whom they treated with the utmost disrespect.

They received nothing of the Old Testament but the Pentateuch, which should intimate them to have descended rather from the Samaritans than from the Jews. They agreed with the Nazarites in using the Hebrew Gospel of St. Matthew, otherwise called the Gospel of the Twelve Apostles; but they had corrupted it in copy in abundance of places: and particularly, had left out the genealogy of our Saviour, which was preserved entire in that of the Nazarites, and even in those used by the Cerinthians.

Some, however, have made this gospel canonical, and

of greater value than our preſent Greek Goſpel of St. Matthew. See NAZARENES.

Theſe laſt, whoſe ſentiments, as to the birth of our Saviour, were the ſame with thoſe of the *Ebionites*, built their error on this very genealogy.

Beſide the Hebrew Goſpel of St. Matthew, the *Ebionites* had adopted ſeveral other books, under the names of St. James, John, and the other apoſtles: they alſo made uſe of the Travels of St. Peter, which are ſuppoſed to have been written by St. Clement, but had altered them ſo, that there was ſcarce any thing of truth left in them. They even made that ſaint tell a number of falſhoods, the better to authoriſe their own practices. See St. Epiphanius, who is very diffuſive on the ancient hereſy of the *Ebionites*, Hær. 30.

But his account deſerves little credit, as, by his own confeſſion, he has confounded the other ſects with the *Ebionites*, and has charged them with errors, to which the firſt adherents of this ſect were utter ſtrangers.

EBOLICS, *ebolica*. See ECBOLICS.

EBONY, *of Crete, Ebenus*, in *Botany*, a genus of the *diadelphia decandria* claſs. Its characters are theſe: the empalement of the flower is ſtenderly indented, and hairy; and is of the butterfly kind, having ten ſtamina. In the bottom is ſituated an oblong germen, which afterward becomes an oblong ſwelling pod, opening with two valves, and inclofing three or four kidney-ſhaped ſeeds.

There is only one ſpecies, which grows naturally in Crete, and ſome other iſlands of the Archipelago. It riſes with a ſhrubby ſtalk, three or four feet high, which puts out ſeveral ſide-branches, garniſhed with hoary leaves at each joint, compoſed of five narrow ſpear-ſhaped lobes, which join at their tails to the foot ſtalks, and ſpread out like the fingers of a hand: the branches are terminated by thick ſpikes of large purple flowers, which are of the butterfly or pea-bloom kind.

Theſe plants will not live in the open air through the winter in England; neither ſhould they be too tenderly treated.

EBONY *of the Alps, Cytiſus*. See *Baſe Tree*-TREFOIL.

EBONY, *Baſtard, Painciana*. See BARBADOES *Flower-Fence*.

EBONY, *Mountain*. See BAUHINIA.

EBONY wood is brought from the Indies, exceedingly hard and heavy, ſuſceptible of a very fine poliſh, and on that account uſed in Moſaic and inlaid works, toys, &c.

There are divers kinds of *ebony*; the moſt uſual among us are black, red, and green, all of them the product of the iſland of Madagaſcar, where the natives call them, indifferently, *bacon mainthi*, q. d. *black wood*. The iſland of St. Maurice, belonging to the Dutch, likewiſe furniſhes part of the *ebonies* uſed in Europe.

Authors and travellers give very different accounts of the tree that yields the black *ebony*. By ſome of their deſcriptions, it ſhould be a ſort of palm-tree; by others, acyſtiſos, &c. The moſt authentic of them is that of M. Flacourt, who reſided many years at Madagaſcar, as governor thereof; he aſſures us, that it grows very high and big; its bark being black, and its leaves reſembling thoſe of our myrtle, of a deep, duſky, green colour.

Tavernier aſſures us, that the Indians always take care to bury their trees, when cut down, to make them the blacker, and to prevent their ſplitting, when wrought. F. Plumier mentions another black *ebony*-tree, diſcovered by him at St. Domingo, which he calls *ſpurium parvulaceæ foliis aculeatum ebeni materiæ*. Candia alſo bears a little ſhrub, known to the botaniſts under the name of *ebenus Cretica*, above deſcribed.

Pliny, and Dioſcorides ſay, the beſt *ebony* comes from Ethiopia, and the worſt from India; but Theophraſtus prefers that of India. Black *ebony* is much preferred to that of other colours. The beſt is a jet black, free of veins and rind, very maſſive, aſtringent, and of an acrid pungent taſte.

Its rind, infuſed in water, is ſaid to purge pituita, and cure venereal diſorders; whence Mathiolus took guaiacum for a ſort of *ebony*. It yields an agreeable perfume, when laid on burning coals: when green, it readily takes fire, from the abundance of its fat. If rubbed againſt a ſtone it becomes brown. The Indians make ſtatues of their gods, and ſceptres for their princes, of this wood. It was firſt brought to Rome by Pompey, after he ſubdued Mithridates. It is now much leſs uſed among us, than anciently, ſince the diſcovery of ſo many ways of giving other hard woods a black colour.

As to the green *ebony*, beſides Madagaſcar and St. Maurice, it likewiſe grows in the Antilles, and eſpecially in the iſle of Tobago. The tree that yields it is very buſhy; its leaves are ſmooth, and of a fine green colour. Beneath its bark is a white bleu, about two inches thick; all beneath which, to the very heart, is a deep green, approaching towards a black, though ſometimes ſtreaked with yellow veins. Its uſe is not confined to moſaic work: it is likewiſe good in dying, as yielding a fine green tincture.

As to red *ebony*, called alſo *granadillo*, we know little of it more than the name.

The cabinet-makers, inlayers, &c make pear-tree, and other woods, paſs for *ebony*, by giving them the black colour thereof. This ſome do by a few waſhes of a hot decoction of galls; and when dry, adding writing ink thereon, and poliſhing it with a ſtiff bruſh, and a little hot wax: and others heat, or burn, their wood black. See DYING.

EBRUHARITES, a ſect, or order of religious, among the Mahometans; thus called from their founder *Ebrubarid*, a diſciple of Naceſchibendi.

The *Ebrubarites*, notwithſtanding the extraordinary ſanctity they make profeſſion of, with an abſolute dereliction of all worldly things, are regarded, by the Muſſulmans, as no better than heretics, becauſe they do not eſteem themſelves obliged to go in pilgrimage to Mecca. To excuſe themſelves from this labour, they urge, that the pureneſs of their ſouls, their ſublime contemplations, eſtacies, &c. ſhew them Mecca and Mahomet's tomb, without ſtirring out of their cells.

EBRICCATUM, a term uſed by Paracelſus, to expreſs the partial loſs, or deprivation of reaſon, as it happens during drunkenneſs; but with the addition of the epithet *caleſte*, it ſignifies, with the ſame author, a much more exalted ſtate, a ſort of divine enthuſiaſm, or inſpiration, ſuch as the ſibyls of old boaſted of; and, among the moderns, the French prophets, and ſome other religious ſects, have pretended to. Paracelſus himſelf pretended, at times, to be under ſome ſuch influence; but his mad fits ſeemed to have very little of inſpiration in them.

EBRIETAS, drunkenneſs: among the aphoriſms of Hippocrates, there is one, ſ. aph. which reſpects *ebriety*, and is thus expreſſed: "If a drunken perſon loſe his voice of a "ſudden he dies in convulſions, unleſs a fever ſeizes "him, or his voice returns at the going off the drunken "fit."

EBRILLADE, in the *Manege*, a check of the bridle, which the horſeman gives to the horſe by a jerk of one rein, when he refuſes to turn. An *ebrillade* differs from a *ſaccade*, the latter being made with both reins at once, and the former only with one. Moſt people confound theſe two words under the general name of a check or jerk of the bridle, called in French *coup de bride*. It is a chaſtiſement, and no aid, and is diſuſed in academies.

EBRIZIUS *color*, a term uſed by ſome of the old writers, to expreſs a very fine yellow. The word ſeems originally to have been obryzium, and was certainly derived from the *aurum obryzum*, or fine gold, of which this *ebrizius* expreſſed the colour.

EBSEMECH, in *Chemiſtry*, a word uſed by Langius, and ſome other authors for quickſilver.

EBULLITION, in *Phyſics*, the act of emitting bubbles, by a vehement agitation of the parts of a fluid, produced by fire, or otherwiſe.

Philoſophers are diſagreed about the cauſe and manner of *ebullition*. See BOILING.

EBULLITION *of the blood, ebullitio ſanguinis*, in *Medicine*, a term uſed by ſome of the old writers, to expreſs what they ſuppoſed to be the occaſion of the motion of the heart, which they attributed to a ſort of *ebullition* of the blood contained there. See BLOOD.
